The first of Bossi's imitators who has appeared successfully for 150 years is Mr. Henry Emery, of Sharp & Emery, 17 at Brunswick Street, Dublin, once an art student at Liverpool, and for thirty years known among Dublin architects as an artistic architectural sculptor in wood and stone, and a thorough student of styles and periods of art, and versatile in adapting himself to them. He has also shown a refined sense of colour and proportion, and there is little of the old Italian Renaissance work of Dublin which he has not made a life study of.

The writer of this, who has made it a study too, and to whom few of the examples that Dublin could show in forty years past have been unknown, ventures to think that the work has been seen by Emery in the manner of Bossi is, without mere egotism, no less refined, and to be valued as highly hereafter as the prized work of the ancient master. Whatever the Italian

tradition or mystery, if secret there may have been of the cement colour medium inlaid in the incised marble, it is mastered, and its perfection of durability and capability of fine polished surface is no less in Emery's than in that of the older work.

THE BLACKPOOL TOWER.

THE hearing of the appeal of the Blackpool Tower Company, Ltd., against the assessment committee of the Fylde Union, was concluded at Preston Quarter Sessions on Saturday. The committee assessed the tower and buildings around at 15,000*l.* gross and 10,500*l.* rateable in July 1902, and in accepting the gross assessment the appellants claimed that proper deductions from the gross annual value had not been made. The committee thereupon knocked off the odd 500*l.*, but the company urged that sufficient deduction had not been made, and therefore the present appeal was brought. In the course of the hearing, Mr. Thomas Dryden, consulting and practical engineer, Preston, was cross-examined by Mr. Ryde with regard to his statement that between 288 feet and 312 feet of the tower was corroded. He repeated that if the corrosion continued during the coming ten years as it had done the past ten years a belt of 24 feet, weighing some 500 tons, would have to come down, and to replace that would cost 40*l.* a ton, or 20,000*l.* Colonel W. Henry Welstead, rating valuer, Hull, gave it as his view that there would be nothing left of the original tower at the end of fifteen years if the corrosion went on at the same rate and no renewals were done. The Court reserved judgment.

THE opening ceremony of the Baptist schools, Grove Road, Lowestoft, which are in connection with the London Road Baptist church, was held on Thursday, April 2. The schools, which have been erected at the back of the existing church and vestries, include large schoolroom, church parlour, infants' room and three other classrooms, capable of being thrown into the schoolroom by means of swivel partitions. Suitable lavatory accommodation is provided. The building is faced externally with red bricks; the dressings are of white Costessey work. The design is of late Gothic. The contract amounted to 1,338*l.*, and has been carried out by Mr. C. E. Earl, of Lowestoft. The architects for the above and for the church (recently completed) are Messrs. G. & R. P. Baines, 5 Clement's Inn, Strand, London, W.C.

STANLEY HALL, SOUTH NORWOOD.

WE have already referred to this building, which was opened by the Chancellor of the Exchequer on February 2. It was erected at the sole expense of Mr. W. F. Stanley, the mathematical instrument maker, and embodies his ideas of architecture. As it is to be a gift to the district, solidity of con-

struction was sought regardless of cost. The Chancellor expressed the general opinion of the audience when he said the building was not only adapted to the purposes contemplated but it would long remain as an ornament to the neighbourhood. Stanley Hall will serve for the amusement and entertainment of people as well as a place of instruction.

PLASTERING IN CANADA.

AT the request of the Toronto Chapter of the Ontario Association of Architects, Mr. W. J. Hynes, on behalf of the Plasterers' Section of the Toronto Builders' Exchange, has prepared and submitted the following description of materials, methods, tools and trade definitions used in plastering, which appears in the *Canadian Architect*, the object being to assist in bringing into use specifications that shall be more nearly uniform than those heretofore employed.

Description of Materials used in Plastering.

1. No. 1 wood lath consists of white pine, cedar or spruce, free from large knots or bark, $\frac{3}{8}$ inch thick, 4 feet long, in widths of 1 inch, $1\frac{1}{4}$ inch and $1\frac{3}{8}$ inch, of uniform dimensions.
2. No. 2 wood lath consists of hemlock, hard pine and culls from white pine, cedar or spruce, of irregular dimensions.
3. Expanded metal lath made from sheet steel, cut and expanded, may be procured either in the naked steel or painted. The Expanded Metal Company, of Toronto, manufacturers.
4. Hayes's metal lathing is made from sheet steel which is perforated, with the points of perforations turned back to form keys. Manufactured by the Metallic Roofing Company, Toronto, either plain or painted.
- For either metal lathing the bearings require to be not more than 12-inch centres.
5. Grey lime from Georgetown, Limehouse and Milton is generally used for mortar for the under coats in plastering. It should be well burned and used while fresh.
6. White lime from Guelph, Galt, Innerkip and other places is used for the finishing coat. Like the grey lime, it requires to be well burned and should be made into lime putty while fresh.
7. White rock finish, a new preparation on the market, appeals strongly for consideration, from the fact of its being scientifically ground and slacked with only sufficient water to complete the slacking, leaving the product in the form of dry powder which can be conveniently handled and used same as lime putty. Manufactured by the Imperial Plaster Company, Toronto. To be used according to the directions of manufacturers.
8. Plaster made from gypsum requires to be finely ground and properly calcined. Should be white in colour and of

uniform setting properties. Our market is chiefly supplied by the Albert Manufacturing Company, of Hillsborough, N.B.

9. Sand for lime mortar should be sharp and clean, but too coarse; for cementwork coarse sand is best.

10. Hair should be long winter cattle or goat hair properly saved.

11. Fibres have been offered as substitutes for hair, nothing at present offered answers the purpose.

12. Nails for wood lathing $1\frac{1}{2}$ inch long, of good weight.

head. For expanded metal large-headed slater's nails.

Hayes's lathing heavy lath of good head.

13. Metal angles.—Hoidge metal angles patented.

manufactured here are a good protection for external angles.

14. Hair mortar consists of grey lime properly slacked mixed with clean sharp sand, to which is added sufficient hair to hold the material from falling or wasting through keys in lathwork.

15. Straightening mortar made same as above with a greater quantity of sand and one-third the quantity of hair.

16. Coarse stucco made from grey lime, or white, as desired, with clean coarse sand.

17. Lime stucco made from lime putty or white rock finish mixed generally one of lime to three of clean sharp sand.

18. Lime putty made from white lime slacked with surplus of water, run through a fine sieve, and allowed to stand in vats until fit for use.

19. Gauging is the term used to describe the admixture of calcined plaster with mortar or lime putty. The larger the proportion of plaster used the stronger the work will be. The same term is used to describe the mixing of cements with mortar, sand, lime or other material.

20. Portland cement gauged with lime mortar is used generally for outside work and first coat on lathwork, the proportion varying according to requirements.

21. Portland cement stucco generally used for outside work and places subject to damp or moisture. When applied to lath use one of Portland, three of sand and add one of lime mortar. Second coat, three of sand, one of Portland and finishing coat generally two of Portland to five of sharp sand. When used on lathing metal lath is to be preferred.

22. Portland cementwork is generally conceded to be the best base coating for Keene's or white cements.

23. Keene's, parian, Martin's, generally described as "white cements," were originally patented. The base of all is gypsum mixed with alum or borax and recalcined and ground. Eng-

LISTS OF ART PLATES
CATHEDRALS, published in THE ARCHITECT
on application to GILBERT WOOD & CO. LTD.
Buildings, Ludgate Circus, London,

Keene's cement is generally made in three grades—coarse, fine and superfine, the first of a pink shade and the latter pure white.

24. For base coats Portland cementwork is generally used, but many manufacturers advocate the use of coarse Keene's sand. This method requires that the heads of all lath nails and exposed metalwork be well shellacked to avoid rust. For first coat use two coarse Keene's, three sand. For second coat use one of coarse Keene's, one sand. Finish with neat cement.

25. Victoria Keene's cement manufactured in England by Messrs. Keene & Co. allows the use of lime in small proportions and is greatly reduced the cost, not so much in the material as in the ease and speed with which work may be executed.

26. Best's American Keene's also uses this method for plastering.

In specifying these materials it is advisable to say they shall be used as directed by the manufacturers.

27. Patent or hard plasters are numerous. The base of nearly all is calcined plaster mixed with sand, cement, hair or fibre, and treated with a chemical retarder which delays setting and allows time for use. They are generally good, being machine made of accurate proportions and furnished at building ready for use with the addition of water only. To save cost of transportation some are delivered ready to use by mixing with sand and water. Owing to the increased cost of this material inner grounds are used.

28. Wood fibre plaster made in Toronto by the Imperial Plaster Company is the best and most general in use here. It is supplied ready for use by adding water only.

29. Paristone made by the Alabastine Company, Paris, Ontario, is supplied without sand and contains no hair or fibre.

30. Rock wall plaster made by the Albert Manufacturing Company, Hillsborough, N.B., is supplied without sand and is advisable to specify these materials to be used as directed by the manufacturers.

31. Patent or hard plasters make only the base or rough coats. Good stucco or float finish work may be done with them, but all depend upon lime putty or white rock finish for a finished coat.

33. Blackboards.—Potter's blackboard material made by the Soapstone Finish Company, Chester Depot, Vt., is generally used. Some contractors have their own compounds and methods. They should be black, hard, smooth, but free from lime or polish.

Description of Work done in Plastering.

1. Rendering is a good coat of hair mortar on brick or stone walls before lathing.

2. Back plastering is lathing and plastering with one good coat of hair mortar on any framework which may be required before regular lathing is done. Back plastering, when done between timbers, is a slow and expensive process. It is better to lath and plaster the timbers and restrap lath and plaster, as this method gives complete separation of woodwork.

3. Deafening is a body of plastic material laid on boards fixed between joists of a floor, composed of lime screenings and cinder or ashes, or lime and mill shavings about 2 inches thick. The use of cement in deafening is a detriment, as when made hard the deafening properties are destroyed.

4. Wood lathing should have joints broken every twelfth lath nailed $\frac{3}{8}$ inch apart for ceilingwork and $\frac{1}{4}$ inch apart for wallwork. Ends butted, no vertical lath allowed.

5. Metal lath should have bearing not exceeding 12 inch centres nailed on with flat-headed nails for either metallic lath or expanded metal, and if finishing coat is required must be specified "three-coat work," as all metal lath must receive a scratch coat foundation for straightening. Arches, grains or furring for heavy mouldings are best executed with metal lath.

6. One-coat work is one good coat of hair mortar or other plaster about $\frac{1}{4}$ inch thick and floated to an even surface.

7. Two-coat work is one good coat of hair mortar straightened with a tool called a "darby" and floated. After this coat is dry apply putty coat of white lime and plaster with sand, if desired. The work cannot be made more than reasonably straight.

8. Three-coat work is one good coat of hair mortar well scratched. Second coat of straightening mortar laid plumb and true. After this coat is dry apply coat of white lime and plaster with a mixture of sand, if desired, and extra well trowelled or polished.

9. Rough-casting is a good coat of hair mortar left from the "darby," and when dry slapdashed with a mixture of lime and clean fine gravel.

10. Stucco.—This term is used to describe plasteringwork finished with a wooden tool or float, leaving a rough granular finish.

11. Rough or two-coat stuccowork consists of one coat of hair mortar well scratched and finished with coarse stucco applied when under coat is dry, straightened with a "darby"

STRIPSO

In 7, 14, 28 and 56 lb. kegs.

Quickly and thoroughly removes PAINT, VARNISH, STAINED ENAMEL, RUST or GREASE, however old or thick, without injury to the Wood or Metal, leaving the surface perfectly clean and ready for applying new Paint or Varnish.

Saves more than half the ordinary cost of stripping Paint and Varnish.

C. CHANCELLOR & CO., 13 CLERKENWELL ROAD, LONDON, E.C.

WHAT WE SAY

VELURE

A new and perfected JAPAN PAINT, superseding varnish, with remarkable spreading, elastic and weather resisting properties. One coat equals two coats of ordinary paint and one of varnish. In 120 colours. Any shade matched. Sanitary—washable. Will not crack, chip, peel, blister, or fade. Twelve months' guarantee given by the manufacturer.

Saves time, labour, varnish and money.

C. CHANCELLOR & CO.,

13, CLERKENWELL ROAD, LONDON, E.C.

WORTH

One Gallon will
Cover about 90
Square Yards.

TRYING.

FINISHED LIKE A MIRROR.

Your white Velure is the best we ever tried on the Yachts. Two coats really finished like a mirror. It far surpassed any enamel or ivory japan we ever used. I have done all the Windows in the house with it.

HUGH DORRIAN, Yacht Builder.

Nunsquarter, Kirkcubbin, Co. Down, June 24, 1901.

VELURE

WHAT CUSTOMERS SAY

H.M. THE KING.

I have had it used at Sandringham for H.M. the King and found it most satisfactory. It was used on some large additions last year.

C. SMEDLEY BECK, Architect.
11a, Prince of Wales Road, Norwich, Jan. 21, 1903.

ARCHITECT.

I am exceedingly pleased with the result of the Velure I had last year. Our doors look and feel like ivory, and show every appearance of great durability. I find that they keep very clean, and do not take the dirt.

A. E. PURDIE, F.R.I.B.A.
Meadow Grange, Blean, near Canterbury, Jan. 2, 1902.

IN A STEAM DISINFECTOR.

I am pleased to state that the Velure has been a perfect success so far. It has been subjected to great heat, steam pressure, and withstood the expansion and contraction of the iron, and there are no cracks or flaws to be found, the surface being perfect. It was applied by unskilled labour, the hospital porter doing the work.

J. BROOK, S.I.C., A.S.I., Surveyor, R.D.C.,
Stratford-on-Avon, 5th December, 1902.

UNDER WATER.

Velure gives a beautifully smooth surface, which remains hard under water, and does not foul easily.

JOHN MACKENZIE, Sail Maker.
Sandbank, Argyllshire, Sept. 26, 1901.

BETTER FINISH. BETTER WEAR.
FEWER COATS. LESS MATERIAL.

STANDS ANY AMOUNT OF EXPOSURE TO SUN OR FROST,
HEAT OR DAMP, WITHOUT CRACK OR BLISTER.

and brought to a rough uniform surface. This work cannot be expected to be more than reasonably straight.

12. Three-coat stucco or float finish consists of one coat of hair mortar well scratched, with a second coat of straightening mortar laid plumb and true and finished with a coat of fine stucco properly floated to uniform granular surface.

13. Bastard stucco consists of work executed as described for three-coat work, with the exception of the last coat being composed of two parts lime putty to three of sand laid true and floated to an even surface. This is then trowelled to a hard surface, but the face is not made perfectly smooth.

12. Trowelled stucco is same in material and method as bastard stucco, the difference being that it is trowelled until face is brought to a true smooth surface. In both bastard and trowelled stucco the under coats must be thoroughly dry; there being no plaster or cement used in this work the success depends upon proper and uniform suction.

15. Dubbing out is the term given for the necessary work in preparing the uneven surface of rough brickwork or fire-proofing to allow of plastering. If done with mortar it will require that no more than $\frac{1}{2}$ inch be put on at one time and may take several coatings to bring work to the proper surface. By using gauged mortar or hard plaster the necessary thickness may be applied at one operation.

16. Portland cementwork requires same methods for stuccowork as here described for mortar, the proportion of materials being as described in Materials, clauses 20 and 21.

17. Trowelled Portland cement requires under coats, as described above, and is finished with two of Portland, one of fine, sharp sand, to which is added one-twelfth of fine lime putty, laid even and trowelled to a fine polished surface.

18. Keene's cementwork may be finished as described for plasteringwork, the proportions being as described in Materials, clauses 23, 24, 25 and 26.

19. Plaster mouldings are formed with gauged mortar and finished with gauged putty. When weight of mouldings is not too great, the mortar may be dispensed with. Owing to the danger from settlements and shrinkages the thickness of these mouldings should not exceed $1\frac{1}{2}$ inch in any place. All heavier work requires to be bracketed.

20. Keene's cement mouldings are executed in neat Keene's cement, either coarse or superfine as may be desired, with a backing of coarse Keene's and sharp sand.

21. Plaster castings are composed of plaster and cast from moulds required by the design or article to be duplicated.

22. Staff castings are composed principally of plaster in which fibre or canvas has been added before the plaster has set. Their cost is no greater than for the plaster castings, and they are much stronger, allowing of very large work to be made in one piece. These casts may be sawn and fixed by nailing.

Staff calls for special attention. There is no limit to its possibilities as a decorative material, either in conjunction with run mouldings for enriched members or for the production of mouldings with enriched members and decorative features complete. By its use the entire decoration may be prepared while the building is in course of erection, ready to fix as soon as work is ready to receive it, in this way saving much valuable time. The manufacturers carry full stock of such ornaments as are in general demand, but work to detail requires special models, for which due time should be allowed. Specification should state whether work is to be from stock or special modelled to detail.

23. Wood fibre plaster or other hard plaster may be specified for any work where mortar is used for interior as described in previous clauses. A great saving in time can be effected by its use, particularly in winter or damp weather.

24. Tools and terms.—Scratching is the term used to describe the cross scoring of the first coat of mortar to form key for straightening coat or coarse stucco finish.

The "darby" is a wooden tool about 3 feet long, 3 inches wide and $\frac{1}{2}$ inch thick, with two handles by means of which the first coat in two-coat work, and the stucco coat in two-coat stucco is levelled or roughly straightened.

The "float" is a wooden tool about 14 inches long, 4 inches wide and $\frac{3}{8}$ -inch thick, used after the "darby" and straightening rod to level out the work, also for finishing stuccowork.

25. Grounds for plastering should be of soft pine firmly nailed and made true and straight. The thickness of ground determines the widths of frames and jambs, and should be considered together. For brickwork or terra-cotta the thickness here given is supposed to be fixed close to wall; if unduly packed out to straighten defective walls a dubbing-out coat is necessary.

Two-coat work in lime mortar on lath, $\frac{3}{4}$ -inch grounds.

" " " brick, $\frac{3}{8}$ -inch "

P. A. GILBERT WOOD, 6-11 IMPERIAL BUILDINGS, LUDGATE CIRCUS, LONDON, E.C.

The Architect.

THE WEEK.

THE decision of Mr. Justice RIDLEY on the subject of arbitrators' fees must be considered as unsatisfactory by architects as well as by civil engineers. There was a dispute between the Llandrindod Wells Water Company and the local Urban District Council. Mr. CHARLES HAWKSLEY and Mr. JAMES MANSERGH were appointed arbitrators, with Sir G. B. BRUCE as umpire. The total of their fees for investigating the circumstances and making the award was 476*l.* 12*s.* The hearing of the arbitration lasted two days, and the umpire made a special journey to Wales to satisfy himself about the evidence. The taxing-master in the first place asked for particulars, and was informed that the arbitrators' fees were 120 guineas each, the umpire's 195 guineas, and there were also solicitors' charges. The taxing-master held that the amount was excessive. As the fees had been paid in full the water company sought to recover the excess, amounting to 119*l.* 5*s.* Plaintiffs' counsel said that the decision of the taxing-master was *prima facie* evidence that the charges were exorbitant, and that view was taken by the judge. Mr. HAWKSLEY said they declined to furnish particulars because it would be inconsistent with the dignity of a Court of Arbitration to do so. But the judge was of opinion that a taxing-master could not do his duty unless he was supplied with necessary information. Evidence was given of the reasonableness of the charges. Mr. Justice RIDLEY considered that 476*l.* was too high for an award of 13,800*l.* The charge of 25 guineas a day he thought reasonable. He allowed the sum of 374*l.* 4*s.* 6*d.*, and gave judgment in favour of the plaintiffs for 102*l.* 7*s.* 6*d.* In a case of the kind it is impossible to fix the limits of the time which an arbitration should occupy. As a rule it depends on the lawyers employed. If either party, or both, will insist on the production of evidence, arbitrators cannot refuse to listen. It was not likely that three gentlemen of high reputation, all of whom occupied the post of President of the Institution of Civil Engineers, would demand more money than they had earned, and judgment might well have been given in favour of them. Probably the point which had most influence with his lordship was the refusal to supply details of the charges.

AN application having been made to the Irish Institute of Architects for information respecting the responsibility of an architect in connection with foundations, the hon. secretary was directed to reply that in the opinion of the Council it is not part of the recognised duty of an architect to sink trial pits to ascertain the nature of the ground upon which a building is to be erected, although in exceptional cases he may, if he thinks it advisable, recommend this to be done at the expense of the employer. The Council consider that the system universally adopted at present is equitable, as the employer only pays for the work which is actually executed. Summary statements of law, especially when formulated by laymen, are not always to be approved, and there is a risk of the advice thus given being misunderstood. There are enough decisions to suggest that an architect is expected by English law to examine the site for a building or to have it examined for him, and he is liable for neglect if any damages should arise through acting on incorrect information. Although the builder is responsible for executing proper foundations, the architect is not in consequence exempted. If the builder should suffer loss he cannot look to the architect for compensation. In France the architect is liable to the client as well as to the contractor. Responsibility is believed to be evaded in England by avoiding to state the nature of the soil, either in a specification or on a drawing. But that is a doubtful expedient which has not been tested in the Courts. The omission would be regarded with suspicion by judges. To ascertain the nature of the soil may sometimes be an expensive operation, in which case the advantage of making borings or trial pits should be explained to the building owner, and his sanction obtained for any necessary

outlay. But in ordinary cases no architect who is careful of his reputation will neglect to ascertain the nature of the ground on which one of his buildings is to be erected.

DURING last year 477,676 people visited the National Gallery, Trafalgar Square, and 201,696 visited the Gallery at Millbank. The daily average at the former was 2,296, and at the latter 979. Almost the same proportion applies to the students' days, for at Trafalgar Square there were 15,866 attendances, and 6,729 at Millbank. On Sunday afternoons the visitors numbered 37,534 and 35,494. Two paintings have been purchased, viz. a portrait of *Waha de Linter*, by JORDAENS, and a *Coronation of the Virgin*, by LORENZO MONACO. Eleven pictures were obtained by bequest, which are examples by ROMNEY, JOHN PHILLIP, W. COLLINS, NASMYTH, DELAROCHE, JAN BOTH, JAN VAN DER HEYDEN and CHARLES VACHER. Mr. G. F. WATTS has presented his *Court of Death*. Other presents were works by PETER SAENNEDAM, JAN FYT, JOHN BRETT, J. WALLEN, E. LANTERI and G. F. WATTS. The cleaning of picture-glass has been done by a firm at a cost of 150*l.* a year; henceforth the greater part will be undertaken by the assistant porters. In order that students may, if they wish, work at both galleries, the students' days at the Millbank Gallery have, since October 7 last, been changed from Thursday and Friday to Tuesday and Wednesday in each week. Independently of partial studies, 585 oil-colour copies of pictures have been made at Trafalgar Square, viz. 311 from the works of 87 old masters and 274 from the works of 21 modern painters. At Millbank 284 completed copies of the pictures have been made in oil-colours, 80 in water-colours and 12 in pastels. The total number of catalogues sold in 1902 at both establishments was 15,687, as compared with 25,990 sold in 1901.

THE publication of the *Burlington Magazine* for connoisseurs shows remarkable courage. The number of people in England who take sufficient interest in early art, to which most of the articles are devoted, is small. Amateurs of that class are, moreover, reputed to be opinionated and not disposed for reading periodicals. It must be said the articles in the first number are authoritative. Mr. WEALE, Mr. H. P. HORNE, M. MOLINIER, Mr. BERENSON and Mr. C. J. FFOULKES are among the contributors. The photographic illustrations are remarkable for quantity and excellence, and there are also plates in colours. The reproductions of five portraits by DOWNMAN is evidence that modern art will not be neglected. The artist, a native of Devonshire, was a pupil of BENJAMIN WEST, and lived until 1824. He preferred profile representations. One of the most interesting of the articles is on the Hôtel de Lauzun on the Quai d'Anjou, Paris, which belonged to the noble who commanded the French troops in Ireland, and whose life, as MACAULAY says, was stranger than the dreams of other people. Nowhere in Paris is LOUIS QUATORZE decoration represented with more magnificence. The mansion has been acquired by the city of Paris, and is to be used as a museum for the art of that period. The success of the *Burlington Magazine* will be a hopeful sign of the present time.

It was lately stated that a site had been found on which the machine gallery of the Paris Exhibition of 1900 could be re-erected. More exact calculations have demonstrated that, although it would be practicable to remove the great metal bays and to set them up in a different place, the cost of the undertaking would be too large to admit of a profit from the enterprise. The removal and re-erecting might cost three millions and a half of francs. For a much smaller sum it would be possible to obtain a structure much more suitable for a suburban exhibition. M. DUTERT's colossal hall is likely to be taken down and sold in lots. The site will become part of the ornamental gardens which it is proposed to form. It is not believed, however, that the transformation can be completed in less than ten years. There will be a stipulation that all the paintings are to be preserved and made over to the State. They include examples by CORMON, LAURENS, MAILLART, FLAMENG and other artists.

TYPES OF COSTUME: ENGLISH, TWELFTH AND THIRTEENTH CENTURY.

EARLY ROMAN ARCHÆOLOGY.

THERE is no place on the earth's surface so well adapted for holding an historical and archæological congress as Rome. There may be more intellectual charm about Athens, but we must remember its influence as a city was brief if compared with its conqueror. Assuming the foundation of Rome to date from seven centuries before our era, we have the unique instance of a city exercising power for about twenty-five centuries. The student of archæology and history has much to see there, and in a short time he must come to the conclusion that without a study of the physical geography of Rome as well as its architectural and engineering remains the history of Rome must have more or less obscurity. One other important lesson it would also be well to learn, which is that the reputation of the Romans was in a large measure obtained under false pretences. We might go so far as to say that Rome was founded by a brigand, and that renown as well as territory was obtained dishonestly.

Everyone has heard of the Seven Hills to be found in the city. It would be more correct to state that there were nine or more of them. But in the old days so much virtue was attached to the number seven, it was considered well to have the capital connected with so lucky an omen. Hills, although of no great height, offered more security than plains, and, as we see in Greece, the majority of the cities began with hilly sites, which from their original importance became sanctuaries. The ground near the Tiber offered a choice of elevated sites, and was therefore utilised, not only by wanderers from Alba, of whom ROMULUS was the chief, but by other settlers. There is little doubt that the Pelasgians were among those who earlier held possession of one or more of the hills, and various other peoples occasionally occupied them. There is, in fact, reason to support the theory expressed by the late Lord LEIGHTON in one of his Academy addresses, when he said that Greeks and Romans were twin offshoots of the same stock, and that "the forefathers of the Greek and Roman races continued to dwell together after leaving their ancestral home." The word Romans should, however, be given a wide interpretation. Sabines had likewise claims on one or all of the hills, and if the Etruscans did not seize on the whole seven, their forbearance was probably dictated by the absence of any necessity for a space so circumscribed.

Protection was undoubtedly the chief inducement for a settlement on the hills, but if any soothsayer like CAPYS was able to read the future he could have pointed out that no spot was better adapted for the creation of a great city. The ground provided excellent building materials. There was clay on the other side of the Tiber from which most enduring bricks could be made, and the soil yielded peperino, pozzolana, travertine, and at no great distance paving-stones were to be obtained on which years could have no effect. ROMULUS and his brigands showed their shrewdness in dispossessing the inhabitants of the Palatine Hill and of adapting the old houses to their own use.

It is unnecessary for us to remark that the legends concerning the early history of ROMULUS are likely to be of less value than the majority of myths. The word Rome

was not derived from him, for it was associated with a Pelasgian stronghold in existence before his arrival. The tradition that he was a son of the war god MARS probably originated with a view to gain support for the martial enterprises of the rulers. The other legend about the connection of the Trojan ÆNEAS with the city was likely to have been devised by some Greek romancist desirous of flattering his master or patron. The only countenance for such a belief to be found in the "Iliad" is the speech of NEPTUNE when he wished to save ÆNEAS from ACHILLES, in which he says:—

Saturnian Jove hath hated now long time
The family of Priam, and henceforth
Æneas and his son, and his sons' sons,
Shall sway the sceptre o'er the race of Troy.

It is now impossible to determine whether ROMULUS was able to construct any works in stone on or about the Palatine. It has been recorded from generation to generation that he enclosed his city by a wall with gates, from which it was known as Roma Quadrata. But modern experience is in favour of the view taken by MONTESQUIEU, who regarded early Rome as one of those tumble-down villages in the Crimea, having only wooden shanties to enclose cattle, corn and booty. The legends relating to the life and death of ROMULUS are incredible, but they do not claim for him any great genius in construction. His end was as marvellous as his birth, and the credulous imagined that after his death the Sabines, who were supposed to be his enemies, bestowed on him the title of their god QUIRINUS, and erected a temple in his honour. There is no doubt a Temple of Quirinus existed in Rome, but there was no Temple of Romulus. The humble house in which he lived was pointed out to successive generations. Not only PLUTARCH, who wrote heroic romances in the guise of biographies, OVID and VIRGIL, the poets, but VITRUVIUS himself declared he had seen it. It was made of wood covered with reeds; it was several times destroyed by fire, but on each occasion a new structure arose, and was duly accepted as original.

The followers of ROMULUS could not have been powerful, for after his death they fell under the rule of a Sabine king. NUMA appears as a peaceable sovereign with a weakness for introducing the worship of a great many gods. Whether the Romans derived their love for a multitude of deities from him, or whether the later Romans were really Sabines who somehow had changed their name, there is no doubt that polytheism was cultivated to an incredible extent in the city. The number of gods and goddesses was continually increased and there never was the least difficulty in making additions. It was easier to become a deity than a patrician. It is doubtful if a complete register of them ever existed, even in the Pantheon. The system was excellent in one way, for building was encouraged by the continual demand for new temples. A great many old walls unearthed in various parts of Rome are accepted as fragments of the primitive Sabine temples. The name of ROMULUS or his tribe is never associated with any of them. Sometimes a temple served for two or three deities, and the arrangement may be due to policy or economy. History

is now disposed to give the credit for famous deeds to Sabine families instead of to Romans; but there can be no question that the patronage of building in the early days of Rome must be credited to the Sabines, and to them alone.

TULLUS HOSTILIUS, who succeeded NUMA, is represented as a tyrant. We are assured he was a Sabine. His name was connected with one great work, the Curia Hostilia, where the senators used to meet. Its site is not determined, but it was probably beside the Forum. He was a political organiser as his predecessor was a religious organiser, and two of the elements of Roman power must therefore be traced to Sabine kings. As was to be expected, TULLUS HOSTILIUS considered his work was the more important. He imagined that, like NUMA, he could call down lightning from above. He is said to have succeeded and was the victim of a thunderbolt.

In what way the Sabines and the Etruscans were connected is no longer clear. There was a second NUMA in ANCUS MARCIUS. But after him the power passed to three Etruscan kings in succession. The Sabines, however, continued to be the patricians of Rome, while the descendants of the followers of ROMULUS were mostly plebeians. Wherever they came from, whether they were Greeks or Germans, the Etruscans were remarkable for their skill in art. The results were not always uniform, for in single examples grace and ugliness are introduced in an incomprehensible manner. From the Etruscans the Romans derived their skill in construction and the power to create works on a grand scale. How much the Romans owed to Etruria was never more clearly described than by LORD LEIGHTON:—

Etruria gave them kings, augurs, doctors, mimes, musicians, boxers, runners; the royal purple, the royal sceptre, the fasces, the curule chair, the Lydian flute, the straight trumpet and the curved trumpet. The education of a Roman youth received its finishing touches in Etruria. Tuscan engineers had girt Rome with walls; Tuscan engineers had built the great conduit through which the swamp, which was one day to be the Roman Forum, was drained into the Tiber. What wonder, then, that in architecture, also in painting, in sculpture, in jewellery and in all the things of taste Etruscans gave the law to the ruder and less cultured race? Accordingly Etruscan architects adorned Rome with temples. So also the Etruscans gave to the dwelling-houses of the Romans their most characteristic feature, the atrium, with its portico and its tank. So, again, sculpture in Rome was wholly in the hands of the Etruscans. The terra-cotta figures which, even in the days of Cato, adorned the pediments of the Roman temples were of Etruscan workmanship. For bronzes, wherein Etruria was famous, Rome was again beholden to her. In the minor and purely decorative arts and industries, Rome was furnished from the same source; the booths in the Tuscan street under the Palatine Hill were gay with artistic manufactures of every kind; here Etruscan tradesmen displayed their famous mirrors, smooth, graven and embossed, their lamps, their candelabra, their cups and vases, their weapons, their musical instruments; here the Roman ladies indulged their passion for those masterpieces of the goldsmith's art for which Etruscan artificers were famous. As in carving, casting and chasing, so also in painting, Etruscans led the way. And this Etruscan supremacy in the things of art lasted for some four or five centuries—lasted, in fact, until it was first sapped, and then finally swept aside by a counter current of influence which, about the third century before Christ, began to filter through Campania into Rome from the opposite end of the peninsula, and after the fall of Syracuse triumphantly invaded and possessed the Roman world—the direct influence of Greece.

Each of the three Etruscan kings recognised the value of public works. The first TARQUIN raised a temple on the Tarpeian Hill; it was dedicated to JUPITER in order to gratify the Latins, and to MINERVA and JUNO, who were honoured by the Etrurians, JUNO being also a protector of the Sabines. The original building was low with thick columns set wide apart, and it was almost as broad as it was long. That was the Etruscan manner. Afterwards there was a proposal to enlarge the building, but this aroused so much opposition, all that could be done was to increase the height. The precise position is unknown, but it is believed the church of Ara Coeli occupies the site. There were several statues in front and a quadriga which, we suppose, was above. TARQUIN in addition constructed a circus, which did not correspond with the Greek hippodrome, and was intended for horse races and pugilistic exhibitions. A more useful undertaking was the embellish-

ment of the market-place in which the plebeians traded. He surrounded it with a portico. His endeavour to conciliate the Latin races excited the jealousy of the Sabine aristocracy, and TARQUIN is thought to have lost his life by the assassins they employed.

SERVIUS TULLIUS who succeeded was, according to a Sabine legend, only the son of a slave. His name is said to have been originally MASTARNA, and possibly he was once a soldier of fortune. He aided the first TARQUIN, and on the death of that king was able to obtain the crown by favour of the Senate. SERVIUS TULLIUS was another temple builder, and one of the first he erected was dedicated to Fortune, of whom he considered himself the favourite. Henceforth that deity seemed to be the best adapted of all for Roman invocation. But the cult of the goddess was not an innovation, for it had been introduced by the Pelasgians. Policy dictated that SERVIUS TULLIUS should raise temples to deities in favour among the plebeians. A large part of the agger which he had constructed, consisting of a wall and a deep trench, still remains, and in HORACE's time was used as a promenade. He also fortified the summits of the hills in order that they might serve as citadels in times of commotion. It is believed that the money coined during his reign was in imitation of Greek models. The art of writing was derived about the same time from the Greeks, and it was said that the earliest example of a written treaty was one concluded between SERVIUS and the plebeians. It was preserved in the Temple of Diana erected by him. It is remarkable that the arts of peace should have made such progress under a ruler who was at first a warrior. If history is to be accepted, he was assassinated at the instigation of his son-in-law TARQUIN, and what is incredible, his daughter TULLIA drove a chariot over his body.

TARQUINIUS SUPERBUS, the next sovereign, was a tyrant, but he remained faithful to Etruscan traditions and endeavoured to elevate the character of the Romans by setting splendid buildings before their eyes. He was not satisfied with works in Rome; he also raised buildings elsewhere. But he is principally known by his completion of the Cloaca Maxima. The arching in a portion of the sewer still remains. It was only a part of the sewage works which were then carried out. The Romans of succeeding ages strove to imitate, although they could not surpass, the sanitary efforts of the TARQUINS. The construction of the sewers caused discontent among the people, who were forced to labour in gangs, and the resulting agitations led to the deposition of TARQUINIUS SUPERBUS and the establishment of the republic. The crime of his son SEXTUS, of which the Sabine LUCRECE was the victim, excited the anger of the patricians, and the Sabine BRUTUS became leader of the revolt. TARQUIN fled, and the "Lay of Horatius" has made English boys acquainted with what followed—how he obtained the aid of LARS PORSENA of Clusium, who swore by the nine gods "that the great house of TARQUIN should suffer wrong no more;" how thrice thirty thousand of Etruria's warriors accompanied him to the side of the Tiber; how among them was SEXTUS, and how they were all foiled by the courage of HORATIUS and his two companions.

Whatever may be the faults of the Etruscan kings, there can be no question they were the first to attempt the creation of architectural Rome. Any earlier works executed should be credited to the Sabines. It is well also to remember that HORATIUS COCLES was a Sabine, and the names of his two companions are more Etruscan than Roman. Sufficient discrimination has not been exercised by those who treat of Roman history about these facts. At a later time the Latin race, through discipline, formed excellent soldiers and citizens, but in the early days of the city they did not distinguish themselves in any way. The plebeians are credited with performances of which they were only the spectators, or, it may be, in which they acted as labourers under Etruscan or Sabine direction. They were adapted to construct aggers and thick walls of concrete. When they obtained power they were forced to depend on foreign artists. It is difficult to persuade people in our time about the true conditions of Roman history, and we hope one of the results derived from the congress which has just completed its labours will be a more general recognition of the historic fact that what

was best in Roman construction was not the work of the race who alone are supposed to have been the genuine Romans.

OLD HOMES.*

IN his preface, Mr. Moss acknowledges that he "had never pretended to know anything whatever about architecture, no more than of the differential and integral calculus." He has, however, in his "Pilgrimages to Old Homes" produced what is, from its illustrations, an interesting book on English architecture. His success is not to be ascribed to his want of knowledge, for, indeed, his descriptions of buildings would have gained by an acquaintance with construction. Fortunate in possessing a genuine admiration for old buildings, he has been enabled

care only for the stately homes of England amidst tall ancestral trees, or the cottage homes amidst glowing orchards and nooks of leaves. But the old houses of gentry or middle-class folk, the franklins of a past age, which have survived are only observed by professional students. A few of Mr. Moss's subjects, such as Moreton Hall, Tintern and Valle Crucis Abbeys, &c., have been introduced in architectural treatises. But many subjects are in out-of-the-way places, inaccessible from the roads shown on maps intended for cyclists. For instance, the Clock House is at Alderley, a place well known to Manchester people, but we are informed how "anyone wishing to get to the house has to go along a cart-road in the field, until that cart-road becomes a mere track and then loses itself altogether, gets mixed up in the grass, and the traveller must walk or wander by faith,

MEES HALL.

to discover many examples which hitherto have been known only locally. The pages show what can be done by a man with the aid of a bicycle and a friend with a camera. The numerous views are so excellent, not only in clearness of detail but in treatment of light and shade, they might all have been prepared to demonstrate the possibilities of some manufacturer's photographic apparatus. But no purpose of that kind is announced.

One advantage of the book by which it is distinguished from others of the same class is to be found in the character of the buildings selected. As a rule, amateurs in photography

for across one or two fields there is not a vestige of a path. The house derives its name from the painting of a clock face on the front, and it is one of those partly-timbered houses which must have been erected when oak trees of a large size were to be obtained cheaply. The difficulty of access was not uncommon at the time it was built. People were then so accustomed to bad roads near their own dwellings they became indifferent to the construction of public high roads, and road making could hardly be considered as one of the practical sciences until a comparatively recent period.

There is no formality in the book. The author and his friend, who has occupied Abney Hall for more than fifty years, have followed a zigzag route. We hear only of such adventures as any pair of cyclists might encounter at the

* *Pilgrimages to Old Homes, Mostly on the Welsh Border.* By Fletcher Moss. With 242 Illustrations. (Didsbury: Published by the Author.)

SHIPTON HALL.

TREAGO CASTLE.

present day. Mr. Moss had apparently no definite purpose in view, and in his descriptions he is not ambitious to exhibit any special knowledge or to advance any political or other theory. He is one of the lucky men who could travel from Dan to Beersheba without finding anything barren on the way. Whatever he says therefore corresponds with the photographs in being truthful representations of what passed during journeys in pleasant weather, for as far as we can discover all the scenes recall summer days. The journey books of travellers in former times are prized in proportion as we are impressed with their veracity, and we have no doubt the "Pilgrimages to Old Homes" will hereafter find many a congenial reader who will be glad to possess so faithful a record of what was antique in one part of England at the beginning of the twentieth century.

Such delight in old structures as Mr. Moss is blessed with we wish was more widespread. To read the essays of some reformers it might easily be concluded that what was most needed at the present time is a class of architects unlike the majority of practitioners. Still more desirable is a class of clients who will not be satisfied with commonplace buildings, or buildings even worse, viz. those which depend on an excess of vulgar ornamentation. But we cannot attain that desirable end until the men who give commissions for buildings are able to perceive the difference between what is good and bad in building. To gain that power it is unnecessary to make journeys to foreign cities. The qualities constituting true architecture are visible in such old habitations as Mr. Moss has visited, and they are as eligible standards as could be required for ordinary purposes. The ancient habitations, no doubt, fail to always comply with modern sanitary requirements, and as becomes a municipal councillor Mr. Moss may sometimes have thought he was not altogether doing his duty when he admired them regardless of their deficiencies. In describing the Red Coat Hospital in Hereford, he says:—

On the ruins of a hospital which had once been stolen from the Knights Hospitallers of St. John of Jerusalem, one Sir Thomas Coningsby erected this home of rest for worn-out soldiers and servants. The founder's badge of conies (or rabbits) is graven on the stones of the walls. The motto he chose for the men was in Spanish, meaning, "Be soldiers—doers, not talkers;" and their costume was rather fantastic, little remaining of it now but the long red cloak in which they go to church or festival. The quaint old houses prop one another up around a tiny yard, where a venerable stone pump is in the middle, with beds of brilliant flowers by the walks and creepers up the time-worn walls and lichen-covered tiles of the roof; all mouldering in long-enduring calm decay. The tottering inmates cling to life with a tenacity that is helped and fostered by the homes and associations in which they live. Modern sanitary inspectors would condemn the court and be shocked at the pump. Modern councils would never allow such artistic homes to be built; so that we must be thankful that some of the legacies left by our half-civilised forefathers have escaped the spoiler, and were made before councillors, medical officers, surveyors, inspectors, officials, "et hoc genus omne," were called into existence to strut and fret their little hour on the stage of public life. If we had an ideal Home of Rest in Manchester—and up Shudehill on Mayes's land there once was an attempt at one—the reformer, the economist and the fool would all agree in agitating for the site to be sold and shops and offices to be erected in endless, wearisome, horrible monotony.

The extract will suggest the position of the author. He has a sympathy with antiquity as expressed in buildings, but it is not altogether on account of their beauty; an interest in the successive generations of occupants is also operative with him. Even when describing Mess, Mees or Meece Hall at Swynnerton, "the desolate home of my fathers," all that is remarked about the building itself in the chapter on the subject is the single sentence, "It is built of big blocks of warm-coloured stone up to the eaves, with stone-mullioned windows, three timber-built gables and big stone chimneys, and it stands by the little river Mees or Sow." An architect would find much else worth notice within and without the building. But the passage is characteristic, for in general the photographs are left to be their own expositors. The ruins of Ludlow Castle are expressive of the state and strength of those who ruled the

Welsh border lands. They are dumb stones to Mr. Moss, or at most they recall the first performance of MILTON's "Comus." He might at least have told us something about the part of the building where the masque was presented. A view of the interior reveals the roughness of the masonry in the banqueting-hall before it was concealed by plaster. SAMUEL BUTLER was steward of the castle, and it is supposed "Hudibras" was there composed. Admission to the castle is no longer free. In one instance, Mr. Moss is forced to give a few particulars about the appearance of a building. It is when he comes to the Vern Farm, near Bosbury, which some artists have considered as the most picturesque in England. Of its present state he says:—"Sanitary authorities have evidently been before us, and marked the place for melancholy and their own. The thatched roof is hidden with corrugated iron, the finely carved overhanging gable is also covered with the galvanised abortion. Parts are newly bricked, and iron is painted brick colour, the dovecot is gone, the dairy looks like a butcher's shambles. Even our bikes seemed to shudder, and with damp feet and heavy hearts we sadly turned away." If it were not for this passage it might be imagined the interest of the pilgrimages was confined to the journeying, and that when the goal was reached there was disappointment which is suggested by silence.

The majority of the buildings mentioned in the book would be described as half-timbered dwellings, and they are, without exception, admirable specimens of that variety. There are, however, some interesting examples of masonry buildings. One is Treago Castle, near the village of St. Weonards, in Herefordshire. It is claimed that it is one of the oldest houses in England, but it must have undergone many changes. Some of the walls are said to be 6 feet or more in thickness; the floors are on different levels. "At the very top of one of the corner towers is a tiny secret chamber in the wall. It is only a few feet square," and, we presume, was intended to shelter some proscribed priest. In the house is the portrait of a Jesuit who was among the victims of TITUS OATES. Shipton Hall is in Corvedale, on the road from Much Wenlock to Ludlow. The interior is equal to the exterior. The house is reported to have been built by the MYTTONS three hundred years ago. The property was lately sold.

All who can appreciate English architecture will find enjoyment in every one of the numerous illustrations. That such photography is the work of an amateur is a hopeful sign. We trust Mr. Moss, with the aid of his anonymous friend, will be able to produce similar works. We desire, however, to make one suggestion, which is, that in future expeditions he would seek to be accompanied by a companion who is an architect or an archaeologist as well as by one who is a photographer. On the other hand, attention to architecture might not be acceptable to the general public, for whom the volume is intended.

EDINBURGH ARCHITECTURAL ASSOCIATION.

AT last week's meeting of this Association, Mr. Hunter Crawford, the president, in the chair, Mr. Frank Caws, Newcastle-on-Tyne, gave an address on "Fireproof Floors and Construction." He pointed out that since the great fire in London, which caused quite a revolution in the substitution of brick walls for those of timber, there had been but very slow progress in fireproof construction. Latterly, however, the comparatively new material, Portland cement, had made fireproof floors a feature, the mode of construction of which permitted of great variation, and the practice of architects and experts showed wide differences in matters of detail. Generally speaking, said the lecturer, the introduction of steel girders as supports for the concrete had been carried to a very unwise excess, inasmuch as the action of fire upon the steel, causing it to expand, made it most injurious to the concrete floors, and instead of being a support, it proved in such cases the means of their destruction. Therefore he advocated a method of constructing floors in large slabs of concrete, with a minimum amount of steel bearers, so disposed and protected from the fire as to give the necessary support without introducing an element of weakness. In closing, Mr. Caws described his own practical experience in buildings he had erected on the principle which he advocated. His remarks were illustrated by blackboard sketches, and at the close he was awarded a hearty vote of thanks.

EXCAVATIONS AT KNOSSOS.

THE following telegram from Mr. Arthur Evans at Knossos has been received by Mr. Macmillan:—
 "Important discoveries. West of north court of palace double flight of broad steps flanked by bastion leading down to paved area, apparently served as seats for spectators. Anticipation of theatre. Analogous to similar steps outside palace at Phaistos. In early building near, deposit of bronze basins, beautiful leaf and lily decoration, and bronze vase with reliefs. North-east of palace house of fine construction running into hill-side, remains of two storeys with three flights of stairs. On a landing stood tall painted jar with magnificent papyrus decoration partly in relief and unique in style. Great extension of works entailed by these various developments."

Even this brief announcement makes it clear, says Mr. Macmillan, that the new season's work at Knossos will be at least as fruitful as that of the three previous years, and that ready works of art of great beauty and interest have been discovered. The suggestion of a theatre promises other results of no less importance to the history of civilisation. But the last sentence in the telegram makes it clear also that the season's outlay has been greatly under-estimated. Setting aside 200*l.*, which has been earmarked for the excavations being carried on at Palaioakastro in Eastern Crete by the Director of the British School at Athens, we had hoped that about 1,300*l.* would have sufficed for the completion of the work at Knossos. It now seems clear that not less than 2,000*l.* will be required for this work alone, besides the deficit of more than 1,200*l.* on the work of previous seasons.

In response to previous appeals the Cretan Exploration Fund has received rather more than 1,500*l.* for the present season's work. Of this only 1,300*l.* are available for Knossos. To enable the explorer to carry on his splendid work without financial anxiety, the managers of the Cretan Exploration Fund desire to raise another 2,000*l.*

GLASGOW ARCHITECTURAL ASSOCIATION.

AT a meeting of this Association, Mr. W. J. Blane, vice-president, in the chair, Mr. Fra. H. Newbery, headmaster of the School of Art, lectured on "Ideals." At the outset Mr. Newbery declared himself an idealist, arguing that what to-day might be ideal and unpractical to-morrow became possible. He deprecated the too close following of tradition, particularly bookwork, believing that, just as the Greek, the Roman and the Mediæval architects worked unconsciously of style," giving but material form to the manifold influences around them, so our own times, through our great business houses, the general wealth, and the high excellence of modern technique, offered the rarest opportunities to the artist, not perhaps for the immediate evolution of a new style, but for a more complete and positive expression of present-daylife and ambitions. Mr. James Lochhead, A.R.I.B.A., proposed a vote of thanks, which was cordially awarded, to the lecturer.

SURREY ARCHÆOLOGICAL SOCIETY.

THE following report was presented at the annual meeting at Guildford:—

The Council, in its forty-eighth annual report, stated that the annual excursion was held on Thursday, July 17, the meeting-place being Horley, whence Charlwood Church, Horley Church, Thunderfield Castle and Smallfield Place were visited. An afternoon meeting of the Society was held in St. Saviour's Church, Southwark, on Saturday, October 11. The annual volume of the "Collections" (vol. xvii.) has recently been issued to all members whose subscriptions to the year 1902 inclusive are not in arrear. In this volume are valuable papers by Dr. F. R. Fairbank, F.S.A., Mr. H. E. Malden, M.A., Mr. A. Ridley Bax, F.S.A., Mr. Philip M. Johnston, Mr. Cecil T. Davis, Mr. M. S. Giuseppe, F.S.A., the Rev. A. J. Pearman, M.A., and Miss Eleanor Lloyd. Two of the original drawings made by John Evelyn in 1640 of Wotton House have, by the kind permission of Mr. W. J. Evelyn, F.S.A., been reproduced as illustrations for this volume. The Council is pleased to be again able to congratulate the members of the Society upon a slight increase in their numbers, and this despite the fact that the losses during the past year by death or resignation have been unusually heavy. But as a set off against the future occurrence of such losses, and that the standard of efficiency maintained by the Society in past years may not be impaired through this cause the Council feels that it must still urge upon all members the great necessity of inducing their friends who are not already members, but are interested in the archaeology of the county, to submit their names for election to membership.

The season of 1902 at Waverley has been a busy and, on

the whole, very satisfactory one. Work has been confined to the area, partly explored last year, west of the cellarium and church. The north wall of the fine infirmary hall of the Lay Brethren was found to extend westward, and formed the northern boundary of what appears to have been a large garden extending nearly to the river bank. Near the south-west corner of this garden was a range of buildings running almost due west, the use of which has not at present been ascertained. The ground immediately north of the lay infirmary has been carefully explored, but though foundations have been found, they are so irregular and detached that nothing can be made of them at present, except that the position of the kitchen and its offices has been confirmed. Further west, however, an important building has been found, measuring roughly 46 feet by 16 feet, and supposed to have been a guest house. The most interesting discovery of the year has been a second guest house of the same date as the later portion of the lay infirmary. The dimensions of this building are nearly 44 feet by 21 feet; the buttress bases and those of the central buildings were found to be in excellent preservation. This building is to the west of the church, and almost joins on to it. The entrance to this guest house was on the south side, and appears to have connected with a large courtyard having an important western gateway.

The Council has to tender the heartiest thanks of the Society to the Rev. T. S. Cooper, who has again superintended these excavations, and also to Mr. Henry Horncastle, who has devoted much valuable time and labour during the past few years to the work. Owing to the discovery of foundations of buildings in somewhat unexpected positions, it is impossible to say exactly how much further work may be necessary before the excavations can be completed. If, however, permission to continue them is again forthcoming, the present year should certainly see an end to the undertaking. Possibly a few weeks may be all that is required. Unfortunately the Council has to report that the expense of the excavations has been greatly in excess of the amount raised by the kind contributions of members and others—notably one of 25*l.* received last year from the Society of Antiquaries—to the special fund created for the purpose. The deficit now amounts to 110*l.*, and the Council, that it may not feel any hesitation in sanctioning the completion of this, perhaps the most important piece of work the Society has ever undertaken, has once again to appeal to the generosity of members to reduce this debt, and thus to relieve the ordinary funds of the Society of a burden that must otherwise hamper its work in other directions for some years to come.

With reference to the resolution which was passed at the last annual general meeting, whereby the Council was requested to lend its assistance to the foundation of the proposed Surrey Parish Register Society, the Council has heard with much pleasure that an immediate start with the work of publication by this new Society is now in contemplation. Additional subscribers are, however, very urgently needed to insure the success of the Society, and those interested in its work should apply for particulars to Mr. W. Bruce Bannerman, F.S.A., hon. sec. *pro tem.*, The Lindens, Sydenham Road, Croydon.

Mr. Thomas Howse, F.L.S., having ceased to reside at Guildford, has resigned his office of hon. librarian to the Society. The Council, while expressing the thanks of the Society to Mr. Howse for his past services, has to announce that it has appointed Mr. Frederick H. Elsley, at a small annual salary, librarian and curator to the Society. The library, it may be mentioned, is now becoming a very valuable one, in consequence of the system of exchange of publications adopted with most of the leading archaeological societies of the kingdom, and it is hoped that during the present year a new catalogue may, with the assistance of Mr. Elsley, be completed.

Among the losses by death the Council has to deplore that of Colonel John Davis, A.D.C., F.S.A., whose very valuable services to the Society, both as a member of the Council and as hon. local secretary for Farnham, will be greatly missed. The vacancy on the Council thus caused by Colonel Davis's death has been filled by the due election of Mr. Philip M. Johnston.

The following members of Council retire by rotation, but are eligible for re-election, viz. Lieutenant-Colonel Godwin-Austen, F.R.S., the Hon. George C. Brodrick, D.C.L., Rev. T. S. Cooper, M.A., F.S.A., Mr. Edmond Foster, Mr. Robert Hovenden, F.S.A., Mr. Mill Stevenson, B.A., F.S.A., Mr. Arthur J. Style, F.R.I.B.A., and Sir John Watney, F.S.A.

The number of members is 405, viz. annual, 313; life, 91; honorary, 1. During the year 29 new members have been elected, viz. 28 annual and 1 life. By death the Society has lost 15 members, viz. 11 annual, 4 life. By resignation, 9 members; total, 24; gain over loss, 5.

The cash account showed the total receipts to be 355*l.* 18*s.* 3*d.*, which included 144*l.* 10*s.* in annual subscriptions. The balance at bank at the end of the year was 107*l.* 4*s.* 10*d.*

NOTES AND COMMENTS.

THE military system of the Germans seems to inspire their archaeological arrangements. The exploration of a new district is followed out according to a regular plan of campaign. As in war, commanders belonging to different services are selected for special duties, so in archaeology specialists are employed according to a theory that is held about the difficulties which will have to be overcome. This excellent method is about to be put in practice in the researches to be made in Palestine. There is a union or Society for the purpose, and there is another devoted to Oriental archaeology. Both have agreed to combine their forces for digging in the Plain of Jezreel about Megiddo. A civil engineer, Dr. SCHUMACHER, will have charge of the work. It has, however, been arranged that Dr. THIERSCH, of the Archaeological Institute in Athens, whom we may consider as an officer of the general staff, is to make a reconnaissance of the district in order to ascertain if any part is adapted to meet the particular aims of the Oriental Society. In order to assist him a theologian will be sent from Leipzig to aid with his Biblical knowledge. We have only given a general outline of what is contemplated. When Dr. THIERSCH prepares his report the work may assume larger proportions, and call for the creation of several sections, but it is evident that the spirit of MOLTKE animates the scheme.

It would be a remarkable event if a Prix de Rome were this year to be carried off by one of the lady candidates. M. GUILLAUME, the sculptor, who has for several years administered the Villa Médicis, is in favour of the innovation. His reasoning on the subject is worth consideration. He says that for several years women have been allowed to exhibit in the Salons. They have been awarded medals from time to time. Last year it was doubtful whether a lady would not obtain the Prix d'honneur in painting. They can overcome the difficulties which await the sculptor. They have also been allowed admission to the Ecole des Beaux-Arts, and as they have won prizes of several kinds, why should they be prohibited from obtaining the highest prize? M. GUILLAUME says that during several years he has superintended the competitions required for obtaining the privilege of teaching in France. Male and female students worked in common, and no inconvenience followed. Indeed, he sometimes found that the young ladies were capable of greater exertion than the men. At the Villa Médicis they would have the use of ateliers which are only intended for one occupant. They would lodge in Rome. M. GUILLAUME can only see advantages in the efforts of the new students, and he considers that in the interests of French art they should be allowed to share in the benefits of the Villa Médicis, and it would be an injustice to prevent them passing through its portals. This declaration from an artist whose advice has always been received by his brother artists with respect, must remove the last of the obstacles against the development of women artists in France.

SCULPTURE may be said to be identified with beings that belong to antique myths. The noblest examples of painting, on the contrary, are generally associated with Christianity. Owing to the peculiar position of sculpture the medallion of St. CECILIA, which belongs to Lord WEMYSS, has been universally admired. In this country, at least, it has been copied more often by students than any work of its class. There was no doubt raised about its genuineness or that DONATELLO produced it. Although there is no mention of it by VASARI, yet we know from that biographer that DONATELLO made adaptations of Greek mosaics, and the *St. Cecilia* might well be one of them. It has antique refinement, but the modesty of the dress, the form of the tiara, and, above all, the nimbus, suggest sanctity. It is cut in very low relief out of "pietra serena," which is as fine as alabaster. Of late years the relief was ascribed to DESIDERIO DA SETTIGNANO, a pupil of DONATELLO. Signor BONOLA, who has written much on the history of Italian art, has now entered the field, and expresses doubt of its authenticity. There is, however, a current of scepticism passing over many works of art, but, whatever may be said about the authorship of the medallion, we hope it will still be prized as a work admirably adapted to inspire incipient sculptors.

ILLUSTRATIONS.

GREAT EASTERN HOTEL, LIVERPOOL STREET, E.C.

THE original portion of this magnificent hotel, which forms but a small part of what now exists, was designed by Mr. CHARLES BARRY, and the builders were Messrs. WM. BANGS & Co., the materials being red bricks and Corsehill stone. The vast extension, of red bricks and terra-cotta, was built by Messrs. MAPLE & Co., LTD., under the personal superintendence of Mr. THOMAS HOLLOWAY, from plans furnished by Colonel ROBERT W. EDIS, F.S.A. The visitor on arrival finds in the hall and lounge reception office, lift, &c. The dining-room is entered from the hall, and the rich red scagliola columns supporting the roof give contrast to the light scheme of colour and gold enrichments. Just above, on the mezzanine floor, is the smoking-room, and a billiard-room adjoins it. On floors above are the drawing-room, the private billiard-room and an elaborately decorated Masonic temple. The bedrooms and suites of self-contained apartments are distinguished by their comfortable proportions and cheerful scheme of decoration. The bedrooms in all number upwards of 300. The Abercorn Rooms, the chief entrance to which is in Bishopsgate Street, are unique of their kind. In the hall or music lounge, the grand staircase, the dado, pilasters, columns and mantelpiece are all in alabaster and white veined marble, while in the stained-glass windows are introduced the arms of the chief cities and towns on the Great Eastern system. The Hamilton Hall, which measures nearly 100 feet long by 42 feet wide and 23 feet high, is adapted from one of the best examples of French work of the early part of the reign of Louis XV., and is taken from a room in the Palais Soubise, Paris, formerly the residence of the Prince DE SOUBISE, and now the Musée des Archives Nationales.

DESIGN FOR MONUMENT AT GLASNEVIN CEMETERY.

AMONG the first memorials erected in the Glasnevin Cemetery was a copy of the tomb of one of the SCIPIOS in Rome. It was intended as a memorial of CURRAN, the Irish orator, who was appointed Master of the Rolls. With such an example it was reasonable to conclude that some care would be afterwards exercised in the selection of the monuments in the new cemetery. But owing to local and trade influences as commonplace a collection as can be found in the world meets the eyes of strangers. There are a very few exceptions, but the majority of the memorials show monumental masons' work at its worst. The example we illustrate this week must therefore be considered as an innovation, and it should have the effect of convincing the people of Dublin that it is not necessary in selecting memorials to be confined to a very few stock patterns which might be turned out by machinery. The monument has been lately erected by Mr. CHAS. MARTIN, D.L., of Dublin, to his late brother, Sir RICHARD MARTIN. The firm has been long known in connection with building. The work was carried out by Messrs. HARRISON & SON, carvers, of Dublin, and is made of green Labrador spar and white marble. The ornamental parts are in appliqué bronze, cast and chased. The models for the bronzework were done by Signor CARLO CAMBI, of Siena, Italy. The total cost of the work has been only 580z., and it has been designed by Mr. THOMAS MANLY DEANE, architect, and executed under his superintendence.

CATHEDRAL SERIES.—WORKS: FROM LADY CHAPEL, LOOKING INTO SOUTH-EAST TRANSEPT.

THE DRAWING-ROOM, CHICK-AND-PRIORY, SHEFFORD, BEDS.

IN 1150 or thereabouts a Gilbertian Priory was founded at Chicksands, or Cricklands, in Bedfordshire. As the Order was instituted in 1148, Chicksands would be one of the earliest houses. GILBERT of Sempringham, the founder, was a native of Lincolnshire and the son of a knight. The peculiarity of his Order was that in each case there was a house for women and another for men, which were separated by very high walls. The men followed the same rules as the Augustinian canons. The Order was abolished by HENRY VIII., and Chicksands was granted to a layman named SNOW. The monastic buildings were altered and adapted to secular use. The house consequently has a remarkable appearance, and presents a mixture of styles that testifies to the history of the buildings and its ancient connection with the church.

ANDREA PALLADIO: HIS LIFE AND WORK.*

(Concluded from last week.)

Country Houses

PALLADIO introduces the subject of country houses with a few preliminary remarks on situation and the various compartments in these words:—"As certainly 'tis highly creditable and convenient for a gentleman to have a house in the city where he is obliged sometimes to reside; so perhaps he may receive no less pleasure and advantage from a house in the country, where he passes the rest of his time in seeing and improving his own possessions, in augmenting his substance by industry and agriculture, where, by exercising himself either in walking or on horseback—which are only proper for the country—he preserves his body strong and healthy, and where, in a word, the mind, being over-laboured by the fatigue of the city, will be singularly recruited and recreated." The open position and extended space available are then dwelt on in comparison with town sites, and the necessity for finding "commodious and healthy places" is referred to at some length.

The Italian sixteenth-century country house had very different requirements from one in modern England. In all of our master's draughts a central *corps de logis* is provided for the master and his family, and this has generally a frontispiece of columns, either flush with the front wall or in advance, and crowned with entablature and pediment. On either side are the wings containing the steward's apartments, the stables, the stores and granaries. Such dependencies in England are generally placed at some distance from the house, and often do not form part of the group. Palladio's types of country houses may be divided as follows in regard to plan:—Type 1.—Block type (as the Villa Capra) without wings. Type 2.—Central block (or *corps de logis*) with quadrangle. Type 3.—Central block, with straight wings. Type 4.—Central block, with quadrant wings. Type 5.—Central block, with returned wings. The kitchen and offices were invariably placed in a basement or lower storey, and an upper storey is often provided and used for granaries. Only a few typical houses can be referred to.

The Villa Capra, also known as the "Rotonda," was originally designed for Signor Paolo Armerico. He appears to have been of a cultured disposition, for "after having travelled a long time to improve himself, and being come to settle at last in his own country after the death of all his friends, chose his abode at a country house he had on a hill." It is situated at the eastern base of Monte Berico, about 1½ mile from the town of Vicenza.

Palladio seems to have been much impressed by the beauty of the site, for he goes on to describe how it is surrounded by several hills "that seem to form a great theatre." This is probably the best known of all Palladio's works, and owes much to its open position and to the excellent views on all sides. It has a central hall, 40 feet in diameter, carried the whole height of the building, which was to receive its light by means of circular windows in the dome. Four angular staircases bring the central portion to a square, around which are placed the living apartments. On each of its four façades is an Ionic colonnade projecting about 14 feet and having an internal width of about 34 feet. These appear to have been placed because of the excellent views to be obtained on all sides. The basement containing the kitchen, &c., extends under the whole of the house, "for the use and convenience of the family," as Palladio quaintly puts it. The ground floor is raised about 11 feet 6 inches by means of wide flights of steps, giving access to each portico. For a sunny climate the Rotonda is undoubtedly a very excellent and suitable design, the central hall forming a convenient retreat from the heat of the summer sun, while the projecting porticoes are so placed as to catch every available ray of sunshine at different periods of the day, meanwhile protecting the interior of the house by means of their deep shadow. The hall has a projecting gallery at the first-floor level, giving communication to the first-floor rooms. The bedrooms, however suitable for the period and country, would undoubtedly be dark and inappropriate in England, as also the passages leading from the central hall to each portico.

Inigo Jones's references to this house are not of great interest. He remarks that it "stands very solid and firm," and "that a great sum of money must have been spent in the building of this house and especially for the terraces," and also that in his time "the lanthorn at the top of the cupola is not set on, but a net to cover the top hole to keep out the flies;" also that "the tiling does not look well, considering the richness of the statues and the beauty of the building."

The exterior view shows the somewhat dilapidated condition of this building, and also that the windows in the dome are not executed, the light being obtained from a very small lantern at the top of it.

In spite of these drawbacks this design has exercised an extraordinary fascination for European architects, who have imitated it again and again. The first imitation in England appears to have been Mereworth Castle in Kent, by Colin Campbell, the architect. It was also copied by Lord Burlington in 1729 in his villa at Chiswick (now used as an asylum), and which belongs to the Duke of Devonshire, and on a larger scale for the Earl of Westmorland at Foot's Cray Place, Kent (now occupied by Mr. S. J. Waring), and also at Nuthall, Notts. On the Continent it served as a model also for the original Château de Bagatelle, near Paris, also for the Château de Marly-le-Roi (since destroyed), a building which was erected for Louis XIV. by the architect, J. H. Mansart, in 1676.

The sculptor Canova also built a house at Inverigo in Italy after the same design. It was still unfinished when Palladio died, and it was left to Scamozzi to finish his master's work.

The house at Maser has a central advancing block of two storeys in height, with straight arcaded wings, returned backwards on each side, and connecting the centre with the stable and kitchen wings. The whole forms an extent of about 280 English feet in length. The courtyard at the back is level with the first floor of the main building. It has a semicircular recess ornamented with Ionic pilasters, statues, sculptured cornices and festoons, and a small basin through which running water passes into a lake. The front view gives a very good idea of the setting of many of our master's country designs, and also shows one of the weak points of Italian country architecture, viz. the poor and ineffective treatment of the chimneys, which in this as in many cases appear merely as circular flue pipes, without any attempt at grouping or harmonising with the architecture. In most of Palladio's own drawings no chimney-stacks are shown. This view also shows the Ionic colonnade of the front, with an unusual arrangement of broken cornice and central window.

The house at Meledo for the Conti Francesco and Ludovico de Trissini has a plan of an unusual and ambitious kind, being a combination of types 1, 4 and 5. The central block resembles the Rotonda, near Vicenza, and has quadrant wings. In front of these are other returned wings. The main block was to be about 120 feet by 90 feet, and to have a central circular hall about 40 feet in diameter surrounded by various rooms and staircases. A columned portico of the Corinthian order is on each face, placed there because "every front of the house has a very fine prospect." Palladio describes its situation "as very fine, being on a hill that is washed by a little river in the midst of a spacious plain, and on a well-frequented road." The house proper is set well away from the lower porticoes containing the farm offices by means of the quadrant galleries—a great improvement on some of the smaller plans, in which the granaries and farm offices are in immediate proximity thereto. The cupola crowning the whole was intended to contain windows to light the central circular hall, and forms a fine terminal to the group, but in execution these windows have been omitted. The kitchens, as usually seen in smaller plans, were in the basement and the granaries in the roof.

Churches—Palladio refers in his writings to the ancient temples in Rome and elsewhere in Italy, and he dwells on the importance of buildings raised for devotional purposes. He then speaks strongly in favour of the circular shape, because it is "alone among all figures simple, uniform, equal, strong and most capacious . . . the extreme in every part being equally distant from the centre; it is therefore the most proper figure to show the unity, infinite essence, uniformity and justice of God."

The cruciform plan is referred to as commendable by Palladio, who says, "In this form I built myself the church of S. Giorgio Maggiore in Venice."

Il Redentore, Venice, situated on the island of La Giudecca, and consecrated to the Redeemer for the deliverance of the city from the plague which ravaged the town in 1576, was intended to express the devotional idea. The plan is in the form of a Latin cross, in the long arm of which are three chapels formed in the aisles on each side of the nave, which is twice its width in length. A dome crowns the crossing, having its base brought to a circle by pendentives.

The sanctuary at the south end of the building has a semicircular screen of Corinthian columns, and contains the principal altar, while the transepts are also of semicircular form. Behind the screen is placed the choir, severely plain, agreeing in treatment with Capuchin ideas.

The walls of the interior are ornamented by an order of Corinthian half-columns coupled between the chapels, and have two niches between them. The arches to the side chapels are semicircular, and rest upon impost mouldings supported by Corinthian pilasters. Each chapel is crowned with an internal semicircular vault, corresponding with the arch to the nave. The height of the nave vault, which is of brickwork, and rises from the main entablature, is about 65 feet, and in this semi-elliptical vault are semicircular windows lighting the nave.

The façade has a main order of the Composite type, expressing the interior nave. This order is formed as half

* A paper read before the Architectural Association by Mr. Banister F. Fletcher on Friday evening, April 5.

columns, the angles being formed as piers and they support an entablature and pediment. The pilasters throughout are diminished, and have an entasis in the same manner as the columns. This order is raised upon a stylobate, in the height of which is managed the principal flight of steps, which is as wide as the nave on plan. On either side of the central space the side chapels are designed as wings, ornamented with Corinthian pilasters starting from the same level as the principal order. Half columns of this same order flank the central door of the church and support entablature and pediment, and are also carried round the lateral façades. On either side of the central doorway are niches for statues, flanked by pilasters supporting entablature and pediment. Above the walls separating the side chapels are taken masses of masonry, forming buttresses to resist the pressure of the nave vault.

S. Giorgio Maggiore differs principally in the aisles, these taking the place of the side chapels of Il Redentore. The church is dated 1556, but the façade was added by Scamozzi in 1610. The plan is cruciform, consisting of a nave 40 feet in width and aisles about half that width. The length of the nave up to the crossing is about twice its width. The transepts have semicircular ends, and over the crossing is a dome constructed internally of brick and externally of timber and lead. One bay beyond the crossing is planned similarly to the nave, and at this point the aisles are stopped and the sanctuary and chapter-house are continued without aisles. In the interior a Composite order of columns and pilasters placed on pedestals a quarter of the column in height ornament the walls. Between the nave columns are semicircular arches resting on the entablature of the smaller coupled Corinthian pilasters without pedestals. The soffit of these arches, which extends over the width of two pilasters, is of considerable depth, and has a much bolder and better appearance than the thin arch in Il Redentore. The nave vault is 70 feet high.

The external façade is of a very similar type to that of Il Redentore, but a better proportion is obtained by raising the principal order on a pedestal and designing the minor order without one. The main order is Composite, resting on pedestals, which in their turn are placed upon a plinth about 3 feet in height. The seven steps at the entrance to the church are formed in the depth of this plinth. This church owes its picturesqueness to its position on an island of its own name, facing the eastern end of the Grand Canal, opposite the Piazza of St. Mark, from which a splendid view of it is obtained.

The little church at Maser is isolated in position at the end of a long road. The plan differs from those of the larger churches already described at Venice. It is circular, having an internal diameter of 40 feet, and is of the type Palladio admires and describes in his fourth book. A wide flight of steps leads to a projecting portico of the Corinthian order, with two lateral arches and a central doorway leading into the church. The length of this portico is nearly two-thirds of the diameter of the church, and Palladio has followed the same proportions as in the Pantheon at Rome, which, of course, had been measured by him. A dome crowns the whole, light being admitted through a somewhat high lantern. The festoons suspended between the capitals is a feature condemned by many. The two small bell turrets on either side crown the small staircase.

The façade of S. Francesca della Vigna, erected in 1562, bears a remarkable resemblance to that of S. Giorgio Maggiore, to which it may be compared, but to which it is inferior, especially as it repeats the defect of interrupting the stylobate by the principal doorway, a much better treatment being adopted at Il Redentore. Another fault is in the management of the orders, for too great a contrast is obtained by starting both the principal and subsidiary order from the same base, the treatment at S. Giorgio being preferable.

Palladio prepared five designs for the façade of the church of S. Petronio at Bologna. This church was commenced in 1390, in emulation of the cathedral at Florence; and some idea of its size can be imagined when we find that its area, if completed, would have rivalled St Peter at Rome. The façade has remained uncompleted. The difficulty Palladio was contending with was the application of a Classic façade to a Gothic structure, and it is interesting to see how he endeavoured to overcome these difficulties. Time, however, will not permit their discussion here, but I am able to show you his fourth design.

The convent of La Carità at Venice (now the Accademia delle Belle Arti) was partly executed during his lifetime, but a fire afterwards destroyed a large portion. The plan published by Bertotti shows an outer atrium, 60 feet long by 45 feet 6 inches wide, of Composite columns, two storeys in height, from which is reached the cloister court, 86 feet by 70 feet. This court is surrounded by three storeys of arcades ornamented with the Doric, Ionic and Corinthian orders. As in so many of Palladio's buildings, brick is the chief material employed. It is covered with stucco, the bases, capitals of columns and upper parts of cornices being in stone.

Of the atrium, of Corinthian columns forming part of this

building Sir Henry Wotton says:—"Mine eye hath never beheld any columns more stately—of stone or marble—for the bricks, having been first formed in a circular mould and then cut, before their burning, into four quarters or more, the sides afterwards join so closely, and the joints concentrate so exactly that the pillars appear one entire piece, showing how, in truth, we want art than stuff to satisfy our greatest fancy."

The centre of the north front of Houghton Hall, Bedfordshire, by Inigo Jones (dismantled 1794), is held to have been similar to the courtyard of Palladio's building, the principal feature being a recessed portico, about 22 feet by 12 feet, with four Doric three-quarter columns; above are the remains of an open Ionic loggia, a feature then new to England, but a favourite treatment of Inigo Jones and used also at the Queen's House, Greenwich, and elsewhere.

Influence—Perhaps few men, with the exception of Vitruvius, have exercised more influence in matters architectural than Palladio. This was chiefly effected by means of his great literary effort, published in four books in 1570, of which countless editions have been published and which has been translated into almost every European language. The most interesting to English students is the third edition, published in 1742, as it contains the notes by Inigo Jones taken from his manuscript in Worcester College, Oxford. Mention should also be made of the valuable Burlington-Devonshire Collection now in the RIBA Library. These drawings of ancient buildings and of his own designs are believed to be by Palladio himself. They show his careful study of ancient buildings in Rome and elsewhere, and from a perusal of them we may agree with Sir Joshua Reynolds that "the greatest natural genius cannot subsist on its own stock; he who has laid up no materials can produce no combinations. The more extensive his acquaintance is with the works of those who have excelled the more extensive will be his power of invention."

Inigo Jones (1572-1652) was the pioneer of Palladian architecture in England, and it must be confessed that no student so thoroughly studied his master's works as he did. He, however, had his transition period, in which the expiring Elizabethan and Jacobean style contributed the detail, as seen in the beautiful façade of St. John's College, Oxford, and in the north and south sides of the quadrangle in the same college. His journeys in Italy, and the notes on his own copy of Palladio's book, show that he went about his task in no half-hearted way, but carefully examined each building. Inigo Jones became, in short, saturated with Palladianism, which he naturalised in England, and through him Palladio became the great master of the English fully developed Classic Renaissance, or, as it is sometimes called, Anglo-Classic style.

The change introduced in architectural style by Inigo Jones's use of the Classical orders of architecture was extraordinary in its results and far-reaching in its effect.

The Banqueting House (afterwards the Chapel Royal and now the Museum of the United Service Institution) in Whitehall was the only part of his magnificent scheme which was carried out. This masterpiece shows the skill with which Inigo Jones, although working on the lines of his Italian master, gave to his designs that English character for which they are distinguished. The extraordinary amount of variety which he has obtained in this façade is remarkable, for no two adjacent columns are alike except the two central ones; the others, either by coupling or by making them three-quarter or half columns, are all different on each side of the central axis of the building. There is a sobriety and dignity about the building which well expresses Palladio's methods of design.

It was in the arrangement and design of the "Court Masques" of the Stuarts that the genius of Inigo Jones first found a field for the display of his Palladian principles, and it was in the interior decoration of his best works that he showed his extraordinary knowledge of architectural detail. Palladio's buildings were mostly shells in which the ornament was lavished on the exterior. Jones, however, carried the details of the style throughout the interior fittings, and excelled in such features as doors, windows and chimneypieces. His deeply coffered ceilings in compartments it is said were introduced from France, but they accord perfectly with the bold style of his architecture.

Among others of Inigo Jones's works which show Palladian influence may be mentioned the river façade of Greenwich Hospital, executed by Webb, one of his pupils. In this building the two storeys are included under one huge Corinthian order. York Water Gate, London; St. Paul's, Covent Garden; houses in Lincoln's Inn Fields; Chevening House; portions of Wilton House, including the Palladian bridge, may be mentioned as other typical examples.

Stoke Park, erected in 1630-34, shows very direct Palladian influence, especially in the plan. The central block, or *corps de logis*, has semicircular wings as colonnades, with a library and chapel at either end. This type of plan is one of many erected or designed by Palladio in the neighbourhood of Vicenza, several of which must have been seen by Jones during his visit to Italy.

The enthusiasm of Lord Burlington (1695-1753) for Inigo Jones is well known, and it is recorded how a design for a gateway by the latter was given to Lord Burlington by Sir Hans Sloane, who had it removed from Beaufort House, Chelsea, to Chiswick House, where it may still be seen. Lord Burlington paid many visits to Italy, and his life there among the artists of the day seems to have given him an extraordinary liking for and interest in the works of Palladio and his school. His collection of drawings by Palladio, already mentioned, and of works by other artists of the period, must have helped very much to have popularised the art of Palladio. Giacomo Leoni was brought over to England by Lord Burlington in 1715, especially, it would appear, to help in the translation of Palladio published in that year. Remaining in England, he executed a number of important buildings, such as Latham Hall, Moor Park, and others, which must have influenced contemporary architecture.

The fully developed English Renaissance architecture was, therefore, given its first great impulse at the commencement of the seventeenth century by Inigo Jones, who founded his style on that of his great master, Palladio, whose works he had studied so thoroughly in Vicenza and elsewhere. Jones, however, gave to them an English character, attempting to make them, in his own words, "solid, proportional, according to rules, masculine and unaffected." This tradition was continued without interruption to the close of the eighteenth century by a body of English architects who were in a general way influenced thereby. To trace this progress step by step would take us beyond the limits at our disposal, but a glance at a few of the principal architects and their works will help us to understand the development.

John Webb (pupil and nephew of Jones) was responsible for Amesbury House, Wiltshire, in the Palladian manner, and Dr. Henry Aldrich erected the Peckwater Quadrangle of Christ Church, and the church and campanile of All Saints, Oxford.

Sir Christopher Wren was born in 1632, or twenty years before the death of Inigo Jones in 1652. The amount of work executed by him, and the influence on him of Palladio and Inigo Jones, caused him to leave a number of buildings which have acted as models for succeeding generations of architects. Besides St. Paul's, London, Wren was responsible for the building of some fifty-three churches in the City of London between the years 1670-1711. In most of these there is discernible the influence of the Palladian ideals, and Classical columns and their entablatures are used in many novel ways. Wren carried out the Sheldonian Theatre, Oxford, the Inner Court and library of Trinity College, Cambridge, a portion of Greenwich Hospital, Chelsea Hospital, a portion of Hampton Court Palace, Morden College, Blackheath, and Temple Bar, London (now removed to Theobald's Park, Herts), all of which are examples of his extraordinary facilities in applying Palladian principles to various types of building.

In the eighteenth century a great number of country houses were erected in England in which the traditional plans of Palladio, imitated and improved upon by Inigo Jones and others, were erected. The pages of the "Vitruvius Britannicus," by Colin Campbell, furnish plans and views of many of the most important houses erected during the century, and form an eloquent tribute to Palladian influence.

Rainham Hall, in Norfolk, and Castle Howard, by Sir John Vanbrugh, are important examples, as are also Kedleston and Stowe House, by Robert Adam. In some cases, as at Kedleston and Holkham Hall, by W. Kent (1730), there are four quadrant wings. Similar types of plan are shown in Palladio, and must have influenced English architecture, as at Stoke Park, already mentioned. The peculiar Italian method of treating the ground floor as a basement storey for the kitchens and offices, and placing the principal apartments on the *piano nobile*, or upper floor, is carried out in most of these buildings. In fact, the peculiarities of the Palladian style, and its inappropriateness when unaltered to suit the English climate, were referred to in strong terms by the satirists of the day.

Symmetry and grandeur were the qualities which predominated in eighteenth-century architecture, due in a large measure to the disciples of the Palladian school.

Nicholas Hawksmoor (1666-1763), Colin Campbell (died 1734), Sir John Vanbrugh (1666-1726), James Gibbs (1683-1754), Thomas Archer (died 1743), William Talman (died 1715), the Earl of Burlington (1695-1753), Kent (1684-1748), Robert Adam (1728-92), and Sir William Chambers (1726-96), stand out pre-eminently as the followers of Palladio and Inigo Jones and as the developers of the truly national elements of the English Renaissance.

Sir William Chambers, by his writings, and especially his "Treatise on the Decorative Part of Civil Architecture," carried on the traditions of the Anglo-Palladian school, and objected to the Greek revival of architecture, which was then beginning to be felt.

Thus, till within a century ago, the school of Palladio and his English followers were bound up with the traditions of

English architecture. In the nineteenth century, tradition being broken up, the age of revivals commenced.

Mr. HUGH STANNUS, who proposed a vote of thanks for the paper, said to deal properly with the work of a man like Palladio one would have to divide it into three great divisions. First, to seek to identify, to isolate and formulate the principles on which Palladio worked; secondly, to endeavour to show where he found those principles; and thirdly, what those principles led to. Every principle formulated in an art was like a chemical solvent; it dissolved the existing or pre-existent art and led to recombination of materials or to the invention of new materials and new treatments. Palladio was compelled to build his brick palaces so that they looked as though they were of stone, but the blame for this should be laid against the patrons who desired this effect of stone. If Palladio had done nothing else he had taught architects how to use the orders, and it would be well to advise all young students who were beginning to study the orders to notice the way Palladio measured them and demonstrated the way to use them afterwards.

Mr. LEWIS AMBLER, who seconded the vote, said in Italy he had been led to study the Cinque Cento work more than the later work. He had to admit he did not admire Palladio's work so much then as he did now. An interesting part of the paper was the account of the connection between the work of Palladio and the English Renaissance.

The CHAIRMAN said he was afraid that with many young architects there was a feeling that Classical architecture and the architecture of the Renaissance were to some extent dry and uninteresting because they were governed so much by set rules and proportions. They were wrong, and the older they grew the more they would feel the beauty and dignity of Classical architecture. It was unfortunate that Palladio had not been able to build more of his buildings in stone instead of brick and stucco; he was compelled from considerations of economy to use these materials. In some cases, where the brickwork had not been covered by stucco, the effect was extremely good.

THE ROYAL ACADEMY AND ENGRAVERS.

A LETTER from Sir Walter Gilbey appeared in the *Times* on Wednesday. He says:—

The day is approaching when the one hundred and thirty-fifth exhibition of the Royal Academy will be opened and public interest in art will receive its annual stimulus. While matters artistic fill a prominent place in our minds I beg the hospitality of your columns for a letter on a subject which, in the opinion of many impartial judges, deserves more public attention than it has yet received. I refer to the position occupied by the profession which is the principal instrument in popularising art—that of the engraver.

My excuse for addressing you in the engraver's interest is that for many years past I have found great pleasure in the collection and study of engravings, while the preparation of two volumes on the "Animal Painters of England" impressed me with a sense of the magnitude of the debt which both painters and their admirers owe to the engraver.

It is not unusual to hear the engraver's art disparaged; there are some who suppose him to be a copyist whose work is purely mechanical. Perhaps the ease with which pictures can now be accurately reproduced and copied in practically unlimited quantity by photographic means may have done something to beguile the minds of those who do not know that engraving, whether in stipple, line or mezzotint, is a work of art of a very high order. This common misconception of the nature of the engraver's work, coupled with the moderate price for which good impressions of modern plates can now be purchased, may help to explain why the art of engraving fails to secure the degree of appreciation it merits. But perhaps a more potent reason is to be discovered in the attitude which the Royal Academy adopts towards the engraver.

In considering this it is necessary to glance at the history of the relations between the Royal Academy and the engraver's profession. It dates from the granting of the charter by King George III., in the year 1768, which omitted all mention of the engraver, though his art at that time had reached very high perfection in England in the hands of such masters as Sir Robert Strange, Valentine Green, Bartolozzi, James and Thomas Watson, and others. The establishment in 1770 of the grade of "Associate Engravers," which entitled the holders (limited to five) to add the letters A E R A after their names, was a concession for which the leading engravers of the time felt no very great gratitude, inasmuch as a marked distinction was thereby drawn between painters, architects and sculptors eligible for the A R A. on the one hand and the engraver's profession on the other. The disciples of the latter department of art may, I think, be pardoned for holding themselves slighted. How the rank of A E R A. was regarded on its inception the names of the five associate engravers first elected will tell us—*i.e.* Thomas Magor, Simon Ravenet, P. C. Canot, John

Browne, Thos. Chambers. Not till five years afterwards (1775) did an engraver of the first rank, Valentine Green, accept the honour. With this single exception not one of the great engravers, examples of whose work now command fancy prices, accepted a distinction which was he'd to be rather a slight than an honour; and it is highly probable that Valentine Green and others who did accept it were influenced in doing so entirely by the hope of being able to effect a change in the law. The position taken up by the Royal Academy towards the engravers was certainly a little inconsistent, for while this hard and fast line was drawn between the engraver and the painter, sculptor and architect, tuition in engraving was given in the R.A. schools from the first year of their establishment in 1778.

The endeavours which, from time to time, were made to persuade the Royal Academicians to take a more liberal view of the art on which the painter depends to make his work popular were unavailing until 1852. In that year, G. Burnett, G. T. Doo, W. Finden, E. Goodall, J. Pye, J. H. Robinson and J. Watt succeeded in enlisting the sympathy and influence of Her late Majesty Queen Victoria, who recommended the general assembly to consider means whereby the wishes of the engravers could be met. The result was an alteration of rule which had the effect of placing engravers on the same footing as their fellow artists in other departments. Under this altered rule engravers became eligible for election not only as "Associates," but for full honours as Royal Academicians; and in 1854 the first election of an engraver to Associateship took place, the recipient of the honour being Mr. Samuel Cousins, who became a Royal Academician in the ensuing year. This recognition of their art by the grant of the diploma to Cousins, followed as it was by the election to Associateship of Lumb Stocks (1855), G. T. Doo (1856), and G. H. Robinson (1856), satisfied the just ambitions of the engravers; and for a period of thirty years they had no great cause to complain of neglect. During the period 1854-83, eight engravers (including Cousins) were elected "A.R.A.'s," of whom five afterwards received their full R.A. diploma. The engraving interest was certainly not over represented in the Academy; but, its claims being recognised and the interests of engraver exhibitors being safeguarded, the profession was content.

This satisfactory condition of affairs, however, was not destined to continue; the Royal Academicians chosen from among the engravers died or retired, and the vacancies were filled by painters, sculptors or architects. In 1883 occurred the last election of an engraver as an Associate, Mr. Francis Holl; and in 1892 the retirement of Mr. Frederick Stacpoole removed the name of the last engraver from the lists of Academicians and Associates. Therefore twenty years have elapsed since the engraving profession has received any recognition at the hands of the Royal Academy, and for eleven years it has been without a representative on its Council.

It may be urged that no engravers have been elected because none have been found worthy, that engraving as an art has deteriorated, and that the works produced by modern engravers will not bear comparison with the works of those of their predecessors whose merits gained them the Associateship and diploma. I cannot accept the argument as sound, for nothing is more eloquent as to the merit of certain modern work than the demand for the services of our ablest engravers among the great art dealers, who are actuated by no sentimental motive. But even if we grant that there is not alive to-day an engraver whose work is equal to that of the former Royal Academician engravers, is a case made out for the exclusion from honours of modern men? Surely not. The Royal Academy do not, when electing an Associate or Academician, measure the painter's work against that of the old masters and say, "This painter, architect or sculptor is not deserving of the honour because he does not display the genius of Reynolds, Gainsborough, Banks or Flaxman." The idea of setting up such a standard would never occur to them. Their mission is to encourage and to recognise merit by singling out for distinction the ablest exponents of art, whether painting, sculpture or architecture, and surely similar treatment should be accorded to engravers.

In the absence of any representative in the Council or on the hanging committee, the interests of engravers suffer materially. It is notorious, I am informed, that in some instances photogravures have been accepted and hung as engravings, and that engravings have been rejected on the ground that they were photogravures. Such blunders, we must hope, are rare; but their occurrence serves to lend point to the engravers' argument that under the existing régime they cannot hope that engravings sent for exhibition will be selected with judgment or discretion. It must be admitted that this argument is a strong one.

In regard to the decline of engraving as an art. Assuming that it is declining—and it must be acknowledged that stipple engraving is a thing of the past, while pure linework is almost unknown nowadays—do not symptoms of decline or deterioration indicate the necessity for taking steps to revive and

encourage the art? Every consideration forbids the painter to regard with equanimity such a possibility as the disappearance of engraving; no mechanical process could replace the skill and sympathy which a good engraver brings to bear upon his work. The sale of pictures for engraving has long been an important source of income to the artist, and the copyright of a popular painting is an asset of great value.

And, apart from the question of justice, it may be suggested that expediency indicates the wisdom of extending the hand of encouragement to the engraver. It is, I believe, a fact that in the Royal Academy schools of the present day no tuition in engraving is given. If there be no students it can only be because no encouragement is given to them, and not because there is no demand for their work. It is permissible to suggest that this is a matter well deserving the attention of the Royal Academy. The claims of the engravers having been acknowledged by them for a long period of years, it does not seem necessary to combat the objection that engraving is "the art of copying" and, because it is not original, cannot be placed on the same plane as painting. Engravings have not always been and are not now invariably copies of pictures; the art has been, and is often, employed as the original medium of expression. The title of engraving to rank as an art is acknowledged, William Roscoe says:—"The principal excellence of an original print is equally estimable with that of a painting. We have every condition of design, composition and drawing; and the outline of an engraving or etching is frequently marked with a precision which excels that of the painting."

The remarks made by C. R. Leslie, R.A., in his speech at the Royal Academy Council in connection with the choice of an A.E.R.A. to succeed John Landseer, who died in 1852, may be quoted here. That eminent painter said that on former occasions, when the admission of engravers to full Academy honours had come under discussion, he had been among the opponents of the measure; but after careful examination of the question in its relation to the arts and to the Academy he had changed that opinion, and wished to take what steps he could to bring an alteration of the law on the subject. "The great battle," he added, "was always about the relative dignity of the arts; but, however that may be, I cannot look at the best works of the best engravers and not feel they are the productions of genius."

In conclusion I will ask the Academy if the two following extracts from the abstract of the constitution and laws of the Royal Academy are not worthy of consideration in connection with the subject.

Section 1.—Members.

1. The Society shall consist of forty members who shall be called Academicians of the Academy.
2. There shall be another order or rank of members, not exceeding twenty in number, who shall be called Associates of the Royal Academy.
3. There shall be another class of members, not exceeding four in number, consisting of Academicians and Associates, who shall be called Academician Engravers and Associate Engravers of the Royal Academy. Such class not exceeding four may at the discretion of the Academy consist of a less number, and the proportion of Academicians shall not exceed two.

Note.—That although such class of engravers shall be considered as a distinct class the privileges and obligations as Associates and Academician Engravers shall in no respect differ from those respectively of the twenty Associates and forty Academicians.

Section 5.—Election of Members.

Associates.—The Associates shall be elected from among the exhibitors in the annual exhibition; they shall be artists by profession, that is to say, painters, sculptors, architects or engravers, at least twenty-four years of age, and not apprentices.

DEVON AND EXETER ARCHITECTURAL SOCIETY.

THE annual meeting of the Devon and Exeter Architectural Society was held at Devonport on the 6th inst. The following report was read:—

Your Council have had several matters of professional import before them, including competitions, and in the case of St. Ives town hall it is gratifying to know that the exception taken to the conditions resulted in only one set of plans being submitted, and these were not adopted on the promoters' discovery that architects declined to compete under the unsatisfactory conditions. Your Council was unable to entertain the proposal to make a donation of 5*l.* to the Architectural Association Building Fund, feeling that our funds were required for local purposes. Two sets of measured drawings have been received. It was resolved that the book prize be awarded to "Portcullis," and that the drawings submitted by "Excelsior" be highly commended. Mr. C. J. Tait offered to

give a book to "Excelsior" The authors were found to be, of "Portcullis," Mr. W. W. Hitchins, and of "Excelsior," Mr. W. J. Halls. The subject of architects serving on street committees of urban councils and that of whole-time officials undertaking private work are receiving the attention of your Council.

During the past year the Three Towns branch has made considerable progress. Although no papers have been read, the committee have met a large number of times for the consideration of the very important subject of building by-laws initiated by the chairman of the branch, Mr. A S Parker, A.R.I.B.A., first in an admirable paper delivered before the members of the branch last session, and subsequently in committee, and it is confidently hoped that amendments such as are desired may be achieved. The Chairman has been untiring in his efforts to gain this end, and a strong hope is expressed that they will be crowned with success.

The president, Mr. J. M. Pinn, moving the adoption of the report, congratulated Mr Hitchins on being the winner of the first prize for the second year, but regretted that there was not more competition. It had been felt for some time that officials had been taking work out of the hands of private practitioners. Where men were not paid for their whole time they had to get their living, and had a right to enter into competition with private professional men; but where they were paid for their whole time they should not take private work. It was a very difficult matter to deal with, because those who employed a public surveyor were not likely to come forward and say what he had done. He had known cases in which work had been done by a surveyor and the plans signed by somebody else.

Mr. Cole seconded the motion. He remarked that after doing a day's work young people did not go sketching, as they used to do. They took the camera. It would be better if they spent more time in sketching and measuring old buildings; but people now took the quickest way, and but for photography they would have very few records at all. As to architects serving on street committees, in Exeter they had a curious state of things. The Council objected to architects being on the streets committee. The town clerk, as the law-giver, was generally a pretty cute man, but architects on the streets committee could tell him a bit of law, and could also quote his decisions given before. That was why he (the town clerk) did not like them on the streets committee; it gave him a little scope. Another reason given why architects should not be on the committee was that they might have to pass their own plans. Would anyone calling himself a gentleman, in order to do harm to a professional brother, endeavour to reject his plans? They found that men who had been assistants to architects became urban and rural district surveyors, and it followed that if a builder wanted to lay out an estate, he did not go to an architect, because the plans would have to come before the official, and he (the builder) thought if he went to the surveyor he would do the designing, keep him within the by-laws, and save him trouble. That was a most immoral state of things. With present-day competition they could not have these pirates interfering with them. Their city surveyors, if it was a question of asylum work, got down a code from the Asylum Commissioners, showing various plans, and worked on those to fit the site. The surveyor had quite enough to do to manage his own affairs without taking away the work of the profession, because he could not do the work so well as the average professional man. (A Member: And it will cost 25 per cent. more.) Although architects were thought but little of they paid the rates, and ought to have a voice in the affairs.

Mr Lethbridge remarked that at Plymouth the Corporation let a large property to a tenant who was bound to spend 10,000*l.* upon it. The Corporation thought they ought to have an architect to see that the 10,000*l.* was spent, and they decided that the borough surveyor should be paid 125*l.* for doing it. Was that a part of the duties of the surveyor? If it were, he should do it without extra remuneration. If it were not, an architect should be employed and paid at a fair rate for his services. As to Looe Street, after architects had been employed the borough surveyor was asked to prepare plans for buildings there, and arrangements had to be made with outside architects as to the fees to be paid. It was very unfair. Younger men should leave the camera severely alone until they had qualified themselves to enter business life. He did not know what a "progressive policy" meant, unless it meant rates. At the beginning of the municipal year a member of that Society was elected chairman of the special works committee at Plymouth, having been chosen by his own party and the opposite party; but at the next meeting a worthy alderman suggested that as that gentleman was an architect in private practice, and the plans of other architects had to be put in, he was not a fit and proper person to fill the position. That gentleman did not feel that on the *ipse dixit* of an alderman even he should resign without consulting the leaders of the party of which he was a member. At the next Council meeting it was referred back. It was stated as one of the arguments that the architects were up in arms, and

that they had held a meeting to protest against it. Both those arguments, he was assured by the secretary, were absolutely false. Anyone elected by a large and important constituency was a fit and proper person to fill any position in the Council. An extraordinary fact was that the lunatic asylum committee had a building committee, from which that member was excluded, while a builder, whose tender was not accepted, was included. It was rotten, and a matter of political, not municipal, honesty.

The Chairman presented the measured drawing prize to Mr Hitchins, and it was explained that Mr. Tait and Mr. Halls were unable to be present.

The Secretary offered a guinea book as a prize for a book of sketches during the summer.

Mr. Ralling complimented Mr. Hitchins on the advance in his work since last year.

Mr. Pinn, in his presidential address, remarked that the most important architectural matter during the year was probably the Liverpool Cathedral competition. That, like most other competitions, had not proved satisfactory to everybody. He was somewhat sorry it had latterly gone out of fashion to adopt the Gothic style for secular buildings. They had only to go to the adjoining town of Plymouth to see what a beautiful effect had been produced by the erection of the municipal Buildings in that style by an able and worthy member of their Society. He would impress on young members that when they had to design a building they should consider the purpose for which it was to be used, as well as other circumstances, and let the building, as far as possible, tell its own tale. They should not make a factory look like a church, nor a church look like a factory. As to the long-discussed subject of registration of architects, he had always seen the difficulty of dealing with the subject in a manner to be of use, and he was not much nearer being convinced that registration would benefit the profession than he was some years ago. He could not but think that if a real benefit would be obtained by legislation the Institute would take steps to further that object, but until it did see that it would do so, it was unlikely that there would be any legislation.

On the motion of the President, seconded by Mr. C King, Mr. A. S. Parker was unanimously elected president for the ensuing year, and, on taking the chair, remarked that the three principal objects of the Society were professional integrity, the promotion of architecture and the allied arts, and social intercourse between architects.

Messrs. C Cole, Harbottle Reed and G S Bridgman were nominated for the office of vice-president, and Mr. Cole was elected.

Messrs. J. E. Harvey, M. A. Bazeley and Coath Adams were elected members of the Council, and Mr. Ralling was reappointed treasurer and Mr. Reed secretary.

The officials were heartily thanked.

At the close of the meeting the members visited the offices of the Prudential Assurance Company at Plymouth, by permission of Mr. A. Waterhouse, R.A.

BRITISH SCHOOL AT ROME.

THE Rome correspondent of the *Times* writes under date April 10:—"Although Great Britain was less numerously represented at the Historical Congress, which is just coming to an end of its labours, than either France or Germany, the British delegates took a very substantial part in the proceedings, presiding in their turn over the various sections, and reading papers. At the Court dinner on Sunday in the Quirinal some nine or ten were present, and to one of them, Mr. Bryce, was given the place of honour on the right hand of the King. It was, however, unfortunate that, with the exception of Sir Alfred Lyall, who represented the India Office, there was no official representative of the British Government, an omission which was no doubt accidental, but is none the less to be regretted. A pleasant feature in the congress has been the receptions held at the different foreign schools. The Germans led the way, followed a few days after by the French and Americans, and on Tuesday, the 7th, by the British School. The reception at the British School was apparently very successful. In the absence of the director, Mr. Rushforth, who had been compelled by illness to leave Rome before the congress began, the guests were received by the acting director, Mr. Ashby, and the chairman of the committee, Professor Pelham. Among the guests were the British Ambassador and Lady Feo Bertie, Drs. Petersen and Huelsen, of the German School, Monsignore Duchesne, of the French School, Professor Norton, of the American School, the Vice-Chancellors of Oxford and Cambridge Universities, Sir A. Lyall, Sir Richard and Lady Jebb, Sir F. and Lady Pollock, Mr. and Mrs. Bryce, Professor Mahaffy, Sir James Ramsay, Mr. Frederic Harrison, Mr. and Mrs. Poole, Mr. and Mrs. Humphry Ward, Mr. and Mrs. Ashby, the Dean of Hereford, the Contessa Caistani-Lovatelli, Mdme Filippo de Filippi, Mrs. Crawshaw, Mrs. Waldo Storey and many others."

GLASGOW INSTITUTE OF ARCHITECTS.

THE annual general meeting of this Institute was held on the 7th inst. in the rooms, Pitt Street, Glasgow, Mr. Horatio K. Bromhead, president, in the chair. The Secretary read the thirty-fifth annual report, from which it appears that the number on the honorary roll is now eight and the number on the ordinary roll remains seventy-two. The usual exhibition of R.I.B.A. prize drawings and of those which gained the Institute prizes in the School of Art and Technical College was held for over a week in April. A local R.I.B.A. examination was held in November and the Council have arranged with the R.I.B.A. to hold similar local examinations in June yearly. The sixth triennial competition for the Alexander Thomson travelling studentship was held on February 26. Five sets of drawings were sent in, coming respectively from London, Liverpool, Edinburgh and Glasgow (two sets). While the trustees would gladly see a larger response in the number of competitors, they have reason to be gratified not only by the wide area from which these were drawn but by the high standard of excellence reached in most if not all of the works submitted. It had been decided that, should the results warrant it, a second prize of 20% (with somewhat similar conditions to those attached to the scholarship itself) should be awarded on this occasion. The Council had again under consideration the matter of the Royal Infirmary reconstruction scheme. No definite reply having been received to the two letters addressed by the Institute to the executive and managers in 1901, when the scheme was last prominently before the public, and in view of the statements made this year at the annual meeting of the infirmary, the Council of the Institute considered it advisable to again address the managers, drawing their attention to its position and proposals, and to press for more satisfactory assurances with regard to the same. To this a letter in general and guarded terms was received, and a reply to the managers was sent on March 27 recapitulating the items considered unsatisfactory.

The President, in moving the adoption of the report, said it appeared to him that the most remarkable event of the past year was the way in which the housing question had been thrust forward. The housing problem was a scarcity of small houses that the poor could and would like to live in. Usually the subject was regarded as like a jelly-fish without any backbone of its own, something that was nasty and must be pushed with a stick. But the backbone of the subject was the will, the desire of the poor. Some people would at once say, "That is the real difficulty. Many of the poor don't know how to live healthy, happy lives." If that was so, why not teach them? Why not have a pamphlet showing briefly the best way for a poor man to live? An average of 5s each from those interested would be enough money to give a copy to every one in the city, and this would probably wipe away the largest and dirtiest part of the housing problem. If, the President continued, the city were taxed to provide a new department in which working men could get a really good black frockcoat and white gloves at half their value, would they go and buy them? Not a bit of it. But if an addition to the Police Act compelled them to buy, what then? Why, it would be found that the working man had a command of language quite beyond what was known of him. He wanted "shoddy." It was shoddy houses that were wanted for the poor—cheap and wholesome houses that a man could pay an honest rent for, without the degradation of knowing that he was being made a pauper of by having his rent partly paid by taxes on other people. How were we to get these houses? If we got rid of our purse-proudness about the cost of our buildings, and got rid of the cruel exactions of our Police and Building Acts, and were to strive to have, right within the city bounds, districts where we might be proud of knowing that working people could and would like to live cheaply and comfortably, and yet where capital would not be cheated, we should have an ideal that would lead in a sound direction. In Liverpool City Council it was said that if they went on building for 2,000 people every year for fifty years they might make up arrears. In Glasgow a million pounds would be a mere drop of what was required. Perhaps the most important item that had happened was the letter to the Lord Provost from Dr. David Murray. In two ways it was exceedingly important. The reception his letter met with indicated the masterful way in which the Corporation were inclined to handle the subject, and also how clearly capital understood that. Secondly, it showed that there was capital in the hands of those who would gladly attend to the housing question if it could safely be done without a lot of blind interference that would render it financially impossible. The President went on to say that they had the Royal Infirmary reconstruction scheme still on the horns of a dilemma. The governing power there had a plan that, according to American phraseology, "can't be beat," and so they issued this plan to a few architects in a competition for decorating it. But alas! architectural human nature was also

weak. Not only did several of the architects venture to improve, or should he say alter, the "immaculate" plan, but the architectural assessor considered these the best, and gave his award accordingly. The committee, however, were equal to the emergency. They overruled the assessor's award, and chose the design that most closely followed their own "immaculate" one. Possibly they thought that its "immaculateness" far outweighed any and all of the bad and miserable features that might have been discovered in the design by the assessor.

The Council for ensuing year was elected as follows: Messrs. J. A. Morris, David Barclay, A. N. Paterson, John Keppie, H. K. Bromhead, Jas Lindsay, N. Macwhannell, T. L. Watson, J. M. Monro, Alex. McGibbon, J. A. Campbell, A. Balfour, W. J. Boston, Chas Gourlay, T. Baird, jun., and Andw. Black. The Treasurer's accounts, which were submitted and approved of, showed that the funds were in a satisfactory position. A meeting of the newly-elected Council followed, at which office-bearers for the year were appointed, viz:—President, Mr. Horatio K. Bromhead, F.R.I.B.A.; vice-president, Mr. John Keppie; auditor, Mr. David Barclay, F.R.I.B.A.; secretary and treasurer, Mr. C. J. MacLean. The various committees for the year were also appointed, including committees on public architecture and on architectural education, &c.

THE CAMPANILE BRICKS.

ACCORDING to the Rome correspondent of the *Morning Post*, Commendatore Boni gave to the members of the History Congress a lecture on various data provided by the examination of the remains of the fallen tower of St. Mark's at Venice. To illustrate his lecture Signor Boni had with him drawings of some twenty or thirty impressions of bricks which formerly helped to form the fallen Campanile.

Great numbers of these bricks were, it appears, roughly traced by the makers with all kinds of figures, sometimes with a number, sometimes with a private mark, and sometimes with letters. One brick, for instance, had the letters "DCL" impressed on it, evidently a sign that in the particular batch to which it belonged there were some thousand one hundred odd bricks.

The shape of the bricks betrayed the fact that they had been used for various purposes at a previous stage of their use. Some had been utilised for arches, some for fortifications, others for tops of walls. The most important feature about them, however, is that they are not Venetian but Roman bricks. This is deduced by Signor Boni from their general appearance, shape and texture. Moreover, he has discovered on close examination that the bricks when being manufactured were not manipulated like modern bricks and made from a mass of clay already stirred up and kneaded ready for use, but were formed from slices of the clay as it was found without its natural layers being disturbed. This process resulted in each individual brick being able to support a weight quite four times as great as that which can be borne by bricks of modern manufacture.

The lecturer showed pieces of ancient brick to his audience for inspection, and then showed them a piece of modern brick manufactured specially by him in exact imitation of the original out of Roman clay. He pointed out that it is quite possible for the new Campanile of Venice to be built with clay of the same origin as that formerly used, and in a manner more likely to prove enduring than that in vogue at the present day.

Some of the drawings showed marks which would have probably been deemed to be of no special importance by the casual and uninitiated observer, but which in reality are of the greatest interest. One of the bricks thus shown in design represented the impression of a horseshoe. The bricks are of the first century. Thus, it is now conclusively proved that at this early time horseshoes were known to and used by the ancients. In view of the heated discussions which have often been carried on regarding this point the discovery of this special brick possesses an importance of no mean order.

Another brick bore a curious impression of the points of a man's hand pressed quite deep into the clay. If, as Signor Boni pointed out, this mark had been found continually among the several thousand bricks examined, it would have been only natural to suppose that it was the result of a tight clasp in the hands of a number of bricks during their transport before being baked. This, however, is not the case; only about one brick in every thousand bears this impression. The lecturer deduced from this fact the supposition that the impression of the point of the hand was none other than a private mark, used once for every thousand or so of bricks that were baked by the manufacturer.

There were also many other and equally interesting marks on the bricks, marks left by animals which had been allowed to touch the clay before it had been baked. The impressions are so clear in each case that no mistake is possible as to their

origin. For instance, one is that of a large dog, perhaps a watch dog, one of a pig, one of a calf, three of a goat and several of sea birds.

The lecturer also exhibited a scientifically executed design of the lower portion of the Campanile, together with the foundation. The design delineates clearly the many different layers and the substructure of the soil on which the Campanile was built. Five metres below the surface have been discovered rows of beams set upright, not for the support of the tower so much as for the general solidification of the naturally damp soil. Further than this depth excavations have not yet been made, but the examination hitherto conducted is sufficient to give a very exact idea of the methods of building used and of the preparation of the subsoil prior to the laying of the foundations.

The first stone of the new Campanile will be laid on April 25. It is hoped that by next spring the first 30 metres will be built, and that the whole Campanile will be finished by the spring of 1906.

CULROSS ABBEY.

A MEETING of those favourable to the proposal to restore Culross Abbey, which was founded in 1217 by Malcolm, Earl of Fife, but which, after passing through strange vicissitudes, is now represented only by the choir of the original building, was held in Edinburgh. A scheme of restoration has been prepared by Sir R. Rowand Anderson, and it is estimated that the restoration will cost 5,000*l*. Of that sum the heritors have offered to pay 2,000*l*., and with a view of raising the remaining portion committees are being formed in Culross, Edinburgh and Glasgow. The meeting was attended by about twenty gentlemen. Rev. Dr. Russell, Moderator of the Established Church Assembly, presided. Apologies for absence were received from Lord Balfour of Burleigh, Sir Henry Campbell-Bannerman, Lord Elgin, Lord Kinross, Sheriff C. N. Johnston and Mr. Younger. Mr. Dalgleish, Brankston Grange, moved that the meeting approve of the proposal, and that immediate steps be taken to carry out the scheme. Mr. A. Burn Murdoch seconded, and the motion was adopted. Mr. Laurence Dalgleish, Keable, Mr. James Arnot, Professor Lawson and others expressed themselves in hearty sympathy with the movement, and a subscription of 250*l*. was intimated by Mr. Erskine Beveridge, St. Leonard's Hill. A committee of seven gentlemen, with Mr. Thomas Aitken, Edinburgh, as convener, was afterwards formed. The Rev Dr. Scott thought it was a shame for a country to allow its historic buildings to fall into disrepair. Mr. Alex. Bogie was appointed honorary treasurer, and Mr. P. H. Cosens hon. secretary.

SOCIETY OF ANTIQUARIES OF SCOTLAND.

THE usual monthly meeting of the Society of Antiquaries of Scotland was held on Monday, Dr. Robert Munro, vice-president, in the chair.

The first paper read was a report on the excavation of Castlecary, one of the great forts or military stations on the line of the Roman wall of Antonine, situated six miles west of Falkirk, which had been undertaken by the Society in 1902, the duration of the work extending from March to November. The history of the site and description of the excavations and their results were given by Dr. D. Christison, secretary; the plans and sections of the structure of the fort itself and of the buildings within it as disclosed by the excavations were supplied by Mr. Mungo Buchanan, a corresponding member of the Society; and the notices of the various articles found, including pottery, bronze, iron and other objects pertaining to the Roman occupation, were given by Dr. Joseph Anderson. In the beginning of last year, the attention of the Council having been called to the probability of the ground close to the fort being feued for building purposes, they resolved to undertake the excavation as their next work in continuance of the investigation of Roman sites in which the Society has been engaged for the past eight years. Permission having been freely granted by Lord Zetland, the proprietor, and every facility given by Mr. Charles Brown, his factor, the direction of the work was committed to Mr. J. H. Cunningham, C.E., and Mr. Thomas Ross, architect, with Mr. Alexander Mackie again acting as clerk of works, Mr. Mungo Buchanan having again volunteered to fill the arduous post of surveyor. Before operations were begun, all that could be seen on the ground was a slight rise of the surface, the site having been successively destroyed and plundered of stones, first for improvement of the highway, which passes close to it; second, in 1769 and again in 1771, for the works in connection with the construction of the Union Canal; and lastly in 1841, when the North British Railway was driven obliquely through the fort. Many notices of Castlecary, as one of the principal forts or stations on the Roman wall, are found in the

works of Sir Robert Sibbald, Alexander Gordon, Horsley, Maitland, Roy, Stuart and others, but their accounts are necessarily meagre and often contradictory. The present excavation has shown that the fort had been surrounded, not by an earthen rampart or ramparts, but by a well-built stone wall 6 feet 6 inches in thickness, consisting of a core of concrete, with outer and inner faces of dressed stones. The masonry is unusually massive, perhaps the most massive hitherto met with in Roman buildings in Britain, many of the stones in the lower courses weighing from half to three-quarters of a ton. The shape is that of a rectangular oblong, with slightly rounded corners, abutting on the line of the wall, which formed the north side of the enclosure, the space inside being roughly about 450 feet long by 350 feet wide. In the south-west corner the foundation of a tower remained, three of its sides being straight, and the fourth formed by the rounded corner of the enclosing wall of the fort. The south-east corner being covered by the railway embankment, it was impossible to determine the existence of a similar tower there, and the south-west tower consequently remains the only angle tower of Roman work hitherto met with in Scotland. Outside the stone wall of the fort were two trenches, surrounding it on the three free sides. Each trench was 14 feet wide and 7 feet in depth, the space between them being 10 feet wide, and the inner trench 5 feet distance from the base of the wall. The fort was entered by four gateways, those in the north and south sides being in the middle of the length of the walls, and those in the east and west sides considerably nearer the north than the south side. Each gateway was single and only 9 feet in width, but flanked by returns inward of the wall, making a passage 14 feet in length. As these returns were 8 feet thick at the base, the walls would be strong enough to carry an archway over the passage, with some tower or other superstructure over the gate for its defence. As the north wall of the fort is fitted into the earthen rampart of the vallum, with which it is aligned, there must have been some special provision to hinder the enemy from obtaining access to the interior of the fort from the vallum, and the widening of the wall at the angles seems to indicate that towers or strong walls were placed here to face the vallum, and bar all access to the fort from it. The general plan of the interior of the fort corresponds to that of all the Roman stations hitherto examined in Scotland, the pretorium being in the centre with the space on either side of it occupied by long, narrow buildings running parallel to it. The only other important structure discovered was an interesting buttressed building with apertures splayed inwards between the buttresses. A building with sundry apartments, described by Nimmo as having been discovered in 1770, is now covered by the railway embankment, but a plan of it has been preserved by General Roy, and in a small part of it not covered by the embankment a well-preserved latrine was laid open. The existence of an annexe to the Castlecary fort was quite unsuspected until it was revealed by the present excavation. It lies on the east side of the fort and is irregularly five-sided, the north face formed by the vallum and the western by the east side of the fort. These were thus strongly protected, but the other three were defended merely by an earthen rampart about 14 feet wide, and a ditch of the same width and 7 feet deep. No remains of buildings were found in the annexe. The question of how far structural characteristics may help in the determination of the dates of Roman forts in Scotland is one of special importance, and in this connection the records of the German Lines Commission may be advantageously consulted, because the period dealt with corresponds closely with that of Roman activity in Scotland. In Germany earthen forts are only very rarely met with as Roman works, out of forty-eight stations excavated the defensive works of forty-five being built of stone, and only three constructed of earth, and these weakly fortified by a single palisaded trench. Thus it appears that on the German frontier line earthen castles had been almost entirely superseded by stone castles, and this carries the stone type of construction back to the reign of Domitian, possibly to A.D. 90. Those that can be dated range roughly from the reign of Domitian to those of Trojan, Hadrian and Antonine. But the four earthen forts excavated in Scotland—viz. Birrens, Lyne, Camelon and Ardoch—are strongly contrasted with the German earthworks, from the elaborate nature of their exterior fortifications as well as by the uniform plan of the arrangement of their interior buildings, and from these features and the inscribed stones found in them they may be referred to a later period than the German earthworks, and this is corroborated by the date of A.D. 151, assigned by the inscribed tablet found in Birrens to the repair, if not to the original construction, of that fort. But the regular manner in which the fort of Castlecary fits into the Antonine vallum, and the fact that the angles of the fort at the junction with the vallum are sharp, whereas the free angles are rounded, go to prove that the fort and vallum are of the same date—about A.D. 142. The relics found in Castlecary are by no means so numerous or so varied in character as those from Camelon, but they present the same mixture of broken pottery,

and glass, some of the Samian ware being finely embossed, and a few fragments of the glass representing vessels of graceful shape. A single intaglio in carnelian, representing Jupiter with his eagle, was found. The usual blue ribbed heads and bronze fibulæ occurred; but perhaps the most interesting of the objects found were the remains of the leather foot gear of the occupants found in the ditch, into which no doubt they had been tossed as they were disused. These remains consist chiefly of fragments of shoes and sandals of various sizes and shapes, the soles of the largest measuring 11 inches in length by 4 inches across the widest part, and the smallest being daintily made shoes of soft leather, with soles about 8 by 2 inches, the uppers scolloped and cut out in openwork, with ornamental tabs at the heels and cut, stamped and sewed work along the sides, evidently made for women.

The second paper, entitled "Additional Notes on Ingram of Kethenys and his Mural Tomb in the Church at Tealing," by the Right Rev. John Dowden, D.D., was a supplement to a paper read before the Society in 1896 by Mr. A. Hutcheson, Broughty Ferry.

In the third and last paper, Mr. John Sinclair, F.S.A. Scot., gave some notes on the disputed tomb of Queen Mary of Guildres and the Stuart vault at Holyrood.

MONKS' LAVATORY, DURHAM CATHEDRAL.

DURING the last few days some important excavations have been carried out in the cathedral cloister garth with a view of ascertaining the site of the old lavatory which was used by the monks for the purpose of washing their hands and faces before proceeding to partake of their meals in the refectory. Up to the present it has always been supposed that the lavatory was situate near the north side of the cloister garth, but the recent excavations prove the site to be at the opposite side, *i.e.* the south side. The idea of searching for this old relic of the monastic days originated in Dr. Fowler. The latter gentleman is at present engaged in rewriting Surtees' "Rites of Durham," and in doing so came across the following passage:—"Within the cloister garth, over against the Frater house door, was a fair laver [basin] or conduit for the monks to wash their hands and faces at, being made in form round, covered with lead, and all of marble, saving the outermost walls. Within the which walls you may walk round about the laver of marble having many little conduits or spouts of brass." Hitherto this "over against the Frater house" [refectory] was construed to indicate the north side of the garth, but Dr. Fowler, whilst considering the correct reading of these words, came across two holes for wall-plates in the bay of the south wall of the cloister. This, coupled with the fact that in the base of the outer wall immediately beneath the wall-plates there is a discontinuation of the plinth which runs round the remainder of the cloister wall, suggested to Dr. Fowler that the old lost lavatory was somewhere close at hand, and he obtained the necessary permission to make search. On excavating immediately beneath the plate-holes the foundations of the old lavatory, so long lost sight of, were brought to light. The laver referred to in the above quotation is the basin-like structure which has occupied a position in the centre of the cloister garth of late years. An examination of this laver reveals at least one of the "conduits or taps of brass" spoken of by Surtees. Internally the old lavatory had a diameter of some 19 feet, and the laver, when in its original position, probably occupied a spot in the centre. Externally at any rate the building was octagonal, with angle buttresses somewhat similar to those of the chapter-house apse, and, according to "Rites of Durham," "had seven fair windows of stonework," and the south side, which adjoined the south cloister, "over against the Frater house door," had a doorway in it. The roof of the old lavatory was a lead-covered one, surmounted by a "fair dovecot, covered finely over above with lead, the workmanship being both fine and costly." The account of Durham Cathedral says the lavatory was erected A.D. 1432-33.

The recent excavations have brought to light several perplexing problems, one of them being the finding (at a lower level) of what appears to be a second lavatory basin of earlier—probably Norman—character. This occupies a position quite out of the centre of the other—the fifteenth-century building. The foundations of the earlier—the Norman lavatory—indicate a building square in form, and 15 feet by 15 feet in size internally. Several old drains have been laid bare. Those in connection with the later fifteenth-century lavatory are in part constructed of moulded stones, whilst the single drains in connection with the older Norman lavatory are all plain. The use of the moulded stones in the drains of the later lavatory is considered as clear evidence of the destruction of the earlier building, the moulded stones of which the latter was constructed having to all appearances been used for the purpose of making drains for the later building. A portion of the ancient lead pipe, 2½ inches in diameter, still remains in

the centre of the bed of the earlier basin. It is hoped when the finds have been more completely studied none of the problems now raised will remain unsolved. Plans and photographs of the foundations have been taken, and the excavations will shortly be filled up.

GENERAL.

The King has commanded that the portrait of His Majesty just painted by Mr. Emil Fuchs shall be exhibited at the Royal British Artists, of which Society Mr. Fuchs is a member. The King is represented in the uniform of the 1st Regiment of Prussian Dragoons (Queen Victoria's). The portrait will be on view at the Suffolk Street Galleries from April 17 next.

The Prince of Wales will open, on April 29, the new buildings of the Royal School of Art Needlework. The design has been prepared by Mr. F. B. Wade.

Mr. Richard Philip Day, architect, has died at his residence, Bloomsbury Square, from cancer. Mr. Day was diocesan architect and surveyor for Canterbury and a surveyor of ecclesiastical dilapidations for the diocese of London.

A Monument is to be erected to Emile Zola. The work has been entrusted to two sculptors, MM. Constantin Meunier and Alexandre Charpentier.

Mr. Logie, of Huntly, Aberdeenshire, has been awarded the contract for the masonry in connection with the monument to be erected in the Matoppos to the late Mr. Cecil Rhodes. The contract for the whole erection was obtained by the Rhodesian Contracting Company, and it is expected that the cost of the masonry alone will amount to 16,000*l.*

The Institution of Civil Engineers have elected as honorary members Prince Auguste D'Arenberg, Mr. Chamberlain, F.R.S., M.P., and Sir Archibald Geikie, F.R.S.

The Marquis de Pienne, Court Chamberlain under Napoleon III., has presented the Academy of Agram, near which town he resides, with his valuable collection of paintings by the most famous painters under the Empire.

A Committee, composed of the Marquis de Lafayette, the Marquis de Grasse, the Comte de Rochambeau and others, is about to present a bust of George Washington to the United States. It is to be a replica in bronze of the one in marble by David d'Angers which was destroyed by fire in Washington.

In Connection with the centenary of the French Academy in the Villa Medici, Rome, several architects have received promotion in the Legion of Honour. M. Pascal becomes a commander, MM. Gerhardt and Marcel Lambert officers, and M. André chevalier.

The Trustees of the National Portrait Gallery have accepted as a gift from the Right Hon. W. E. H. Lecky, O.M., a plaster bust of Henry Grattan, the Irish statesman, modelled by P. Turnerelli in 1812, and formerly the property of Grattan's daughter. The trustees have also acquired by purchase a posthumous miniature portrait of Edward FitzGerald, the translator of the Quatrains of Omar Khayyam, painted by Mrs. Rivett-Carnac.

The Exhibition in the Grand Palais of the Champs-Élysées, of which the subject will be the dwelling-house, is to be opened on July 30. The providing of houses at a cheap rate will receive special attention.

The Jury of the section of architecture in this year's Salon will be composed of MM. Pascal, Laloux, Moyaux, Vaudremer, Daumet, Girault, Scellier de Gisors, Raulin, Deglane, Redon, Gaudet, Mayeux, Paulin, Bonnier.

An Exhibition of photographs of Roman tympana and lintels with figures or symbolical sculpture to be found in churches in the United Kingdom opened at the Guildhall this week. The exhibitor is M. Charles E. Keyser. The photographs number nearly 200, and will be on exhibition for a month.

The Prefect of Constantine has asked the local council to grant him a vote in order that the representatives of the Paris journals who have followed M. Loubet to Algiers can be sent to the Roman remains of Timgad. The traction will be by means of automobiles.

The Exhibition of the Société Nationale des Beaux-Arts, or the rival Salon, will contain 2,608 pictures, or 165 more than last year. There are 1,922 paintings and drawings, 512 examples of sculpture and *objets d'art*, 172 engravings and 102 architectural designs.

Mr. Bertram Mackennal, an Australian sculptor, has received the commission to execute the memorial to Queen Victoria which is to be erected at Blackburn. Mr. Mackennal was for a time a student at the Royal Academy, but it was before day classes for sculptors were established in the schools. He continued his studies in Paris, where he exhibited several times in the Salon.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BLACKPOOL.—June 30.—The Corporation of Blackpool offer premiums of £100, £50, £30 and £20 respectively for designs for new picture poster. Mr. C. Noden, Corporation advertising manager, Town Hall, Blackpool.

FENTON.—April 30.—Designs are invited for a public free library. Premiums of 60*l.* and 30*l.* are offered for the two selected designs. Mr. S. A. Goodall, surveyor, Town Hall, Fenton.

MANCHESTER.—April 30.—Architects within a radius of thirty miles of Manchester are invited to submit competitive designs for an hospital to be erected in Quay Street, Manchester, at a cost not to exceed 14,000*l.* Premiums of 75*l.*, 50*l.* and 25*l.* respectively will be awarded. Mr. James Fildes, hon. secretary, Quay Street, Manchester.

NEW BROMPTON (KENT).—May 30.—Designs and plans are invited in competition for public swimming and slipper baths to be erected in Windsor Road, New Brompton. Three premiums are offered, one of £20 to the author of the design which is considered to be the first in order of merit, one of £10 and one of £5 respectively for the second and third. Mr. F. C. Boucher, clerk, New Brompton, Kent.

STOCKTON-ON-TEES.—May 13.—Designs are invited for a girls' high school, to be erected as a memorial of Her late Majesty Queen Victoria, at a cost not exceeding 5,000*l.* Premiums of 25*l.*, 15*l.* and 10*l.* respectively will be awarded. Mr. C. J. Archer, 77 High Street, Stockton-on-Tees.

SUNDERLAND.—April 30.—Designs are invited for proposed alterations and additions to Victoria Hall, Sunderland. Premiums of 100*l.*, 50*l.* and 25*l.* will be awarded for the first, second and third designs respectively. Mr. F. M. Bowey, Town Hall, Sunderland.

CONTRACTS OPEN.

ALNWICK.—For the erection of a house at Alnwick. Mr. George Reavell, jun., architect, Alnwick.

ALNWICK.—April 20.—For the erection of a villa residence at Alnwick. Mr. William T. Spence, architect, Ashmount, Shotley Bridge.

ASKERN.—For the erection of stabling for nine horses, sheds and other buildings to the Railway hotel, Askern, Yorks. Messrs. Garside & Pennington, architects, Ropergate House, Pontefract.

BAILDON.—April 23.—For the erection of a house at Baildon, Yorks. Messrs. Walker & Collinson, architects, Swan Arcade, Bradford.

BALLIDON.—For the erection of extensive farm buildings, &c., at Ballidon, Derbyshire. Messrs. William Sugden & Son, architects, Leek.

BISHOP AUCKLAND.—April 20.—For the erection of seven workmen's houses with outbuildings at Cockton Hill, Bishop Auckland. Mr. R. Askwith, engineer, South Road, Bishop Auckland.

BLACKBURN.—April 22.—For rebuilding the Punch Bowl hotel, Chapels, Darwen, and reconstructing the Cross Guns hotel, Church; Swan hotel, Blackburn, and York inn, Broadfield, Oswaldtwistle. Mr. Jas. Bertwistle, architect, Tacketts Street, Blackburn.

BLACKPOOL.—April 22.—For the erection of ornamental shelters and bandstands in connection with the promenade widening works. Mr. John S. Brodie, borough surveyor, Town Hall, Blackpool.

BRIDLINGTON.—May 9.—For the erection of engine-room, boiler-house, boiler settings, chimney-shaft and offices. Mr. Ernest R. Matthews, borough surveyor, Town Hall, Bridlington.

BRIDPORT.—April 29.—For the erection of a 13-bed iron hospital at Bradpole, near Bridport (G.W.R.), Dorset, with commodious administration block, foundations, baths, earth-closets, grate, and furnished complete for occupation, water storage 150 gallons; and for the erection and fixing of an iron building with foundations at Bradpole, nearly adjoining the last-mentioned building, to contain ambulance, mortuary, laundry, coal and disinfecting chambers, with earth-closets, water storage 150 gallons. Mr. John J. Roper, Rural District Council clerk, 74 East Street, Bridport.

BRISTOL.—April 24.—For the construction of four underground concrete electrical sub-stations. Mr. H. Faraday Proctor, city electrical engineer, Temple Back, Bristol.

BRISTOL.—April 28.—For alterations and additions to a shed at Pylle Hill, Bristol, for the Great Western Railway Company. Mr. G. K. Mills, secretary, Paddington Station.

BURY.—May 4.—For the Blackford Bridge improvement works, comprising the taking-down of the present bridge and the construction of a new skew masonry bridge 50 feet between parapets, 66 feet span, with retaining-walls, road formation, &c., for the Joint Committee of the Lancashire County Council and the Corporation of Bury. Particulars may be obtained at the County Bridgmaster's Office, Preston.

NORTH OF ENGLAND SCHOOL FURNISHING CO., LTD.

MANUFACTURERS OF COMPLETE FITTINGS FOR

LIBRARIES, TECHNICAL & ART SCHOOLS,
SCHOOL DESKS, &c., and CHURCH FURNITURE.

Catalogues and Estimates Free on Application.

Sole Makers of WILKS PATENT "CLIMAX" SLIDING PARTITIONS.

Contractors to H.M. Government, London and Birmingham School Boards, &c.

Addresses: DARLINGTON, NEWCASTLE, SUNDERLAND, MIDDLESBRO, and NORWICH.

CAMBERWELL.—May 12.—For the erection of public baths and washhouses in Old Kent Road. Mr. E. Harding Payne, architect, 28 John Street, Bedford Row, W.C.

CANNOCK.—April 22.—For the repairs to the flooring of and provision of wood-block flooring at the old infirmary at the workhouse, Cannock, Staffs. Mr. A. W. Carver, clerk, Union Offices, Cannock.

CLEATOR MOOR.—April 20.—For raising roof, making an additional storey and building additional out-premises at 79 High Street, Cleator Moor, Cumberland. Mr. L. Billington, High Street, Cleator Moor.

CLEATOR MOOR.—April 30.—For alterations and additions of a classroom for St. Patrick's schools, Cleator Moor. Mr. R. Robertson, architect, Public Offices, Cleator Moor.

YORK.—May 9.—For the erection of engine and boiler-houses, offices, &c., at the electricity generating station. Mr. A. Creer, city engineer, Guildhall, York.

THE Council of the British Archaeological Association having heard of the threatened demolition of a portion of the remains of the town walls of Berwick-on-Tweed, passed at their recent meeting a resolution deploring such a proceeding, and expressing the hope that the municipal authorities will adopt a more enlightened course and refuse to sanction the destruction of the ancient ocular evidence of the history of their town. The walls of Berwick are almost unique at the present day, and forcibly recall to the mind of the observers the past famous history of the ancient borough. To preserve these remains for generations to come is a duty which, it is hoped, the Town Council will not overlook.

* Amended tender, with four of the houses reduced in size, £1,956 (accepted).

WILSON'S PATENT "MULTILUX" WINDOWS

The above illustrates an office where the light coming from the sky falls on to the floor and is absorbed, thus leaving the back part of the room dark. The illustration below shows the same room with WILSON'S PATENT MULTILUX WINDOW fixed. This refracts the rays of light and throws them horizontally, thus preventing them falling on to the floor, and lighting up the whole room.

PRICE

5/- per foot super.

Wilson's Patent
"SAFETY" Pavement
Lights prevent slipping

Wilson's "DIOPTIC"
Pavement Lights are
an improvement on
the semi-prism at the
same price.

COLUMNS, STANCHIONS,
GIRDERS, AND ALL ARCHI-
TECTURAL CASTINGS.

NEW CATALOGUES.

THE British Accumulator Company, of Parliament Mansions, Victoria Street, S.W., are about to issue their illustrated catalogue for 1903, and have sent us an advance copy. It contains a detailed description of the accumulators which are the firm's specialty, lists giving the dimensions and prices of their cells, &c. The Company ask us to mention that they will be glad to forward a copy to any of our readers who are interested in accumulators.

FROM the Dermatine Company, Ltd., of 95 Neate Street, S.E., we have received a catalogue, also illustrated, descriptive of Dermatine and the purposes to which it can be applied. Dermatine is, it appears, a manufactured product composed of various gums and chemicals, the use of which in combination, or, to speak more exactly, in conjunction, was the original idea of Mr. Ziegler, who had for many years occupied himself with trying to find a substitute for gutta-percha. In 1884-85 he took out patents for Dermatine as a substitute for leather, applicable for soles, belts, roller coverings, &c. His original ideas have, however, undergone considerable extension in recent years at the hands of Mr. John Cooper, the present managing director of the Dermatine Company, Ltd. It is now employed for the manufacture of machine belting, circulating and ball valves, brick pads, buffers, hydraulic cup and press pump rings, packing rings, all kinds of hose and tubing, mats and stair treading, &c.; indeed, its uses are multifarious.

TRADE NOTES.

THE partnership existing between Messrs. A. Estcourt & Sons, builders and contractors, Gloucester, was dissolved from January 1, 1903, by mutual consent. The business will be continued by George Oliver Estcourt and H. Percy Estcourt in the name of A. Estcourt & Sons.

MESSRS. POWER, POWER & CO., 5 Philpot Lane, E.C., notify us that they have purchased the goodwill, business and works of Deane, Ransome & Co., Limited, of Plymouth Wharf, Wharf Road, Cubitt Town, E., where they will continue the manufacture of girders, roofwork and constructional iron and steelwork generally as hitherto.

IN consequence of the death of Mr. W. Harry Stanger, we have been requested to announce that the son, Mr. R. H. Harry Stanger, will continue the practice as a consulting engineer with the late Mr. Stanger's colleague, Mr. Geo.

Blake Oughterson, at the same address, 2 Broadway, Westminster.

MESSRS. MATHER & PLATT, LTD., of Salford Iron Works, Manchester, have in hand, or have lately completed, the following plants for dealing with water softening by the Archbutt-Deeley process:—Steel works, 6,000 gallons per hour; colliery, 6,000 gallons per hour; hosiery factory, 4,000 gallons per hour (in each of the above cases the plant supplied is a duplicate of an already existing one previously supplied by Messrs. Mather & Platt, Ltd.); steel works, 16,000 gallons per hour; colliery, 10,000 gallons per hour, as well as other smaller installations. They have also in hand orders for their patent automatic sewage appliances for the following places:—Creswell, Somerset; Brigg, Thornton, and the smallpox hospitals at Troon and Ayr. They have further lately erected three of their patent gravity filters for the water committee of the Hereford Corporation to deal with water from the river Wye, which is subject to high floods at intervals, when the water is very heavily charged not only with clay and similar substances, but also with vegetable fibre. The combined output of the three filters is 1,500,000 gallons per 24 hours, and they have been found most efficient in extracting the matters suspended in the water, even under the exceptional cases of flood mentioned above.

ELECTRIC NOTES.

AT a meeting of the Kilmarnock Town Council on Tuesday, Provost Hood presiding, the draft provisional order for the electric traction scheme was discussed and approved. The estimated cost is 65,000/.

THE electric-lighting committee reported, at a meeting of the Paisley Town Council on Tuesday, that they had considered the report upon the tenders received for supply of engine and alternator, and agreed to recommend the acceptance of the engine and alternator tendered for by Davey, Paxman & Co. (Schuckert Combination), being an exact duplicate of the existing 300-k.w. alternator, at the price of 2,400/.

IT was also agreed that Mr. Parkinson should submit to next meeting a statement of the probable cost, along with plans, of new building proposed to be erected for accommodation of additional plant.

AT a meeting of the Kingswinford Rural Council on Wednesday the Clerk said with regard to the arbitration

between the Council and the Midland Electric Corporation for Power Distribution, the award was absolutely in favour of the Council's contention on all the points they raised. He had seen officials of the company that day, and they stated that they had spent something like 6,000*l.* in the Council's district in laying cables, and it would cost 7,000*l.* or 8,000*l.* to complete the work. They asked him to tell the Council that in a fortnight's time they would have a definite scheme to put before the Council. The Clerk said the Corporation now realised they had to do the work *in toto* or to pay the Council damages, according to their agreement.

A BODY of about 200 members and students of the Institute of Electrical Engineers, with Professor Thompson at their head, arrived at Como on Friday, April 3, by special train from Switzerland. The mayor, several Government officials, and a number of ladies and gentlemen were in waiting at the station, and as the visitors alighted from the train a band played the English and Italian National Anthems, while all present cheered and shouted "Long live England!" The Englishmen were evidently deeply touched by this spontaneous demonstration. The visitors were driven through the town in a long file of carriages, the procession passing the Volta monument, which was illuminated. In the evening the English electricians were entertained at a concert. On Saturday morning they visited the electrical installations at Valtellina, and on Sunday the grave of Alessandro Volta, where they deposited an artistic bronze memorial tablet sent by the Institute. The visitors were subsequently entertained by the municipality of Como.

THE committee appointed to advise the Bath City Council what to do with the offer made by the Bath Electric Tramways Company to acquire the electric-lighting works on a lease of thirty-two years, has decided practically unanimously to recommend that the offer be not accepted, and that the Corporation do not consider further the question of parting with the works under any circumstances. The offer was to pay to the Corporation, as rental, sufficient every year to pay the interest and sinking fund on the present capital (110,000*l.*), and the company said they would also pay the Corporation, by instalments spread over the period of the lease, the sum of 5,100*l.*, which represents the actual cost to the rates of the undertaking. These two sums together represent an annual rental of 6,660*l.*, but as the Corporation can already rely on a gross profit of that amount the offer was not attractive. The decision not to part with the works commits the Corporation to a further large

capital outlay, probably 50,000*l.* As, however, the Council are not prepared to sanction the immediate outlay of 50,000*l.*, the committee suggest that half of the scheme representing that amount be carried out during the current year, and the balance the following year.

BUILDING AND BUILDERS.

THE foundation-stone has been laid of the Bishop Latimer Memorial Church in Handsworth New Road, Winson Green.

A MOVEMENT is in progress at Putney in the direction of erecting a hospital at a cost of about 20,000*l.*

A TENDER of 596*l.* for the erection of a new Welsh Wesleyan church at Glyndyfrdwy has been accepted. The highest of the four tenders received was 631*l.*

THE erection of the building at Hendon which is to serve as a storehouse for the newspapers at present in the British Museum is to be proceeded with without delay, and it is hoped that within three years the place will be ready for the transfer of the papers to their new home. The total estimated cost, including the purchase of the site, is stated to be 18,000*l.*

It is proposed to build a new parsonage in place of the present building at Royton. The site, hitherto held on a 999 years' lease, has now for a nominal sum been conveyed by the Roman Catholic lord of the manor, Sir Percival Radcliffe, to the vicar and churchwardens for the purpose of a parsonage house. The building is estimated to cost about 1,900*l.*

THE foundation-stone of a new drill-hall which is being erected on the banks of the Rheidol, Aberystwyth, was laid on Tuesday. The drill-hall will be 130 feet long by 68 broad, and will contain rooms for officers, non-commissioned officers and men, harness-room, armoury and a detached magazine.

AT Tipton the memorial-stone was laid on the 13th inst. of the Park Methodist New Connexion church school. The building is connected with the Oldbury circuit, and is situated in close proximity to the Victoria Park. It is being erected by Mr. Walker from plans prepared by Mr. J. Dallow, at a cost of 500*l.*, and will provide seating accommodation for 200 people.

AT a meeting of Kingswinford Rural Council on Wednesday, Mr. Horne presiding, the Clerk read a letter from the Local Government Board relating to the sewerage scheme, for which the Council are asking for a loan of 70,000*l.* The Department had made certain suggestions which the Clerk stated would

considerably increase the estimated cost of the scheme, and in reply to the Council's request that the Department would receive a deputation they now wrote that they thought no practical advantage was likely to result from an interview, and they asked for written replies to the points to which they called attention. It was resolved that the replies should be drafted at a special meeting of the Council.

THE foundation-stone of an important extension of the Chelsea workhouse, situated off King's Road, was laid on the 8th inst. The new buildings, the contract price of which is £2,825, will provide accommodation for 200 additional inmates, the present workhouse buildings housing from 700 to 800, while the infirmary has beds for about 400. When the new buildings are completed an important object will have been achieved, for the Guardians will be in a position to dispense with the branch workhouse at Fairfield House, Footing. With all the indoor poor at one establishment a great saving in the cost of administration will, it is hoped, be effected. In addition to dormitories and day-rooms for the inmates and mess and recreation-rooms for the officers, the extension will comprise a new board-room and committee-rooms and relief offices.

MR. J. THOMPSON, jun., harbour engineer, Dundee, has issued a report to the members of Dundee Harbour Board on proposals for the improvement and reconstruction of Dundee river jetties at the east end of the harbour. The trustees have provisionally agreed to adopt a system of ferro-concrete piling similar to what obtains at Southampton, and the figures given by the engineer are on the basis of an amended scheme, the original cost being nearly 20,000. The engineer's estimate of the cost of a new wharf on a parallel line 10 feet further into the river is put at 13,900, with 8,500 for warehouses and the cost of dredging, making a total of 22,400. On a plan showing the wharf extended into the river 15 feet the cost is put at 13,200, the wharf proper costing 14,700, and warehouse and dredging 8,500, while at a line 110 feet further into the river the total cost would be 30,500, 18,000 being required for the wharf and 12,500 for warehouse and dredging. In the report it is stated that probably the most suitable plan would be that estimated at 23,200.

At a recent meeting of the Worcester City Council the order of Mr James Dickson, of Townsend, St. Albans, for £841, was accepted to carry out the necessary outfall sewers and provide an iron tunnel beneath the bed of the Severn, con-

taining duplicate syphons to carry the sewage to the Bromwich site for treatment. The Council discussed at some length what method should be adopted for the treatment of the sewage. The Local Government Board have already sanctioned a scheme for the chemical precipitation in tanks and coke breeze filters, the total cost of which is estimated to be 44,792. Compared with this, Messrs. Beesley, Son & Nichols, the engineers of the scheme, estimate the cost of the works necessary for septic treatment at 111,369, but whereas the annual cost of the chemical treatment would be 1,247, that of the septic treatment would be only 150. Capitalising the annual cost in each for thirty years, and adding to the capital cost, the respective amounts are:—Chemical precipitation treatment, 82,022; septic treatment 115,869. A very much larger area of land would also be necessary than that provided for the original scheme. A proposal by the Mayor that the scheme for chemical precipitation be proceeded with was defeated in favour of an amendment by Alderman J. Millington, that the question of treatment be deferred with a view to obtaining further information.

VARIETIES.

DINGWALL Town Council have resolved to offer a site for a public monument to the late Major-General Sir Hector Archibald Macdonald.

A NEW school is shortly to be built at Crayford, Kent, the architect for which is Mr. Morgan, of 43 Cannon Street, London.

THE City Temple is to be closed in June next for the purpose of renovating the building and the introduction of a new and up-to-date system of heating and ventilation.

A PRIVATE view of picture-miniatures painted by Mr. Charles Sainton, R.I., is to take place in the Quest Gallery, 172 New Bond Street, W., on Tuesday, April 21. The collection will include the paintings on ivory by Mr. Sainton that are the properties of H.M. the Queen and of H.R.H. the Prince of Wales. In order to show the manner in which the artist works, the original studies made for the picture-miniatures are to be on view. Further, in the collection will be included a few of the artist's water-colour drawings and some of his smaller pictures in oil.

MR. J. MILLER CARR (of Messrs Doulton's, Ltd.) will read a paper before the Society of Architects next Thursday. The

subject will be "Modern Terra-cotta, Constructional Faience and Ceramic Mural Decoration." The lecture will be illustrated by working details, cartoons, photographs and actual examples of work.

THE great screen organ in York Minster, which has been rebuilt at a cost of nearly 5,000*l.*, was on Wednesday morning dedicated by the Archbishop of York, and reopened by Sir Walter Parratt, Master of the King's Music and organist of St George's Chapel, Windsor. The work of rebuilding has occupied twelve months, and the organ is now considered to be one of the finest in the country.

ARCHITECTS who have designed fire-stations are requested to communicate with Mr. Frederick R. Farrow, F.R.I.B.A., of 29 New Bridge Street, E.C., not later than Saturday, April 25, with the view of the possible exhibition of perspectives, elevations, photographs, or plans of modern stations in the architectural group of the impending International Fire Exhibition at Earl's Court.

A REREDOS has just been erected in the church of St. Michael and All Angels, Howe Bridge, from designs of Messrs. Austin & Paley, the architects of the church. The reredos is of Italian marble, the upper part of the panels being filled with mosaics executed in Venice from designs of Messrs. Shrigley & Hunt. On each side of the reredos arcading in red Devonshire marble extends to the north and south wall of the chancel. Lieutenant-Colonel Philip Fletcher, the donor, has also presented a new brass altar cross. These gifts were dedicated on Easter Eve.

A MEETING of the East of Scotland Engineering Association was held on the 25th ult. at 18 George Street, Edinburgh, Mr. J. D. Gibson presiding, when a paper was read by Mr. James Pirie, C.E., on "The Protection of Iron and Steel Structures." The necessity for protecting such structures from oxidation was pointed out, and most of the ordinary methods of doing so described. The advantages and disadvantages of the various materials used for the different paints were gone into, the author stating a preference for red lead as an under coating, finished with iron oxide. The imperative necessity of having a perfectly clean surface to paint and the usefulness of the sand blast for insuring this was also remarked upon. Mr. Pirie was awarded a hearty vote of thanks for his paper. Mr. C. J. Brown, C.E., exhibited and described a number of lantern views of railway work, principally of bridge renewals and similar matters.

CORPORATION CONTRACTS.

AT the Ayr Town Council meeting a discussion took place regarding the Town Clerk's fees for legal contracts in connection with Corporation work. A minute of the finance committee bore that the contractors for the heating of the town hall had requested the Corporation to relieve them of the half of the expense of the contract, but the committee refused to entertain the application. Bailie Allan proposed that their schedules in future, over and above indicating that contractors would have to enter into a legal contract, they should state the sum they would probably have to pay. It was evident that firms had been misled as to the sums they would have to pay. It touched his (Bailie Allan's) honour to some extent; he felt a little ashamed of, although he was only guilty in a corporate capacity. They were carrying out a practice somewhat original and singular. Certainly if it was not original it was unrivalled in the charge made for these documents. It would be more creditable if they could state in their schedules the amount to be paid. Mr. Craig said he understood it was stated in the schedule. Provost Templeton said it was stated that they would require to pay half the cost. Bailie Tait said it was explained that the sum could not be ascertained till the contract was completed. Deacons of Guild Allan thought the proper way would be for the town to pay the whole sum. If they adopted Bailie Allan's suggestion contractors would put that in the schedule, and the contract would be to that extent higher. Mr. T. Young thought it would be a good plan to have a scale of charges and a note fixed to every specification. He had suggested this long ago. The Provost said that might be a better plan. He moved that it be remitted to the sub-finance committee to draw up a scale, and report to the finance committee.

The Town Clerk (Mr. A. G. Young): I object to this drawing up of scales, because you have no power to do anything of the kind. Bailie Allan states that I charge more than the ordinary fees. I give a distinct denial to that.

Bailie Allan: I never said anything of the kind.

The Clerk: You insinuated that I did; you said it was abnormal.

Bailie Allan: I said we were evidently carrying out a practice different from any other Corporation, but I never for a moment insinuated that Mr. Young charged higher than other firms for if he did such a thing why the auditor would check that; once.

The Clerk: Show me any Corporation that is charged different from us.

Baillie Allan: Tell me any Corporation that charges at all have been challenged to do so before.

Mr. Craig: In view of what has taken place I think this discussion should drop. The matter was then allowed to drop.

EGYPTIAN WORKS.

his report on Egypt and the Soudan Lord Cromer says that on previous occasions he alluded to the great want of public buildings in Egypt. No less than £E1,078,000 has been spent on the construction of these buildings during the past six years, but large sums of money must yet be expended before it can be said that all the departments of the State are properly supplied. The demands for new buildings are, indeed, increasing year by year. The question of repairs and maintenance is also becoming one of much importance. Nearly £10,000 was spent under this head during the past year, and this large amount of money is quite inadequate to meet the necessities of the case. The amount spent on new buildings in 1902 was £E154,000. The Egyptological Museum in Cairo was completed. The Arab Museum and Khedivial Library were well advanced; the transfer of the collections has commenced. The Agricultural College is practically finished. The construction of the School of Law is well advanced. The offices of the Governor, as also the new Post Office at Port Said, are both nearly completed. A sum of £E15,000 was spent on model workshops at Cairo. The tobacco store and customs warehouses at Alexandria were completed. Several courts, prisons and Government offices were constructed in the provinces.

The cadastral survey progressed steadily in 1902. The surveys of the provinces of Menoufieh and Fayoum have been completed, and those of Galioubieh and Dakahieh commenced. The completion of these two latter provinces, the whole of the Delta will have been surveyed. The triangulation of the Matruh and Girgeh provinces has also been commenced. The Meteorological Service has furnished daily weather reports; telegrams are exchanged daily between Alexandria and various Mediterranean ports. It is hoped that very shortly this communication will be extended to Cyprus. The new observatory at Helouan have just been commenced. The work of the Geological Survey has consisted mostly of collecting geological specimens from the Eocene strata of the western desert.

Parties have also been engaged in an examination of the cataracts and of the desert lying to the east of Cairo.

The Caisse de la Dette granted £E20,000 some while ago to be spent on improving the streets of Cairo. Some delay occurred in deciding how the money should be employed. The question has, however, now been settled. The sum allotted will enable about two miles of road to be laid down with asphalt. There will for the time being be no increase in the cost of maintenance, the asphalt company having agreed to keep the new roads in order for a term of twenty years. A further heavy expenditure will be required if all the principal streets in Cairo are to be metalled. It is, however, satisfactory to know that a commencement has been made. During the course of last year the scavenging and watering service of Cairo was taken over by the Sanitary Department. The whole of the town is now cleansed and watered daily, except in those quarters where the roads are in such a condition that it is impossible for carts to pass. In view of the great increase of traffic, the question of constructing a second bridge over the Nile at Cairo is becoming one of some urgency.

The most important work of the antiquities service during the past year has been the transfer of the collections from the Ghizeh Museum to the new building in Cairo. The removal of the cases began on December 3, 1901, and by July 13, 1902, the last train-load of objects was removed. By September 10 the collections were completely arranged and classified in the new building. That such a work should have been possible in so short a period of time, without the loss or destruction of a single object, is a feat of which M. Maspero and his very competent staff have every reason to be proud. At Karnak the foundations of those columns of the great hall, which collapsed in 1899, have been rebuilt. At Abydos and Edfou the roofs have been repaired. M. Maspero reports, however, that several of the monuments are still in a dangerous state, more especially at Kom Ombo and Edfou. Some interesting discoveries were made last year in the course of excavation. At Karnak fourteen royal colossi have been brought to light, among them being one of an unknown king. At Sakkarah, the tomb of one of the earlier kings, whose monument already existed at Abydos, has been discovered. The catalogue has made good progress. Four new volumes have been published, viz., those of "Vases en Faïence," "Royal Tombs and Monuments" and "Greek Pottery and Stelæ of the Middle Empire." Five other volumes are in the press, and six more are in course of preparation.

CABOT'S INSULATING & DEAFENING QUILT.

A PERFECT DEAFENER.

the transmission of sound through walls and floors by absorbing and breaking up the sound waves. The only deafener that does not decay, and for Special Book on Schoolhouse Acoustics, illustrated.

A SCIENTIFIC INSULATOR.

Contains innumerable minute dead-air spaces, giving highest insulating power. Warmer than back-plaster or six layers of rosin paper. Decay, moth, and vermin-proof, and unflammable.

FIREPROOF, DEADENING.

A fireproofing result infinitely superior to that obtained with sheet asbestos, and practically perfect sound-deadening, can be had in all kinds of buildings by using

CABOT'S ASBESTOS "QUILT."

The only scientific deafener. Indestructible by decay, moths, or vermin.

	Per Bale.	Half Bale.
Single Ply ...	£1 : 11 : 0	£0 : 17 : 0
Double Ply...	1 : 16 : 6	1 : 0 : 0
Asbestos ...	2 : 16 : 6	1 : 10 : 0

Bales containing 500 square feet each; half-bales 250 square feet. Weights: Single-ply, 80 lbs.; Double-ply, 120 lbs.; Asbestos, 190 lbs. per bale.

CABOT'S CREOSOTE STAINS, FOR EXTERIOR WORK.

valued for depth and freshness of colour, durability, wood-preserving properties, and freedom from blackening. Superior to paint for exterior woodwork, and fifty per cent. cheaper. One gallon will cover 100 square feet of surface, two brush coats.

THE B. & S. FOLDING GATE CO.

19, 20 & 21 Tower Street, Upper St. Martin's Lane, London, W.C.

About £7,600 was spent on the preservation of Arab monuments during the past year, £4,000 of this sum being provided by the State, and the balance by the Wakf Administration. It will be borne in mind that, in March 1896, a grant of £20,000 was made by the Caisse de la Dette, to be expended on the preservation and repair of these monuments. Of this amount, £18,000 has now been spent. The balance of £2,000 was reserved for expenditure on Coptic monuments. In 1902, an additional grant of £2,500 was made by the Caisse de la Dette. As regards Coptic monuments, it is satisfactory to know that an arrangement has at last been made with the Patriarch. Work has been commenced on one of the principal churches in Cairo. The estimated cost of the repairs is £1,200, of which one-half will be paid by the Patriarch at the rate of £200 a year. Up to the end of 1902 a sum of £700 had already been spent.

BRADFORD TOWN HALL EXTENSION.

THE finance and general purposes committee of the Bradford Corporation have passed the recommendation of a sub-committee "that the extension of the town hall and municipal buildings be forthwith proceeded with." The town hall at Bradford, which is modelled on the lines of that at Manchester, has long been inadequate for the administration of the city, and one of the chief considerations that helped to bring the Corporation to a decision was the fact that at present an outlay of nearly 1,000*l.* per annum is being incurred in rent, rates, &c., for the housing of important departments away from the town hall. This decision of the finance and general purposes committee, if it be ratified by the City Council, will mean the erection of a new building at the rear of the present town hall and upon the site of the old conditioning-house, as well as the addition of another storey to the present town hall. The cost of the work is estimated at 75,000*l.*, and the plans have been drawn by the city architect (Mr. Edwards). Mr. Norman Shaw, R.A., is acting as consulting architect. Mr. Edwards, in the plans which have been approved, has provided for the housing of all departments at the town hall. There will be a new council chamber, having accommodation for 102 members, the seating being arranged in tiers of circular benches. The chamber will also have two side galleries for the public, each capable of accommodating fifty-four persons. Then there will be a new mayor's parlour and luncheon-room, with large banqueting-hall, ante-room, robing-room, &c. The

present council chamber will be converted into a second police court, and new offices for the chief constable (Mr. Joseph Farndale) and his staff are allotted on the ground floor of the present building. The city coroner (Mr. J. G. Hutchinson) will be provided with a better court and the town hall superintendent with new quarters. The floor levels of the new premises will be made to correspond with those in the old, that no steps will occur in the main corridors of communication. By this extension the floor space of the town hall will be increased by 52,300 feet. It was Mr. Norman Shaw who recommended the addition of another storey to the present building, and it is anticipated that this alteration, besides providing fine rooms and offices, will very much improve the appearance of the hall.

CRYSTAL PALACE SCHOOL OF ENGINEERING.

SIR GEORGE BARCLAY BRUCE, past president of the Institution of Civil Engineers, last week presented the certificates won by the students of the Crystal Palace Company's School of Practical Engineering during the past term.

The reports of the examiners having been read by Mr. Maurice Wilson, the vice-principal, Sir George Bruce addressed those present, and referring to the reports, said they were very glad to have laid before them testimony so reassuring to the value of the Crystal Palace School of Engineering. He was told that it was twenty-five years since his last visit to the school, and the impression made upon his mind by what he had seen that day was that the Institution had not stood still but that it had advanced with the times. When he was a boy there was little scientific teaching, and the great want in our common schools to-day was teaching in scientific subjects. He was quite sure that what a boy learnt in early life of science, mathematics and physics would stick in his mind afterwards but unfortunately schools did not give that kind of instruction. We English were told that we were very silly people, that we were nothing like the Germans and Americans, and that we were altogether behindhand. He did not believe that, but he did think we ought to do more for education in mathematics and science in our schools and colleges. He recommended the students to learn all they could of their profession while they were at an institution, when they had someone to guide and direct them. In conclusion he urged them to do their best and keep up the traditions of a great profession.

JENNINGS' PATENT DUPLEX BATH VALVES

(For Hot and Cold Water Supply), and
HALF-TURN LEVER WASTES

Upwards of 5,000 in Use in Various Parts of the Country in Public Baths, Asylums, Hospitals, Infirmarys, Hotels, and Private Houses.

Cold water can only be admitted first, thus preventing damage to the Bath, and injury to Bather from scalding.

Supplied to H.M. the King at Windsor Castle, and various Residences of the Nobility.

AWARDED THE MEDAL OF THE SANITARY INSTITUTION

THE "LONDON" WARMED FRESH-VENTILATING GRATE & STOVE,

USED IN THE BANK OF ENGLAND and BRANCHES; the CAMBRIDGE HOSPITAL, ALDERSHOT, and other important Buildings.

NEW SHOWROOMS: Architects are invited to inspect these and other Specialties at the New and Extended Showrooms, where further particulars can be obtained. Catalogues on application.

The certificates were then distributed, Mr. C. T. Richardson being awarded the medal of the School of Art, Science and Literature for having obtained during his course through the school the necessary eight certificates, none being below in order of merit.

On the motion of Mr. J. A. Botham, assistant manager of the Crystal Palace Company, a hearty vote of thanks was recorded the examiners.

Mr. E. de B. Sanderson, Mr. A. T. Bean and Mr. Sidney Vtelli replied, and all joined in congratulating the students on the work done in the several departments.

Mr. J. W. Wilson, the principal, stated that some 1,570 students had passed through the school, which had been in existence about thirty years. They did not try to cram students in theory, but gave them practical instruction. He mentioned that one of their old students had been in charge of the work on Kew Bridge, which was to be opened shortly by the King.

A vote of thanks to Sir George Bruce concluded the proceedings.

STORM-FELLED TIMBER IN IRELAND.

GREAT many trees were cast down in various parts of the land in the recent gale, and there is difficulty in dealing with them. The Irish Forestry Society has prepared the following suggestions to meet the case:—

The economical handling and preservation of fallen trees after a destructive gale is one of the most serious of all practical forestry problems. In Ireland more especially the storm of Thursday, February 26, and Friday, the 27th, is believed to have done more damage to woods, parks and plantations than anything experienced since the "big wind" of 1839. The barometer acted most erratically on the night of the early morning of the gale we have mentioned. The lowest reading was 28.49, and occurred between three and four o'clock on Friday morning, and it was between 2.30 and 4.30 A.M. that most of the damage to timber took place.

In the Phoenix Park, near Dublin, above 3,000 trees were uprooted or broken off, and 54 of the permanent labourers of the Park and 20 extra labourers were employed at a considerable cost in clearing the roads and ground. Four hundred men of the 21st Lancers were also employed for two days in clearing the road behind the Viceregal Lodge so that the military could get in passing to or from the Park. To an advertisement

for the sale and removal of the fallen timber only one dealer replied, and the terms offered were so small and the time limit for the removal so excessively deferred that the offer he made had to be declined.

All over the counties, from Waterford to Dublin and northwards to Drogheda, trees are prostrate by the thousand. At Carton and Straffan great devastation has taken place amongst both ornamental as well as forest trees, 5,000 trees having been counted on the estate at Straffan alone. This is nothing, however, to what took place at Knockdrum Castle, Westmeath, where 60,000 trees were blown down, and over 40,000 are said to be prostrate in the plantations and woods of Emo Park, near Portarlington, Queen's County.

The immediate problem before us consists of two main heads, viz. firstly, how best and most cheaply to preserve the best of the fallen timber; and secondly, how best to replace the loss by replanting new or young trees. As the latter operation cannot now be entertained on any large scale until the autumn of this year, attention must be turned at once to storing the best of the timber now down in view of a future demand. No doubt a large proportion will lie as it fell until next winter, seeing that at present both farm and garden work is in full progress, and men and horses fully employed in other necessary work that cannot be kept waiting. As we have seen, the clearing of roads and ornamental grounds has already been a heavy tax in time and cost of labour.

Wherever possible, the best way of dealing with fallen timber in woods will be to dress or trim the trunks, sawing them into the most convenient and useful lengths, say multiples of 7 or 9 feet, and finally stacking them on sleepers or bearers of inferior quality, so as to guard against ground damp or earth moisture. Each pile, made as close to convenient roads or drives as possible, may then be roofed with the smaller logs, birch branches, gorse and bracken and topped with sods or corrugated iron sheeting, to throw off rain. The logs may best be piled crosswise in alternate layers so as to allow of free ventilation, and as so protected will season as well as if in a timber yard.

Coming to the treatment of particular kinds of trees, elm is next to useless, and there is now no demand for it; it cannot be sold, and has in some cases been given away for the sake of getting it removed out of the way. A fair market may be found for ash, beech, oak and sycamore, and these may be trimmed, measured and advertised, or otherwise offered for sale as soon as possible. Very heavy logs may be trimmed

and rolled with levers on to smaller logs as sleepers, so as to allow a current of air to pass all round them. Some timber trees such as beech, horse chestnut and sycamore do not store well, and should be cleared and disposed of as soon as possible.

All other trunks may be stacked or rolled on to sleepers as above recommended.

No matter how the timber is stored for seasoning and future sale or utilisation, the cost of clearing the woods will be very large, no matter how cheap the local labour, or how good and suitable mechanical appliances may be.

The same excess of rainfall which helped to loosen the earth around the roots of the fallen trees, and so rendered them unable to resist the gale, has also rendered most woods and plantations quite impassable for timber hauling at the present time, hence either leaving the trees as they fell until next winter, or roughly stacking and protecting them as we now recommend, are the only practicable alternatives. Eventually portable steam or other sawmills may rip up the timber in the woods where it now lies, and so minimise the hauling difficulty. In many cases the old stumps will be left to rot in the ground, except where passages for hauling timber or machinery must be made. When stumps must be removed Nobel's dynamite cartridges are efficient and cheap in the hands of careful men, or the firmly-anchored engine of a steam plough and its wire cable may be utilised in dragging large trunks to the stacks or for removing old stumps.

In any case this gale has destroyed the profitable sale of home-grown timber in Ireland for some years to come, and as much of it as possible should be stored, seasoned and ripped up for utilisation on the home estate.

From all points of view the simple plan of stacking the best of the fallen timber in the woods or plantations where it now lies seems to be the least costly and laborious, and the best that can in the majority of cases be adopted.

We fear that Irish timber will be a drug in the local markets for a long time to come, and in some cases we have heard of wood buyers having actually demanded premiums for removing fallen timber in addition to the value of the timber removed.

One patent result of the gale has been to show the lack of woodcraft ability in the case of ordinary labourers, who are practically helpless in dealing with disasters of this kind.

Since the above was written a letter from the Recorder, Sir Frederick R. Falkiner, to the *Irish Times* of March 31, suggests that as some millions of trees have fallen, owners

might co-operate in procuring labour, proper machinery or other appliances to deal with the timber. It was suggested him that in such an emergency as this the Army Reserve might or at least some of them, might be utilised in repairing disaster, and he concludes by expressing a hope which cordially re-echo, viz, that "the havoc, and the carnage, and unsightly desolations of the winter of 1903 may evolve in lasting and national blessing."

SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers held at the Royal United Service Institution, Whitehall, on Monday evening April 6, Mr J. Patten Barber, president, in the chair, a paper was read on "Road Maintenance and Administration," by Mr. Robert J. Thomas, M. Inst. C.E.

Prefacing his remarks by emphasising the necessity of keeping to the legal definition of a "main road" in discussing roads, the author stated that there were now 26,978 miles main roads in England and Wales, as compared with 18,070 in 1889, and that sixty county councils were responsible for the whether they maintained them directly, allowed district councils to do so, or had to leave them to the control of urban authorities entitled to keep the maintenance in their own hands. He also stated that forty of these county councils had adopted direct management, the advantages of which were enumerated. Discussing materials and pointing out the enormous growth in the sale of granite during recent years, the exclusion of other softer stones, he expressed the opinion that for country main roads a size not exceeding 1½-inch 2-inch gauge was the most desirable, and that too much reliance should not be placed upon tests made under artificial conditions not met with in the daily wear and tear of roads.

Giving the results of tests made in actual wear, he stated that on a country main road, granite surface, steam rolled, with an ascertained traffic of 100,000 collars per annum, the actual wear averaged 1 inch in five years, that 1½ inch wear took place along the 7 feet in centre, and rather more than ½ inch along each of the 6 feet 6-inch sides.

After discussing steam rolling, scarifying, cleansing and watering, he defended road labourers against unmerited attacks, and expressed his conviction that, as a class, they were far in advance of their predecessors and equal to the labour employed in any other industry.

MERRYWEATHER

On Fires in Tall Buildings and Water Supply to Mansions.

MERRYWEATHER'S PATENT LIFT SPRINKLERS, as at Whitehall Court, Grosvenor Hotel, &c.

MERRYWEATHER'S FEMALE FIRE DRILL PAMPHLET.—How to Form Private Brigades.—How to Escape from Tall Buildings.

MERRYWEATHER'S HOUSE FIRE DRILL PAMPHLET, illustrated.

MERRYWEATHER'S PATENT ELECTRIC or HAND "PRESSURE AUGMENTOR." There are hundreds of tall buildings having fire mains where water pressure is too weak to touch a fire on the upper floors. The "Pressure Augmentor" is the only remedy.

MERRYWEATHER'S "CHUTE" FIRE ESCAPE.—The acknowledged simplest Fire Escape. For £10 you are practically secure.

MERRYWEATHER'S INSPECTION OF FIRE APPLIANCES by Experts who know their business.

MERRYWEATHER'S PATENT METROPOLE FIRE HYDRANTS.—Will not set fast. Occupies very little space. These Valves have been in use at the Hôtel Métropole for nearly 20 years, and have not cost 1d. for repairs. Architects should call and see this Valve.

FIRE—ELECTRIC LIGHTING.

Until now many householders have avoided Electric Light owing to damage from fire. MERRYWEATHER & SONS are the pioneers of Safe Electric Lighting, their knowledge of fire prevention enabling them to combine highest efficiency with safety from fire. Write for Pamphlet. Works:
Greenwich, S.E., London.

The system in force in Buckinghamshire until recently, whereby the County Council contributed towards all other roads, as described, also the improvements effected in the roads.

Referring to metropolitan and town streets, and to the exaggerated statements made relative to the streets of foreign towns being so much better than those in London, the author stated towns in Russia which had been held up as patterns, though they were anything but satisfactory. He laid stress on the unique size of the Metropolis, its variations of climate and temperature, the phenomenal traffic and particularly the power which companies had been given by Parliament to cut up and block streets, and which was exercised to such an extent that the rights and access of the public to their own thoroughfares were already small and fleeting, and the cost of restoration of surfaces enormous, all which might be obviated if subways were constructed and the companies compelled to bury their pipes and cables into them. He expressed the opinion that slow traffic should be better regulated, that vehicles could be kept close to the near side of the street, that omnibuses should stop at fixed points and that the loading or unloading of railway and other goods vans should be prohibited on busy thoroughfares.

Admitting the necessity for tramways in large towns, and for help in solving the housing question, the author strongly advocated that country roads should be widened to 40 feet, and a double line of tramways was laid, in order to provide a least 12 feet of metalled roadway at each side. He suggested that traction-engine traffic would be far less objectionable to travelling public if drivers were licensed and could be dealt with for inconsiderate and obstructive conduct.

Dealing with motor-cars, he said that from his experience that form of locomotion the greatest need was the reduction of dust and mud on granite roads, but that the question of additional expense incurred in doing so was one which had to be considered.

As to hill-lowering schemes, he expressed the view that this meant more difficulties and expense than appeared at first sight, and that, as residents in hilly localities should not be asked to pay more than their share for such work, the scheme should be a national one.

New road construction for motor and other fast traffic he did not consider feasible, but suggested that the cost of widening existing roads in rural districts sufficiently to provide a hard track might be borne by the State, a tax at per cent per car being levied sufficient for its up-keep, and which

tax would necessarily diminish as the number of motors increased. Having referred to numerous alterations and amendments which were desirable in highway law, he pointed out how difficult, if not impossible, it would be to make every county or district pay an equal share of the country's road bill, unless the nationalisation of every highway was effected. Failing that, a contribution of one-half the cost would be a partial remedy, or the creation of one highway authority in each county would equalise matters so far as each county was concerned.

Stating that agriculture, with its 196,700,000*l.* of invested capital, was entitled to every consideration when the motor-car industry, with its 4,000,000*l.*, obtained so much attention, he expressed the opinion that the introduction of cheap, reliable motors for agricultural work would make powerful allies where sympathy was now at a discount.

ELECTRIC-POWER DISTRIBUTION.

THE way in which the country is now being mapped out into districts for electric-power distribution, writes a correspondent of the *Times*, indicates a change in industrial conditions which will probably prove to be second only to that which occurred during the early part of the last century, when the steam-engine superseded water-mills and other still more primitive sources of energy. This change is proceeding apace, although it appears to attract comparatively little public attention. Already fourteen schemes have been put forward, covering almost the whole of the most important manufacturing area of the country, including the Clyde Valley, the North-East Coast district, Lancashire, the chief industrial part of Yorkshire, the busiest part of the Midlands, a large part of the metropolitan area, and the South Wales iron and steel-making centres, besides other districts.

It is for the smaller users of power that this new development has the greatest importance. Some years ago, when a scheme for power distribution by compressed air was being proposed, Sir Frederick Bramwell made an exhaustive inquiry into the cost of power to small consumers owning their own steam-engines in the Birmingham district. It was then found that for steam-engines of from four to twenty-five horse-power the consumption of fuel ranged from 36 lbs. to 8½ lbs. of coal per indicated horse-power per hour. When it is remembered

that with steam-engines of large size one-horse power can be generated for one hour by burning about $1\frac{1}{2}$ to 2 lbs. of coal, it will be seen how large a margin there is here to work upon. The saving in fuel, however, is but one advantage, and that by no means the greatest, offered to a small-power user. To look after an engine and boiler a skilled man is needed, and space is occupied; the chances of breakdown and stoppage of work at critical times are incomparably greater with small engines, generally not too well looked after; the nuisance of having coal brought into works, summonses for smoke nuisance, besides several other matters of a like nature, often make the engine and boiler more trouble than any other feature. The difference between this and simply switching on current will be apparent.

One of the most important of the new electricity supply undertakings is that which has obtained Parliamentary powers for the rich Yorkshire district, to which reference has already been made. The Yorkshire Electric Power Company have commissioned Mr. H. F. Parshall, M.Inst.C.E., to inquire into the question of electric-power supply on their behalf, and his report gives some figures which may be taken as typical, and will be of interest in connection with this subject. The district which the company is authorised to supply has an area of approximately 1,800 square miles, in which are the five county boroughs of Bradford, Halifax, Huddersfield, Leeds and Sheffield, besides urban, rural and local authorities, the total population being over $2\frac{1}{2}$ millions. The company has not entirely a free hand over the whole of the district, but in certain cases must make terms with the corporation authorities. These matters, however, are not of interest in connection with our present subject. It may, however, be stated that in this case, as in others, the scheme is welcomed by the large-power users of the district, many of whom gave evidence in support of the Bill when it came forward; indeed, those who have expressed themselves favourably to the undertaking in this way, or by taking shares in the company, represent the employment of 161,614 hands and 118,031 horse-power. Nothing could be of better augury for the success of the various electrical distribution schemes than the way in which they have been supported by power-users.

It has been roughly estimated that 2,000,000 horse-power is used in this district. This may be an excessive estimate, but 1,000,000 horse-power is said to have been accounted for. It is intended to erect at first a station between Huddersfield and Dewsbury which will contain a plant capable of generating

10,000 kilowatts, half the installation of machinery being provided for at first. One kilowatt is equal to $1\cdot341$ horse-power. The present arrangement is to establish four generating stations in various parts of the district. The cost of the station, sub-stations, transmission plant, &c., for a 10,000-kilowatt plant would be about 448,000*l*. Of this sum about 330,000*l*. would go for the steam-engines and boilers and other generating or transmission plant. The cost of operating such a plant, including rents, rates, taxes, depreciation and management is estimated at 44,855*l*. per annum. Taking these figures as a basis and adding other charges incidental to the formation and working of the undertaking, Mr. Parshall finds that electricity can be generated by a 10,000-kilowatt plant at a cost of 0·652*d*. per Board of Trade unit for a 25 per cent. load factor; or if for a 5,000-kilowatt plant, at 0·729*d*. These figures do not include interest on capital and sinking fund.

The effect of load factor—that is, the proportion of the quantity of current demanded to the maximum demand—is remarkable, and some interesting diagrams are given by Mr. Parshall in his report. For instance, with a load factor of only 4·57 per cent., which would represent the maximum demand for 100 hours per quarter, the cost of current would be 2·9*d*. per unit; whilst if the load factor were 73 per cent. or 1,600 hours per quarter, the cost would go down to 0·35*d*. per unit, or somewhat over a farthing (0·26075*d*.) per horse-power per hour. A Board of Trade unit equals 1,000 watt-hours, and a thousand watts are equal to $1\cdot341$ -horse-power. Therefore, one-horse power exerted for an hour would equal 0·746 Board of Trade unit. Perhaps from 500 to 700 hours would be the usual demand made by factories, and that would give a selling price approximately about 1·1*d*. per unit as an average, or eight-tenths of a penny per horse-power per hour. In working out his figures Mr. Parshall brings forward a fact perhaps not fully recognised. The cost of production is reduced by increasing the size of plant and the volume of output. This, of course, is a well-known fact with most industrial processes; but in this case of electrical generation when a production of 100,000 horse-power is reached the increase in profits becomes negligible, and the undertaking may be considered in full swing when the capacity reaches 60,000 kilowatts. A plant of that size would need a capital of about two and three-quarter millions sterling, and on the figures as to cost and selling price given would pay interest at $9\frac{1}{4}$ per cent.; whilst the smaller 10,000 kilowatt plant would show a profit of only 5·83 per cent. on a capital of something over half a million sterling.

HIGHEST AWARDS:
EXHIBITIONS 1891-93-94-95-97.

Twice Awarded the Royal Photographic Society's Medal for Architectural photography.

Telephone, 3245 Gerrard.

The Architect.

THE WEEK.

THE competition for the proposed town hall in Durban attracted twenty-eight designs, and if it were not for the uncertainty surrounding all things African the number would no doubt be much larger. One-half came from England. The authorities have acted in a rather autocratic manner. As the building is likely to cost a quarter of a million sterling the people of Durban should have been granted an opportunity of seeing suggestions of the different kinds of municipal offices obtainable for that outlay, but a view of the drawings was denied the public. Out of the twenty-eight designs six have been selected as entitling the authors to take part in the second competition. Mr. ROBERTS, of Natal, was assessor. They are by the following architects:—Mr. STREET WILSON (Durban), Messrs. WOOLFACOTT & HUDSON (Bulawayo), Mr. H. L. ALDWICKLE (Johannesburg), Messrs. MITCHELL & RAYNE (London), Mr. W. S. PAYNE (London), and Messrs. EWAN HARPERS & BROS. (Birmingham).

ACCORDING to FERGUSSON, the archæology of India has been neglected because the country prior to the thirteenth century could not be said to possess a history. This is the more remarkable since the literature of India is represented by some thousands of works. But it never occurred to an Indian to record the incidents of his own life or the events of the state or province in which he lived. They believed it was a law of destiny to be forgotten. It is, however, impossible to avoid having records in some form. The stratified rocks, including the earliest formations, reveal to us the history of organic life, and in the same way countless objects are to be found below the earth's surface which, rightly interpreted, become a history of humanity. There were cities in India which have vanished, but there is no reason why exploration of their sites might not be as successful as similar operations elsewhere. Great Britain should be considered as under an obligation to reveal all that is feasible, but the neglect of Indian buildings which was so long a characteristic of British rule does not inspire confidence among foreigners that our archæological researches would be pursued with the proper spirit. It was partly on that account an International Indian Exploration Society was founded at a congress in Paris in 1897. The remoteness of the country is an excuse for delay, but last year at the Hamburg Congress it was resolved to make an attempt. The Germans, who have already exhibited much earnestness in archæology, have formed special committees in their principal cities in order to obtain aid towards meeting the cost of sending out explorers. The annual subscription for members is fixed at 20 marks. It is believed the Indian Government will offer facilities for the work, for it is not to be supposed the representatives of the Society could have other motives than the removal of the darkness which envelops the history of India during a long era, and through which the styles of architecture became only "a chaos, without purpose or meaning."

IN the efforts to civilise the Soudan the erection of buildings is one of the most important factors. According to Sir REGINALD WINGATE, the Governor-General, the progress in the rebuilding of Khartoum and other towns in the Soudan, notably Wad Medani on the Blue Nile, is most marked, and when the heavy cost of transport of building material is taken into consideration, there is evidence of no little enterprise on the part of merchants and others, who apparently anticipate considerable commercial development in the not distant future. The construction of the British barracks and the Gordon College is nearing completion. The majority of the working population are engaged in building, quarrying and brick-making. Quarrying at Khartoum has superseded brick-making, and the latest houses are of stone with a course of bricks every 4 to 6 feet to bind the walls. One advantage of the use of stone is that less fuel will be required. Attempts have been made to clear the ruins at Soba, the remnants of a once great Christian kingdom, of sand and earth. It is hoped that the discovery of these ancient

relics in the heart of the Soudan will induce lovers of antiquities to pay them and Khartoum a visit. The antiquities of the Soudan are both numerous and valuable, and when funds have been obtained for exploring and clearing them further interesting discoveries will no doubt be made. In Dongola the houses are now better built. In Bahr-el-Ghazal, a region which was subject to continual raids, the Dinkas are settling down without fear, and are erecting houses near the British posts. All this is satisfactory evidence of confidence in the new rule.

THE usual annual excursions in connection with the German Archæological Institute of Athens have commenced. The route selected for the first trip allows of visits to Corinth, Tiryns, Argos, Mycenæ, Epidauros, Nauplia, Calamata and Olympia. Afterwards Leukas, Ithaca and Delphi will be seen. Another tour will comprise the Ægean Sea, Ægina, Calauria, Eretria, Delos, &c. Before the return there will be visits to Knossos, Gurnia and Phaestos. There will also be an excursion to the site of Troy, where Dr. DÖRPFELD will explain the ruins and deliver an address. Many of those who take part in these excursions are Germans who leave home in order to see places in which their countrymen have been successful in reviving the interest in Greek history and art. Greece is now looked upon as a region which owes a debt to Germany, for it is supposed that without SCHLIEMANN, DÖRPFELD and CURTIUS the country would have been no better known than it was in the days of STUART and DODWELL.

THE case relating to arbitrators' fees, which a Master of the Court considered to be excessive, was, we suppose, affected by the withholding of particulars of the charges. Another case heard before Mr. Justice GRANTHAM on Tuesday suggests that in claims for fees it is wise to state the length of time occupied by the work. Messrs. ARDRON & DAWSON, of Westminster, sought to recover damages from Mr. EDWARDS, a financier, for breach of contract. Alternatively they claimed remuneration for the preparation of plans. The defendant was connected with land near the Broadway, Westminster, having an area of about 35,000 square feet, on which he proposed to erect a six-storey block to be arranged as offices, flats and shops. Mr. ARDRON was invited to prepare plans and report to show how the site could be most profitably utilised. Plans for buildings which were estimated to cost £24,000 were sent in. The charge made was 2½ per cent. The defendant denied liability. With a case of the kind there is always a possibility of the judge declaring there was speculation on the part of plaintiffs as well as defendant. Mr. ARDRON was able to show that the preparation of the plans occupied no less than 1,300 working hours, and the alternative claim for reasonable remuneration was, therefore, well founded. This was recognised by counsel, and a consultation took place with Mr. Justice GRANTHAM, when it was decided to accept the offer of 500£ by defendant for the work done and the costs of the action.

ONE of the by-laws in force in Bexhill has given rise to much discussion within as well as without the town hall. The town has of late years expanded, and it is sometimes found necessary to enlarge premises used for business as well as to convert private houses into shops and offices. The by-law in question deals with alterations in a manner which, to say the least, is not always uniform. Old buildings can be extended as far as the sites will admit, or, in other words, a yard at the rear can be built over. But premises erected more recently have to remain in their original state. In that way one class of property is favoured, and it is often difficult to decide whether premises are to be taken as old or new. There is much agitation in the town for such alteration of the by-law as would allow the rearward extension of buildings provided sufficient space were allowed for sanitation. But a majority of the Council are opposed to any change. The case is only another example of the inconvenience which arises from the want of a definite plan which would provide for the growth of a town, and which should be followed. Most seaside towns appear to have come into existence by chance, and the building regulations correspond with temporary needs.

TYPES OF COSTUME: ENGLISH, FOURTEENTH AND FIFTEENTH CENTURY.

ENGRAVING IN ENGLAND.

THE kindly letter from Sir WALTER GILBEY which we published last week revives an old grievance. The engraver's art, and more especially the line engraver's, has of late years fallen out of favour with the public, and the change of position is suggested by the absence of its representatives from the list of Royal Academicians and Associates. Nor is there any instruction in engraving given in the Academy schools. There is, of course, some excuse for an indifference on the part of the Academicians which may be more apparent than real. It is no disrespect to the Academy to compare the members to a theatrical troupe. Every playgoer is aware that certain classes of entertainment which were at one time admired are no longer pleasing. The financial success of a theatre absolutely depends on the extent to which the public is gratified. The Royal Academy, in the same way, is as expensive an establishment as any ordinary theatre, and it has to rely entirely on an annual performance or exhibition for the funds required to meet the expenses. It must be obvious to all observers that neither the architectural drawings nor the engravings give any pleasure to the crowd. The architectural room is useful only as a refuge or a semi-solitude which serves for confidential conversations. The room containing engravings, etchings, drawings in black and white and miscellaneous designs is so neglected there is no necessity to place a seat within it for visitors. Painting is now the pet of the public, and we need not wonder if painters demand a monopoly of the power in the Academy, which they alone can make prosperous. It is by their works the money is earned, and with some right they can claim the control of the spending of it.

It cannot be affirmed that this treatment of engravers is a modern innovation. Sir WALTER GILBEY quoted a few sentences from WILLIAM ROSCOE, the historian, who said:—"The principal excellence of an original print is equally estimable with that of a painting. We have every condition of design, composition and drawing, and the outline of an engraving or etching is frequently marked with a precision which excels that of the painting." Sir WALTER does not realise that those words are sufficient to excite an animosity among painters towards engraving. If it could be understood that engravings were to be kept locked up in portfolios there would be no rivalry between the two arts. But when both are recognised as having a common object, which is the decoration of walls, it is not to be expected that the representatives of one art would gladly give way to their rivals. When, for instance, we look back on the majority of the painters who aspired to be the first Academicians, there is no doubt their works, if judged by a modern standard, would be considered less pleasing than engravings by STRANGE, WOOLLETT or GREEN. Some of STRANGE's translations of the Italian masterpieces have never been surpassed, and when fresh from the copperplate printer they must have been remarkably brilliant objects. There was consequently a jealousy of STRANGE as a rival. Besides, in the conflicts preceding the foundation of the Academy, he, as became a man who took part in the Scottish rebellion and

fought at Culloden, was on the losing side of the artists. He tells us himself how the dominant party in preparing the scheme for the Academy, "the more effectually to prevent every chance I might have of partaking the honours they were sharing, proposed that nothing less than a total exclusion of engravers should take place." Then, when it was found that such extraordinary narrow-mindedness was absurd in an academy of the arts, which was supposed to be a royal creation, STRANGE was passed over, but BARTOLOZZI, an Italian, was selected. This gave dissatisfaction, and the academical wire-pullers, trusting in the public ignorance, declared they had imitated the precedent of the French Academy of Arts, from which engravers were excluded. STRANGE happened to be a member of that body. Then it was said there was a mistake, and it was the practice of St. Luke's Academy in Rome which had been followed. But the Roman Academicians had, in a full assembly, likewise elected STRANGE to be one of their members. After this double discomfiture, in order to demonstrate there was no difference to engraving as an art, THOMAS MAJOR, the King's seal-engraver, was elected an Associate. CANOT and REVENET, two foreigners, were then brought in as figure-heads, or, shall we say, as substitutes, for able artists like WOOLLETT and SHARPE.

It may be imagined by people unacquainted with the history of English art that no other course was open to the Academicians. Was not the art then and for a long time before in the hands of foreigners? While an admission of the kind may be allowed to some extent, there is no doubt that for a very extensive period there were English engravers as well as English architects. VERTUE collected lists of English engravers which went back to the middle of the sixteenth century. According to him, CUNNINGHAM, a physician, engraved a view of Norwich in 1559. AGGAS, the surveyor, produced views of London in 1578. Several English engravers appear to have been engaged by Archbishop PARKER for the illustration of his Bible. ADAMS made engravings of numerous actions off the British coast between English ships and the Spanish Armada. NORDEN produced a view of the Lord Mayor's Show in 1603. MARSHALL about 1634 was employed to engrave heads of poets. GAYWOOD imitated HOLLAR. FRANCIS PLACE was offered 500*l.* a year to produce prints of the Navy, but declined it because, as he said, he could not endure confinement or dependence. SAVAGE's preference was for portraits of politicians who died on the scaffold. WILLIAM LODGE engraved portraits of the most eminent Italian painters. The two FAITHORNES were also distinguished for portraits. WREN is supposed by some to have invented the mezzotint process. JOHN EVELYN not only wrote about engraving, but produced plates. Of ROBERT WHITE it is recorded that no man exceeded him in the multiplicity of English heads. HAMLET WINSTANLEY, the son of the designer of the first Eddystone Lighthouse, was the author of many etchings, one being a view of the cupola of St. Paul's, showing THORNHILL's paintings. STURT's Book of Common Prayer contains nearly two hundred engravings by his own hand. EDWARD KIRKALL

invented a method for printing in colours. JOHN PINE, who was a friend of HOGARTH, engraved plates of the tapestries in the House of Lords. Many other names could be mentioned.

It has been said, however, that in 1733 there were only two printshops in London, and their business was limited in extent. The daring experiment of HOGARTH with his *Hurlo's Progress* caused a revolution. He obtained twelve hundred subscribers, but as no copyright law then existed an immense number of copies were made and circulated throughout the country as well as abroad. HOGARTH lost no time in agitating for an Act which would secure his rights, and was successful. By means of it artists gained confidence, and the trade in prints was extended. Illustrated books were also brought out. The prices paid were often modest. HAYMAN, who was afterwards an Academician, was glad to accept two guineas for a design to be engraved, WALE, who also was to be an Academician, thought he was well paid in receiving nine guineas for eight designs. Among the early works depending for success on the plates was STUART's folio on Athens, which appeared in 1762. A series of prints illustrative of English history should also be mentioned. The designs were prepared by FRANCIS HAYMAN and BLAKEY. The influence of HOGARTH's enterprise is traceable in many directions.

It might be assumed that engraving possessed sufficient interest to induce the Academicians to foster it as far as lay in their power. But the peculiar grudging of the foundation members inspired their successors. In 1809, and again in 1812, it was resolved that engravers should not pass out of the class of Associates. The grounds assigned for the decision were the original law of the Academy, which was sanctioned by the king; the inferiority of engraving as an art consisting, as it was said, in copying, or, at the most, translation, and having no claim to invention like the other arts. Finally, there was a prior claim for artists who were the support of the institution by their talents. It was, of course, hard, if not cruel, to exclude engravers from the positions obtainable by other artists, but it was still more tyrannic to prohibit them from exhibiting. One of the Academy regulations was as follows:—"Each Associate engraver shall have the liberty of exhibiting two prints, either compositions of his own or engravings from other masters, which have not been published, and these shall be the only prints admitted in the Royal Exhibition." We may give the Academy credit for sometimes departing from the rule, but care was exercised that there should be no excessive competition with paintings to adorn the walls. It might be supposed that the only use of engraving was to illustrate books.

If we allow engraving to be no more than a species of translation, the painters should be the last to complain of its character. The majority of engravings were taken from pictures. Sculpture and architecture were rarely employed. Many painters have not merely been popularised by means of engravings, but they have derived large sums through granting permission for plates to be derived from their works. Sir THOMAS LAWRENCE was paid 3,000*l.* a year by one firm. WILKIE received as much out of the print from his *Chelsea Pensioners* as the Duke of WELLINGTON paid for the picture, viz. 1,200*l.* In later times still greater sums have been obtained. It would be interesting to discover how much was received by Sir J. E. MILLAIS for the privilege of allowing engravings to be published, but it must have equalled a small fortune. The Academician engravers who translated his pictures were not less anxious to do him justice because they belonged to the same institution as himself.

As to the mechanical execution of engraving the charge mainly applies to those in line. Works of that class have to be produced by countless repetitions of a few lines. Some may be straight, but in figures and drapery they must be compound curves, and in all great works they have to be of a beautiful form. If it is remembered that a figure would be marred by the introduction of one line that was irregular, the anxiety attending the process will be more apparent. A true artist will employ a different variety of lines for each of his figures, and in that way, without the aid of colour or an excess of contrast, a variety is produced which is sometimes marvellous. Engravers have not hesitated to undertake the translation of paintings

of every kind. As ROGERS says, "the faithful graver dares to trace A MICHAEL's grandeur and a RAPHAEL's grace," and although restricted to black and white, they have suggested some of the characteristics, at least, of the originals. The objection about mechanical execution might be made with no less force to architecture, because buildings are constructed of elements which are identical in form—courses of squared stones or rectangular bricks. There is, in fact, a correspondence between the two classes of work, and nowhere are examples of Italian, French, or English engravers more apposite than on the walls of an architect's sanctum.

Our day is not favourable to the production of effects by so slow a process as was devised by the Italian and French engravers. If we place an etching by M. WALTNER beside an engraving by RICHOMME, HENRIQUEL-DUFONT or BERVIC, the great admirer of English work, we seem to have the spirit of a leisurely age opposed to one in which there is a continual rush and excitement. There is more vigour in our time, but that repose which is essential in a line engraving is absent. We do not know of one case in which a man succeeded equally in painting and engraving. But from the age of REMBRANDT to the present day the painter's art appears to qualify men to be successful in etching. It may be on that account there is so little desire to admit artists who are only etchers within the Academy. Whatever may be the cause, it is not an advantage to suggest that engraving in any form is a lost art. Engravers have rendered faithful service to other artists, and have done much to spread the knowledge of pictures, statues and buildings. A creative and enterprising artist like HOGARTH preferred to be independent of his contemporaries or of the Old Masters. But although there have been men such as CALLOT, REMBRANDT or DÜRER, who resembled him to some extent, they were wanting in his business spirit and daring. The history of the art shows that the engraver was always satisfied to respectfully follow the painter, and so much service deserves a different sort of recognition from that which is to be obtained from the Royal Academy.

THE PRINCIPLES OF ARCHITECTURAL DESIGN.

By PERCY L. MARKS.

CHAPTER IX. (continued).

OF at least equal importance with the outline of a window is the filling-in treatment. Where plenty of light is obtainable for a building, and where some specific window is not destined to be the medium of outlook, full play can be given to design, whether in the nature of tracery, diamond panes or coloured glass; but these should all be subordinated where light and outlook are of importance. In churches, outlook not being an object, it is only the questions of light and expense that will modify the treatment. The mediæval and early Renaissance windows, though picturesque in many instances, are not well adapted to modern ideas of comfort. The Queen Anne style is also open to a similar objection; but all these styles possess one economic point in common which may recommend them, namely, that there is less expense in renewing any one pane of glass than is the case with a modern window; this recommendation is, however, worth very little if plate-glass or a good quality of sheet-glass be used in the first place for our twentieth-century windows.

What fenestration is in regard to the lighting area, *portalage* is for entry purposes, and the æsthetic effects obtainable are evidenced by numerous buildings. The treatment may take one of several methods—a mere door opening, a door case, recessed porch, projecting porch, a *porte-cochère*, a hooded porch, a tower, &c., or two or more of these may be combined. Most of the forms illustrated elsewhere for windows are equally adapted for door cases and door openings, and some of these are very elaborately treated, more especially in mediæval Gothic buildings. The "recessed-order" varieties of western porch in Norman and French Gothic ecclesiastical structures are magnificent examples, and advantage was taken of their employment to run riot in sculptured figures and grotesques. These porches were often great media for the

Portals & Porches (with names of Architects, where known)

display of symbolic sculpture. Some remarks will be found later on respecting the use of symbolism in architectural design.

There is everything in favour of some form of protection being introduced in connection with an entrance, as the propriety of some degree of shelter from the rough or trying elements whilst waiting admission cannot be exaggerated. Whether this form should be of the nature of a hood, a recessed or projecting porch or a *porte-cochère* depends on circumstances. Where a maximum of light is desired or necessary, a recessed porch would be the least, and a mere "hood" the most suitable. Where the first object is to obtain protection from rain or snow before entry is obtained, a recessed porch is quite satisfactory, but in cases where there is a desire to correct the bad effects of unfavourable "aspect," a projecting porch is best, as by this means the side of entry to same can be suitably arranged. A *porte-cochère* is admirable where the size or importance of the building justifies it. By this means carriages are brought to a stand under shelter before the entrance, thus obviating the nuisance of opening and carrying umbrellas in order to protect evening-dress finery from the inclemency of the weather. The above few notes treat the selection from the point of view of appropriateness, which should be the first consideration, and this being determined, it will then be necessary to adapt the design to the general treatment of the façade; the external appearance of many old cottages is to an extent redeemed from insipidity by the quaintness or picturesqueness of a door hood, these qualities being altogether independent of the age of the building.

If the aspect and climate be sufficiently genial a pleasurea provided in conjunction with the porch is a "feature" worthy of commendation, but one that is, of course, applicable only when there is a certain degree of privacy obtainable in relation to the general public. This can be well understood when the reserve natural to the English character is remembered.

If a porch is introduced into a design it should not look like an excrescence, but form an integral component of the building; otherwise it is, from the æsthetic standpoint, best omitted. The iron porches so frequently to be noted cannot but look like exotics in most cases, and even if forming part of the original scheme will yet seem to be an afterthought. An architect should think his scheme of design throughout on some definite and homogeneous basis, and avoid everything of the nature of scrappiness.

A porch may often be carried up to form a storeyed tower with happy effect and with practical benefit; that it is a mistake to use the storey immediately over the entrance as a bath-room or sanitary annexe can be readily conceived, but with the definite use made of it there need not be any further concern here.

Sometimes the portal to a house is very largely developed beyond the cases previously noted, the entrance being approached through a conservatory. This may result in very pleasing effects if well managed, but extra care would be necessitated to prevent the access of damp to the house.

In a recent instance that came under the writer's treatment, this arrangement of entrance was observed, and it certainly deserves appreciation, as it evinced a determination to make the best of what was otherwise very uncouth—the house small, old, rat-haunted and unworthy of the property, but the entrance made passable in appearance by the introduction of the glass-enclosed flower walk. As regards the glazed corridor entrances so often seen leading to the front doors of large houses, they may be (indeed, they are) useful, but are as a rule not at all ornamental or artistic.

Fig. 72 gives some sketches in connection with portalage.

CHAPTER X.

UTILITARIAN FEATURES.

IT is a matter of concern how to adapt certain utilitarian features to the façades of a design, so that there shall not be any undue prominence given to these uninteresting requisites; reference is more particularly intended to the various pipes and chimney-stacks, and in a lesser degree to ventilating gratings. It is not that *primâ facie* there is anything anathema in any of these; on the contrary, their

absence would be deplorable. As, however, the highest art evinces a sense of due proportion in its compositions, from the largest to the smallest details, it is desirable that the spectator of a building should not be greeted with shouts of "See me! I'm carrying off waste-water," or, "Look here! I'm a foul-air extractor," &c., before there has been sufficient time allowed to grasp the general idea of the design.

This is fully recognised by a large proportion of the fraternity when submitting designs in competition, showing the buildings *in posse*, disregarding (though not unmindful) of the same as they would be *in esse*, and to an extent that can scarcely be justified; but as the writer does not desire to compound for sins, by acting on the principle noted in "Hudibras," this point will not be elaborated. From a sanitary standpoint, there is nothing to be urged in favour of placing pipes for waste-water or for "soil" inside instead of outside a building. The earlier that all pipes liable to the passage of contaminated air or water are taken outside a building, the better sanitary result obtains. The objection to the conspicuousness of external pipes is frequently met by chasing them in flush with the outer face of the wall, but this method cannot be recommended for water-courses, as in the event of any length of duct becoming cracked or broken, some of the water may percolate into the wall, and this is to be deprecated, even if the water be unadulterated. As regards the merely ventilating portion of a pipe, there cannot be any serious sanitary objection to urge against chasing-in, and indeed it might be cased in if the design would be improved. This might be remembered with advantage in dealing with those portions of ventilation shafts that are carried above the level of the top of any wall, as an ornamental casing in keeping with the general scheme of design would be very desirable. But in introducing such casing, there should not be any attempt made to treat it *en masquerade*, as this would be a false conception of architectural ethics.

Pipes may be so dealt with as to support the artistic effect of a façade to a slight extent, if suitable cast-lead heads and effective lead tacks are used; many old, and some modern, buildings bear witness to this. Where sanitary by-laws intervene the following note is unnecessary, but it is well to point out that it is inadmissible to reduce the height of ventilating pipes below the sanitary minimum of level for the sake of avoiding unpleasant breaks on the sky-line. Nor is this minimum an arbitrary quantity: it bears a direct relation to surrounding obstructions, the principle being to render down-draughts along the pipes impossible.

It may be borne in mind that in scheming a building where some apartment may be disposed indifferently in one of two possible positions, and where unsightly pipes are a necessary accompaniment, it may be possible by careful adjustment to choose the less prominent position for the purpose.

Observation will attest the advisability of considering as far as possible the influence of utilitarian features upon the appearance of a façade. If the average urban terrace-house of 45% to 70% rental be in question, the planning may easily result in a satisfactory disposition of the pipes. The example shown in fig. 73, of an existing terrace-house in a London thoroughfare, will serve to show the unobtrusiveness that may be obtained; it will be observed that only two rainwater-pipes and a short length of air-shaft are in evidence, nor are these conspicuous; all other conduits are in the rear of the building, and in spite of RUSKIN and his school, it will be generally conceded that the street elevation of a terrace-house is of greater artistic importance than any other.

Another feature which is apt to have an unpleasing effect is the ventilating grating, and the best method of treatment is of a twofold nature:—(1) To have the grating of the same material and colour as the wall surface in its immediate neighbourhood, and, (2) if the grating is not rendered artistic in itself, it is well to introduce near by some *objet d'œil* to draw the glance from dwelling on the utilitarian feature, which, in fact, should be rendered both positively and negatively unobtrusive.

Chimney-stacks are apt to assert their presence with undue emphasis, and the sky-line may be quite spoilt as a result. One point should be always borne in mind, and that is that, other matters being equal, a concentration of flues is very desirable, both from a practical and from an æsthetic

standpoint. Practically, such concentration tends to improve the up-draught in flues, due to the more efficient heating of the stacks; and, æsthetically, the diminution in the number of chimney-stacks is advantageous.

In a small-sized house it may be possible to gather all the flues into a central stack, and this produces a very happy result at times. The writer calls to mind a house so dealt with in a town near the metropolis, the effect being very picturesque. Putting aside for the moment the question of strict economy, endeavour should be made to impart as much artistic appearance to chimney-stacks as possible; as a rule, they are very badly treated, or where attempts are made to cover their nakedness, the result is seldom satisfactory.

Elevation shewing
Economy with Effect.

FIG. 73.

Hampton Court Palace possesses some charming examples of ornamental brick stacks, and they are the more pleasing in that they are not all of one pattern.

Sir WILLIAM CHAMBERS was responsible on one occasion for a chimney-stack design that would be considered by some purists as a grave dereliction from the ethics of the profession. In getting out the drawings for Lord CHARLEMONT's casino at Marino, near Dublin, CHAMBERS introduced vases over the attic, one forming a chimney-stack in disguise; and, moreover, he gave the following written instructions:—"These vases will do best in lead or some sort of metal painted and sanded to look like the stone." Whilst being averse from urging over-conscientiousness or undue realism, this treatment is certainly somewhat cross-grained. Sir JOHN VANBRUGH used similar disguises. The use of chimney-pots and cowls serves but to accentuate, as a rule, the ugliness inherent in the average chimney-stack.

When auto-smoke-consumption is brought to perfection and when it is generally introduced, the prominence given to chimneys may be modified, if not altogether avoided. *Sit nobis gloria!* Meanwhile, the market is stocked with patent stoves, constant only in the rapid change from one to another.

Engineers, when patenting their improved ventilators have paid some attention to ventilating turrets; and though many of the latter are inartistic beyond possibility of redemption, at times some that are passable are placed on the market; however, an architect can always prepare designs for individual cases, provided stringent economy is not the keynote. But these turrets should always be in harmony with the design, and not, as is so frequently to be noted, mere exotics. If properly treated, though ventilating turrets are distinctly a utilitarian feature, they may be employed with happy effect.

The concealed roof ventilators that have been introduced of late years obviate, of course, the use of turrets but this is not altogether advantageous.

Lightning-conductors are too unobtrusive in appearance to need critical mention here.

Fire escape staircases, where introduced, must be tolerated for the sake of their practical value and utility, but it is difficult to make them harmonise with a design, and they should be tucked out of view from the street to the utmost extent that the scheme, from the point of view of safety, will justify.

(To be continued.)

THE BEDE MEMORIAL.

THE work of designing the Bede Memorial has been entrusted to Mr. Charles Hodges, of Hexham, whose knowledge of Anglo-Saxon stones, and whose works—notably the Caedmon Cross, the Acca Cross and the Rothbury Cross—are a guarantee that the monument will be in keeping with the best traditions of Northumbrian feeling and craftsmanship.

The cross is to be erected within hail of Monkwearmouth, on Roker Point, where it will be seen by the vast holiday population of Wear and Tyne. It was felt that, whatever were the natural claims of Jarrow and Durham, the church at one place and the tomb at the other were lasting monuments of the great Northumbrian who is worthy of honour, and that it was unwise either at Jarrow or Monkwearmouth to entrust such fine sculpture as is intended to the grime or the fume of the open air. To place the cross under cover within a building at either place was impossible. The committee therefore determined to erect it, by leave of the Town Council of Sunderland, in clear and clean air on a headland which must have been familiar to Bede, and which is actually "in territorio monasterii," given by Egfrid the king to Benedict Biscop for the founding of the sister monasteries of Monkwearmouth and Jarrow.

The cross, 25 feet high, will be Anglian in form, as being germane to the district and contemporary with Bede's time. The shaft of the cross on the west side will be ornamented with scroll patterns from the Lindisfarne Gospel and from the stones at Jarrow, and will contain, within a twisted loop of the duck-billed serpent seen on the Monkwearmouth doorway, pictorial subjects from the life of Bede. On the east side will be Roman lettering, giving two extracts from Bede's work—one from the "Ecclesiastical History," one from his "Life of St. Cuthbert"—both extracts speaking of the accuracy and care with which he worked. On the south side, within a vine scroll, will be carved in alto and bas-relief the heads and busts of the friends and associates of Bede. On the north side a scroll introducing birds and animals springing from a harp, emblematic of his poetic gifts, will show Bede's love of nature.

Beneath these four sculptured sides will run in a band the little verse written by Bede on his death-bed, beginning, "Fore there nedfarae," in Latin, in rune, in minuscule and in English. And on the block out of which the cross rises will be carved a short inscription—"To the glory of God and in memory of His servant Bede."

GLASGOW ARCHITECTURAL ASSOCIATION.

ON Saturday afternoon the Glasgow Architectural Association visited Edinburgh, and, in company of representatives of the sister organisation in the city, had a passing look at many of the more interesting public and private buildings both in the Old and New Town, while an hour was profitably spent at both George Heriot's Hospital and Craigmillar Castle. Arriving at Princes Street station shortly after two o'clock, the visitors were received by the office-bearers and other leading members of the local body, Mr. A. Hunter Crawford, the president, conducting the visitation, and giving notes regarding

the principal buildings on the long route traversed, the party, numbering some sixty in all, being accommodated in a couple of four-in-hands. After driving round Charlotte Square the company proceeded by Maitland Street, Palmerston Place, to George Heriot's Hospital, where Mr. Hippolyte J. Blanc, R.S.A., gave a description of that institution. The drive was continued by Lauriston Street to Craigmillar Castle. Here again Mr. Blanc acted as leader. At each place he was cordially thanked for his service. The return journey was by Duddingston, Queen's Drive, Abbey Mount, Regent Road, Waterloo Place and Princes Street to Ferguson & Forrester's, where dinner was served at seven o'clock, at the close of what had proved an altogether enjoyable outing. Mr. Crawford presided, and the croupier was Mr. W. J. Blane, Glasgow. Several toasts were honoured. That of "The Glasgow Architectural Association" was proposed by Mr. William M. Page, secretary of the Edinburgh Association, who spoke of the value and usefulness of these joint visits, which not only offered opportunities for gaining professional knowledge, but for fostering such a kindly feeling as was desirable should exist between West and East. Mr. Charles E. Whitelaw, president of the Glasgow Association, replied, and heartily endorsed Mr. Page's remarks as to the good purposes served by such excursions, than which nothing more tended to the broadening of their ideas and the strengthening of their ties of friendship. He looked forward to the time when all the architectural societies in Scotland would be united in some form in order to the protection of their common interests. Mr. Blane gave "The Edinburgh Architectural Association," and the Chairman responded. The visitors returned home by the 9.50 train.

TESSERÆ.

Nature and Art.

TO study nature is worth little practically unless right conclusions are drawn from it. In the natural sciences, and in the arts and manufactures founded on them, this is comparatively easy, as any ideas we may have can be tested to any extent by experiment. In architecture, for instance, if we erect an edifice and neglect the laws of gravitation, ventilation or acoustics the error is made manifest, and nature informs us what is right with as much certainty as if the truths of physics were proclaimed with trumpet tongue. But the case is different in questions of taste or art. Here, as in graver things, to all inquiries of what ought to be observed we are met by the awful silence of nature. In painting, which, as it might be supposed to consist in a representation of nature, ought to present little difficulty, there are, as many different theories how far nature is to be followed as there are schools. In industrial design the question becomes still more involved, as here we have not merely to represent but to select. We may support heavy entablatures on delicate leaves, form jugs in the likenesses of illustrious individuals, represent lions and tigers on our carpets, and there is no manifestation of nature to indicate that we have offended against any of its laws, and, in spite of inherent ideas of taste, many worthy people would be found who would give substantial proof that they considered such things useful, beautiful and agreeable. The question, we know, is attempted to be solved by establishing the principle that in representations for such purposes natural forms must be "conventionalised," but to what extent still must be determined by the artist. He may adopt one or more of the theories on the subject, and by its aid adapt natural forms to his purpose, but to do this successfully supposes previous knowledge.

Originality in Art.

The important question often arises in what originality consists, whether belonging to invention or imagination; and, above all, in what cases the use of elements or ideas belonging to another deprives the artist of the merit of originality, or where he may claim to be still original. If he may avail himself of the inventions of others, or merely convert to his own use what he already finds prepared for him by nature, there appears but little occasion for resorting to originality. On the other hand, if availing himself of the ideas used by others, or of those which nature yields, deprives anyone's ideas of originality, hardly any can lay claim to it, as these materials constitute, as it were, the raw commodity out of which the imaginative intellectual wares of all are formed. The true test and criterion to determine whether originality exists or not, whether ideas be dishonestly stolen or lawfully appropriated, appears, therefore, in reality to depend not on the borrowing, but on the application of them. If the ideas in question are simply taken and transposed by the artist from the work of another, or from nature herself, without acknowledgment of the proprietorship, or without making any alteration or modification, the mere purloining of the ideas of another is all that is effected, and the person so using them is a pilferer and a copyist. But if, before applying them to his own use, he entirely remodels their form, or alters their position, or recon-

structs their disposition, he is entitled to be considered an original composer, however much he may be indebted to the source from which he derived them. He is, in reality, in such a case under obligations not for his workmanship, but for his materials only. His was the machine which effected the work, while the quarry merely supplied the stone. Some men, although they imitate others by obtaining ideas from them, recreate them anew and convert them to their own property by the original combinations which they effect. By the fire of their own genius the old materials are melted down, and reappear in a new composition. We may fairly and honestly obtain the bricks from others, if the building we raise is of our design. It is no derogation to the genius of Wren that he did not create the stones out of which St. Paul's is built, as well as erect that stupendous edifice.

Painting in Tempera.

The word "tempera" is used in more than one signification; sometimes it signifies no more than the liquid vehicle by means of which the colour was applied; occasionally it means a glutinous, in opposition to an unctuous medium, and in its most restricted sense it is properly applicable to a vehicle in which yolk of egg is the principal ingredient, sometimes mixed with the white and sometimes, as in the practice of the Italian painters, beat up with the milky juice of the young fig-tree. Eastlake thus speaks of tempera, properly so called:—"On walls and in coarse work warm size was occasionally used, but the egg vehicle, undiluted, was preferred for altar pictures on wood. Thus used, and drying quickly, it was difficult to effect a union of tints in the more delicately modelled parts of a work—for instance, in the flesh—without covering the surface with lines (*tratteggiare*, Anglicé, hatching) in the manner of a drawing. Vasari, indeed, assumes that tempera pictures could not be executed otherwise. Examples of works painted with the egg vehicle being rounded and duly finished without this laborious process are certainly not common in Italy. The pictures of Gentile de Fabriano and Sandro Botticelli are among the rare exceptions. An early specimen of Perugino in the National Gallery exhibits the dryer method." He goes on to say that the old Rhenish pictures, such as the glorious altar-piece in the cathedral of Cologne, have scarcely any appearance of this hatching. Various methods were in use for making the tempera dry more slowly. When the picture was on cloth the back was kept wet with a sponge, and in Germany and England honey was used; a material which has recently been again introduced into the manufacture of water-colours.

The Garden of Epicurus.

None of the rural retreats of the Greeks became so celebrated in the history of philosophy as the garden of Epicurus. This school of his sect was consecrated like a temple, and the administration of it confided to those who successively taught the opinions of their master, and perpetuated the spirit of his famous system like a sacred and eternal flame. They could not, however, alienate this extensive domain which, planted with olive trees and cultivated with economy, sufficed to maintain all the professors of their doctrine. An inscription, says Seneca, on the front of their sanctuary, announced that the sovereign good was only to be found on the bosom of pleasure, and invited those who were weary of wavering between opinions to repair thither and cultivate the repose of the mind. But he confesses that those who were attracted by such magnificent promises and flattering hopes must have been not a little astonished to find simple and honest mortals practising the most sober regimen, and united by the ties of indissoluble friendship, which they considered as the purest virtue and most sublime enjoyment. Mutual failings met with an indulgence there unknown to the rest of mankind; and they supported without murmuring the caprices of their chiefs, who in reality were neither wanting in wisdom nor moderation. Apollodorus alone, from his imperious character, received the epithet of *Cepotyranos*, or the tyrant of the garden; but his pretended despotism never occasioned the effusion of blood, nor even the sacrifice of a tear. These Epicureans were not ignorant that in their paths through life they must meet with thorns as well as flowers, for they spring up, says Lucretius, around the very altars which are consecrated to the graces. It appears by the letters of Cicero that in his time a Roman named Memmius, who was of great consideration in the republic, conceived the unaccountable design of usurping the domains bequeathed by Epicurus to his successors in the vicinity of Athens. Their friends, however, were powerful and zealous enough to protect them against all the efforts of Memmius; and they preserved their possessions until Greece fell under the yoke of the Christians, who desolated that country from one extremity to the other. Whole troops of priests and monks, armed with axes and torches, were seen by Libanius over-running the districts, burning the temples and demolishing the statues, so that nothing remained on their passage but scattered fragments and piles of smoking ruins.

NOTES AND COMMENTS.

A COMPETITION to which exceptional interest was attached was that for the church of St. Andrew in Patras, Greece. It was not difficult to obtain a design from one of the French or German architects in Greece, but no doubt it was considered better to avoid complications and allow all the world to compete. Thirty-two designs were received. They were examined by a jury in Athens, and it was decided that the authors of eight of the designs were to be allowed an opportunity to work them out more definitely. The architects who gained this measure of success are:—(1) M. BINET, Paris; (2) M. ROBERT, Paris; (3) M. DUCK, Vienna; (4) "Sophia," England; (5) M. PANICONI, Rome; (6) M. TSILLER, Dresden; (7) M. DEMADÈS, Athens; (8) M. KARATHANASOPOULOS, Athens.

MYCENÆ was known to every reader of HOMER as a royal city, and there was therefore no surprise when SCHLIEMANN was able to reveal some evidence of its former greatness. Further explorations have shown that its influence was not confined to Greece, for it was an agent in the civilisation of other parts of Europe. It would be strange if Argos, which was only a few miles distant from Mycenæ, did not also exhibit evidence of greatness. Although the city had suffered before his visit, PAUSANIAS found in Argos no less than thirty temples, a gymnasium, a stadium, many monuments and statues and other signs of prosperity. If England cared to increase the knowledge of ancient Greece, no better site could be found for spade-work. But the tardy aid afforded to Mr. EVANS in Crete indicates how limited are our aspirations. We have in the case of Argos succumbed to the Dutch, the last people who might be expected to become enthusiastic about a remote antiquity. M. GOEKOOP, who aided Professor DÖRPFELD in his researches in Athens and elsewhere, has undertaken excavations in Argos, and has entrusted the direction to his countryman, Dr. VOLGRAFF. Already remains of an age preceding the Mycenaean period have been found. On one of the hills a little sanctuary was found enclosed by a double line of walls, the outer being of much stronger masonry. Five graves cut in the rock were opened, and corresponded with those of Tiryns, Mycenæ, &c. The remains of a Temple of Apollo were revealed on the northern slope of the Aspis hill. It was identified by means of some broken inscriptions. Countless fragments of sculpture are to be found in the earth, for Argos produced many sculptors, including AGELADAS, POLYCLETUS, ANTI-PHANES, &c. The work has been suspended, but will be resumed when the favourable time arrives in the course of the year.

ILLUSTRATIONS.

EVELYN HOUSE, 101 FINSBURY PAVEMENT, E.C.

THESE premises, which occupy a prominent position at the corner of Finsbury Pavement and Ropemaker Street, immediately opposite the Moorgate terminus of the North Metropolitan Tramways Company, consist of shops on the ground floor and suites of offices on the upper floors. They occupy the site of the old offices of the Tramway Company.

The elevation is of stone, and the construction throughout is of fire resisting material. The building is provided with an hydraulic passenger lift, and fitted with all modern requirements for office purposes.

The general contractors were Messrs. E. LAWRENCE & SONS, of Wharf Road, City Road, and the premises were erected from the designs and under the superintendence of Messrs. DAVIS & EMANUEL, architects, 2 Finsbury Circus, E.C.

LONDON AND PROVINCIAL BANK, CAMBERLEY.

THIS was built by Messrs. MARTIN WELLS & Co., of Aldershot, from designs by Mr. ROBERT KEIRLE, F.R.I.B.A., the materials being Lawrence's red facing bricks with Bath stone dressings. The upper portion, it will be noticed, is used as a dwelling-house for the bank manager.

SOLDIERS' HOMES, KILBRIDE MUSKETRY CAMP, AND BALLYKINLAR CAMP, COUNTY DOWN.

THE buildings illustrated comprise two of a series of soldiers' homes now being carried out at the large military summer camps in Ireland. These have been erected by Miss SANDES, who has collected and subscribed for a large number of homes in connection with them. Both have been opened by His Royal Highness the Duke of CONNAUGHT. Owing to necessities of site and camp arrangements, the buildings have been designed in a bungalow type, of timber construction, and provide recreation and refreshment-rooms for the men in the camps. The building of the Musketry Camp at Kilbride, co. Wicklow, comprises coffee-room, 40 feet by 20 feet; reading-room, 40 feet by 20 feet; social-room, 30 feet by 20 feet, with private rooms, kitchen, store, bedrooms for staff and all necessary offices. That for the Musketry Camp at Ballykinlar, co. Down, contains similar accommodation, and also in addition suites of rooms for the ladies who will be carrying on the work of the home. These suites include sitting-rooms, parlours and bedrooms. Full sanitary and lavatory fittings have been put into the buildings.

The contractors were Messrs. McLAUGHLIN & HARVEY, of Belfast and Dublin, and the sanitary and plumbing work was executed by Messrs. J. DOWLING & SONS, Belfast. The architect for both buildings was Mr. W. J. W. ROOME, M.S.A., Kingscourt, Belfast.

BROADWAY THEATRE, DEPTFORD.

CROWN THEATRE, PECKHAM.

CHICKSANDS PRIORY, SHEFFORD, BEDS: TOP OF STAIRCASE.

THE illustration we publish this week is more suggestive of the monastic style of Chicksands than the plate given in our last number. The old priory of the Gilbertians has at the present time obtained a little additional interest. As our readers are no doubt aware, there is a controversy in progress relating to an alleged breach of copyright in respect of a new edition of the love-letters by DOROTHY OSBORNE. Most of those letters were written from Chicksands. At the dissolution of the monastery the buildings were obtained by a layman called SNOW, and from him after an interval passed into the possession of the OSBORNE family. When the Civil War broke out Sir PETER OSBORNE, a Royalist, was governor of Guernsey. His son and daughter met WILLIAM TEMPLE, the son of the Irish Master of the Rolls, who was about to make the grand tour. In an inn at which they stopped in the Isle of Wight, OSBORNE scratched on the windows opinions adverse to the Parliamentary authority, and in consequence the three travellers were arrested. DOROTHY OSBORNE, however, assumed the whole responsibility for the offence, and as she could hardly be punished they were all set at liberty. The incident was not without its effect on young TEMPLE, and although DOROTHY'S family were Cavaliers, while TEMPLE'S were Puritans, they became attached. The courtship lasted seven years, and during that time there was correspondence between the lovers. TEMPLE'S letters are lost, but many of DOROTHY OSBORNE'S have been preserved, and are now in the British Museum. They afford us information about the domestic life of the period, and there are allusions to Chicksands and neighbourhood in the pages. TEMPLE'S life as a diplomatist and statesman is part of English history. When he retired from public affairs he lived at Moor Park and Sheen, and it was there WILLIAM III. used to visit him. He had for his secretary JONATHAN SWIFT, who was supposed to have laid the foundation for his brain disease by surfeiting himself with Sheen pippins. It was there also resided HETTY JOHNSON, the daughter of the housekeeper. TEMPLE could have explained the true cause of the mystery which surrounded the lives of his two dependents. But as he was silent it can only be surmised. When TEMPLE was ill in 1693 SWIFT wrote a poem in which he referred to Lady DOROTHY TEMPLE as "Mild DOROTHEA, peaceful, wise and great, Trembling, beheld the doubtful hand of fate." After her marriage little was heard of Lady TEMPLE. She died in 1694.

TERRA-COTTA, CONSTRUCTIONAL FAIENCE AND KERAMIC MURAL DECORATION.*

PERHAPS the history of modern terra-cotta should begin with the works of Coad, Blanchard and Blashfield. Excellent material was made by all of these makers, and here are one or two fragments of pieces made at Lambeth more than 100 years ago.

The figure of Britannia on the dome of the Liverpool Exchange is also an example of Lambeth manufacture of about that date, and though exposed to very severe ordeal from the acid fumes of the district and the full force of sea air, I believe that figure is in a perfect state of preservation. The dressing above ground-floor to the Sun office at Charing Cross may be mentioned as a little known example of Blashfield's work, and the entrance gateway to Sion House, Isleworth, is another example of work done over 100 years ago.

The one idea of all the makers of that period was to produce a clever and exact imitation of stone—truly an unworthy motive; but as to their success, I think my reference to the Sun office will suffice, as I think it probable most of those present will have accepted that as Portland stone.

The early part of the past century was a time when all kinds of imitations and frauds were not only tolerated but were still fashionable; and surely it is one of the most hopeful and wholesome signs of our times that these deceptions have lost their charm and no longer obtain any hold on the educated public. I think we may say that the true modern use of terra-cotta began with the building of the Natural History Museum at South Kensington, and I think it is a remarkable achievement for an architect to have demonstrated so true a use of the material at his first essay on any such large scale. Perhaps someone will say the colour is raw and somewhat aggressive. It is true also that mistakes were made and manufacturers practically ruined by supposing that because the material could be made cheaper than stone that it could be made ridiculously cheaper than stone; but every good cause has had its martyrs, and I think it should be recognised that such a fine building, so suitable for its purpose and of such an enduring nature, was indeed a triumph for something like a first attempt to use a practically new material. I have heard it remarked that the Natural History Museum looks almost as clean to-day as when first built—surely a valuable quality in our dirty atmosphere.

Much has been learnt since the day that was built, and many different kinds of material have been tried in the manufacture of terra-cotta; delicate shades of colour have been obtained by combining clays from widely separated localities and generally the manufacture may be said to have reached a high state of efficiency. Still I venture to call your special attention to the enlarged photographs I show of this early building of Mr. Waterhouse, because of its suitability of design to the material, and after about twenty-five years one has to say that a large number of the designs produced recently for this material are not nearly so well adapted to its characteristics as this early example.

Typical Buildings.

I propose now to call your attention to a few typical buildings gathered at random, which will serve to show a large variety of style and purpose, pointing out those characteristics which indicate special suitability of design to the material.

I suppose all here will agree that it is a true principle that the method of manufacture should be a motive in the design—that the architect should study his material and that the most characteristic use of the material is its truest use.

Let us now look at the Victoria Law Courts at Birmingham, of which Mr. Aston Webb is the architect. The exterior is in red terra-cotta with pleasing accidental variety of colour, but all red, whilst the interior is of a warm buff colour. The design is exceedingly intricate, and both exterior and interior produce a very rich effect; but note what care has been bestowed on obtaining repetition of forms and features, while at the same time a different disposition of the features avoids monotony. The smallest details of this building repay the most careful study; everywhere it is evident that the material has been studied and that a true use of clay has been constantly kept in view. Note the tracery in the great windows, how far it is removed in design from ordinary stone-like tracery.

The French Protestant Church, Soho Square, London, also by Mr. Aston Webb, is specially interesting in much of the internal work.

Now let us look at two of Mr. Collicutt's designs. Bechstein's, in Wigmore Street, and the Palace Theatre, in Cambridge Circus—note in both these designs how he gets

shadow, not by the projection of impossible cornices but by the arched method of producing deep recesses; note also the beautiful free modelled work. I am sorry to say the principal feature of the ground floor, the spandrels to entrance, are almost entirely hidden by the hideous iron shelter. Now, in contrast to these examples of Mr. Collicutt's and Mr. Aston Webb's use of the material, suppose we look at a more Classic type of building—Tootal's warehouse, in Oxford Street, Manchester, the late J. Gibbons Sankey, M.A., architect. We see at once that its great projecting cornices and its row of great columns and other similar features marks it as nothing like so suitable a design for the material as those examples previously noticed, though of course it can be done.

The Higher Grade Schools at Aston, near Birmingham, Messrs. Crouch & Butler, architects, have many features which are specially well designed for terra-cotta, but some that one cannot regard otherwise than forcing the material out of its proper field, as, for instance, the enormous projecting cornice about 3 feet over the wall face, with a modelled trophy in the pediment, something like a foot further projecting. This, of course, is hung up by copper rods and cramps.

A good example of an entire terra-cotta front for a city property is Mr. Chas. H. Worley's building, New Cavendish Street, and for theatres, Mr. Ernest Runtz's designs, Middlesbrough, Peckham and Hastings, all recently built and showing a successful use of the material either alone or in conjunction with brickwork. The General Hospital, Birmingham, of which Mr. Henman is the architect, possesses many interesting and some unique features; notice the ceiling to corridor in which two colours are used, red ribs and with buff panels. These are about 2 feet square and about 4 inches thick, the usual hollow back being made the means of attachment to the iron girders which are buried in concrete, and the concrete then holds up the ceiling panels without any special preparations whatever.

One of the most striking features of modern Birmingham is its ramification of covered arcades. Here is one of the five entrances of the City Arcades (Messrs. Newton & Cheate, architects). The interior of these arcades is faience of a special kind called malachite, to which we will refer when dealing with faience materials.

A building which has attracted a good deal of attention is the recently completed one for the Ocean Accident Guarantee Corporation, Ltd., in Temple Row, Birmingham. This is in a special kind of grey terra-cotta finished with a dragged surface. Messrs. Mansell & Mansell, of Birmingham, are the architects, and they were very anxious to avoid meaningless ornament. I have therefore had a photograph made of each feature and attached these to the margin of the $\frac{1}{2}$ -inch scale elevations now shown.

By the kindness of Mr. A. H. Kersey, the architect, I am able to show you this exceedingly fine photographic enlargement of the front of Messrs. Redfern's premises, Conduit Street. The multiplicity of fine vertical lines in this building, where the pilasters are not only fluted and reeded, but in addition, have a V in each fillet and other special characters about the work, rendered it desirable to carry out nearly the whole of the work by what are called direct methods, *i.e.* without the assistance of plaster moulds. Those who know this building well will doubtless be aware that the porch or main entrance is somewhat different from photograph.

The photograph truly represents the building as designed by the architect and as originally carried out, but the pair of fine architectural grotesques supporting the hood over entrance were considered by his clients to be "indecent," greatly to the disgust of the architect, who had taken very special pains over them, and to meet the objection these were removed and trusses of a totally different kind were introduced after the building was completed. I thought it might be interesting to architects to see the banished grotesques, and have therefore had the photograph enlarged. Here also is an enlargement of the entrance generally, showing to advantage the beautiful bas-reliefs which were modelled by Messrs. Elmes & Son, of Kensington.

The special construction of the hood over this entrance is interesting, and is therefore shown by cartoon. Note that it is formed of interlocking blocks which neutralise the outward thrust and make the hood into practically an elliptic lintel, and at the same time ducts are provided in the thickness of the material for the passage of electric wires for the lamps in the coffered soffit.

Our list of terra-cotta buildings would, however, be incomplete without examples of some of the great modern hotels, so here we have the Hôtel Great Central, of which Colonel Robert Edis is the architect, and the Hôtel Russell, by Mr. Chas. Fitzroy Doll, both being good examples of modern use.

The great hotel is surely the most telling example of active life; it will therefore be an entire contrast to look at two resting-places of those who have passed from its busy scenes—Sir Henry Doulton's Mausoleum at Norwood Cemetery, and the Stearne Mausoleum at Nunhead. With these examples we pass from the consideration of general design to details of manu-

* A paper by Mr. J. Miller Carr (of Doulton's) read before the Society of Architects, St. James's Hall, Piccadilly, on Thursday, April 23.

facture, and will next consider the range of colour available for use in terra-cotta.

Some time ago a lady was shown into my office with a small figure which she had modelled in clay and wished to have repeated in terra-cotta. I naturally asked her what colour she wished to have the copies produced in, to which she replied, "Why, in terra-cotta colour, of course." Assuming as much innocence of expression as I could, I inquired what colour that might be. The lady seemed surprised at this ignorance, which she evidently thought culpable in a person in my position. Had she not bought blouses and possibly tailor-made gowns also in terra-cotta, and even seen it advertised as a distinctive colour in a book of patterns of wall-papers? So, putting on that smile serene and high which ladies can so well assume when they are quite sure they know, she informed me that terra-cotta was a pale-red colour as seen in the statuettes and other similar wares manufactured by the Watcombe Company, at Torquay.

That material is, of course, a kind of terra-cotta, literally baked earth, but would be of little use for architectural purposes.

The Range of Colour.

An immense range of colour is possible in the material, from a pale milky white through all gradations of yellow and buff to burnt sienna and red and on through purple to the familiar blue brick, and all of these gradations can be obtained from different kinds of clay and their combinations and by different kinds of fire.

Here are four blocks, practically bricks made in four of our most usual colours of terra-cotta, viz. buff, cinnamon, grey and red. Each of these has been broken in two, and one-half has been fired in a terra-cotta kiln and the other half in a blue-brick kiln. Note the surprising difference in colour resulting from the different kind of fire to which the material has been exposed.

Almost all colour in terra-cotta is due to the oxidation of the varying quantities of iron contained in the different clays.

It is possible by use of an oxidising fire to develop all the colour of which a particular clay is capable, or by what is called a reducing fire to repress the colour, so that a block which might be almost red under certain conditions of fire would be nearly white under others.

Now as it is (fortunately, I think) practically impossible to exactly control the conditions within a large open-fired kiln, we have the natural result of variety of colour produced on the same material.

This characteristic quality of the material—its charm and the hall-mark so to say of its having been among the ardent tongues of the kiln flames—is much better appreciated to-day by architects than was the case some fifteen years ago, when the profession almost universally specified uniformity of colour, and, of course, the manufacturer had to try to obtain it to the great detriment of the material.

Mr Alfred Waterhouse did good service to the craft when he coined the phrase that he desired to have on his building the results of the "accidents of the kiln," referring to these varying evidences of the fiery trial through which the material has passed.

Beyond the range of colour to be obtained by differences of fire on natural clays and their combinations, there are other possibilities by the admixture at the time of grinding the clay of certain mineral oxides, and with these various kinds of greys and greens and even pale blues can be obtained. Such stained "bodies" are, of course, of the same colour all through, as seen in the vitreous floor tiles of self-colour. Any attempts at surface colouring other than by fired glazes is, of course, highly reprehensible and is not practised by firms of high standing.

The Question of Cost.

On the important question of cost it may be sufficient to state that this is, of course, controlled by suitability of design and the amount of repetition of the several forms employed. It may be taken as certain that where the design is fairly well suited to the material the cost will be below what it would be, say, in Portland stone, and where the design is specially suited and highly elaborated with many repeated forms, such as in the Birmingham Law Courts or the Natural History Museum, the cost will be very considerably below that of the same design in Portland stone with the carving included.

Terra-cotta and Iron Construction.

We must now pass on to the most modern type of building, I mean such as are either constructed entirely of glazed ware of various kinds or are composed partly of glazed ware and partly of terra-cotta, and as these almost invariably combine some kind of iron or steel construction in their design and execution, I propose to take them together as a special class. The Birkbeck Bank and the large block of buildings attached to it, with the new extensive front in Holborn, is I suppose by far the largest example of an entirely glazed building in this country. The whole of the exterior is

in Carrara ware, the colours used being fawn, sage-green and ivory. The method of manufacture of this material produces beautiful accidental gradations of colour, so that dead uniformity is never to be found on even a large surface of theoretically the same colour. The new building at the corner of Fleet Street and Fetter Lane, for the *Sheffield Daily Telegraph*, is another large example of this ware, and in this case it is nearly all ivory; but it is only needful to imagine the difference between the effect produced by the ivory Carrara with its soft and pleasing gradation and what it would have been in, say, white glazed bricks.

Referring again to the Birkbeck Bank, the whole of the interior of the banking-room, corridors, staircases and many of the principal rooms and offices are treated in various kinds of faience, the board-room being a specially fine example in purple, brown and cream colours. The panelled ceiling of this room and also all the galleries to the bank are covered with Doulton's patent safety back tiles on their special preparation blocks, and have now stood the test of about seven years with no sign of weakness of any kind.

Now, if you had told one of the grand old master masons of the thirteenth or fourteenth century that you wanted a dome nearly 80 feet diameter and a similar height, but could not allow of any room being taken up on the ground floor by abutments or buttresses, I think the good man would have either regarded you as a cheerful idiot, or at any rate would have been likely to say, "Ask me another!" or words to that effect. But here are these conditions carried into actual fact, the dome being constructed of sixteen great steel stanchions, tapering as they rise from the floor, and connected at their upper ends by a collar on which a gallery and lantern is carried, the stanchions themselves, as well as the spaces between them, being covered with faience, and the structures of the cores or carcase of the dome of hollow terra-cotta blocks, light and strong, bonded together with glazed panelled surface on the under-side. A full-sized section is here shown.

Work of this magnitude and importance naturally presents many interesting problems in which the architect, engineer and ceramic expert may all have their share.

Mr. T. E. Knightley, the architect, has certainly demonstrated the courage of his convictions on a large and important scale, and has shown in many points the true use of the materials chosen. For instance, in the great exterior columns to the upper parts of the Southampton Buildings front and to the great tower, no attempt at large blocks has been made, but the plain fantatised shaft between the enriched portions has been candidly built up of blue green Carrara ware blocks not more than 10 inches by 6 inches on face, and consequently the broken colour produced by the difference of tone from block to block is pleasant, and at the same time substantial columns have been built up which carry the superstructure without the assistance of iron cores, except only those under the great tower.

The advantages offered by steel construction in connection with modern buildings are such, in the way of lightness and strength, that they will doubtless demand increasing attention from architects and engineers, and I venture to say that there is no other material so suitable as terra-cotta and glazed wares for casing such constructions.

Hardly has the fringe of this subject been touched, and those who have devoted most attention to the matter have yet much to learn, and the paramount importance of association on the part of architect, engineer and keramist cannot be overstated. The usual practice is to let the engineer work out his structure in all its details, irrespective of the needful clothing which is to encase it, with the result that (his contract being already arranged) the engineer cannot make such adaptations as are desirable to give the keramist his fair opportunity of doing his best, and consequently the best is not done, but some kind of compromise is.

In many parts of our country, if not in the streets of London, it will be found increasingly desirable to erect steel structures and put the roof on before perhaps all the details of various floors are arranged as to elevation, and certainly new countries like many parts of South Africa need such structures in which the walls can be formed of rough local materials, and while the internal parts are being completed, materials to encase the steel structure can be obtained from England.

These conditions are so novel that I think, if truly considered and architecturally treated, there should result a new style of architecture the absolute growth of the conditions.

In this connection I may call your attention to a steel structure now in process of clothing with Carrara ware and terra-cotta in High Street, Leicester, the property of the architect, Mr. Arthur Wakerley, F.R.I.B.A., president of the Leicester Architectural Society. Here is a photograph taken of the building with all its steel structure erected and the floors in and the roof on, but with no part of the casing applied. And here is a second photograph taken about a fortnight ago, with the structure about three-quarters covered, and here we

have a perspective drawing of the completed building as it will shortly appear.

The ground-floor piers are encased with blue-green Carrara ware for about 6 feet up, and then the general material of the clothing is grey terra-cotta relieved with light enrichments in cream colour. This bi-coloured effect is quite a new departure obtained by the use of two kinds of clay wedded as to shrinkage and worked together into the same block. We have here one of the ground-floor pier caps, which, while it produces a novel effect in the two colours, is yet surely a legitimate use of the possibilities of the material. The central bay is spanned by an elliptic arch of light section with the steelwork inside, and the spandrels are filled with light open work, modelled work, not suggesting that they carry the superstructure.

It may also be noticed that there is no pretence of arch jointing in the long beams over the shop fronts, but the material is simply treated as a casing of the steel girders.

Mr. Wakerley calls his building the Coronation Building, to commemorate in a measure the recent coronation of King Edward VII., and has introduced the Union Jack as a spot of colour in the centre of each shield of the bays, these being suspended theoretically by a chain of State and carrying emblems of the six great colonies above the shields, while the centre part is further enriched by two decorative marine subjects painted in Parian colours on tiles and a fine group of sculpture in cream colour in a hollow domical recess. The great arch has a modelled dolphin at each springing, and a figure of Britannia seated on a sort of throne with her attendant lion at her feet. This group is about 7 feet high; a colour band is also introduced over the group of sculpture below. I have thought this building sufficiently novel in treatment and material to justify my showing you the full-sized details of the various parts and photographs of the various enrichments.

Here are also other details of ceilings constructed of iron with terra-cotta and faience, and an example of casing stanchions now being carried out in the new building at Birmingham for Messrs. Bird & Sons, of custard-powder fame.

Every example I have put before you has stood the test of actual execution, and can be examined as to its fitness.

Keramic Mural Decoration.

I must now ask your attention to the most interesting part of my subject, viz. ceramic mural decoration, and I only wish it had been possible to devote the whole evening to its consideration, as I fear with the time now at our disposal we can do little more than glance at a few examples without studying any of them very closely.

Let me call your attention then to what I think to be one of the most courageous attempts yet made to get colour and interest into our street architecture. This building, erected about five years ago for Mr. Edward Everard, at Bristol, is a high-class printer's establishment, and was designed by Mr. W. J. Neatby, who at that time was one of Messrs. Doulton's principal artists. The whole front is in Carrara ware, with the figure subjects and other decorative features treated in slab mosaic. You will notice the excellent decoration formed of the name "Edward Everard," and the spandrels of the arches over first floor are occupied, on the left by a figure of Gutenberg, the first printer, pulling his proof, with his alphabet decorating the wall behind him, while on the right is William Morris, the nineteenth-century printer, pulling his proof and with his alphabet decorating his part of the wall. The great winged figure in the centre represents the spirit of Literature presiding over Ancient and Modern Printing, whilst above all in the great lunette in the gable you have the spirit of Light and Truth with her emblems of the Mirror and the Lamp.

The purely decorative details are all of them interesting and the printer's mark is used for a decoration in the hall.

Now Bristol is a very dull sort of city and not easily aroused, but when the scaffolding was removed from this front the police had to regulate the traffic in Broad Street for some two or three days.

Now I know very well how much easier it is to criticise than to do, and I know also that anyone who ventures to strike out a new line in architectural treatment will probably meet first of all with execration, later on he may get admiration, and finally imitation, but that is the order.

What I have to say about this front is that it is a genuine attempt to produce a building that can be read like an open book, just as the interesting fronts of the thirteenth and fourteenth centuries could be read by every passer-by. It is also essentially English, and not copied from any existing building at home or abroad. I know that the cry can easily be raised that it does not harmonise with its surroundings, but pull down the public-house on the one side and the bank on the other, and give us a chance, and we will bring them into harmony.

I should like to point out to you the suitability of salt-glazed stoneware for exterior work, but must leave the few samples here to speak for themselves, or we shall have no time to look at interiors.

The Tilework of the Moors.

A profitable evening might be spent on tilework alone, beginning from early examples, and considering the work of the Moors at Granada, and so on to the more modern use, much of which I think fails of that mural character which all wall-decoration should have. If we would only learn from the ancient Egyptians and the Persians and Moors, we should not see that prevalence of worrying a wall with projecting mouldings, panellings and the like, but should return to broader decorative treatments, in which the wall is allowed to retain its wall-like surface, and the decorative effect is obtained by a suitable use of colour and patternwork. Here are a number of examples of different materials and methods, all interesting, and each possessing special qualities of its own which render it suitable for certain uses. Here are examples of Doulton ware tilework in its low tones of colour; strong rich blues and ever-varying effects, vitreous enamels suitable for strong effects either out of doors or for interiors, imparts painting with its dull surface so restful to the eye. Then here are varieties of the majolica glazes with deep translucent effects of colour, malachite and fluxor, paintedwork, Carrara and Parian. An important example of painted Parian work on a large scale is afforded by the new fish and game market at Harrod's Stores, Kensington, where twenty great roundels, of which we have three cartoons present, represent various kinds of sport, such as the hawking party, a stag-hunt, boar-hunt, &c.

The value of the gold outline used in this work may well be noted. One of our latest new departures is that called Parian vitograph, in which a stained body tile is used for a large part of the decorative treatment and a little Parian painting is added to give full effect. The negress and the alchemist are good examples of this method.

Will you in conclusion allow me to depart from practicalities for a few moments and take a short excursion into the realms of fancy?

I hope you will forgive me if I "magnify my office," as St. Paul says, by calling your attention to an important consideration in relation to the various arts and crafts which combine to produce the various materials to which I have called attention to-night, and that consideration is the large number of persons and interests employed in those various trades, as compared with the very small number of persons and the very limited number of trades which would be employed if the buildings I have put before you had been done in stone.

Without asking you to pin your faith to any socialistic scheme, I think I may claim that those crafts are most useful to the nation which employ most of the people, and the more varied in station, education and craftsmanship the better. I suppose it is one of the strongest objections to the brewing industry that it employs so very few people compared to the value of the product.

Now, if we compare a glazed-ware building like the Birkbeck Bank with the same building carried out in say granite and Portland stone, we have first of all much more drawing and clerical work to be done; we have next the employment of artists, that host ever being augmented by the schools of art—surely we should care a little about employing them; then we have the plaster-making industry at, say, Uttoxeter, producing the large amount of plaster used in models and moulds, the model and mould-makers, the clay worker as well as the clay miner, and other various means of transit; the factory and all its attendant urban responsibilities, such as rents, rates, taxes, gas and water; the labour handling and the whole of the kilnwork, besides the cement labour in filling and fitting, and then all the industries connected with the making of materials for glazes, with the shipping employed to bring many of the materials from abroad; and so we might go on and should find that these crafts benefit the nation at large to a much greater extent than if the money were spent on stonework, which would only employ a tithe of the people.

Surely it is according to the fitness of things that we should be doing exactly what we are doing in this country to an increasing extent.

We take the mineral treasures laid up by kind nature for us in our own land, layer on layer.

On the surface flows the water, that useful means for the conveyance of heavy materials from place to place by canals.

In the Midlands it is not very clean water, but sufficiently liquid for manufacturing purposes. Then just below we have the coal shales and a little deeper the coal and iron.

You take the marl or shale from the coal measures and call in the merry demon, fire, resident in the coal, to aid you in subduing the iron to your purposes, and having got your engine and mill out of the iron you set it to work to crush your marl; then the water is made use of to give plasticity, and in that state the combined elements of earth and water wait your commands, responsive to your lightest touch of fancy; and as soon as your wish has taken actual shape, the water, being no longer required, modestly and silently retires, escapes from its clod of earth and purified

goes up higher again to bless the human family by descending in the gentle dew or rain. You now bring your product into closer touch with the element of fire again and commit it in the kiln to that merry demon who, with many quips and cranks of his own fancy not only makes you rock again out of clay, but puts what I have called his own hall-mark upon it. And while all this is going on, in another part of the Black Country the colour maker is busy with his china clay, chemicals and colour mills, and then the snorting iron horse gets hold and brings both products to London and there the artist is called in to add his touch to the whole, and so in time your erstwhile clod of earth becomes brother to the precious stones, enriched with colour and sheen and fit to take the place for which it has been designed by the architect.

You have paid me the compliment of allowing me to bring these subjects before you to-night. Will you let me plead with you as to the importance of present-day architects leaving their mark upon their time, by not copying continental or other examples, however interesting they may be, but out of the conditions of life now present evolving an architecture as true and good to our day as was the Early English to its day, guided in its evolution at least as much by the Seven Lamps as by the Five Orders of Architecture; and when you want a lunette panel for the hall of your Society let me suggest as a suitable subject "A Frolicsome Figure of Fancy" seated blowing bubbles and watching as they rise, with a stern "Figure of Restraint," her hand on "Fancy's" shoulder and pointing her back to a great winged figure in the background whose right hand rests on a pile of ponderous tomes, the history of the past, and who belongs to the past, the present and the future, the Genius of Architecture.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Mr. Aston Webb, A.R.A., president, in the chair.

The SECRETARY announced the decease of the following members:—Messrs E. Birchall, associate 1863, fellow 1871; F. Edwards, associate 1857, fellow 1861; Young Bolton, associate 1882; R. Phillip Day, associate 1882; Colonel John Davis, elected hon. associate 1887.

Messrs. John Woolfall, of Liverpool, and John Swarbrick, of Manchester, were elected as members.

Mr. EDWIN T. HALL read a paper entitled

Four Modern Hospitals.

He did not deal with hospitals in general, but with concrete examples on which he had personally laboured. These were representative of four types, viz. (1) Hospitals for scarlet fever, diphtheria and enteric diseases, which are generally grouped under one staff; (2) those for smallpox; (3) sanatoria for tuberculosis or consumption; (4) general hospitals. The examples the lecturer brought forward illustrated one of each kind, viz. (1) the City of Leeds Fever Hospital, at Seacroft; (2) the City of Leeds Smallpox Hospital, at Killingbeck; (3) the Sanatorium at Frimley, in Surrey, for the Brompton Consumption Hospital; (4) the Camberwell Infirmary.

Before dealing with his examples, some general observations were made on each type of hospital, discussing questions of site, plan, location, medical treatment, numbers to be accommodated, &c. Consumptive sanatoria the lecturer considered justified, if only as schools of domestic and personal hygiene. Patients may or may not be healed entirely of their disease, but they are taught the value of cleanliness, of exercise, of fresh air, of regular habits, of order and self-respecting discipline, and they go back as missionaries to their families and friends. As regards site, all kinds of infectious hospitals should be away from a densely built neighbourhood. For a general hospital in town, the site should be as open as possible, and preferably surrounded by roads which form wind channels to change the air. Low-lying land with a shallow gravel subsoil should be avoided. Public smallpox hospitals are required to have a quarter-mile zone around them—that is to say, the land forming the hospital estate must be 130 to 160 acres in extent, and in the heart of this, shut in by a ring fence, must be the portion reserved for patients. For mixed fever hospitals a zone is required to protect not only the public, but also those suffering from different diseases. But where the site is large enough the isolation of the pavilions or ward units should be considerable for the comfort and pleasure of the sick. Prospect, sunlight, trees and gardens are all aids to recovery. No hospital on a rural site should be more than two storeys in height. In all the best modern examples of hospitals, the main wards are placed with their axes north and south, when this is practicable, with windows on both sides and at the ends. Thus every bed and every wall gets all the sunlight there is during some part of the day. Double wards—that is, wards

with a central wall and rows of beds on each side of it—should always be avoided. For consumptive sanatoria, as distinct from hospitals, large wards are not adopted; the ideal is a single room for each patient, with a southerly aspect, in a building not more than two storeys in height. On a city site, where relatively high buildings are a necessity, three or more storeys are suitable, and lifts and thoroughly aerated staircases for access and for fire escape must be provided.

Referring to the ordinary layman's idea that a hospital is but a single building, the lecturer said that a fever hospital is almost a village, with thirty to fifty separate buildings, and with a staff of three hundred or more persons. In one of his hospitals there were within the curtilage six miles of drains, twenty-nine miles of water and steam pipes and forty-two miles of electric wire. At Seacroft there were eight to nine miles of drains.

The City of Leeds Fever Hospital, at Seacroft, is about three miles from the centre of the city. The site was formerly a beautiful park, and the trees have been kept wherever possible. The area is 41 acres, and from one end of the building to the other is about a quarter of a mile. The hospital consists of forty-two separate buildings. It is presided over by a medical superintendent with three medical assistants, a lady superintendent or matron with her assistants, and a staff of 102 nurses and seventy-two female servants. The male officers and servants number about thirty-eight. Accommodation is normally provided for 452 patients, but in cases of emergency a much larger number can be received. Attached to the hospital is a quarantine station of many cottages, to which infected families are removed until danger is past. The administrative buildings consist of:—(1) The offices, with residence for the matron, for the assistant medical officers and for resident porters and others; (2) the nurses' home, containing 121 rooms; (3) the female servants' home, with eighty-four rooms; (4) dining-rooms for nurses and servants between the homes and the kitchen; (5) the hospital kitchen, steward's stores, dispensary, staff consultation-room, sewing-room, &c. A complete laboratory, with students' rooms, forms another building. To the east and west of this group, on the main covered way, are patients' admission rooms to the different parts of the hospital. Every part of the hospital is connected by glass-covered open ways, with subways beneath for steam, hot and cold water, and gaspipes, electric mains, &c. The hospital pavilions are grouped in pairs, with fuel store and nurses' lavatories common to both on the cross corridor. Beneath these staff offices is the heating chamber. Each pavilion is axially north and south, with windows on both sides and at the ends. It has an entrance hall, with the duty-room opening from it. To right and left are large wards, each containing fourteen beds, and opening from these are single-bed wards, all overlooked from the duty-room or ward kitchen. Each large ward has a wide balcony at the extreme end, flanked and sheltered by the towers, containing bath-rooms, lavatories and water-closets, and near these is an external flight of steps leading to the grounds. Beneath every pavilion is a paved open basement, about 5 feet or 6 feet high, forming an aerial disconnection of the wards from the earth. In this all pipes and cables are placed, so that repairs can be done without coming inside the building. The smoke flues are also swept from beneath. The ward floors are of polished teak laid direct on the concrete. The walls are of cement, painted and varnished to match the faience chimneypieces. The heating is by passing fresh air over hot-water radiators at a calculated low velocity, so as always to be changing the atmosphere of the room, and this is done completely three times an hour. The extraction is by fire and aspirating flues. Heating should never be done by pipes laid in channels with gratings over. These become receptacles for dust and filth of all kinds. The ventilation of the hospital was secured by natural, as opposed to artificial, means, such as that usually called the Plenum system. In the lecturer's judgment the latter was a mistake in any hospital. The windows, consisting of a pair of sashes and a fanlight with glass spandrel cheeks, extend to the ceiling. Describing the sanitary fittings the lecturer showed a drawing of a bedpan sink designed by himself for hospital use. Its advantages are that it uses about half the water of any other; no water stands in any pipe when out of use; one flush not only feeds the rim but spreads a palm-like wave which, entering the bedpan handle, thoroughly cleans everything. The isolation pavilions, of which there are four, consist of wards of one, two and four beds each, with nurses' rooms and special sanitary accessories for treating different diseases. In each of the diphtheria pavilions there is an operating-room with side and top light. The block for severe operations contains an anaesthetic lobby, a theatre and a sterilising-room. The staff quarters have everything necessary for comfort. There is a large recreation-room, a writing-room, a library, a third sitting-room for probationers, a suite for the home sister, ample offices and a separate bedroom for each nurse. The whole hospital is of fire-resisting construction. The hospital kitchen is a room 50 feet long, with a large

cully attached. Close by is a large bakery, and there is a group of larders facing north and arranged with through currents of air. The steward's store is 60 feet 6 inches by 5 feet 7 inches, with a gallery round. From this centre enclosed trolleys convey food and stores to all parts of the hospital. There are separate laundries for patients and staff. Near the entrance to both is the disinfecting house and the destructor. All unconsumed food and pieces are burnt. The engine-house will contain three large direct coupled dynamos to light both this hospital and the Killingbeck Hospital. The heating of both will be done from this centre. The exhaust steam from the various engines is collected and used for heating. In like manner is collected all the condensed water, all the cooling water from electric engines, &c., and this is filtered and pumped at 180 degs into the economiser. In this way, when the engines are running, all the heating and hot-water supplies will be done for nothing, thus saving some hundreds of pounds a year. Describing the drainage and treatment of sewage, attention was drawn to the sewage irrigation outfall, from which it is necessary to exclude typhoid germs. He showed drawings of an apparatus devised by himself for dealing with these germs. It consists of receiving tanks and boilers for alternate use. The typhoid sewage is received and boiled by steam, after which it passes to cooling beds, and thence to the outfall sewer.

Killingbeck Smallpox Hospital is situated on the top of a hill, with undulating country all around. The grounds proper are 12 acres in extent, but the total attached area is 140 acres. The hospital buildings proper are grouped together on the summit of the site, the offices and medical quarters being in the centre, the laundry and mortuary to the west, the discharge block to the east, all outside the hospital road. Entering in the centre, the nurses' and female servants' homes, respectively, are to the west; the kitchen and stores, dispensary and serving-room to the south; the male servants' home to the east. Beyond, to the north, lie three large pavilions and two isolation blocks, while the admission block to these is at the junction of the covered way. The mortuary here has no visiting-room for friends to view their dead, but it has, under a peristyle, a plate-glass sarcophagus, into which the body, suitably dressed, is placed from the mortuary on a rolling bed. The visitor, standing in the open air can thus see the dead, but cannot come into actual contact with the body. To enable the heating to be done from Seacroft, as above mentioned, the highway had to be tunnelled, and a covered trench carried right up the hill. The hillside down which the drain had to come was very steep, and reasonable gradients were got by a series of weirs in the pipes.

The Frimley Sanatorium for the Brompton Consumption Hospital was next described. Here he had tried to get away from the hospital, to suggest breeziness and health and the pleasant atmosphere of a large home. The institution consists of sixteen buildings. The patients' block is cross-shaped, with accommodation for eighty-eight patients in four two-storeyed radial pavilions, and for twelve in the centre where special cases may be under closer surveillance. Every patient's room faces S., S.S.E. or S.S.W. His first design was for putting the eighty-eight patients in single rooms, but this was overruled. For the King's Sanatorium, however, his original plan was shown to His Majesty and to Sir Ernest Cassell, and the committee came to the same conclusion as that he originally contemplated. As regards concentration, which in Germany was carried to an extreme, the lecturer said he had tried to find a mean. At Frimley they had 100 patients all within a radius of 195 feet from the doctor's consulting-room and matron's sitting-room, and yet every room has an open outlook; all are away from noise and bustle, all have the greatest amount of sun, and all are sheltered. Another advantage of the plan was that ample classification could be got. They could have units of twenty-five males or females, with their separate group of closets, bathrooms and lavatories, or they could arrange convalescents by themselves or make other divisions of patients in units of eleven. There was but one dayroom on each floor. The great aim is to get the patients out into the open air for their recreation, not to encourage them to remain within. Provision is made by which beds can be wheeled out on to the terrace, and at each extremity of the pavilions there is a sun-room formed in the turret for patients in the end ward, in addition to a balcony. As regards roofs to terraces and balconies, the lecturer's idea of rolling canvas shop-blinds had been adopted. These could be lowered or rolled up at will.

Camberwell Infirmary, Brunswick Square, although technically a parish infirmary, is, owing to its position, really a general hospital, dealing with accident and acute cases of all kinds. The original building in Havil Street he was altering and modernising to form part of the larger institution. It consists of twenty-one buildings, standing on a site of 4½ acres, practically surrounded by roads, and all buildings are connected by glass-covered ways and subways. It accommodates 800 patients, has a resident staff of five doctors, while the other officials, nurses and servants, number about 160. The block

plan is as follows:—In the centre of the west front is the administration block, with a pavilion north and south of it. To the east of the administration is a quadrangle, having on the east side the female staff house, and north and south two other pavilions; to the north-east lies the old pavilion, now divided into three parts. To the east is a circular pavilion, its conical roof, surmounted by a turret, forming a feature of interest in the general composition. To the south-east are the kitchen buildings, the stores and men-servants' quarters. Further south the laundry, engine and boiler-houses, the mortuary and ambulance station. All buildings may be reached by the private road on the outside and by covered ways on the inside. The principal buildings are of red brick and Portland stone, the main front forming a flat crescent. The new pavilions are axially north and south. The pavilion to the north—which may be taken as typical of all, although they differ in detail—consists of three main storeys and a fourth one over part of the area. It has at the home end a wide staircase, with walls of glazed brick from bottom to top. At the other end it has a secondary or escape staircase, extending from the flat roof to the road, in what is practically a separate tower. There are three exits from the building. On each floor there is a ward of twenty-four beds, with windows on three sides, and other wards of six, four and two beds respectively, affording opportunity for great classification. There is a ward kitchen. This and the corridors have also all their walls of glazed brick.

The twenty-four two and four-bed wards are open to supervision from the ward kitchen and from each other. All are well lighted, and every window opens. There is only one fireplace in each ward, for cheerfulness, the heating proper being by hot water. The large ward on the top floor has been specially designed for consumptive patients, and is a unique provision for a general hospital. Practically the whole of the enclosures on three sides consist of opening windows for open-air treatment, and above is a flat roof on which patients may spend all the day with something of interest to see in the panorama stretching across London. Three of the pavilions are so designed. One of the greatest modern improvements in hospitals is the superior accommodation now given to the staff. The female staff home at Camberwell Infirmary is situated in the central quadrangle, with a pleasant garden attached. It has several large rooms for dining, recreation, writing, &c., for nurses and servants. Each of the staff has a separate bedroom, warmed by hot water, with an inlet and outlet ventilator. There are 140 rooms in the building. Details were given of the children's pavilion, the kitchen block, the engine and heating-rooms, smithy, shops, boiler house and laundries—the most costly block of the whole; also of the heating and ventilation. The laundries are arranged so that linen received soiled at one end passes through and out clean at the other. Electric fans remove all steam and polluted air. The drying is by hot blast.

In concluding, the lecturer said he trusted he had been able to show that in hospital work there is much to interest the architect. In addition to the general design and detailing of not one, but dozens of buildings of diverse purpose to their grouping and co-ordination, so that each may take its proper place among the whole, one has to give special consideration to the medical requirements and hygienic conditions; to aeration and ventilation, to the design and organisation of the services for heating and artificial lighting; for telephonic and other means of intercommunication; for fire extinguishing; for transport and commissariat. Unremitting attention is necessary to deal with so much of detail, often not alluring in itself, but with enthusiasm the driest bones may be made to live, and to the strenuous man difficulties and new problems are but a spur to greater effort, an added zest to all enterprise.

Mr. HUGH STANNUS, who proposed a vote of thanks for the paper, said it was clear to him that the present was essentially an age of hospitals. The manner in which Mr. Hall had classified the hospitals had enabled him to deal with the subject in a masterly way. He (the speaker) had heard very able papers on the specialised work that architects had to do with in practice. They had had papers on barracks, school buildings, private school buildings and on libraries, and they had just heard a paper on hospitals. These papers would form an exceedingly valuable corpus to students.

Mr. T. BLASHILL seconded the vote. The adoption in modern work of hospital pavilions was, he said, a tribute to the original authors of the idea in so far as it had undergone little modification. The improvement in hospital construction was achieved by an intense study of details.

Messrs. W. G. WILSON, R. J. ANGEL, E. A. HAWKINS, W. HILTON NASH and J. OSBORNE SMITH supported the motion.

Mr. HALL, in returning thanks, answered the questions which had been put to him. Referring to the cost of erecting a hospital, he said he would prefer not to give figures. Hospitals were the most expensive buildings in the whole world if attention was given to details—from 400*l.* to 650*l.* a bed would be about the average cost in an infectious hospital.

The area of such a hospital would be about three times the cubic space per bed of a general hospital. The aspect would be governed by the disease to be treated. In cases of infection free currents of air were needed so that the foul air was driven away immediately. In a sanatorium not one person in sixty was confined to bed, and the German authorities agreed that the best aspects for consumptives were south, south-south-east or south-south-west. Deal floors were not to be advocated; the most suitable material was teak, wax polished. The question of soil was of importance, though very often a hospital had to be built on the one site available. Low-lying gravel was bad, clay was cold, green-sand formation was the best, but so long as the buildings were well drained it mattered little whether the soil was gravel or clay.

THE ROMAN FORUM.

A CORRESPONDENT of the *Scotsman*, when describing the Historical Congress at Rome, says:—Naturally the recent excavations in and about the Forum have proved highly attractive; and Commendatore Boni has been indefatigable in displaying the results of his work to small parties and great, while he has explained it to the Congress at large by the aid of lantern projections. The lantern demonstrations in the large hall of the Collegio Romano, the seat of the Congress, have indeed been one of the features of the week, and the display of slides relating to the Italian excavations at Phaestos, in Crete, by Signor Pernier, was of special interest to British members as showing that Mr. Arthur Evans's Knossos is only one of many sites in the island that are contributing to restore to us the outlines of a long-lost civilisation.

The importance of these recent discoveries in the Forum Romanum is threefold. In the first place there has been a complete removal of the Mediæval and modern buildings, notably the church of S. Maria Liberatrice, which intervened between the Forum and the corner of the Palatine Hill overlooking it. The road till recently in public use that ran under the Arch of Titus is now closed, and the whole area about the Arch and beyond it nearly to the Colosseum has been given up to "scair" which are extending from this side up the slope of the Palatine. Only the church and convent of S. Francesca Romana are allowed to survive, and the old cloister of the latter is being now fitted up as a Forum museum. Palatine and Forum form now a single field for exploration, and in consequence the difficult topographical questions which concern the means of access at different periods from the one to the other have at last some chance of being settled. In the second place, the extensive clearances that have been made on the north side of the Forum proper beyond the Arch of Septimius Severus and eastwards to the Temple of Antoninus and Faustina have rendered easier the comparison of levels, with the result that some structures formerly ascribed to the regal period have been proved by their levels to be much later in date. Notably is this the case with our old friend the Cloaca Maxima, which is now relegated to the Imperial epoch. The original conduit of the time of the kings must have run at a much lower level.

The third and most important result is the establishment of a new principle in the excavations of ancient Rome. Hitherto it has been the custom to clear away the accumulations of modern and Mediæval times to such a depth as admitted of the complete display of the first stratum of antique masonry that was laid bare. This stratum might often consist of structures of the later empire that had taken the place of earlier and more interesting fabrics of Hadrianic, Augustan or republican times. The new principle, on which the more recent excavations have been carried out, establishes it as the duty of future explorers to examine all these underlying strata till the virgin soil is reached, so that the earliest Roman, or perhaps pre-Roman, remains on each site will be made as clear as the more extensive relics on higher levels to which alone attention has hitherto been paid. In this way is created a situation which corresponds in some degree to that existing in England at the epoch of church restoration in the last century. Early work in most of our old churches had been overlaid in the course of time by later, and to restore the old a good deal of what was more recent was sacrificed. This more recent work, however, though Late-Mediæval or perhaps Jacobean, was part of the history of the church, and its summary obliteration gave rise to not a few well-supported protests. In the case of Rome it will no doubt be difficult to preserve the upper strata while investigation proceeds at the lower levels, but Signor Boni is fully alive to the danger here hinted at, and is sparing no pains to avoid any injury to works of secondary interest in the course of the more searching explorations of lower strata now demanded. The means adopted may be seen in the case of the so-called "Lapis Niger," or black marble slabs let into the pavement of the Comitium and supposed by the Romans of the later empire to mark the place of burial of the

founder of Rome. These black marble slabs, discovered a few years ago, have been supported below by concrete and iron, and are sustained exactly *in situ*, while excavation carried out beneath them have disclosed to view an interesting and apparently very archaic group of monuments connected with this supposed Heroon of Romulus. These relics, which include the broken stele with the early inscription, have not yet been officially described and illustrated, but they certainly bring us into contact through a chain of tradition with the associations of the Rome of the kings. A more definite connection has, however, been established between the Forum as we know it and the earliest Rome by the discovery, close to the Temple of Faustina, of a group of primitive burial-places of a kind already known from excavations in other localities, some of which almost certainly go back to the epoch of the tradition founding of the city. In one of the graves, opened at the view of the Congress, there is still lying a skeleton that most probably belonged to a member of one of the small separate communities out of which afterwards grew the city of Rome. This discovery carries back the history of the Forum and its neighbourhood further than it has yet been traced, and much attention is naturally being paid to it.

The extreme interest of these Forum excavations, and the prospect opened of new and fruitful work in the revelation of an older Rome that is still underground when we have reached the ordinary late Imperial levels, show that the recent opening of the British school at Rome has come just at the psychological moment, and establish in its favour a claim for practical support on all interested in historical studies. The school, located in a portion of the Palazzo Odescalchi, gave a reception which has been one of the pleasantest social events of the week. The official functions have included a dinner at the Quirinal to a selected number of delegates, and receptions by the Minister of Public Instruction on Sunday afternoon in the Palatine, and by the Syndic of Rome, Prince Colonna, in the Museum of the Capitol. The last two functions were necessarily crowded and miscellaneous.

ARCHITECTURE AT THE ROYAL GLASGOW INSTITUTE.

OUR Glasgow Exhibition of Architecture as represented by drawings, says the *Glasgow Herald*, is smaller this year than ever. In location it has been most cavalierly treated. There is, perhaps, little to allege against the stairhead itself; it is better lit than the Edinburgh octagon, it is not very inconvenient, and it quite suffices in extent for the contribution. All the same, the indifference shown, not to hostility, is well calculated to reduce still further the drawing sent in. Soon, we take it, there will be none at all to poster hanging committee. Possibly, however, visitors will regret the exclusion this year of artistic jewellery and the like that in the past few exhibitions have lent interest at surely the smallest possible cost of space. One must hope that with new premises the Institute will better realise its obligations to others than painters and sculptors.

The collection is a small one, and yet it cannot be said that the selection committee have been over-exacting. Photographs again principally illustrate executed works; there are few coloured drawings; pen-and-ink is the favourite medium and perspective the favourite method, and of geometric elevation there is but one solitary specimen. It is remarkable that churches are so few and unimportant; all, as regards style, are versions of Gothic. St. Michael's, Canby, is a small mission chapel apparently. Mr. Clifford has done something like that before, and shown very well how interest can be given without expensive treatment. There is a low, squat tower, whose apex seems to be thrown into the church, a side aisle and a projecting porch. The type and its treatment are essentially English but none the less welcome because of that. In a Wesleyan church at Girvan, by Messrs Watson & Salmond, also small but with no tower, the most is made of a gable with a tracery window, low side aisle, and a porch, partly of timber. There is apparently no gallery in the church; the style is Perpendicular, freshly treated. St. Columba's, Blackhall, Edinburgh, by Mr. P. Macgregor Chalmers, is of an earlier period; the detail is Norman, but something of the altitude of Gothic is given in the general composition. There is a fairly tall tower or steeple, with a corner turret. No plans accompany any of these views, and this is unfortunate. The interior of Kilbarchnie Church, Mr. W. H. Howie, is shown by photograph to possess a side aisle that contains a gallery; the arcade is of stone, and there is a hexagonal apse and open-timber roof.

Of domestic examples the most important come from England. Hintow House, Northamptonshire, illustrated by two frames of photographs—one hopelessly skewed—is a charming country house with all the thoroughness of design one expects from Mr. Morris. It has few features and little ornament. Level lines prevail; in the interior ceilings are of heavy timber and in some apartments the stone is exposed in rather

sophisticated if not rude fashion. Mr. Fred. Rowntree, of Glasgow, shows two houses for York, of brick principally, early eighteenth-century period; as to style a Classic treatment—that is, of cornices and pavilion roofs rather than gables; one has timber oriels and the upper part of the walls rough-cast. The house at Wimbledon, by Messrs. Niven & Wigglesworth, has also level cornice and pavilion roof and walls wholly rough-cast or harled—no doubt effective enough sheltered among trees, but a little more of design would not be amiss. Nearer at hand, a House at Pollokshields, Mr. John Nesbit, has more pretension, with tower-like roof, gables and oriels, but, in contrast, a very quiet entrance. The lower storey is of stone, the upper rough-cast—a favourite recipe that insures variety of colour; a plan is given. Craigend, Troon, by Mr. Clifford, is principally one-storeyed, with dormer windows and carved stone gable tops, a composition quaint and out of the common; the semicircular porch is just a little droll. Taymouth, Skelmorlie, by Mr. P. Macgregor Chalmers, is an addition in substantial stonework, but with half-timber gable; some of the detailing is a little commonplace. Photographs of country work, by Mr. Campbell, in rustic style, but of that fortunate variety that has a good deal of money expended on it. Mr. Austin Laird's three residences at Kilmalcolm are very nicely drawn and of varied character, all good; one at Giffnock is in half-timber style. The interiors of Mr. Burrell's house, Great Western Terrace, Mr. R. S. Lorimer, are particularly interesting and quite the most important exhibit of the collection. The photographs show rich and beautiful work, and original, at least in the sense of happy combinations of known elements. Some pieces of old work are skilfully incorporated with the modern settings, and whole walls are hung with old tapestries, so there is excuse for the archaistic treatment of the carvedwork—the stair newel-posts for example. Of the interiors, by Mr. A. N. Paterson, the chief interest lies in the plaster ceilings, that may be described as flat vaults, left ever so plain excepting for a largely modelled band of fruit forming a panel, a treatment that as a change from strapwork and plaster enrichments generally is welcome, but it just verges on the extreme of protest. The central hall of Hamilton Middle Ward Offices, by Mr. Alex. Cullen, is surrounded by an upper-storey colonnaded gallery in Exchange fashion, and lit from rooflights in the segmental arched ceiling; all is finished in plaster, and there is some well-modelled work. The staircase is of stone, and a good deal of fresh character is given to the phase of Classic adopted. A portion of the lofty office block erecting at the corner of West George and Hope streets, Mr. John A. Campbell, architect, one of the important additions to street architecture of the year, is notable for the rather aggressive plainness of three storeys; they, at any rate, act as foil to the richer top storeys. There is a suggestion of a tower, not actually on the corner, and it, with long projecting oriels, gives verticality; the horizontal element results from the tiers of square windows without much assistance from strings or cornice. The somewhat robustus carving is allowable on so large a façade, and it is employed sparingly and with discrimination. The Sailors' Home, Niven & Wigglesworth, is of a type hardly known among us, the brick Georgian treatment seems peculiar to England; here well managed and shown in a good pen drawing. Mr. D. Andrew's School at Kilbowie is straightforward and appropriate, and the Street Buildings, Kirkcaldy, J. D. Swanston, shown in colour, are piquant and must give life to the thoroughfare. Wolverhampton Exhibition is recorded in Messrs. Walker & Ramsay, architects, constructed of plaster, and for purposes of temporary scenic display architectural canons were not seriously taken, and the humorous vagaries of "new art" had ample warrant. One of the rejected in a district library competition, by Messrs. Watson & Salmond, is a good and suggestive design in its largeness of parts, undoubtedly the right treatment for a low building that must be dominated by high tenements, and the quality conspicuously absent from the trio most recently chosen.

Tea-rooms are in Glasgow a favourite field for architectural effort, and those in West Campbell Street are as noteworthy as any. Mr. Rowan has successfully manipulated many styles in larger and more serious work, and this essay proves that the latest architectural fashion is neither beneath nor beyond him. A reconstruction has been skilfully effected, and throughout the detail is playful, but never eccentric. Mr. Salmon's offices, St. Vincent Street, are unmistakably "new art," and at least the technical execution may be praised in stone carving and wrought metal; marble panelling is beautiful in itself. All the same, the architectural quality is poor; stone is treated as if a plastic material, and, generally, the forms are capricious for all materials. This disregard of convention in architecture is just as inartistic as a natural treatment of ornament without conventionalism is. The doorway, Mr. D. Whittet, has apparently play on the stone of a kind usually found only in cabinetwork, and whether the novelty is worth the expense may be questioned. By the same is a good pencil sketch of a hall in the

farm-kitchen manner. A colour scheme for a hall, Mr. John Ednie, is nicely touched in, and this design is not too aggressively original, as this kind of decoration usually is.

The collection, it will be gathered, has little of first importance; many of our architects are unrepresented, and this is hard to explain, for there are throughout the city not a few building projects that might well be submitted to public view and criticism. Of course, this cannot be done by photographs; drawings there must be, and architectural draughtsmanship as a minor art should therefore receive encouragement from the Institute.

Among the paintings are representations of buildings only moderately successful. Sometimes the architecture is only incidental, and so a slight indication suffices. Still, Mr. Lauder's Swiss tower might have had its upper part centred with the lower, and neither Mr. Coventry's street scene nor Mr. Newbery's church interior would suffer by a little more definition. Mr. Cameron's presentment of a Venetian palace is admirably detailed, but the Glasgow Exhibition buildings—may not one fairly argue from unsympathetic delineation of architecture that painters hardly find in the mother art that attractiveness she ought to have for all who claim to be artists?

THE CROSSES AND HOLY WELLS OF LANCASHIRE.

AT the meeting of the Lancashire and Cheshire Antiquarian Society, held at Chetham's College, Manchester, on the 17th inst., Mr. Henry Taylor, F.S.A., of Birklands, Birkdale, read the sixth paper of a projected series of seven on the Ancient Crosses and Holy Wells of Lancashire. The subject that night related to the Hundred of Lonsdale, which consists of two oval-shaped pieces of land divided by Morecambe Bay, each measuring roughly about thirty miles from north to south, and fifteen from east to west. The paper was copiously illustrated by maps of the district, and by plans of the most important towns and market-places, and by photographs and engravings of the numerous pre-Norman and other ancient crosses which are scattered up and down over this portion of the country.

Lonsdale, north of the sands, is in the diocese of Carlisle, and Lonsdale, south of the sands, in that of Manchester. Lonsdale, north of the sands, is divided into two portions, called High and Low Furness, the latter consisting of comparatively flat land, and the former, which forms the northernmost portion of the county, of lofty fells and mountains. Ancient crosses are not numerous in High Furness. It has never indeed been a district, like the mountainous parts of East Lancashire, where crosses were placed as guides to travellers from one abbey or castle to another, or for the use of merchants, but has been the abode of shepherds who have never had occasion to go far from their own hillsides, every mile of which has been intimately known to them. In Low Furness the circumstances were different. In pre-Norman times there were the Norse settlements, the invaders erecting monuments of a distinctly Scandinavian type, and subsequently, in this rich and beautiful undulating country, the monks made their homes at Furness, Conishead and Cartmel, and small towns grew up at Ulverston, Dalton-in-Furness, Cartmel and Broughton-in-Furness, where churchyard, market and other crosses were erected.

Mountainous districts all the world over have been the home of poets and mystics, and have fostered superstitions. This is eminently the case in the Lake country, where the fells have had given to them in the far-away past the most imaginative and romantic names, such as "Queen of the Fairies' Chair" and "Raven Tor," maintaining the tradition of the sacred bird of all the Teutonic and Scandinavian races; and, furthermore, it is not surprising that holy wells abound. Sometimes the wells are dedicated to scriptural saints, St. Mary, St. John and the Archangel Michael. In other cases the spring is known merely as the holy well. In certain districts the wells appear to have been named in an arbitrary and capricious fashion, as Sheriff Well, near Ulverston; Mary Bank Well, near Dalton-in-Furness; Bean Well, near Aldingham. In Lancaster we find St. Mary's Well, the Friarage Well, Wolf's Well and St. Patrick's Well. Near Warton the well is dedicated to St. Oswald, and at Glasson the Hob and Dob fairy superstitions are perpetuated in Dob's Well. Several of these wells have been for centuries frequented for their supposed medicinal and healing properties, the word "holy" meaning "healing." The Holy Well, Humphrey Head, has been so used from the time of the Romans by the lead miners.

Market crosses were erected (and in many cases still survive) at Broughton-in-Furness, Ulverston, Dalton-in-Furness, Cartmel, Hornby, Over-Kellet and elsewhere. In Lancaster there was the historic high cross in the market-place—where many kings and some pretenders to the throne of England have been proclaimed—the Covel Cross, the White Cross and the Red Cross, and, more important than all, the celebrated

pre-Norman cross (on which is carved an inscription in Runic letters) now in a glass case in the British Museum.

The bases of many ancient crosses, put up in Mediæval times to mark the boundaries of lands given to Cockersand Abbey and other religious houses, are scattered up and down throughout this district.

A pre-Norman cross to which extraordinary interest attaches is to be found in Halton churchyard, two and a half miles north-east from Lancaster, and many have been the speculations as to the meaning of the extraordinary sculptures with which it is covered. On the west face are scenes from the Gospel narrative, the Resurrection and the Ascension of Christ. On the other three sides are sculptured scenes from the "Volsunga Saga," the classical legend—a most bloody story—known and recited in the great halls of Scandinavia for years before the Norman conquest of England. It is a great story, whose influence has been compared to that of the tale of Troy upon the Greeks.

In Du Chaillu's "Viking Age" illustrations are given of precisely similar carvings from stones and church doors in Norway and Sweden. In both cases we find Sigurd piercing with his sword the body of the snake, and near him is Grani, the riderless horse. The heart of Fafnir is being roasted, and the head of the smith Regin is seen separated from his body. In these sculptures, which have been called the "Pagan-Christian Overlap," we have evidence of the religious struggles, so eloquently described by Green in his "History of England," which took place during the two or three centuries preceding the Norman Conquest. Portions of other ancient crosses, some of pre-Norman date, are to be seen in the porch of this church.

St Wilfred's Holy Well is in a field close to the church. It was always considered a necessary part of the baptismal service for water to be brought to the font from this old well. The water is very pure, and has the reputation of being efficacious in the cure of inflamed eyes.

The lower portion of what must have been at one time an extremely beautiful cross of pre-Norman date is in the churchyard at Heysham. Scriptural subjects are carved on it amidst luxuriant floral ornaments. The Saintry Well is near Heysham Church.

Some interesting pre-Norman work is to be found along the valley of the Lune. In Hornby churchyard is to be seen the lower portion of a massive and lofty cross, carved and erected before the Norman Conquest. This stone is about 6 inches in height and about 2 feet 6 inches square on plan; the sides are enriched with Romanesque arcading. The celebrated Ruthwell Cross in Dumfriesshire is so built up, with tapering stones. An excellent illustration of it is given in Stephen's runic crosses. Another notable instance is to be found in the market-place at Sandbach. In the churchyard attached to Cartmel Priory the remains of what must have been at one time a most beautiful cross in the Late Decorated or Early Perpendicular style of architecture is still to be seen.

A cross at Thurnham, erected with much formality in the year 1340, cannot now be found. It is thus referred to in the Chartulary of Cockersand Abbey:—"Therefore on the bank thereof, as for a boundary mark to endure for ever, William, son of Sir William de Furness, Lord of Thurnham, has caused a certain cross to be erected for a boundary between Thurnham and Cockerham, whereby all uncertainties of this kind respecting the bounds and limits of the said moss may be for ever removed."

We understand that when this series of papers is finished it will be reprinted in one volume, with copious illustrations, the title probably being "The Ancient Crosses and Holy Wells of Lancashire, with Notes on the pre-Reformation Churches, Monastic Institutions and Superstitions of the County Palatine."

GENERAL.

The International Society of Sculptors, Painters and Gravers has leased the New Gallery, Regent Street, for the seasons of 1904, 1905 and 1906, and the Society's first exhibition in these galleries will be opened in January next. The president of the International is Mr. Whistler, and among the members of the committee are Messrs. Guthrie, Lavery, Thaulow, Sauter, Sullivan and Pennell.

Mr. J. McNeill Whistler has received the honorary degree of LL.D. from the University of Glasgow, a distinction which is well deserved.

At a Meeting of the executive committee of the National Trust, held on Monday, Sir Robert Hunter presiding, it was reported that the President of the Royal Institute of British Architects had nominated Mr. G. F. Bodley, R.A., to represent the Royal Institute on the Council of the Trust, in the place of the late Mr. Penrose, and that Mr. Bodley had consented to act.

Mr. Henry James Castle, retired surveyor, of Westminster, who died at Hampstead on February 8, aged fifty-seven, has left property of the total value of 2,915*l.* The net personal estate has been returned at nil.

The Metropolitan Asylums Board have approved plans prepared by Messrs. A. & C. Harston for the provision of additional accommodation, &c., at the Joyce Green hospital at an estimated cost of 7,650*l.*

M. Louis Schutzenberger, the Alsatian painter, has died in his native town Strasburg, in his seventy-eighth year. He was the pupil of Paul Delaroche and Gleyre. He obtained his first medal at the Paris Salon in 1850, and received the Cross of the Legion of Honour in 1869.

The Guildhall Exhibition of works by early and modern painters of the Dutch school will be opened to the public on Monday next.

The Southampton Harbour Board have resolved to carry out the work of dredging the Itchen Spit at a cost of 12,000*l.* The improvement is to enable ocean-going vessels to reach the Test Quay.

Artists who have painted fire scenes or studies of fire-brigade life are requested to communicate with the hon. secretary of the loan section of the impending International Fire Exhibition, Earl's Court, S.W. There will be a special group for British art in this section, as also a black-and-white group. Owners of pictures depicting acts of heroism at fires, either on land or at sea, are also requested to communicate with the hon. secretary with the view of exhibiting on this occasion.

The President and Council of the Royal Institute of the Architects of Ireland have issued invitations for a conversazione to be held in the rooms of the Royal Hibernian Academy on Thursday evening, April 30.

The Tower of Shrewsbury Abbey Church is to be restored at a cost of 2,000*l.*

Colonel Sir Herbert Jekyll has been nominated to represent the Board of Trade on the committee appointed, at the request of that Department, by the Institution of Civil Engineers in regard to the Government grant of 3,000*l.* in aid of the funds of the Engineering Standards committee.

Mr. Robert Aspland Marillier, of Scarborough, civil engineer, formerly engineer to the Hull Docks Company and to the North-Eastern Railway Company for docks, who died on February 12 last, aged seventy-eight years, left estate of the gross value of 98,248*l.* 4*s.* 10*d.*, including personalty of the net value of 78,508*l.* 15*s.* 9*d.*

The Bavarian Excavations in Orchomenos, in Boeotia, have been successful in discovering the foundations of a palace which evidently was adorned with paintings in the Mycenaean style.

The Brighton Town Council has accepted the offer made by Mr. Henry Willett of his collection of sixty-six works, mostly by great masters and their pupils, which has been on exhibition since February last.

The Fund for the renovation of Sherborne Abbey has reached 600*l.*, which is about 100*l.* short of the sum required. According to the report of Mr. Batchelor, the architect, the work on the roof will absorb 430*l.* Other work is necessary, including overhauling the bells, recasting the seventh bell (119*l.*), restoration of the south transept in order to bring it into character with the rest of the building, and taking up and relaying the nave.

The Yates Lectures on "Archæology" at University College will be given this year by Dr. Arthur J. Evans, the subject being "The Minoan Civilisation of Crete and its Place in the Ancient World."

The Newcastle-on-Tyne Associated Masters on Monday decided to withdraw their demands for certain alterations in the masons' working rules and for the extension of the stonemasons' working day by one hour. The 400 masons who came out on strike last Thursday against these demands therefore returned to work on Tuesday.

Lieutenant-Colonel John Temple Temple West has left personal estate of the net value of 261,588*l.* 10*s.* 1*d.*, and the gross value of whose estate is 433,518*l.* 11*s.* 10*d.* Colonel West left the residue of his property in trust—as to two-fifths to the Trustees or Governors of the National Gallery, in trust for the use and benefit of that institution, to expend the income on works of art in such manner as the said authorities shall see fit.

The New municipal map of Paris, which is 25 yards long and nearly 20 yards wide, shows every detail of the city, and 88,500 houses are recognisable.

The Saturday Afternoon excursions of the London Geological Field Class conducted by Professor H. S. Seeley, F.R.S., will commence on April 25. Amongst the localities to be visited this season will be Walton-on-the-Hill, Aylesbury, Harefield, Sevenoaks, Leighton and Tunbridge Wells. Further particulars can be obtained from the hon. secretary, Mr. R. Herbert Bentley, 33 Church Crescent, Muswell Hill, N.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BLACKPOOL.—June 30.—The Corporation of Blackpool offer premiums of £100, £50, £30 and £20 respectively for designs for new picture poster. Mr. C. Noden, Corporation advertising manager, Town Hall, Blackpool.

FENTON.—April 30.—Designs are invited for a public free library. Premiums of 60*l.* and 30*l.* are offered for the two selected designs. Mr. S. A. Goodall, surveyor, Town Hall, Fenton.

MANCHESTER.—April 30.—Architects within a radius of thirty miles of Manchester are invited to submit competitive designs for an hospital to be erected in Quay Street, Manchester, at a cost not to exceed 14,000*l.* Premiums of 75*l.*, 50*l.* and 25*l.* respectively will be awarded. Mr. James Fildes, hon. secretary, Quay Street, Manchester.

MANCHESTER.—May 1.—Plans are invited for a new Manchester Royal Infirmary, to contain about 500 beds. Mr. W. L. Saunder, general superintendent and secretary, Manchester Royal Infirmary.

NEW BROMPTON (KENT).—May 30.—Designs and plans are invited in competition for public swimming and slipper

baths to be erected in Windsor Road, New Brompton. Three premiums are offered, one of £20 to the author of the design which is considered to be the first in order of merit, one of £10 and one of £5 respectively for the second and third. Mr. F. C. Boucher, clerk, New Brompton, Kent.

SHEFFIELD.—Competitive designs and tenders are invited for the erection of about 122 artisans' dwellings on the High Wincobank estate. Premiums of 50*l.*, 30*l.* and 20*l.* are offered. Mr. C. F. Wike, city surveyor, Sheffield.

NEW CATALOGUE.

THE April Stock Sheet just issued by Messrs. Hahn & Co., of 66 Mark Lane, timber merchants and importers of foreign hardwoods, shows that they hold a very large stock of the choicer hardwoods. Especially is this the case as regards the finer kinds of mahogany, of which they have a large variety. In addition to cabinet and ornamental woods, they carry a most extensive stock of seasoned hardwood specially selected for builders' requirements.

THE "PHALANX" REVOLVING VENTILATING BLIND.

FEW, if any, who have been accustomed to the use of outside window blinds or shutters can have failed to be forcibly impressed from time to time by the serious shortcomings which seem inherent in most of those of the regulation types, being due as much to the system adopted as to the materials employed, and the effect of our much-discussed climate. And this season of the year being an appropriate time to call attention to the improved system introduced by the Phalanx Window Blind Company, whose showrooms we recently visited, a brief description will no doubt be read with interest.

Taking first the prismatic revolving ventilating blind, designed to take the place of venetian or spring-roller blinds for external use, the laths which are made one inch wide are so fixed that a space is left between each one sufficient to admit air and light, while affording perfect protection against the rays of the sun. They are attached to a wooden roller placed under the lintel, and which, to prevent warping, is strengthened by an iron rod through the centre. The blind descends into a grooved-iron frame which holds it rigid, and is raised or lowered by means of a band of webbing wound round one end of the roller. By means of an ingenious winding-box which is fixed inside the room, the band is wound up as it is drawn down to raise the blind, and also acts as an automatic holder, securely maintaining the blind at any desired height, immediately the hand releases the drawing band. The winding-box is well-finished and ornamental in appearance, but it can be preferred let into the wall, and the drawing band placed out of sight.

When the band is released from the holder the blind descends by its own weight, and while under complete control is checked from going too far by the top lath, made thicker than the others, which prevents it entering the iron frame, but does not take up extra space, as it fits into a groove in the roller when the blind is raised.

Fig. 1 shows front view of blind when lowered. In fig. 2 it will be noticed that the iron frame is hinged, allowing the blind to be swung out as an awning when desired, and also shows the usual manner of fixing. Fig. 3 illustrates an alternative method where there is not sufficient space below the lintel.

Another form of the ventilation roller-shutter enables it to be used as described above, or the light and air can be excluded from the lowest part to any desired height. This is

ected by mortised laths connected together through the
ntre by movable steel strips, galvanised to prevent rust.
hen the blind is lowered it forms a solid closed surface, but
drawing the lifting band the laths move one by one half an

Fig. 1.

Fig. 2. Fig. 3.

ch away from each other, commencing from the top, until
e band is released. This shutter is also made with slots cut
the laths, affording more light and air, but preventing the
terior of the room being seen from the outside.

The company also manufacture venetian blinds for inside
outside use, but with improvements. The old method of
ords is discarded, and in place of them for inside use bands
e employed and fixed to a roller, the same as with the
utters, rendering it impossible for the blind to run unevenly.
hey are raised and lowered by the drawing band and winding-
x and holder, and are extremely easy to manipulate, and one
nd only is necessary to be used.

For outside use no webbings at all are used, only rust-proof
aterials. By use of the iron frame they can be swung out as
awning, and the laths closed or opened at will from inside
e room.

In all cases the outside blinds and shutters are protected
hen drawn up by canopies made in zinc of ornamental
signs to suit the character of the building, and can, if de-
red, be supplied painted in colours.

We have said sufficient to explain the various improvements

both in shutters and blinds adopted by the Phalanx Window
Blind Company, whose showrooms are at 50 Bishopsgate
Street Without, where further particulars can readily be ob-
tained, and the different patterns be seen in operation; but we
may mention that the manufacturers have during the past
twenty-five years supplied them to royal palaces, mansions,
hospitals, and sanatoria, municipal and government buildings
throughout the continent of Europe, and have met with the
approval of all those who have adopted them.

NEW "BALTIC" AND SHIPPING EXCHANGE.

THE imposing palatial building which has risen on the site of
the world-renowned "Baltic" coffee-house was opened with
considerable ceremony by the Lord Mayor on Tuesday last.

The new building has a frontage in St. Mary Axe, of which,
being in free Renaissance style, it forms a very handsome
feature. A spacious vestibule, finished with grey and white
marble, with a range of detached marble columns on either
side, leads to the great hall, and the windows are filled with
painted glass representing the crests of the leading City
companies and the principal ports of the kingdom. At the end
of the hall is a postal and telegraph department, with offices
for the chief of the cable companies, and above is a reading-
room. A marble staircase leads from the hall to the basement,
where are located members' dining, luncheon and smoking-
rooms, and auction and arbitration rooms. In a sub-basement
is an electric-light installation and pumping machinery, for the
building provides its own light and its own water. Above the
Exchange are four floors of offices, privately approached.
Altogether the building represents an expenditure of about
half a million of money. The architect is Mr. T. H. Smith, with
whom the late Mr. W. Wimble was associated, and the con-
tractors are Messrs. G. Trollope & Co.

TRADE NOTES.

Ludgate Circus, London, E.C.

THE Arrolithic Company (Mainzer's patent), of 18 Berners Street, W., have secured the contracts for paving with their marble Arrolithic the following buildings, *i.e.* the Warwick Union Infirmary (Mr. F. P. Trepass, architect), Northampton Infirmary (Mr. F. W. Dorman, architect), new central police station, Hull (Mr. J. H. Hirst, city architect), and the new electric sub-station and offices for Willesden District Council (Mr. O. Claude Robson, engineer to the Council).

BUILDING AND BUILDERS.

THE foundation and memorial-stones of a new Wesleyan chapel have been laid at Cayton.

THE foundation-stones of a new Roman Catholic church and school, to take the place of St. James's at Renfrew, were laid on the 18th inst.

THE Little Lever (Lancs) Wesleyans are proceeding with the erection of a new place of worship at a cost of nearly 5,000*l.* It is expected to be completed by November.

THE Hay Rural District Council, Talgarth, have received the sanction of the Local Government Board to the borrowing of 5,597*l.* for purposes of sewerage and sewage disposal. The engineer to the scheme is Mr. R. E. W. Berrington, M.Inst.C.E., of Wolverhampton and Westminster.

AT a mass meeting held in St. Cuthbert's Hall, Edinburgh, of the joiners of Edinburgh who were last week on strike, it was stated that the masters had signed the twelve months' agreement, which included the wages agreement and the non-alteration of the rules, which were the questions at issue. Thus ended the strike, which lasted scarcely half a day.

THE competitive designs for the proposed new municipal and library buildings in Hamilton, recently sent in, had to be set aside owing to the estimated cost exceeding that stipulated. The question of the payment to each of an honorarium was discussed at Hamilton Town Council last week, and by 12 to 3 it was decided that none should be paid.

THE first stone was laid on Easter Monday of the new mission church at Foulridge, near Colne. The village is in the large and straggling parish of Christ Church, Colne, but lies at a distance of two miles from the parish church, so that a mission church is greatly needed. A site has been given, and a certain proportion of the building fund has been obtained.

A MEETING of the district committee of the Ayrshire County Council was held in the county board-room, Ayr, on the 14th inst., Mr. Claude Hamilton, chairman of the committee, presiding. The hospital committee minutes dealt with the proposed new infectious diseases hospital at the old powder magazine, near Ayr. The committee recommended that the site and terms for the purchase of the site were satisfactory, that competitive plans be asked for, that the total cost of the hospital be not more than 7,000*l.*, and that the size of the hospital be for sixteen beds. The recommendations were agreed to, and it was remitted to the committee, with full powers, to proceed with the construction of the hospital.

THE baths committee of the Manchester Corporation have adopted the estimates for the year. They propose to expend 25,850*l.* in the erection of new baths in High Street, Chorlton-on-Medlock, 750*l.* in plans and other preparations for the erection of another set of baths in Bradford, and 3,750*l.* in meeting a long-felt need in Pryme Street, Hulme, where they propose to build a small bath and a set of public washhouses. The amount for the purpose will have to be specially borrowed. The receipts last year from bathers were 6,737*l.*, which was considerably less than the estimate of 7,208*l.*, and leaves an excess of 1,280*l.* to be raised this year from the rates. The original amount estimated as required was 22,847*l.*, which, with the 1,280*l.* already mentioned, brings the grand total up to 24,127*l.*

THE completion of considerable improvement and extension at High Street church, Shrewsbury, was celebrated by special services on the 7th inst. The alterations include the enlargement of the church on the south side to provide an organ-chamber and the removal of the organ from the gallery to the ground floor. Accommodation has also been provided on the ground floor for the choir, and the place they formerly occupied in the gallery has been utilised for the enlargement of the school-room, thereby making room for thirty additional scholars. New choir stalls, made in oak, greatly improve the appearance of the church, and another improvement which will be most acceptable to the worshippers is the substitution of comfortable seats for the old-fashioned high pews which have been a feature of the church for so many years. The walls, &c., have been tastefully re-decorated and the floor has been relaid, that of the aisle in mosaic by artists from Venice, and the body with parquet paving. The organ has also been thoroughly overhauled and repaired. The

THE HELLIWELL

"PERFECTION SYSTEM"

PATENT GLAZING

WORKS: BRIGHOUSE, YORKS.

LONDON OFFICE: 11 VICTORIA STREET, WESTMINSTER, S.W.

erations, including the acquisition of two cottages, will cost out 1,000/. The contractors were Mr. Stanley (decorations), Mr. Pace (restoration) and Mr. Bickerton (reseating). It is interesting to note that this church is one of the oldest nonconformist places of worship in Shropshire. The present structure was built in 1691, the community being founded in 162.

At Lings's Row, North Wingfield, on Easter Monday, a number of foundation-stones were laid of the new chapel which is being erected there by the Primitive Methodist body. The cost of the new building, which has been rendered necessary by the need of increased accommodation to meet the rapidly increasing population of the district, which is now estimated at 2,000, adjoins the existing Salem chapel, which was erected in 1864 and which for a number of years back has had to serve both as a Sunday-school for the children and as a place of public worship. The new chapel, which is being constructed according to the designs of Mr. W. C. Jackson, F.S.A., architect, of Chesterfield, by Messrs. Cowley & Bell, of Hasland and North Wingfield, is designed in the Gothic style of architecture, in pressed bricks with stone dressings. The roofing and woodwork will be in redwood, and the windows glazed with leaded lights. The cost, inclusive of the site, is estimated at 1,275/.

VARIETIES.

Mr. E. W. MOUNTFORD is the architect for the new disinfecting station in Cowcross Street. The panels on the front are by Mr. W. Pomeroy.

The annual meeting of the Institution of Civil Engineers, when the report of the Council will be received, will be on Wednesday next.

The Local Government Board have approved of the scheme for the erection of houses for the working classes at Kingstown, Dublin, to the extent of 58,000/.

The Manchester City Council will insert in the Bill now before Parliament, a clause authorising the purchase of the Manchester Infirmary, and conferring powers to borrow the money required.

The dedication of the new All Saints Episcopal Church at Sackville, N.B., by the Lord Bishop of Glasgow and Galloway, took place on Saturday. The church, erected at a total cost of about 2,000/, is of Early English architecture.

THE contract for the new naval college buildings at Osborne, Isle of Wight, has now been placed. Nearly a quarter of a million feet of Uralite, the new fireproof material, will be used. Uralite is manufactured by the British Uralite Company, Ltd., at Higham in Kent. Head office, 50 Cannon Street, London, E.C.

THE new Primitive Methodist school in Lightbowne Road, Moston, was opened on the 8th inst. This extension has become necessary on account of the great increase in the number of scholars. The new structure is estimated to cost about 1,400/.

On the 18th inst. the Victoria Memorial Cottage Hospital, which has a pleasant southern exposure at Balmallock, Kilsyth, on a site granted free of charge by Sir Archibald Edmonstone, Bart, was formally opened. The cost of the building, of which Mr. R. Walker is the architect, is nearly 2,000/.

At a meeting of the Glasgow Archaeological Society in the rooms, 207 Bath Street, papers were read on Carsluith Castle and Browns of Sweetheart Abbey by Mr. J. S. Fleming, F.S.A.Scot., and on sculptured stones at Kilmodan by Mr. Robert Brydall, F.S.A.Scot. Both papers were illustrated by drawings.

THE election of the Architectural Association of Ireland has resulted as follows:—President, Charles H. Ashworth; vice-presidents, H. Allberry, James H. Webb; hon. treasurer, E. Bradberry; hon. librarian, T. Cullimore; hon. secretaries, A. G. C. Millar and F. Hayes; hon. auditors, P. F. O'Sullivan and G. R. Corringham.

MR. JAMES MAITLAND, who, since the death of his brother, the late Provost Maitland, has been sole partner in the firm of A. Maitland & Sons, architects, Tain, has taken into partnership his nephew, Mr. Andrew Gordon Maitland, son of the late Provost Maitland, and the business will be carried on as before, under the firm name of A. Maitland & Sons, architects.

THE Galston Gas Light Company have just inaugurated the completion of a new gasholder, with a holding capacity of 80,000 cubic feet. The tank and holder, which are of steel, were built by Messrs. Clayton, Son & Co., Leeds, and the foundations by Mr. Thomas Timothy, builder, Galston. The cost is about 2,500/.

THE amount of church extension which is going on in the large towns is shown by the following figures. The amounts are for a period of twenty-five years. Manchester 859,757/.

THE SILICATE PAINT CO., J. B. ORR & CO., Ltd., CHARLTON, LONDON, S.E.

Bristol 505,351 $\frac{1}{2}$, Leeds 358,278 $\frac{1}{2}$, Birmingham 315,807 $\frac{1}{2}$, Sheffield 303,957 $\frac{1}{2}$, Bolton 290,000 $\frac{1}{2}$, Halifax 275,117 $\frac{1}{2}$, Nottingham 233,466 $\frac{1}{2}$, Hull 207,335 $\frac{1}{2}$, Preston 156,300 $\frac{1}{2}$.

THE new parish hall, erected adjacent to the Church of the Ascension, in Thorold Road, Bitterne, Hants, was dedicated and opened on Wednesday. The hall is 68 feet long by 28 feet, and is capable of accommodating 300. It is built in Queen Anne style. There are no elaborate adornments, but it is comfortably furnished. A commodious stage has been erected, with the usual appointments, and there are retiring-rooms, boiler-house and a kitchen.

THE new waterworks of the Prestatyn Urban Council were opened on the 16th inst. The old works were purchased from Lady McLaren and reconstructed by Messrs. Beloe & Priest, civil engineers, Liverpool, the contractor being Mr. Carder, Penkridge, Stafford. The water is obtained from a natural spring in the mountains nearly 400 feet above the sea-level, and gushes out at the rate of nearly 8,000,000 gallons a day. It is the second largest spring in the kingdom, Holywell being the largest. The total cost of the works will be about 18,000 $\frac{1}{2}$.

THE foundation-stones were laid recently of two new hospital pavilions and an annexe to the nurses' home at the workhouse of the Chorlton Union at Withington. The infirmary accommodation is at present inadequate, and the Board of Guardians have recently obtained permission to borrow 33,920 $\frac{1}{2}$ for purposes of extension. Mr. J. B. Broadbent, of Manchester, is the architect of the new buildings. The pavilions, when complete, will be practically a new infirmary, which, with the existing hospital, will accommodate some 1,600 patients. The pavilions will have thirty-two beds on each of three floors. The surgical wards will contain thirteen beds. Altogether the number of beds provided is 205. The nurses' home provides for the present and for the future requirements of the nursing staff of the workhouse infirmary, and it is to be built on the single-corridor plan. There will be accommodation for forty-nine nurses and ten servants, or for fifty-five nurses if the servants are housed elsewhere. The cost of the home is put down at 7,400 $\frac{1}{2}$, and that of the two pavilions at 25,300 $\frac{1}{2}$.

HIS Majesty the King has been graciously pleased to accept from Professor Corfield, M.D., of University College, consulting sanitary adviser to His Majesty's Office of Works, a copy of the Milroy Lectures on "The Etiology of Typhoid Fever," delivered by him before the Royal College of Physicians last year, by special request of the Council of the College, in

one of which lectures Dr. Corfield states his opinion that the attack of typhoid fever from which His Majesty suffered in 1871, when Prince of Wales, was not due to any sanitary defects in Londesborough Lodge, Scarborough, the house in which he was staying, and the sanitary condition of which was described by Dr. Corfield in a letter published in the *Times* of January 23, 1872, but was no doubt due to contaminated food or drink partaken of by His Royal Highness, the gentlemen of the party, and some of the men-servants, away from the house—perhaps at a shooting luncheon; as Her Royal Highness the Princess of Wales, the ladies of the party, and all the female servants escaped the infection. The disease, in fact, entirely spared those who were most in the house, and only attacked those who were most away from it, and some of whom did not even sleep there.

ELECTRIC NOTE.

THE estimates for the electricity department of the Manchester City Corporation were submitted to a meeting of the electricity committee on Tuesday. On the revenue side it is estimated there will be an income of 233,000 $\frac{1}{2}$, as against an estimated expenditure of 242,450 $\frac{1}{2}$, leaving 9,450 $\frac{1}{2}$ to be provided out of the reserve fund. The principal items on the income side are 150,800 $\frac{1}{2}$ by sales of current and meter and motor rentals, 81,250 $\frac{1}{2}$ cost of current for the tramways departments, and 330 $\frac{1}{2}$ for street lighting from the City Fund. On the expenditure side coal is responsible for 36,700 $\frac{1}{2}$; oil, engine-room stores, &c., 8,900 $\frac{1}{2}$; wages, 30,200 $\frac{1}{2}$; repairs, maintenance and renewals of buildings, machinery and mains, 30,000 $\frac{1}{2}$; rent, rates and taxes, 17,000 $\frac{1}{2}$; stationery, printing and advertising, 1,800 $\frac{1}{2}$; general establishment charges, 2,500 $\frac{1}{2}$; law and Parliamentary expenses, 3,000 $\frac{1}{2}$; interest on mortgage debt, 61,300 $\frac{1}{2}$; sinking fund, 44,157 $\frac{1}{2}$; and instalment of loans repaid, 5,043 $\frac{1}{2}$. The corresponding expenditure estimate last year was for 175,459 $\frac{1}{2}$ and the approximate actual expenditure 189,266 $\frac{1}{2}$; whilst the income, which was estimated to be 166,447 $\frac{1}{2}$, was approximately 189,266 $\frac{1}{2}$. On capital expenditure the amounts, which last year were estimated at 875,799 $\frac{1}{2}$, and of which 626,959 $\frac{1}{2}$ was actually disbursed, this year drop to 350,600 $\frac{1}{2}$. Buildings and machinery at Dickinson Street are to cost 20,000 $\frac{1}{2}$, at Bloom Street 16,000 $\frac{1}{2}$, at Stuart Street (where the new railway is an added charge) 200,000 $\frac{1}{2}$, whilst the various distributing stations are estimated to cost 66,000 $\frac{1}{2}$ before next March. Mains are put at 42,000 $\frac{1}{2}$, meters at 1,500 $\frac{1}{2}$ and motors

EASINGWOLD WATERWORKS.

On Tuesday last an important scheme for supplying the villages of Carlton Husthwaite, Raskelf, Flawith, Tholthorpe, Easingwold, Aldwark, Tollerton, Huby and Sutton-on-Forest with an ample supply of pure water was brought to a successful fruition. The reservoir is situated just beyond Kilburn, at the foot of the Easingwold Hills, and directly beneath the feet of the Great White Horse, which is such a prominent landmark, visible for many a mile. The works, which are of an extensive nature, bear testimony to the efforts which the Rural District Council have made to boldly grasp the question of supplying a large part of their district with a copious and pure supply. Messrs. Fairbank & Son, C.E., of Lendal Chambers, York, were consulted, and after an exhaustive inquiry into the existing condition of the district and the possibility of procuring a good and permanent supply of water, the scheme now completed is presented to and approved by the rural district council. Application was made to the Local Government Board to borrow the sum of 17,600l. in order to carry out the works, and after an inquiry by Mr. W. A. Ducat, on August 30, 1900, permission to do this was granted. The supply is obtained from two sources, namely, part of the springs supplying the Kilburn reservoir and the Cragg Hall springs. The supply from Kilburn is conducted to the inlet chamber, and any water not actually consumed is returned to its original course by means of the overflow. Cragg Hall springs are conducted into the inlet chamber of the reservoir by 4-inch cast-iron pipes. These pipes are provided with an equilibrium float valve at their lower end, so that as soon as the reservoir is full the rest of the Cragg Hall spring water overflows into its original watercourse at Cragg Hall. The total supply available from these two combined sources is close upon 80,000 gallons per twenty-four hours. From the inlet-chamber the water flows into the covered storage-reservoir holding 120,000 gallons. The reservoir is constructed of Portland cement concrete, and is provided with a usual overflow, wash-out pipes and valves for controlling the supply, and is covered with a self-supporting galvanised iron roof. A special feature of the reservoir is the drawing off the supply to the villages from just beneath the surface of the water by a floating arm. A 5-inch pipe is carried from the

inlet-chamber to the reservoir, and is provided with a valve so that the water may flow direct to the villages at such times as when the reservoir is being cleaned out. From the reservoir the water is conducted by a 5 inch cast-iron main as far as Alne Cross, then to Huby in a 4-inch main, and finally to Sutton in a 3-inch main. Three-inch mains for the purpose of distributing the water are laid in the various villages. Valves are provided *en route* to divide the delivery main into sections and control the supply. Wash-outs and air-valves are provided, also hydrants in the villages for fire protection and local flushings. The water is supplied to consumers by service pipes carried to the boundary of the private property and provided with stop taps. About thirty miles of mains have been laid. The water level in the reservoir is about 400 feet above the surface of the ground at the lowest part of the system. A break-pressure tank therefore is provided at Husthwaite so as to prevent an excessive pressure on the lower portion of the system. The whole of the works have been designed and carried out under the supervision of Messrs. Fairbank & Son, who in 1898 completed the Nunnington, Stonegrave and District Waterworks, who have been represented on the works by Mr. R. Godfrey as resident engineer.

BIRKENHEAD TOWN HALL TOWER.

A SPECIAL meeting of the Birkenhead Town Council was held recently to consider a recommendation of the finance committee to accept the tender of Messrs. William Thornton & Sons, Wellington Road, Liverpool, to rebuild the upper stages of the tower of the town hall for 5,335l.

Mr. A. M. Robinson, chairman of the finance committee, said the Council had been called specially so that the work of restoring the tower might be commenced at the earliest date. There were six tenders received, the amounts varying considerably. The lowest was unfortunately coupled with unfavourable conditions for the Corporation, among them being a clause setting down the time for the work at a great deal more than double the period agreed to by the firm recommended, whose tender was next to the lowest. Messrs. Thornton had agreed to all the somewhat onerous conditions imposed by the Corporation, and their tender and work was fully approved by the architect, Mr. Henry Hartley. Among other buildings Messrs. Thornton were building the Royal Insurance Company's new offices in Liverpool. They also

undertook to complete the work in six months, which would give the Council the use of the completed town hall for next winter. He moved that the tender of Messrs. Thornton be accepted. Mr. W. G. Wall seconded.

Messrs. Grice and Snape asked for particulars of the other conditions of the lowest tender which rendered it unfavourable, Mr. Snape stating that it came from a Birkenhead firm and deserved full consideration before it was rejected. Personally, too, he doubted the wisdom of completing such work in the short space of six months.

Alderman Singleton said the lowest tender was from Mr. J. E. Gabbutt, of Birkenhead, who tendered to do the work in fifteen months for 4,997/. Messrs. Thornton offered to complete it in eight months for 5,085/., but afterwards reported that the special stone required by the Corporation could not be obtained, that particular quarry having contracted to supply all their available stone elsewhere. They offered to supply another and harder stone at an extra cost of 250/., and undertook to do the work in six months. Apart from the time the money difference in the two tenders was 330/., and more than that amount would be saved in the renting of outside offices for certain departments which could be rehoused in the town hall as soon as the work of restoration was complete. Under the circumstances the finance committee unhesitatingly recommended Messrs. Thornton's tender as the most advantageous in every way.

Mr. Snape thanked Alderman Singleton for the explanation, and said he entirely agreed with his observations.

The committee's recommendation was accepted without further comment.

THE SURVEYORS' INSTITUTION AND IRELAND.

ARRANGEMENTS for the visit of the Surveyors' Institution to Ireland next month are now completed. The Conference on the first day (Thursday, May 7) will be held, by permission of the Royal Dublin Society, in the lecture theatre of Leinster House, when the visiting members will be received by Lord Ardilaun, and an address of welcome will be delivered by the Lord Mayor of Dublin. The morning will be devoted to the reading and discussion of papers, after which the Irish members of the Institute will entertain the visitors at luncheon. In the afternoon parties of members will visit Trinity College,

St. Patrick's Cathedral, Dublin Castle, the National Library, the Bank of Ireland and Guinness's Brewery, and in the evening there will be a dinner at the Métropole Hotel. On the following day excursions will be made to Powerscourt House, by permission of Viscount Powerscourt; to the Agricultural College, Glasnevin; to Belfast and the Giant Causeway, and to Killarney, reduced fares having been provided for in each case. It was hoped that arrangements might have been made, as on former occasions, for a reduction of fares on the English railways, but this has proved impossible owing to new regulations at the Clearing House. The Irish railways, however, have been more compliant, and have conceded special facilities. Reserved saloon carriages will be attached by the London and North-Western Railway Company to the luncheon car train leaving Euston at 11 A.M. on Wednesday, May 6, and the party will reach Dublin (North Wall station) at 8.30 P.M. The Shelbourne hotel will be the headquarters of the Institution during the visit.

FIRE IN AN IRON AND STEEL FRAME BUILDING.

THE Roosevelt Building, Broadway and Thirteenth Street, says the *Engineering Record*, is a 110 by 110-foot eight-storey and basement building used for commercial, manufacturing and warehouse purposes. It had unprotected cast-iron interior columns 8 inches in diameter and steel wall columns. The floor and roof were of hollow tile segmental arches between 10-inch I-beams, supported on double 12-inch I-beam girders. The lower flanges of the beams and girders were protected by plaster on expanded metal furring, set close to the steel without enclosed air space. The floors were covered with 1-inch boards nailed to wooden strips bedded in concrete filling. The ceiling was plastered direct on the under side of the floor arches. There was a central elevator and stair shaft and a rear elevator and a rear stair shaft, all enclosed with hollow-tile partitions having wooden doors and large windows glazed with thin glass in each storey. Both sets of stairs had iron strings and stone treads without reinforcing webs. The basement, first, second, fifth and seventh storeys were occupied with stocks of clothing on wooden tables. The third and sixth storeys were used for the manufacture of suspenders and neckwear, the fourth storey for storing spool and embroidery silks, and the eighth storey for a tailor's cutting department.

ing and contents was injured or destroyed by a severe fire was made the subject of investigation by the Continental Insurance Company of New York. Their special inspector trained engineer made a report in which he described the destruction of the building substantially as above noted, the extent of the damage, and, in conclusion, the lesson to be learned from the standpoint of the insurance company. He stated the building as belonging to the "class commonly designated as fireproof buildings with unprotected ironwork adapted for mercantile and like manufacturing purposes." The report goes on to say that—

"The first warning of the fire was given by the pneumatic (automatic) alarm with which the building was equipped. As far as can be determined, it started in rear part of the northern half of the sixth floor amongst a quantity of drummers' trunks, samples, &c. It evidently spread very rapidly and reached the central stair and elevator shaft referred to (which was practically not cut off except by thin glass windows and wooden sashes) and entered each of the floors above. The sixth and seventh floors were divided in two at the centre (north of the stair shaft) by 2-inch brick tile partitions plastered $\frac{1}{2}$ inch on each side, and the fire succeeded admirably in confining most of the fire on the sixth floor to the southern half; but in this portion the stock was about total on each floor. In the eighth floor the fire burned more fiercely than on the others, and produced the most disastrous results. Five of the cast-iron columns supporting the roof broke off clean about 2 feet from the top, and all of the remaining columns were badly warped and twisted; like part of the framework of the outer walls, where the portion had been pulled off by the falling of the roof beams, giving way of the columns caused the entire roof except about one-third of the area in one corner to fall, and in consequence one section of it fell through the eighth floor, making a hole in the same about 12 by 15 feet, and landed on the ninth floor, which sagged considerably (where hit) from the increased load but remained intact. Part of the roof dropped on the stair landing in the central shaft referred to and fell right down through the building, carrying each landing with succession. The ironwork in the sixth and seventh floors appears to be in good condition, and structurally the building does not appear to be seriously damaged below the eighth floor, with the exception of the two broken floors where the roof fell through. The exterior walls being chiefly of brick and terra-cotta, damage to them was slight. Had they been of stone the

loss would probably have been much larger. Loss on building estimated at from 25 to 30 per cent.

While this fire is probably the most important that has occurred in this class of risks in New York, it can hardly be considered as teaching any new lesson, but rather as demonstrating and emphasising the opinions universally held by insurance engineers; firstly, that vertical openings not thoroughly enclosed in fireproof material are an extremely vital defect, and make an otherwise well-built building practically at the mercy of any fire once well under weigh, and secondly, that unprotected ironwork is a dangerous thing, never to be depended upon. The floor arches withstood the extreme heat of the fire satisfactorily, and it can be stated to a certainty that had the elevators and stairways been enclosed according to underwriters' standards, and the ironwork been protected, the same fire under the same conditions would not have spread beyond the floor upon which it originated.

Another point the fire emphasises is the necessity of at least two stairways in all buildings of this class, and the importance of having the treads rest on an iron web or plate, as called for under the new laws. It will be noted that one stairway in this risk was made a wreck by the falling of the roof, and had it not been for the second stairway escape would have been entirely cut off for the firemen, and there would have been no way to fight the blaze except from adjoining buildings. From an insurance standpoint a fireproof building with unprotected ironwork and floors not cut off when filled with merchandise is scarcely better than an ordinary building, and as far as the stocks in such buildings are concerned they are hardly as desirable, if all on one floor, as when in an ordinary building of medium height. The floors of a fireproof building act as a reverberating furnace, and stocks contained therein are liable to be most effectually cremated, but if they be distributed over several floors properly cut off only that proportion on the floor where the fire originated should suffer.

BRIDGE CONSTRUCTION AT WORKINGTON.

MR. A. A. G. LISTS of ART PLATES and of
CATHEDRALS, published in THE ARCHITECT, sent
on application to GILBERT WOOD & CO. Ltd., Imperial
Buildings, Ludgate Circus, London,

Mr. John Warwick, appeared on behalf of the Workington Corporation.

Mr. J. Bintley, surveyor to the Westmoreland County Council and engineer of the bridge works, produced plans and gave evidence. He detailed the items of expenditure not included in the specification. Amongst these were a cut-water and the pitching of the west bank. In his opinion the pitching of the bank would prevent the flooding of part of the town by the spring tides. The bridge was commenced on July 4, 1901. He was practically certain that his estimate would not be exceeded.

The Inspector inquired if there was any other authority except the County Council concerned.

Mr. Mayer replied in the negative.

Mr. H. McAleer: What has the additional cost of the girders been?

Mr. Bintley: About 1,700%.

The Inspector: What do you mean by additional cost?

Mr. McAleer: The original girders did not turn out quite right.

The Inspector: The girders were found useless, you say?

Mr. McAleer: That is with regard to the mill stream bridge.

In answer to the Inspector, Mr. Mayer explained that the girders for the mill stream bridge were rejected, and the Maryport bridge girders were used instead, and fresh girders obtained for the Maryport and railway bridges. The extra cost was 1,700%. He had the rejected girders on hand, which he would try to sell.

Mr. McAleer said he thought Mr. Bintley ought to bear the loss in connection with the girders.

The Inspector: You must take that to the Town Council. This point of the County Council's contribution seems rather mixed up.

Mr. Mayer stated that Mr. Bell, Mr. Eden and Mr. Wood all made estimates for a bridge, but not for the work that had been constructed.

The Inspector said what the Board would want to know was on what basis the 10,000% put in the Act as the provision for a new bridge was made, and why the bridge actually constructed had cost 27,000%.

Mr. Mayer said Mr. Bell's bridge would have drowned the houses out at Northside. Mr. Bell put in nothing for compensation.

Mr. Bell: I was not asked to.

Mr. McAleer: There would not have been if the thing had been carried out in the proper way.

Mr. Bell said his instructions were to make a bridge between two points. There was a great deal of feeling whether the bridge should come out at the top end or at the lower part of the town, and he made a straight road to come right out on William Street. The intention of the Council then was to buy the William Street property.

The Inspector said a point was that at first the Council considered 10,000% would be sufficient, and now they sought sanction for the greatly-increased scheme.

In reply to the Inspector, Mr. Hodgson stated that the County Council had never promised any specific sum.

The Inspector asked what might be given by them.

Mr. Hodgson: I can only say that the committee have considered the application, and that at present the minutes of the County Council speak for themselves. It was exceedingly improbable that the County Council would contribute more than 5,000%. The County Council objected strongly to the height of the bridge. As far as they could the County Council were insisting on bridges 17 feet 6 inches in height on account of tramways. The bridge was only 14 feet 6 inches.

The inquiry then terminated.

THE CONSTRUCTION OF A SKYSCRAPER.

In the *New York Evening Post* Mr. Edward Lowry gives an account of the way the tall buildings of New York are raised. In the beginning, he says, there is the man with the money who buys the ground and pays for the building when it is erected. Next comes the capitalist, who executes the plans, prescribing definitely and comprehensively what manner of building is to be erected; how many floors, of what height and width, saying where stone shall be put and where iron. He draws plans showing the exterior appearance of the building. Then the third factor, the designing engineer, takes charge. Before his share in the work is explained it must be understood that a modern steel-frame building is constructed on the same architectural principles as a canvas canoe—a light tough cover on a rigid, secure frame. Given the dimensions of the cover, the engineer designs a steel frame over which the hull of stone, brick and cement may be reared. In a steel-frame building the only purpose the outer walls serve is to keep out the weather. When the designing engineer has made

is shop drawings and sent them to the rolling mills his work ended.

The site cleared and the steel framework ready to be delivered, the fourth and most interesting factor—the engineer of construction—takes the work in hand. Because these men, by habit, speech and manner, in mental alertness, in their power to grapple with and master problems and obstacles, in their ability to “turn a keen, untroubled face home to the instant need of things,” typify what we are all proud to call the American spirit, the day’s work of one of them is chronicled here:—

First, he must be a master of men, knowing the sluggards among the workers, and the malcontents from the trustworthy, and able to bend them all to his will. In erecting a big “skyscraper” employment is given daily for many months to from 500 to 800 men, representing from thirty to sixty-five trades. Each of these trades has its union, and each of these unions has precise ideas as to the limitations of a day’s work and the price to be paid therefor, and in the present state of a fallen world these ideas are “subject to change without notice,” as the programmes in the vaudeville houses put it. The construction engineer must have the tact and the knowledge of human nature necessary to keep these men of diverse interests working in harmony. He will, if he is a man of the first class, seek to establish such relations with his men that they will show his interest is their interest, and that any delay on the work is “a throw-down for the boss.”

In one building that I know of, the estimated cost of the outside marblework alone was 1,000,000 dols. One day, when every marble worker in New York was busy, the men of that trade on this particular job decided they must have 50 cents added to their daily wage. The lock-out lasted a week before the men were taken back, and their demands granted. The enforced concession cost the contractors in round numbers just 2,000 dols. “And that didn’t do me a bit of good,” commented, in rueful tones, the engineer who told me the story. The incident throws a sidelight on one of his manifold responsibilities.

Sometimes it happens that men of two trades claim the privilege of doing a certain kind of work. The engineer must decide which trade is to have the job, and must make his decision so plain and deal such evenhanded justice as to satisfy the disappointed artisans. Practically not a week passes that is not marked by some labour dispute that, however trivial in its beginning, has not in it potentialities for

danger and delay. So it has come about that one of the prime requisites of a construction engineer is an ability to handle men. This must be considered apart from his executive ability, as shown in a well-ordered plan of work, supply of materials, and the direction of the activities of his labourers and artisans.

When an engineer is assigned to a building he takes the plans of the designing engineer and the architect, and studies them until he has mastered and carries in his mind the last intricate detail of each truss and beam and angle, until he knows each physical detail of the building to be erected, as a man may know his own children. An engineer coming into New York one morning recently from his New Jersey home pointed to a string of flat cars on a siding loaded with iron beams and pillars:—“There’s that section C stuff I have been waiting for,” he said. He had recognised it from the plans.

Carrying the entire plans for the building engraved on the plates of his mind, the engineer is ready to begin work. When the ironworkers and the riggers have shoved the framework up three or four storeys, the masons, stonecutters, steamfitters, fireproofers, tilelayers, carpenters and what not are called in, and the work of putting on the hull of the structure begins. The engineer is in daily consultation with the architect; he lives on the building, and as soon as possible establishes his office in it. Here he installs a clerk to receive materials, a time-keeper, a stenographer and maybe a clerk. At a certain hour each day he requires his division foremen, that is, the foreman of each trade, to report. He questions them regarding the progress of the work and the number of men employed and their needs. But decisive action is never taken until he has made personal inspection. The engineer must know as much about the work of each trade as the best man in that trade knows. He notes the number of men employed on each task, and he must know whether or not they are doing their full stint.

When the boss steamfitter comes to him with the demand that a hole be cut through an angle iron that a certain pipe may be placed, he must know whether the hole is necessary or not. He must be able to tell a stonecutter or a mason with equal positiveness wherein his work is lacking.

He must look far ahead and keep constantly before his eye a mental picture of the completed building. When a pipe is once placed or a beam laid and rivetted, the work must not be undone again to make place for something that should have gone before. Mr. Kipling has written of that board of London

directors who destroyed half an acre of calculations by decreeing at the eleventh hour that Findlayson's bridge should be half a foot wider than the original plans specified. The engineer must uphold the plans of his architect.

Sometimes it happens, when haste is desirable, that a building is started before the architect has completed his detailed plans, when none of the "inside work" is laid out. Then the engineer's work becomes doubly difficult. He must anticipate the plans of the architect, and do many important pieces of work on his own responsibility. Told that a certain heating system is to be installed, work must be directed in such a way that the steam or hot-air pipes will not mar the inside architectural beauties of the building. Every question the engineer decides means a saving or a loss in time and money to his employers, and usually involves no inconsiderable sum. They all agree that the man who can see furthest into the future and discern the needs of the growing structure is the man of highest value.

One afternoon, while I sat in an engineer's shanty on the ground floor of a big building now towering over Madison Square, these things happened in the order in which they are related:—

The engineer, a stockily-built, square-jawed young man, with the clearest grey eyes I ever saw, sat at a flat-topped desk going through a mass of papers like a young steam-engine. The cavernous interior of the incomplete structure echoed with the clanging of the rivetters' hammers and the harsh rattle of steam-winch.

"Take a letter to these cement people, Miss Daisy. Tell em that last lot of stuff wasn't up to grade, and I won't stand or it. Make it pretty strong. Tell the architect I'll be here all day to-morrow, and he can come any time he gets ready. You can answer this other stuff yourself. Have 'em all ready in an hour. Jim, tell Brannigan—y' know him? Foreman of the painting gang?—tell him to paint eight of those A16 beams along the Twenty-fourth Street side of section C with that new rust-proof paint. I want the architect to see how it goes. I don't want the rust spots covered where they were painted before, y' understand?"

He began signing the day's time card, while an under-sized man in a labourer's mortar-stained overalls stood in the doorway, waiting for the boss to look at him.

"Well, what is it? What can I do for you?"

The man whispered in the engineer's ear for a few minutes.

"Well, do you want to stay on the job? You can if you

want to, and you won't have to pay anybody 10 dols. either. Send that labour delegate to me, and I'll put it up to him so good and hard he won't come about this job again. The work's too hard, eh? and you want to quit? All right. Tom, give this man his time up to five o'clock. You come back here then and get your money."

"Scared out," said the engineer in explanation to his visitor. "I took him on to oblige a friend of mine, and to-day a walking delegate told him he would have to pony up 10 dols. if he wanted to stay on the job. He hasn't earned that much yet. I've got that labour delegate just where I want him, but this man says the work is too hard for him."

His assistant came in with a roll of blue prints. "You'll have to make a ground plan of that area on the east side of the entrance; the masons want to begin on it in the morning."

"What shall I do about this man?" broke in the time-keeper; "he says," &c. A workman came to the door. "Them cornice-irons that you wanted to see are here. Can you come up now?" "Jersey City is on the 'phone," said the stenographer, "and they want to know when you'll be ready for that fancy bronzework." These problems of the day's work were disposed of as rapidly as they came up. Then the engineer talked of the future:—

"Building booms, as history will show, have come in New York at long intervals. Each boom has been marked by some characteristic. Just now we are riding on the crest of the wave and eating cream. Never before at any one time has so much money been put into building in New York. I calculate that it is going to last about ten years more, and I can figure out where I won't care what happens after that time. I'm going to make my pile in those ten years. I've earned what's coming to me. I've had to master sixty trades before I could hold this job, and learn a lot of other things besides. I've sweated and worried about things until I am gray on the temples at thirty-five."

"Ten years from now these masons that are getting 65 cents an hour now (they'll get 75 next year) will be glad to work for 35 cents, and may be less. Then these labour unions will begin to crumble and go to pieces, when the work gets scarce. Mind you, I'm not against 'em, not for a minute. Anybody's liable to play a pat hand too strong, and they are certainly doing it."

These are the views of many other engineers. For the most part they impress you as strong men who know their work and are able to do it up to the handle.

ARMoured FIRE DOORS

Telephone,
No. 143 Westminster.

Telegrams,
"Sprinkler, London."

The Architect.

THE WEEK.

BUILDERS and others who have obtained approval of plans from local authorities will be wise in acting with some expedition. We are so accustomed in this country to consider all edicts as irrevocable unless a complicated procedure is gone through, the nature of by-laws is apt to be overlooked. They represent the state of knowledge about sanitation and construction at the time they were issued. They are only, as it were, tentative efforts to insure public safety. If knowledge advances they have to be altered, but in such instances there can be no doubt inconvenience may be caused. An appeal case which was heard a few days since by the Lord Chief Justice, Mr. Justice WILLS and Mr. Justice CHANNELL, is enough to show what is possible. Mr. WHITE, a builder in Sunderland, appealed against a conviction of the local magistrates for a breach of by-laws in the construction of a terrace. The plans for all the houses had been approved, but before all were completed new by-laws were issued. His counsel contended that the appellant had acquired an indefeasible right to erect the houses according to the plans which had been approved, and that the local authority could not deprive him of that right by passing new by-laws, and that the new by-laws were *ultra vires* in so far as they sought to deprive the appellant of the right which he had acquired. Further, it was argued that the houses in question were not new buildings; that the terrace was one entity—one building, in fact, and that the commencement of one of the houses which formed the terrace was the commencement of the whole terrace. The Lord Chief Justice considered it would be undesirable to tie the hands of local authorities for all time from altering their by-laws in respect to the construction of houses, simply because the houses formed part of a terrace, the plans in respect to which had been previously approved. The question as to the time of the commencement of the building of the houses was one of fact, and he was of opinion that the new by-laws were not *ultra vires*, and that the justices were right. There was no difference of opinion among their lordships, and the appeal was accordingly dismissed with costs. Application was made to bring the case before a higher tribunal, but Lord ALVERSTONE said they had not power to grant it. This is to be regretted, for similar cases have lately arisen, and it would be well if some check were imposed on the issue of new by-laws. The liberty to alter is especially hard on architects who prepare plans in London for buildings to be erected in provincial towns and districts. It needs constant watchfulness on the spot in order to become acquainted with the changes that are allowable. They should be treated in a similar way to changes in harbours or channels, which are announced in such a manner that mariners can amend their charts. At least there should be some central office in which records of new and amended by-laws could be seen without much difficulty.

THE discovery of a beehive tomb at Orchomenos, of which the walls were adorned with slabs covered with a design that might be called Assyrian, has revived the interest in a place described by HOMER as renowned for its wealth. It was known as the Boeotian Orchomenos, as there was another city of the same name in Arcadia. There are so many ruins about the site, it is difficult to determine where was the city or its most important part. It has been supposed there was a removal, caused by the overflowing of a lake, to a higher position. The treasury of Minyas, included by PAUSANIAS among the wonders of Greece, stood at the foot of the Acropolis. It was constructed of white marble, which must have been conveyed from a long distance. The ancient topographers evidently preferred the treasury of Orchomenos to that of Mycenæ. SCHLIEMANN visited the place and made some discoveries in it, but he cared more for Mycenæ from its connection with Troy, of which he was in search. There can be no doubt that Orchomenos has importance of its own which makes it a

desirable field for exploration. The work is about to be undertaken under the auspices of the Bavarian Academy. Funds have been provided by Herr JORDAN, and the operations will be directed by Herr BULLE, who will have the aid of Herr FURTWÄNGLER. They will endeavour in the first place to bring to light the remains of the palace. As Orchomenos was called the City of the Graces, it is to be assumed the place possessed some architectural dignity. But, so far as is known, the masonry was of polygonal construction, the style seen in Tiryns having been only partially adopted.

THE worship of MITHRA, or the Sun, existed at an early age in Persia. It may have been derived from India, but how far it was followed in Greece is not clear. That it was allowed in Tripoli during the Roman occupation is made evident by a recent discovery. Two sarcophagi have been found bearing an inscription in Latin to the effect that a man and his wife of the Punic race reposed within them. On one was painted a representation of a lion with the sentence, "Leo jacet," and on the other a lioness with the words, "Quæ lea jacet." From the figures it is concluded that the deceased when living were sun-worshippers. The Mithraists were divided into seven classes, which the worshippers were expected to pass through before they were considered as fully initiated into the mysteries. The Punic couple belonged to the fourth degree, and must have gone through the three inferior degrees of Coraces, Gryphi and Milites. If they had survived for a longer period they might have ascended through the upper grades of Persæ, Heliodromi and Patres, although, according to some, the last consisted of priests or priestesses.

BRESLAU is about to lose one of its treasures. "The Golden Crown" will shortly be removed. The building occupies a large site in the centre of the town, and it will be supplanted by several houses of business. "The Golden Crown" was much prized by the people, for it was one of the stateliest mansions to be found in Germany. It was erected between 1521-28 by JOHANN HOLTZ, who by his marriage was able to obtain possession of the site, which even at that time was valuable. The building evidently was erected when Italian influence was powerful in Breslau, and an old representation of it shows that the front was adorned with figures and ornament executed either in painting or in scraffito. An inscription dated 1544, "Quævis terra patria," suggests the building belonged to a stranger, and indeed HOLTZ was not a native of Breslau, but of Cologne. The house was altered from time to time, yet it was never degraded, and was always occupied by people of some rank. Breslau's prosperity through manufactures is increasing, and the ancient patrician mansion, like many another example of antiquity, has to succumb to trade. There is general regret at its loss, but the inevitable is not to be avoided.

It was expected that the name of the late CHARLES GARNIER would be given to some thoroughfare in the vicinity of his principal work, the Paris Opera House. A street will be called after him, but it will not be in the centre of the city, for the "Rue Charles Garnier" will run over the site of the former prison of Roquette. This is supposed to be preferable to a street at Mazas, where the prison for juvenile offenders stood. The Rue de la Roquette was not always connected with prisons and executions. The original name was Rochette. It contained a branch establishment of the Hospitaliers for paying patients and for other people who desired the quiet of a convent life without entering a religious order. SEDAINE, the dramatist, who was also secretary to the Academy of Architecture, and who is held by some to have been the originator of comic opera, lived for many years in the street. RÉAUMUR, the naturalist, was also a resident. But all admirers of the architect would have preferred to see his name on a tablet in a different district.

TYPES OF COSTUME: ENGLISH, SIXTEENTH CENTURY.

ARCHITECTURE AT THE ROYAL ACADEMY.

ANYONE who was familiar with the statements about the depressed state of the building trade which have appeared in so many newspapers during the past year would be amazed on seeing the large number of drawings in the Architectural Room of the Royal Academy. There are about two hundred and fifty, which is in excess of the average. It is not to be assumed they are all remarkable as works of art. Indeed, we must admire the unusual leniency which was exercised in examining many of the drawings. If the most excellent of those submitted appear on the walls the question must be asked, "Of what quality were those which were rejected?" and the answer will suggest mournful reflections about the condition of modern architecture. This year a novel experiment is attempted in the hanging of the drawings. As a rule there is a mixture of various classes of work on each of the walls. But care was generally taken to place those which were considered as most impressive opposite the entrance, and on the long wall there were if possible several points of vantage utilised in order to avoid any appearance of monotony in so large a space. That arrangement is not followed this year. The majority of the drawings which represent ambitious works are to be found on the short walls which flank the entrance, while with a few exceptions the wall with the largest area is assigned to domestic buildings. It may be supposed that the few people who will turn into the room during the season are incompetent to judge of important designs, while the majority of visitors, whether old or young, can appreciate a drawing of a house. Anyone who is thinking of erecting a domicile will find in the Academy this year examples to suit all requirements and all degrees of wealth.

It would be a thankless undertaking to discriminate between the merits of about 150 houses. A reader would not be gratified by an exercise in which there could be little variety, for the limitations of invention for town houses, country houses, business premises, flats and offices are fixed by laws which resemble those of fashion. Designs are to be seen by Messrs. GEORGE & YEATES, BELCHER, MOUNTFORD, WORLEY, R. BLOMFIELD, BOLTON, WIMPERIS & EAST, CATTERALL, MITCHELL, PRENTICE, C. SMITH & SON, PERKS, WILSON, MAWSON, A. C. BLOMFIELD, GUY DAWBER, E. NEWTON and others whose manner of treatment can be inferred without difficulty. But, as we have remarked, the judging this year was rather benevolent, and many designs for simple structures have in consequence found places as if to encourage the authors. A more rigorous standard of criticism will be applied by other architects, and in that way success will be neutralised.

Mr. BODLEY's "diploma work," "A View of the Exterior of St. Mary's, Clumber," with two other designs by him, are hung among the houses. The Duke of NEWCASTLE's chapel is the most remarkable example of its class in England. As a rule Englishmen were timorous before a suspicion of being ostentatious in devotion, and therefore their chapels were not detached buildings. Indeed, BACON in his ideal Elizabethan mansion, supposes the chapel to be an annexe to the withdrawing-room. As a result, it is difficult to discover examples of private chapels, apart from those in

churches or cathedrals which have architectural interest. St. Mary's, Clumber, might be a parish church, and in style it is among the most interesting of the architect's works. The interior of "Proposed New Church, Leeds," is another fine Gothic example which is so treated that the chancel appears from colour and adornment to be the necessary climax of the composition. The "Design for Canon Carter's Tomb" gives opportunities for using sculpture and mosaic. We hope there will be no retrenchment of details for the sake of economy. Mr. JACKSON has a view of "New Buildings for Hertford College, Oxford," in which a bridge is introduced—a novelty in collegiate buildings—and the "Entrance to Sedgwick Memorial Museum, Cambridge." The position is sheltered, but there is compensation in the number of steps which will have to be ascended. The "Proposed Restoration of Gateway of Nottingham Castle" is one of those exercises which give delight to all who love Mediævalism, and Mr. JACKSON has evidently worked at it *con amore*. Mr. BELCHER has a drawing of the remodelled "Tapeley Park, North Devon," a large brick mansion in which apparently some features of dressed stone are introduced. "The Royal London Friendly Society's New Building" is a hopeful indication of co-operative enterprise in undertaking a costly building as an investment. The upper parts are not sacrificed to the ground floor, and vertical as well as horizontal divisions are emphasised. A large-size model of a corner is also exhibited. An entrance wing to "Cornbury Park, Oxon," shows some novelty in the treatment of the Ionic capitals and of the caps of pilasters. Tapestry has been provided for, and the hall is refined in all details. Mr. ASTON WEBB has two large elevations of the "Victoria and Albert Museum," together with a detailed drawing of a bay. For the first time it is possible to obtain an adequate idea of the exterior of the new building. Although they have a generic correspondence the two elevations show variety of treatment between general lines, and it is evident also that in the details traditional forms have not been followed with exactitude.

Some designs for the Liverpool Cathedral are exhibited. Mr. SKIPWORTH has three drawings, an interior which, being in grey and white stone, has a reposeful effect, and exterior parts which are in keeping. Mr. CORLETTE's interior is marked by severity, while the exterior from the point of view taken appears to be constricted by the numerous buttresses. Mr. BERESFORD PITE's design is of a Byzantine type, the tower showing a later development of the style. The flat domes give the key to the composition for the arches and many details are in keeping with them. There is consequently a sense of unity throughout; still, the design from its novelty could not fail to be considered as extraordinarily expensive by men who had to count the cost and found a difficulty in attracting subscriptions. Mr. C. H. REILLY's "Design for a Cathedral," of which there are interior and exterior views, is Italian in style. There is no plan, but evidently the dome is sufficiently capacious to comprise the greater part of the building, as if it were a symbol of a protecting Providence. The small chapels, as shown on the exterior, appear insignificant beside the mass

of the building, but there is on the whole an effect of majesty which it was courageous to introduce. Mr. J. OLDRID SCOTT has a drawing of the "New West Front, Hereford Cathedral," which is in keeping with the older work, and the drawing of "St. John the Baptist Church, Norwich," is almost suggestive of a cathedral.

There are several competition designs for municipal and other buildings. That the colonies may be turned to account is shown by Mr. HALSEY RICARDO'S "Proposed Government Building at Johannesburg." The building covers a large area, but economy was recognised. The blocks in which are entrances slightly project, and the intermediate parts show verandahs with flat arching. The design for "Lahore Post Office," by Mr. M. STARMER HACK, is Classic treated in an Indian spirit, and the effect is pleasing. Mr. MOUNTFORD has some drawings for the "New Sessions House" for the Corporation of London, but he has not been favourably treated this year, as some of his works have been skied, although they merited positions on the line. In fact, this year there is a good deal of haphazard hanging, and we do not consider that the exhibition will be considered as satisfactory.

INDUSTRIALISM IN AMERICA AND ENGLAND.

WHEN NAPOLEON found his improvised ambassadors were discomfited by foreign ministers he changed his tactics. He induced some of the Royalist aristocrats to accept office and sent them on embassies. They ferreted out all the information he desired. Some of our manufacturers, also believing in the principle *similia similibus curantur*, have endeavoured to imitate NAPOLEON'S example. Finding themselves outwitted in the markets by Americans and Germans, they sent foremen and managers to the rivals' countries in the hope of discovering the secrets of success. They have been rarely fortunate. Manufacturers have then gone abroad, and they also have been puzzled. When they relate their experiences they generally admit the failure to discover much difference between the foreign systems of production and transacting business and their own. The workmen they consider on the whole not more productive than English workmen. The wages are at least as high and the other expenses not less. In the case of Germany, some of the travellers have not hesitated to say that the classes of productions with which they were best acquainted could not be sold so cheaply if it were not for secret subsidies from the Government. In America the case is different. For the differences between the work in the two countries there is always the plausible explanation that American work is made to be sold, and there is indifference about its endurance.

The Mosely Commission, of which the reports have appeared, is the most organised of the attempts to gain information about the methods of our rivals. It was confined to work in the United States, but sooner or later Germany may be subjected to a similar investigation. The experiment originated with Mr. ALFRED MOSELY, who invited representatives of trade societies to accompany him as guests in a tour of which the main object was the investigation of industrial methods. The majority of the members belonged to trades producing exports, such as cotton, cutlery, paper, printing, leather, machinery, &c. Americans are not, however, content with becoming our competitors for an export trade. They have already endeavoured to supplant Englishmen in some forms of building in this country. Accordingly the Operative Plasterers, the Operative Bricklayers, the Operative Carpenters and Joiners were allowed to send deputies. This broadening of the scope of the inquiry merits recognition at a time when the building trades are in a state of fluctuation, and the Americans believe they have gained the advantage of appearing under the highest auspices as contractors. In a late number of one of their building papers it is stated that HIS MAJESTY, wishing to have schools erected near Sandringham, was compelled to give the order for them to an American firm, as they were prepared to complete the work in about a quarter of the time asked by an English firm. There is little doubt of some error in the story, but it is calculated to advance American

interests in this country and to facilitate the success of strangers.

It would be absurd to suppose we have a monopoly of good building in England or to deny the possibility of Americans producing work which will be as enduring as ours. But it should be remembered that among all practical arts building is the most representative of the spirit of a country, and as it happens the national spirit in England and America is not identical.

We are more or less conservative and the present is affected by the past, while in America the future has stronger influence on the present time than any former age whether near or remote. Sixty years ago EMERSON told his countrymen that theirs was "the country of the future," and that "Man's heart the ALMIGHTY to the future set by secret and inviolable springs." Everything around them was "giving an aspect of greatness to the future, which the imagination fears to open—a new and more excellent social state than history has recorded."

Although for less transcendental reasons the American has so kept his eye on the future, he can only look on his own time as one of transition. In the description by a hustling "engineer of construction" which we published in our supplement last week, he told his interviewer that his own views did not extend beyond a future of ten years, for in that time he was to "make his pile," and for what was afterwards to happen he did not care. It was not impossible masons' wages would then be 35 cents instead of 65 cents, and the whole building system would be changed. We cannot expect people who believe that invention may at any time cause a revolution in a trade will do more than create temporary organisations. The ruling maxim is "get out as much work as possible to-day, for our process may be superseded to-morrow."

In the reports of the Mosely Commission we find many instances of the power of this apprehension, and its influence on the expedition with which work is produced. One of the party tells us that at Mr. CARNEGIE'S works at Homestead on an occasion when things were being taken very quietly, "I saw a large block of steel turned out of the furnace and laid on the rollers, and in three minutes and thirty seconds it was a steel plate 150 feet in length, 3 feet wide and $\frac{3}{4}$ inch thick." The representative of the carpenters was told by the head of one woodworking factory:—"Machinery does the work here. Whenever we hear of a new machine coming out, and we find it is better than what we have got, we chuck the old out and put up the new one at once. Here is a mortise machine, the best I could get at the time. Now there is a new one. I ordered one at once, but I cannot get it; such is the rush of orders. That is how we get along so fast with the work here; in the old country they just drag along with the old machinery, and only when it is worn out, and not till then, will they think of replacing it."

In the Cleveland factories for joinery machinery was not only supreme, but omnipotent. "I found," says Mr. CRAWFORD, "machines doing what we entirely do by hand labour at home. All the men had to do was to put together, the cleaning-off being done by a machine called a glass-papery machine. It had rollers about 4 feet wide. Round each roller was a layer of carpet, and then the glass-paper. As the rollers moved in opposite directions both sides of a door or sash would be cleaned off at once. The pulleys of sash-frames are rounded at the ends instead of square, as at home. The machine completes the housing, nothing being left for the mechanic but to put it in its place." Bevelling or chamfering, glueing-up, &c., are all performed by machinery. Two joints 1 inch thick can at once be completed by the jointer, four caps or trusses are simultaneously turned out from the carving machine, and the carving is never touched by hand unless in special cases. A franking machine mortises sash-bars. A housing machine can do any width desired. In a billiard-table manufactory it was found that the veneers of the legs were put on from the band-saw; the veneer is steamed and stamped by a machine the exact reverse of the leg. At a large cabinet factory, having an area of 11 acres, Mr. CRAWFORD ascertained that "nothing is done by hand, except in the shop where new designs or patterns are made. They have a show of furniture every six months, when three new designs are submitted to their

customers; if any of them take, then an exact pattern of every piece is made, and all are numbered and sent out into the factory. The machines do all the rest except glueing together." In a sash and door factory it was stated that four men with the aid of machines were able to turn out 150 five-panelled whitewood doors per day. A chain mortise machine for use when the mortise does not go through is described. It works on two small pulleys like a band-saw, digging into the wood and bringing up the core with an action like a grain elevator.

It is, we suppose, difficult for any English trader who is allowed to inspect American manufactories to resist the belief that in our country we do not sufficiently utilise machinery or are too considerate in the working of machines. Mr. MOSELY, who organised the Commission, says:—"My own observations lead me to believe that the average American manufacturer runs his machinery at a much higher speed than is the usual practice in England—in other words, 'for all it is worth'—and the men ably second the employer's efforts in this direction." If the machines are less productive with us, Mr. MOSELY believes it is owing to the absence of inducements to the attendants like those obtainable in America, where large earnings are willingly paid to men because it is considered the profits will be proportionately increased.

There are trades in which machinery can be of only partial assistance, and what is their character in America? Bricklaying is one. Mr. TAYLOR, the reporter, arranges the buildings he examined into three classes, viz. those with steel skeletons, buildings of smaller types resembling those in England, and suburban houses and villas. He was surprised to see men at work on different floors at the same time, but the only advantage of the arrangement is the saving of time to the contractor or client. In America more than elsewhere time is supposed to be money, and becomes a valuable asset. On the other hand, the rivalry which is induced causes rushing and scamping. Of work in the first and the other classes of buildings which more nearly correspond with English, Mr. TAYLOR says that "no architect or engineer worthy of the name would permit any of these systems to obtain in this country, as in all three there is no pretext and no attempt to properly bond the brickwork. Nearly all the faced work consists of stretching courses only (merely a veneer), although on the rough and interior walls of any thickness there is usually one course of headers or bonders to every five or six courses of stretchers, instead of English bond consisting of alternate courses of headers and stretchers, or the Flemish bond consisting of headers and stretchers laid alternately in each course—either of these systems (the English for preference) securing the proper bonding of the brickwork, both longitudinally and latitudinally. Flushing-up or grouting, i.e. filling in the interstices with mortar of a more or less liquid nature, in order to obtain greater solidity of the work, is very seldom practised." Gauged work is rare, owing to its cost. Terra-cotta blocks partly hollow are employed for partitions. The bricks, we are told, are "very well burnt, very hard and fairly true." Measuring is per 1,000 bricks. Mr. TAYLOR says that hitherto cheap work and nasty was demanded, although some good work is now executed. He describes a party wall of a comparatively new building as "certainly one of the worst specimens of work I have ever seen; joint upon joint, in many cases, for eight and nine courses at a time; very few cross-joints put up at all, and in several places no mortar had been used to even bed the bricks, which were laid on dry. I was informed that that class of work obtained a few years ago, and when I suggested that probably in those days bricklayers were employed to lay bricks, not mortar, my informant quite agreed."

Mr. TAYLOR ascribes the defects to custom and system rather than to employers and employed. But so long as Americans believe in the coming of constructional revolutions, we can hardly blame them if they do not endow their buildings with the qualities which are required for a lengthened endurance. The English builders' desire to see work "stronger than strong enough" must seem to Americans to be only a relic of old fogeyism. The effect of an introduction of American methods in this country would be, according to Mr. TAYLOR:—"All that natural

pride the real craftsman takes in the strength, durability and finish of his handicraft would be extinguished and destroyed; all the years of struggle and work we have had to raise the standard of workmanship to its present high standard would have been in vain, and all would be sacrificed to the interests of present-day utility." Those who are eager, owing to their ignorance of the differences between building construction and modes of production in which machinery is the chief factor, to see American contractors at work in this country will do well to reflect on the inevitable consequences of the innovation. English buildings have generally resembled other things in this country. They exemplify that commanding sense of right and wrong from which springs, according to EMERSON, that thoroughness and solidity of work which is recognised as a national characteristic.

The plasterers have long been reckoned as the *enfants terribles* of the building trade in England. When we found a representative of their incorrigible association was one of the Commission, we anticipated a report in which American work would be lauded. Mr. DELLER has, however, set all prejudices aside, and presents an impartial statement. When he was asked whether he could cover 10 yards of lathwork with one hod of stuff he was nonplussed, but when the doer of such a feat said that was all the stuff allowed by the "boss," it became a revelation of the American system. Next he heard that "a plumb rule was seldom if ever used, and that employers invariably insisted upon either adulterating the better material or substituting altogether inferior material to that contracted for." Such work as he saw in the Buffalo Post Office he declares to be "a standing disgrace to the trade." At Cleveland he was informed that "the architects preferred speed to quality, everywhere they think only of to-day;" but, as we have said, that is a national characteristic. The President's room at Washington had walls which were "very poorly plastered," and at a theatre in the evening Mr. DELLER states that he had "the mortification of sitting under a ceiling that had simply one coat on the laths." In New York, for the first time in America, he saw real plastering, but the bad could not be worse. On the whole, Mr. DELLER found the work to be "far and away behind that executed in England, and the hampered conditions are anything but pleasant to work under." The scaffolding is often dangerous, which he attributes to the utter disregard for stability and human life.

There will be found a general agreement among the members of the Commission about what they saw in the towns visited. In all that can be carried out by the aid of machinery the Americans are ahead of us, for they sacrifice machines with as little remorse as six-storey buildings are transformed into twenty-five or thirty-storey skyscrapers. But in work which demands the constant operation of men's hands it cannot be said they have gained or are likely to gain supremacy.

THE NEW GALLERY EXHIBITION.

IF the will could be taken for the deed, if aspiration were a substitute for perfect execution, then this year's summer exhibition at the New Gallery would be attractive to all classes of visitors. It would, however, be necessary to avoid applying the tests usually supposed to belong to the painting of natural objects and to be satisfied with forms of which it can only be said they are suggestive. No doubt paintings can be seen on the walls which recall actualities, but the unreal classes become most characteristic of this year's exhibition. There is of course another way of regarding the collection. An exhibition is a sort of market which is dominated by the law of supply and demand. There are people who from a belief in their individual superiority and refinement are dissatisfied with ordinary life. They resemble those who wish to have better bread than can be made from flour. If they desire pictures of a peculiar sort it is allowable for artists to produce them. But many of the works in question appear to be only exercises made by amateurs for their own enjoyment.

The work which could be pointed to as the highest example of the new aims would be Mr. WATTS'S *The Sower of the Systems*. While recognising his genius, which often attains the sublime, we are compelled to say that in this

instance he has attempted to make painting serve a purpose for which it is incompetent. It may be Miltonic to suggest the Creative Power casting worlds into space with the same ease as the sower throws seed. But painting should be Dantesque, or, in other words, precise and definite rather than Miltonic. We see a figure, or rather an adumbration of a figure, of which the only portions distinctly human are the hands. The robe resembles a cloud which is piled up in such a way as to make it doubtful whether there is a head. This no doubt may be intended to recall the figure in the Temple of Isis, and the inscription, "I am whatsoever is, whatsoever has been, whatsoever shall be; and the veil which is over my countenance no mortal hand has ever raised." But when considered as a question of technique what is it more than the old Classic painter's evasion of a difficulty in expression by covering the face of AGAMEMNON in representing the sacrifice of his daughter? Mr. WATTS has not the courage to follow the example of the Renaissance artists. But by so doing he omits the part of the body associated with intellect, and it might be said that his figure is no more than a mechanical apparatus, part of which resembles the human hand. The truth is that painting has its limitations, and it is only reasonable to respect them. Mr. WATTS departs from nature in a majestic manner. Some other exhibitors merely display their weakness. His *End of the Day* is simply a combination of colours, which an uninitiated observer would not be able to define. We seem to have a renewal of TURNER's attempts to make colour serve instead of form, or something corresponding with FLAUBERT's proposal for a fine poem in which melodious words should be introduced regardless of sense.

Another endeavour to make colour supreme is in the *Fates*, in the first room, by Mr. WALTER CRANE. As a decorator he has produced admirable colour schemes, but, knowing the company in which his picture would be placed, he has in this case become lawless. The daughters of THEMIS were generally known as sisters of the same age, but we do not quarrel with the artist because they belonged to different periods of life. From the peculiar diversity of colour, which seems to be haphazard, the solemnity of character which should belong to them ceases to be manifest.

Near this last work, in the south room, is Lady WENLOCK's *Sunrise on the Himalayas*, which will afford much delight, for it appears to be an honest representation of a natural phenomenon. All the world over it is supposed that "jocund day stands tiptoe on the misty mountain tops" without much change of manner. But nature varies, and this sunrise is a novelty. Mr. GERALD METCALFE's *Credo* shows the knight looking steadfastly forward as if prepared for some coming struggle, regardless of the very substantial demon behind him. It is a brilliant example of colouring, and asserts itself over the neighbouring works. It is refreshing, however, to turn from symbolical subjects to Mr. GRAHAM PETRIE's *The Market, Fiume*, one of the pleasantest scenes of its class, and Mr. ERNEST PARTON's *To their Night Pasture*, showing sheep going towards a small plantation that stands out against the sky. Mr. SHANNON, in his *The Baroness de Meyer*, enhances the subject by making art and nature auxiliaries to the figure. On one side are some tall lilies, and behind is a sculptured prie-dieu or band of ornament. The lady is clad in black and ray. The companion picture, *The Baron de Meyer*, is in the west room. The first impression is that a priest is represented, for the peculiar black robe and white collar are not suggestive of modern secular attire, but the blue lining of the sleeves is out of keeping with that notion. The *Sleeping Nymph* of Mr. LLEWELLYN shows a figure who has selected a spot amidst trees and rocks, well adapted to increase her charms. Mr. GODWARD's *Old Story* is a Greek youth and girl with the usual variable accompaniments; and Mr. HERBERT SCHMALZ as an expressive French girl holding an old-fashioned glass called *A Toi*. Mr. HENNESEY's *Twilight and Night* might be presumed from the title to be an allegory, but it is simply a happy presentation of a child between an old French peasant woman and one much younger. Mr. FREDERICK SHIELDS, a painter animated by the highest aims, and he sometimes has expressed moralities very ably on canvas. But it

is doubtful whether, despite the aid of a long description in the catalogue, any visitor will find the time requisite to interpret his *Patience*. The figure bears a manifold, if not a heavy, load. Mr. BARCLAY's *Amongst Flowers*, children in a field abounding with primroses, is another welcome sight. Sir J. D. LINTON's *Madonna and Child* competes with the Italian works in which the Virgin is seen seated on a throne with a narrow back that rises to a height. Upholstery and robes are of the richest stuffs. The wreaths or swags are of the requisite stiffness, and the picture is unquestionably one of the most brilliant in the south room. The face seems to be a portrait rather than an idealisation; not only RAPHAEL's *Madonnas*, but those of other Italian masters, are no more than portraits, which, through the influence of association, have come to be regarded as if they were superior in idealism to ordinary life. They served as altar-pieces, and we doubt if in any church or chapel the work before us could be utilised in any way. Mr. REGINALD BARRATT's *In the Piazza, Venice*, shows two of the recessed entrances to St. Mark's, with one of the flagstaffs in the foreground. Here we have accuracy combined with pictorial effect. The New Gallery artists are not disposed to acknowledge inspiration from books. The incident from "Wilhelm Meister," by the Hon. JOHN COLLIER, is therefore somewhat of a novelty. It represents the egg-dance of MIGNON. It is doubtful whether in that scene the Italian girl was dressed as a boy, for she had been purchased out of the troupe of tumblers. But the figure is suggestive of the fairy-like creature. A German looks on the Walkyries as of gigantic size, but Mr. CRANE, in *The Walkyries' Ride*, shows them as particularly slim figures—as if they formed a part of the light cavalry.

In the west room are Mr. WATTS's paintings. Mr. G. WOOLISCROFT RHEAD has represented the *Ten Virgins*, but has carried the expression in the foolish faces to excess that ceases to be tragic. Sir GEORGE REID has two portraits in the room. TOM MORRIS, the golfer, is sure to be the favourite. Mr. J. T. PEDDIE's *Tulip Stealer* has almost from fine colouring the effect of a piece of tapestry. Mr. BYAM SHAW shows the ruins of an abbey which is visited by a mysterious old lady as an illustration of the text, "Here we have no continuing city, but we seek one to come." Mr. HALLÉ's altar-piece, *Madonna and Child with Attendant Angels*, is Guidoish in character, but is sufficiently successful to prove there is no necessity for convents to go to France and Germany for altar-pieces. His *St. George* shows the warrior on foot. The dragon is not more successful than the majority of those by other modern artists. Mr. LAVERY's *Miss Idonia la Primaudaye* is a skilful adaptation of black drapery against a black background, a variation being obtained in the gilded framing of the chair. Sir J. D. LINTON's *Washing the Beggars' feet on Maundy Thursday* is further evidence of his success in the treatment of old German costume. We see a prince in rich robes engaged amidst a crowd of monks and ecclesiastics, courtiers and others going through the annual ceremony. An incident of the kind, even in the present century, cannot be regarded as otherwise than serious. But as a painting the artist has marred the effect by the introduction of elements entirely out of place. It was never likely that a Hofnarr or jester would within a few feet of the prince have struck a man with his flapper. The painting becomes an incongruity, for we have a solemn sixteenth-century ceremonial represented as it would appear to a modern sceptic. The *St. Christopher* of Mr. WINDSOR FRY is a frank acceptance of Mediæval treatment. The saint is a powerful giant who might well use the stem of a tree as a staff. But the spirit of the legend is not suggested by the slight alarm of the Child at the faltering of his strong bearer. The work is carefully executed throughout, and is among the successes of the exhibition.

In the north room Mr. H. J. FORD's *Evening Harmony*, in which we see a satyr and nymph, gains distinction by the treatment of the upright lines of the pines. The rocks are of a reddish colour, and there is a glimpse of the ocean; it is an idyll in keeping with the title. Mr. A. D. PEPPERCORN's only contribution is *Evening*, a simple scene of a creek with very low banks, but which derives solemnity from the happy manner with which the time is indicated. The *Flowing Tide*, by Mr. MOFFAT LINDER, is an interesting effort to show waves on a flat shore with the

sun striking the crests as they arise. The *View on the River Uruguay*, by Mr. MacWHIRTER, would pass for a scene in England; there is nothing especially suggestive of South America. The *Scheherazade*, by Mr. WILLIAM WONTNER, looks like an English girl clad in very bright eastern robes. Mr. W. H. BARTLETT'S *Waiting for the Ferry* is one of the Connemara subjects painted with his customary feeling and truth, but is larger in size than the majority of its predecessors. Mr. PICKERING'S *Au Pays de Chataigniers et d'Oliviers, Corse*, is a revelation of Corsican scenery. The mountain peaks appear to have suffered in some great physical catastrophe, and almost every chasm is distinguished by a different colour. The trees seem to be wild, and present contrasts of form as well as colour. It is a mountain view to be remembered. Mr. THORNE WAITE'S *At the Foot of the Downs* is a vision of beauty almost too unsubstantial for an English landscape. The portrait of the late J. F. Bentley, the architect, by Mr. RENÉ LE BRUN DE L'HOPITAL, is so lifelike it should find a place in one of the buildings attached to the Westminster Cathedral he designed. The scheme of colour is suitable; a dark gray coat makes the sketch which the architect is considering stand out more effectually. The head was a difficult one to paint, but it is presented with force. Above it is a second portrait by the same artist, *The Very Rev. Alderman Canon A. White*. The countenance is refined, and would serve for an artist, a mystic or a divine; but it is strange to find such an apparent type of unworldliness doomed to the affairs of a borough council. Mr. JOHN LAVERY in *Spring* has a contrast to the portrait we have already mentioned, for here we have a girl with early blossoms painted vigorously.

There is no portrait in the exhibition which is likely to gain more attention than that of J. MacNeil Whistler, by JEAN BOLDINI. Without the name of the painter it would be accepted as a portrait of himself by Mr. WHISTLER. He is represented in mourning, and in his left hand carries a hat with a very deep band. The thin but sinewy right hand supports his head. The expression is vivid, as if the sitter were about to make a sarcastic remark in a friendly manner. It may be said that Mr. WHISTLER has set up a rival to himself. The work appears to be extraordinarily simple in treatment, but it would assert itself in any collection of portraits. Mr. A. J. BLACK'S *A Sea of Mirth* well describes waters which seem to express their revels by kaleidoscopic colours. Mr. T. AUSTEN BROWN'S *A Peasant Idyll*, a young man and a young woman, will excite much discussion. The colours, if few, have been laid on liberally, and the picture has almost the effect of a fresco in white and red.

On the wall of the balcony there are about a hundred smaller paintings of various degrees of merit. In the central hall are miniatures, examples of sculpture on a small scale, and of gold and silverwork, enamels and jewellery. The panels in gesso and mother-of-pearl cannot fail to attract the attention from their novelty and brilliancy.

THE GUILDHALL EXHIBITION.

THE visitor to the Corporation Art Gallery is likely to be startled on entering when he perceives the scarlet cloak in *My First Sermon*, and not far off finds its companion. For the moment it would be allowable to suppose that as this year's exhibition relates to the Dutch school, copies of the English painting were produced in Holland. On looking round it is realised that the main gallery—the only one worthy of the name in the building—is filled with paintings the late Mr. CHARLES GASSIOT bequeathed to the Corporation. The visitor will see before him many familiar works by representatives of the English school—CONSTABLE, PHILLIP, COOKE, DYCE, G. LESLIE, HOOK, MULLER, W. COLLINS, WEBSTER, FAED, GOODALL, &c. It will be wise to spend some time in the examination. It is not fair to draw a comparison between works belonging to two schools and produced under dissimilar circumstances, but it may be taken for granted that English works are more likely to afford pleasure to English visitors than the works by Dutchmen which are found in the upper rooms. Some critics may say there is too much diversity among the English paintings, but what else is to be

expected from a people who are not only travellers, but can take an interest in all manner of subjects?

The Dutchmen have the advantage of possessing a school of older date than ours, and examples of the earlier as well as living artists have been lent to the Corporation. By JACOB VAN RUISDAEL there are three forest scenes, a view on the Brill and a sea-piece. The artist's name is generally associated with forests and waterfalls, but the sea in his view on the Brill, as well as in the last-mentioned work, might be produced by a man who had devoted himself to marine scenes. He was one of the painters who believed there was a soul in nature, and he expressed his moods as if they were in keeping with his own. By REMBRANDT there are six examples, but it is impossible to accept them all as genuine without a little misgiving. Never was there an artist more addicted to representing himself, and the portrait lent by the Duke of WESTMINSTER is the earliest of all we have seen. His son TITUS might well pass for a bejewelled girl. *The Beginning of the Storm* is marvellous in its aerial effects, but the ground has suffered, and the gradation is ineffective. Lord DENBIGH'S *Abraham Dismissing Hagar and Ishmael* is characteristic. REMBRANDT was deficient in sympathy, and there is not a trait in this work to suggest that a wrong was being inflicted under the guise of morality. The Patriarch is one of the artist's conventional Jews with a rich turban, and HAGAR is a commonplace Dutch woman. *A Rising in a Dutch Town*, by GERRIT BERKHEYDE, is interesting from the care taken in the representation of a red brick church or town hall, and the restraint which the Revolutionists have imposed on themselves. JAN STEEN'S portrait of himself must have compelled his contemporaries to laugh at him. The man who painted such a work must have been wanting in self-respect, and it is a pity to see so much talent misapplied. There is only one flower-piece by JAN VAN HUYSUM, but it is a masterpiece. It is as bright in colour as if painted a few years ago. BREUGHEL'S road scene would suggest that Holland was a thickly-wooded country. The trees form a frame through which the earth and sky is seen in the middle, and the effect is heightened by the number of men wearing red coats. GERARD TERBURG'S portrait of a gentleman shows a student who might say "In my wisdom there is woe and in my knowledge care." He holds a volume with red edges in his hand, and another of larger size lies near him on a desk. On a shelf behind is a row of books all bound in plain calf. In those days labels were not found on the backs of works, and the artist was deprived, therefore, of one means of variety. Although on a small scale, there is no more definite rendering of character in the room, and the same may be said of a portrait of a young woman. A second portrait of a lady by TERBURG deserves to have a place in a book of costume, for never was there a more formal and stiff display of millinery. VAN AELST knew the value of vertical lines, although the subject might be only still life. In a *Dead Partridge* with hoods and gesses he shows the strings by which they are suspended, and, although evidence of a very useful practice, in this case it is unnecessary, or carried to excess.

It is remarkable how many paintings of buildings are to be found in the collection of which the subjects cannot be identified. VAN DER HEYDEN'S view of a town is very interesting, for there are two or three buildings elaborately represented, but the interest would be increased if it could be known what had attracted him. JAN FICTOOR is one of the Dutchmen who has been systematically neglected. The large head of an old man with a stern mouth is enough to demonstrate his power. By PAUL POTTER there is only one work, three rabbits, one of them resembling a squirrel. The decayed trunk of a tree introduced compels us to conclude that with all his love of nature he could not escape from conventionalism. FRANK HALS is at his best in single figures. His portrait of Admiral DE RUYTER belonging to Earl SPENCER, is a masterpiece; although he was an enemy of England he must in many ways have resembled an English sea-captain. The likeness does not correspond with one by FERDINAND BOL in Amsterdam. Beyond the naturalism the group called *The Man with the Rumble* cannot be considered pleasing; the faces are undoubtedly lifelike, but it is difficult to make a work of art out of so much ugliness. GEERAERT VAN HOEGGEEST was one of the foremost of the Dutch painters of architecture

The *Tomb of the Prince of Orange at Delft* shows the Gothic church in which men walk about without removing their hats. ALBERT CUYP generally represented animals on a small scale, but the *Head of a Cow* seems almost larger than life-size.

The pictures we have referred to would all be considered of immense value if they appeared in an auction room. But the modern examples of the Dutch school possess points of interest which will be more appreciated by the majority of visitors. In several of them we observe signs of a restlessness from which there is no escape. Holland is supposed by travellers from other countries to be a sleepy place, and only parts of cities like Rotterdam and Amsterdam show signs of the feverish activity inseparable from most parts of Europe. In several of the paintings the artists seem to be desirous to suggest there was no difference between Holland and the most agitated cities. Few would be able to recognise the view of Amsterdam by JACOB MARIS, owing to the want of repose in all parts. The *Knife Grinder*, which at one time was a stock subject and gave occasion for the introduction of several spectators, now a representation of a solitary man engaged with a big machine worked by steam or electricity. The nameless Dutch towns give a similar impression. It is therefore well to enjoy works recalling the old manners of the people, for a time is approaching when they will have to succumb to the modern love of expedition.

By JOSEF ISRAELS are no less than twenty-eight works, and he may be considered as a connecting link between the past and the present. The old Dutch masters, if they could return to earth, would enjoy most of his works seen in the gallery. But they could hardly help pointing out that in a Jewish wedding, with its full-sized figures in latest fashions, the painter was unable to resist the temptation to get out of his true element, and in such a scene as *Washing the Baby* they would say that in his haste he was indifferent to the form which the infant was to assume. JOSEF ISRAELS is an admirable painter and he is a master of the pathetic, but there is no use in concealing the fact that he can be careless in the modelling of his figures. The elements of his pictures, and especially of his interiors, are very simple. It might be said that the window with its muslin curtain and flower-pots is part of the domestic personæ. No painter of our time has made so much of glass. It serves to show the fisherman's wife anxiously looking out for the return of the husband; it becomes a ray of sunshine; it throws light on the whole of the workers in the sewing school; it reveals the church in which the old churchwarden is an authority. But JOSEF ISRAELS is equally successful in utilising land that is not picturesque. The flat and gloomy ground is adapted for the funerals he represents. The shallow canal serves to wash the cradle, a painting which has no touch of tragedy in it; and *The Late Hour* would be less sombre if we saw a woman and child journeying through a less desolate district. The *Young Lovers*, both silent, simple and stupid, seem to be a product of the land over which they walk, and the son of the chosen people, a poor Jew dealing in rags and cast-off clothes of the humblest kind, is in keeping with his miserable habitation. The earlier masters have painted Dutchmen and Dutchwomen of as humble a condition, but they never, like M. ISRAELS, made it plain that the peasants also could feel pangs of the keenest kind.

JACOB MARIS in number comes nearest to M. ISRAELS. He does not confine himself to the incidents of one class of people or one class of painting. He can be pathetic. A shepherdess and sheep indicates a bovine desire to protect the barefooted girl to give protection to her flock from the coming storm; while the power of the colouring in his little work is almost Venetian. In *Gathering Seaweed* the great expanse of sky makes the ground appear insignificant. *A Stormy Sea* might have come from the hand of a specialist, and *The Arrival of the Boats*, in which a fisherman is introduced to pull them ashore, is equal to any work of M. ISRAELS. *The Weary Watcher* is marvellous in its light and shade and feeling. MATHEW MARIS is more modern. The vaporous view of the outskirts of a town is almost ghostlike. The ram's head would bear microscopic examination. The still life with its brass platter will sustain comparison with any French or Dutch work. In a *Lady with Goats* it is hard to say whether the trees, the animals, or the richly dressed woman is the most captivating. The

Butterflies, representing a child lying on a bank with her long hair floating about, seizes the attention by the vigorous drawing and the skill with which blue, white, brown and green are utilised. *L'Enfant Couchée* is a variation of the same scheme, and no less successful. In the *Lady of Shalott* he has taken a subject with which he could have little sympathy, but he is not the first artist who has failed in treating TENNYSON'S poem. WILLEM MARIS, the third of the brothers, devotes himself mainly to small cattle-pieces.

Another Dutch painter who is largely represented is ANTON MAUVE. He appears to be the most faithful representative of the old school of landscapists. He prefers, of course, out-of-door scenes, but his view of the studio of his master, VAN OS, a room in an old mansion with a grand chimney-piece, proves that in his early days at least he had the qualities of producing successful interiors. The garden at the back of his own house with its thatched cottage, plants and trees is delightful. There are two works by MESDAG which suggest his power as a marine painter. JAN BOSBOOM is the modern successor of the Dutch painters of interiors. There are four of his pictures—an interior of a cathedral; a church in Maasland, with a massive timber roof; an archway at Hoorn; and a second interior of a remarkably white cathedral.

It is evident that the old traditions which made the school famous continue to be respected, for in almost every variety of painting the early practice continues to receive attention. It would not be possible in the limited space of the Guildhall Gallery to exemplify the history of Dutch art, but a comparison of the early and later works will convince the student of art that the continuity between past and present, at any rate from the time of REMBRANDT, was unbroken. In England, Dutch paintings have long been favourites, but it may be doubted whether at any time examples have been brought together to surpass in interest those which the public can enjoy through the exertion of the library committee of the Corporation of London.

EDINBURGH ARCHITECTURAL ASSOCIATION.

THE annual general meeting in connection with the Edinburgh Architectural Association was held on the 22nd ult. in the Rooms, 117 George Street, Edinburgh, Mr. A. Hunter Crawford, F.R.I.B.A., president, in the chair. The treasurer's report showed that there had been exceptional expenditure, but that up to date there was a small credit balance. Among the office-bearers appointed were the following:—President, A. Hunter Crawford, F.R.I.B.A.; past president, Henry F. Kerr, A.R.I.B.A.; vice-presidents, H. O. Tarbolton, J. Stuart Syme; hon. secretaries, William M. Page, Colin B. Cowrie; hon. treasurer, W. Glassford Walker, C.A. In his closing address the President said that the membership, which now reached the total of 358, was the largest attained in the history of the Association. He alluded to the proposed registration of architects, and moved that it be remitted to the Council of the Association to consider what reply should be sent to the Royal Institute on the subject. This was agreed to, and it was also arranged that the associates' section of the Association should communicate their views on the subject to the Council. The meeting thereafter separated.

ROMAN REMAINS AT CAERWENT.

THE exploration at Caerwent, which has been continued during the winter, has resulted in further important discoveries. A small building with an apsidal end, which it is thought may have been a Christian church, has been unearthed at the north gate, where Lord Tredegar is conducting the search. Near the gate in an adjacent field have been disclosed the remains of an amphitheatre about 150 feet in diameter. The consent of the parish council was obtained to excavate on the village green, and here, it appears, was the centre of the Roman town. One of the most important discoveries yet made at Caerwent was here. It consisted of a memorial-stone, mutilated, but still standing upright on a broad stone base. The stone, which is 3 feet in height, has panelled sides, and on one bears a well-preserved inscription showing that the citizens of Silurum erected the stone in honour of an officer, whose name, however, is unfortunately missing, though enough remains of the inscription to show that he was a commander of the Second Legion, governor of the senatorial province of Gallia Narbonensis, and legate of the imperial province of Gallia Lugudunensis. The inscription reads as follows:—"... legatus legionis secundæ Augustæ proconsuli provinciae Narbonensis legato Augusti præpore provinciae Lugudunensis ex decreto ordinis republica civitatis Silurum."

NOTES AND COMMENTS.

STUDENTS of German art will hear with regret of the death of FRIEDRICH PECHT, the author of "German Artists in the Nineteenth Century," "The History of Munich Art in the Nineteenth Century," an autobiography and recollections and other works. He was a constant contributor of criticism to the Munich journals and was editor of the periodical *Die Kunst für Alle*. By birth he was a Swiss, for he was born at Constance in 1814, being therefore the NESTOR of the numerous Munich art critics. He began as a lithographer, and assisted in the production of the series of plates from paintings in the Dresden Gallery. Like so many artists he was attracted to Paris, and studied in the atelier of PAUL DELAROCHE. When he returned Munich was enthusiastic for wall paintings, and PECHT was allowed to decorate the Maximilianeum. He also adorned the council chamber in Constance. For the last fifty years he resided in Munich. He published drawings illustrative of the works of LESSING, GOETHE and SCHILLER. His "Shakespeare Gallery" is one of the most interesting books of its class.

WHEN an agreement is entered into that works are to be kept in order or maintained for a certain period it is sometimes supposed not to be easy to determine whether it is necessary for an architect or engineer to grant two certificates, viz. the customary final one and a special certificate for maintenance, or whether a single certificate can be made to serve both purposes. That seems to have been the difficulty in which the case lately decided in the Irish King's Bench Division, *McLARNON v. Carrickfergus Urban District Council*, originated. Plaintiff entered into a contract to carry out a sewage scheme for 4,999*l.* 1*s.* 3*d.* in the course of twelve months. After completion the works were to be kept in order for a year, and 10 per cent. on the amount of the contract was to be retained. There were some extras, and plaintiff claimed 1,040*l.* as the balance due, including the retention money. The defendants lodged 50*l.* in Court, and contended that neither the balance nor the retention money was to be paid unless a certificate was forthcoming from the engineer. When the case was tried judgment was given for the plaintiff for 975*l.* The District Council appealed on the ground that judgment should have been entered for them or the application for a new trial granted. There was no certificate forthcoming, and it had been agreed that 10 per cent. was to be retained for twelve months. It was also alleged that the terms of the contract had not been complied with. The appeal was heard last week by the Lord Chief Baron, Mr. Justice GIBSON and Mr. Justice BOYD, when their lordships came to the conclusion that judgment should have been entered for the defendants at the trial, and it was accordingly changed, with costs against plaintiff. We must suppose that in this case the plaintiff did not understand the terms of his contract. He should have known that a final certificate was necessary under any circumstances, and although it might appear rather severe, it was allowable for the architect to wait until the term of maintenance was at an end. The litigation might be avoided and the contractor need not be left at the mercy of the Council as he is at present if in the contract deed it had been stated that the final certificate was to be granted within a certain period after the completion of the work, 10 per cent. of the amount, of course, being retained.

THE Department of Agriculture and Technical Instruction for Ireland announce that a limited number of scholarships and of teacherships in training, tenable at the Royal College of Science, Dublin, will be offered for competition among students of science and technology in 1903. The scholarship will entitle the holder to free admission to lectures and laboratories, and to instruction during the associate course, with a maintenance allowance of 21*s.* per week for the session of about forty weeks each year, and third-class railway fare for one journey each session to and from Dublin. The examination for these scholarships will be held in Dublin on June 3 and on July 1 and 2, but application for admission to the

examination must be made on or before May 30 next, on a form to be obtained from the Secretary of the Department, Upper Merrion Street.

THE struggle for existence among architects is exemplified by the circumstance that no less than 124 designs were prepared for a proposed free library in Castleford, Yorkshire. The work might be expected to attract only architects in the district, but drawings arrived from many parts of the country. Mr. BUTLER WILSON, the assessor, has made his award, with the following results:—1st premium, Mr. GEO. H. VERNON CALE, of 60 Newhall Street, Birmingham; 2nd premium, Mr. WILLIAM BAKEWELL, F.R.I.B.A., of 38 Park Square, Leeds. The assessor has placed the designs by the following architects, next in order of merit:—Mr. H. V. ASHLEY, 50 Berners Street, London; Mr. FRANK L. HESLOP, East Parade, Leeds; Mr. JAMES CARTER, 64 Hinkle Street, Darwen; Mr. ARTHUR MCKEWMAN, 3 Newhall Street, Birmingham; Mr. HENRY T. HODGES, 7 First Avenue, Heaton, Newcastle; Mr. A. F. McMILLIGAN, Central Chambers, Castle Street, Liverpool.

MR. HENRY VAN BRUNT, the American architect, died on April 8. He was born in 1832. He designed several important buildings, one being the Memorial Hall of Harvard University. He was President of the American Institute in 1899.

CATHEDRAL SERIES.—WORCESTER: CHAPEL OF ST. JOHN.

HIGHER ELEMENTARY SCHOOL, FINCHLEY.

THIS school, for which tenders have just been received, is to be erected on the Great North Road, between East Finchley and Whetstone. The school, which will give accommodation for 330 scholars, contains on the ground floor ten classrooms, a large central hall 60 feet by 30 feet, separate cloak-rooms and entrances for boys and girls, and headmaster's room. On half-landings rooms for assistant masters and mistresses, and on first floor physical and chemical laboratories, balance and preparation-rooms, lecture-room and drawing-class room. A schoolkeeper's house is to be erected on the site. The buildings are built of brick, with picked stock facings for back and Wrotham sand-faced bricks for the front walls, with Bath stone dressings. All internal walls will be plastered with "Sirapite" excepting the lower portions, which have glazed brick dados. The roofs will be covered with Westmoreland green slates. The heating will be by means of ventilating radiators, and a thorough system of automatic ventilation will insure a frequent change of air. The floors are of fire-resisting construction. All classrooms are lighted from the left hand, and the laboratories have in addition cross lights and top lights. Mr. W. G. WILSON, A.R.I.B.A., of 5 Bloomsbury Mansions, Hart Street, W.C., is the architect.

DESIGN FOR TOWN HALL, PONTYPRIDD.

THE conditions required the placing of the principal elevation and entrance to the short frontage facing Gelliwastad Road. An opportunity seemed to present itself of making a special feature of the council chamber, which is given plenty of height, and is not hampered by rooms or offices over. The central spacious corridor seems to be an integral part of the scheme. The long elevation to Morgan Street was of secondary importance, and is treated inexpensively. Local stone was to be used for the walling, and Bath stone dressings. The cost of the building at 8½*d.* per cubic foot amounts to 10,000*l.* Mr. ALBERT E. DIXON, Leeds, is the architect.

THIRKLEBY CHURCH, YORKS.

NEW GAIETY THEATRE, STRAND.

IN view of the visit of the members of the Architectural Association to this theatre to-morrow, we have thought it would be of interest, not only to the members of the Association, but to our general readers, to give some details of this, the most prominent structure at present rising upon the Strand Improvement, together with a *résumé* of the facts which led to the consummation of the reinstatement, rather than the confiscation, of the Gaiety Theatre by the London County Council—a policy of new lamps for old.

Prior to the passing of the London County Council (Improvements) Act, 1899, the Gaiety Company opposed the Bill in committee, and after considerable negotiation with the Council, withdrew their opposition, in consideration of that body granting the company a lease at the rent now paid for the old theatre for fifty years of a site at the north angle of the so-called "island" site of at least a similar area to the existing theatre, plus such additional land as might be found necessary for further staircases, exits, &c, to comply with the then existing theatre regulations.

The new site allotted consists of 12,800 square feet, as against about 11,200 square feet upon which the existing theatre stands, and has a frontage of 97 feet 6 inches to the Strand, a corner frontage of 40 feet and a frontage of 138 feet 6 inches to Aldwych, both of which thoroughfares at the point being 100 feet in width.

In settling the question of reinstatement with the Council, a sum of money was agreed upon (50,000*l.*) as the minimum to be expended in covering the site, and a sum beyond this by way of compensation for disturbance. Designs were prepared and were part of the agreement as a "type" contemplated by the parties in entering into a contract; but a special provision was made whereby the Council, should they desire a building of a more ornate or costly character and design, should pay the difference between the cost of such more ornate design and the "type" design.

It is now well known that the perspective of the "type" design, which was on the line in the Academy in 1901, was intended to be carried out in red brick and Portland stone.

It was then found that the theatre (*qua* theatre) could not be carried up to the full height of 80 feet as permitted by the Building Act, and that the adjoining new Gaiety hotel and restaurant (also being reinstated) would, for obvious reasons, take advantage of the maximum height. The Council were of opinion that the difference in the heights of the two structures was not desirable, and were further of opinion that the material for the exterior should be of a more costly nature, and the architects were instructed to send in an amended design. This was done, but prior to this eight suggestions by as many architects had been submitted to the Council at its invitation for the general treatment of the elevation upon the Strand Improvement, which led to a somewhat chaotic condition of affairs, tending towards a delay which would have been against the interests of all concerned. This condition of deadlock was ultimately solved by Mr. R. Norman Shaw, R.A. (who from the first had taken a keen interest in this great street improvement), being approached by the architects, with the consent of the Council, and he, taking the matter in hand, prepared sketch designs for the exterior which were acceptable to the Council, and from which the architects prepared the working drawings of the exterior as now executed.

Practical architects will appreciate the difficulties attending the adaptation of plans to an elevation designed apart from such planning, but the difficulties have been surmounted in such a manner as can hardly be appreciated by the lay mind.

Pending the settlement as to the elevation, however, an entirely new set of theatre regulations had been passed by the Council, still further complicating matters and promising to be a fruitful source of controversy, but fortunately this was avoided, and a compromise between the old and the new regulations accepted. Still later, new regulations in regard to electric installations at theatres were passed by the Council, thus putting further trouble upon the architects.

It may be added that under the new theatre regulations no projection shall extend beyond one inch of the wall surface of any corridor or staircase, even if they exceed the dimensions prescribed; structural decorative treatment is therefore now a thing of the past to these portions of theatre buildings, and it is well the general public should be acquainted with the limitations imposed upon the architects.

Prior to giving a descriptive account of the building, we may mention that the plans in their successive stages had to receive the approval of the following bodies and committees:—

The improvements committee and its departments, the corporate properties committee (as freeholders), the Building Act committee and its departments, the theatres committee and its departments, the Lord Chamberlain, the Westminster City Council, the district surveyor, and the New Gaiety Theatre directorate.

Truly a Brobdingnagian task to be accomplished more than

once, but a course of procedure which will naturally appeal to all architects and building owners who are fortunate enough to obtain building agreements on the Strand Improvement, as being so simple and expeditious that they will welcome the arrangement as one which will at any rate enable them to complete their buildings at least a few years prior to the expiry of their eighty years leases.

Having given some slight insight to the members of the Association of the pleasurable occupation which may be derived from the preliminary steps essential to enable an architect to successfully erect a building upon this improvement prior to his entering the "sere and yellow leaf," we may be permitted to revert to the architecture of the Gaiety, whose career has happily not been brought to an untimely close by its infantile indispositions.

Internal Planning.

Auditorium.—The disposition of the site, with its two frontages diverging from the important circular corner, has naturally influenced the plan of the building. The position for the chief entrance was naturally at the junction of two such thoroughfares as the improved Strand and the new Aldwych, and gave the cue, so to speak, to the general internal arrangement, suggesting a symmetry of plan as regards exits and entrances about an axis passing through the chief entrance. This, together with the circular treatment of the crush-room and foyer, prompted by the most striking external feature, became the guiding principles in the planning of this theatre.

Entering, therefore, under the dome we find ourselves in a circular columniated crush-room, with retiring-rooms and box office, from which staircases lead right and left up to the grand circle "back." This again leads one right and one left for the full width of the tier, with three entrances thereto and down both sides of it, with additional entrances at the bottom, and midway between them on either side an extra exit on to the street, which obviates the necessity of passing through the crush-room in the event of a panic. This arrangement obtains practically in all parts of the house. Suitable accommodation for both ladies and gentlemen is provided for each part. Below the crush-room is the stall saloon, and above it are the saloons to the grand circle, balcony and gallery, all following the lines of the crush-room and circular or oval in plan. A special feature has been made of private retiring-rooms or lounges to the private boxes of the stalls and grand circle tiers; those to the latter on the O.P. side become the royal retiring-rooms, with a separate entrance from Aldwych, and with private and separate accommodation. The ranges of boxes and the adjoining retiring-rooms can be respectively thrown into one at will.

The entrances and exits to the parts other than the stalls and grand circle are alternately in the Strand and Aldwych. On the north side is provided a convenient and commodious suite of offices for the use of the management.

The open colonnade or loggia is approached by two staircases from the gallery level.

Great care has been taken in designing the line of the tiers so as to insure a perfect view of the whole of the scene from every seat in the house.

The theatre is what is known as a "three tier house," and the seating accommodation is approximately as follows:—Gallery, 400; upper circle, 250; dress circle, 180; stalls, 140; pit, 320; private boxes, 48; total, 1,338.

The chief dimensions are as follows:—Auditorium, 60 feet wide by 64 feet deep; proscenium, 30 feet wide by 32 feet high by 36 feet 6 inches deep.

Stage and Dressing-room.—Behind the proscenium is a commodious stage 45 feet deep, and of an average width of 80 feet, with a mezzanine floor and cellar below. Right and left to the Strand and Aldwych are the stairs leading to the stage exit and entrance and the dressing-rooms, numbering twenty-nine in all.

The flies will be provided with a separate gallery for the convenience of the electrician managing the lighting effects.

The "gridiron" is very convenient, and of more than usual working capacity.

Exterior Treatment.

The grand but simple proportions of the Italian Renaissance of the Florentine school have supplied the *motif* of the external treatment, sufficient relief for the large wall spaces being found in the large circular-headed windows and niches with their pilasters and pediments. The massiveness of the treatment is well crowned by the open order of coupled Ionic columns, entablature and balustrade. But the most striking feature is naturally the large dome 40 feet in diameter and 90 feet above pavement level, supported by seven pairs of consoles of strong, yet graceful, outline, and surmounted by a figure 17 feet in height.

The whole of the façades are executed in Portland stone, with bands of verde antique marble. The internal dome will be constructed of steel and concrete, and finished in gold and

colour mosaic. The external dome will be built up in steel and wood and covered with copper.

The crowning figure is being designed by Mr. W. J. Neathy.

Construction.

The whole of the construction is as fireproof as is practically possible, and generally consists of cement, greystone and blue lias-lime, brickwork and steel, and concrete floors and roof. The floors are almost exclusively finished in cement, and the roofs (of auditorium) with a double layer of asphalt. The steps throughout are of granolithic, supplied by Messrs. Lascalles.

Scagliola will be employed in the columns of the crush-room and foyer, with modelled caps and bases in plaster, and where practicable all architectural decorations will be in plaster.

Steel Construction.

The constructional steelwork of the tiers, roof and dome has been executed by Messrs. Dennett & Ingle, engineers.

The circles are constructed in steel and concrete throughout, and so designed as to carry from wall to wall of auditorium without intermediate supports. The main girders of circles vary from 3 feet to 4 feet in depth, and support lighter shaped girders through which cantilevers project 12 feet to 15 feet to the front of circles. The cantilevers are built up with steel plates and angles, and the larger ones have a depth of 2 feet at the fulcrum. The total weight of the three circles when fully loaded is estimated at about 350 tons, and this weight is transmitted to the foundations partly by the brick walls and partly by cast-iron and steel stanchions embedded in the brickwork. The stepped surface of circles is formed in concrete upon steel bearers spaced from 2 feet to 3 feet apart, and the ceilings are constructed with metal lathing suspended below the girders and cantilevers, and at such a level as to permit of an unbroken soffit and a clear height of not less than 8 feet from circle to ceiling.

The large dome, which will be a prominent feature of the new building, is placed partly over the auditorium, and is carried upon steel girders at the roof level. The two main girders support loads of 200 tons and 120 tons respectively. The ends of the larger of the two girders come over openings in the auditorium walls and are supported by twin rivetted girders, and the weight is eventually transmitted to the foundations by means of cast-iron stanchions built in the walls.

The total weight of the tower portion of the building at its base is estimated to be about 1,700 tons, inclusive of the loads supported upon girders and stanchions.

Fire-resisting Appliances.

To cope with an outbreak of fire, a complete system of high-pressure fire mains and hydrants is being installed by the well-known firm of Merryweather & Sons, Ltd., both in the auditorium and behind the scenes. In addition to this the proscenium is to be fitted with an improved double thickness asbestos fire-resisting curtain, with patent slip gear at the stage level and at the stage door, as demanded by the London County Council, as well as the usual raising and lowering gear and counter-balance weights. Provision is also made for cooling the curtain by means of a specially designed sprinkler controlled from the stage level or in necessity from the stage door.

Sanitary Appliances.

It need hardly be said that the plumbingwork and the sanitary appliances in general are of the best description and thoroughly up to date. The fact that the latter are being supplied by the eminent firm of Doulton & Co., Ltd., is a sufficient guarantee of their excellence.

Ventilation and Heating.

The system of ventilation is known as the propulsion system, and the ventilating and heating arrangements by Messrs. James Stott & Co., Ltd., are in combination.

The air-supply is all obtained at the roof line, one intake for the auditorium portion and another for the stage. These positions are selected as being at the purest points of supply.

Immediately after leaving each intake the air will be passed through a patent revolving air-screen, the functions of which are to arrest dust, smuts and any suspended matter that the outside air may contain. Leaving the screen the air is driven forward by means of a disc propeller, and passed through heating pipes that are formed of certain standard lengths with special gills or fins arranged radially at certain distances. The air, now being washed and in a high state of purity as well as warm, is passed into a short main duct over the ceiling of the auditorium and finally enters the auditorium through interstices or openings arranged in the fibrous plaster decorations.

Circulation and diffusion immediately begin, and the fresh air penetrates to all points of the house. For dealing with the gallery a special fresh-air trunk leads away in the roof from the fan-chamber,

The stage portion is arranged on similar lines, fresh air coming down from above after being suitably warmed and purified.

The temperature control is of the most complete character, inasmuch as the heating batteries are furnished with sliding valves that permit the whole of the heat being shut off or *vice versa*; the whole of it may be warmed, or, on the other hand, half warm and half cold sent forward, or any intermediate mixture of each, and all this simply by raising or lowering the dampers in question, and without in the slightest degree restricting the volume of the air. The positions of the inlet points at the ceiling level are arranged and calculated so that at no point will there be a stagnant portion. The whole of the atmospheric contents will be continuously diffusing and circulating, and gradually but imperceptibly reach the various levels of outlet.

For the outlet special flues run from the pit level and the stage floor to the roof, and on the various circle plans connection is made with these foul-air flues at the floor level. The heating medium is in the shape of a low-pressure steam-boiler suitably placed in the basement, and from this the requisite mains are led on to the batteries in the roof.

A special feature of the system is that there will be no indications to the playgoer that the building is warmed or ventilated.

The necessity of hot-water pipes is entirely dispensed with.

From an architectural point of view this, we think, will be admitted a distinct step in advance. The displacement power of the air-propellers is computed to maintain a constant pressure in the building, but at the same time it is quite of an imperceptible character. Air leakage is thus outward, and therefore dangerous and uncomfortable draughts, so chronic to theatres, will not occur in this building. Opera cloaks and overcoats can thus be thrown off during the performance with impunity.

The system of heating is on the most economical lines, as all condensation is returned to the boiler, and after the performance is over steam can be shut off and all heat confined to the boiler instead of being transmitted hours and hours when not required through walls of the heating medium, as is the case with hot-water pipes.

From what has been said about the patent air-screen it will be readily understood that it forms a great factor in the preservation of the decorations and furnishings. In addition to its purification properties the screen is also used as a cooling medium.

The Electrical Installation.

In designing the electric-light installation every precaution has been taken to minimise the risk of a total extinction through the failure of supply. The two-circuit system is being installed throughout the theatre, in the auditorium, passages, entrances and exits, the lamps being installed alternately on two circuits, these being connected through the necessary switchboards and change-over switches to two absolutely independent sources of supply, so that the lamps at any moment can be fed either all from one supply or half on each as desired. As a further means of protection a number of lamps throughout the theatre are being installed for the purposes of identification, called "police lights," and connected to a third independent system of supply. In the event of the first two supplies failing there will be sufficient illumination for the public to leave the building in safety. These "police lights" will be used during the daytime for cleaning purposes.

The whole of the lamps in the auditorium, passages, &c., are controlled from two points only, the two large switchboards, having a total of about seventy switches, being fitted in chambers leading out of the stalls saloon, where they will be under the control of a responsible official. All the lamps in the auditorium in view from the stage will be controlled by switchboards by the fire-resisting pass door to stage, and will be fitted with arrangements for lowering the illuminating power of the lamps whilst the play is in progress, and under the control of the electrician in charge of the stage.

The electroliers and fittings are being specially designed by the architects so as to harmonise with the general scheme of decoration.

The stage is being fitted on the three-colour system, and special attention has been given to the regulating arrangements so as to produce the necessary lighting effects as near to nature as possible.

The system of regulation which is being adopted is novel in this country, although largely in use in the State theatres on the Continent. A total of fifty-seven regulators are provided for, this being the largest number in use in any theatre in England.

Two independent sources of supply will be available for the stage and three supplies for the dressing-rooms, &c.

A switch platform will be provided for all the stage regulating gear, the switchboard being bolted to the proscenium wall and the regulating gear being fixed on the up-stage edge of the platform, thus enabling the person manipulating same to

face the stage, instead of as now in usual practice having his back to the lamps he is regulating. The resistances themselves will be fixed in fire-resisting chambers built above the stage switchboard, extending to the under side of the fly floor, the multiple switches which are bolted to the resistance frames being connected to the regulating gear by means of steel wire ropes.

To enable some idea to be formed as to the amount of copper required for the installation, a total of 2 square inches sectional area of such metal is being installed from the point where the supply company enters the premises to the main stage switchboard, allowing of a carrying capacity of 5,000 lamps of 16 c.p. each.

A complete system of electric lamp signalling is being installed to the principal points in the stage cellar, on the stage and to the flies, the whole being placed under the control of the stage manager in the prompt corner.

A total of twenty-four arc lamp points are to be installed, and special lighting flies provided and fixed underneath the ordinary working flies.

The whole of the work is being carried out by Messrs. Roger Dawson, Limited, to the specification of the consulting engineer, Mr. Thomas J. Digby.

Decorative Treatment.

The Auditorium, Proscenium, Boxes, &c.—The former is flanked with twelve private boxes, with arched loggia over, forming also a constructional feature in carrying the novel vaulted ceiling with its squinch-arch treatment, trumpet-like in general formation for acoustic purposes, and embellished with bold winged figures and modelling by Mr. W. J. Neatby, and three decorative tympanum panels in oils by Charles Buchel, the principal one over the proscenium opening representing Aladdin journeying with his magnificent retinue to his new palace. Upon either side of this arched opening and in the spandrels are two niches containing figure-subjects of Music and Dancing, by Hibbert Binney. The whole of these figures will be decorated in colour.

The boxes are divided by pilasters and columns, in front of which are conventional figures bearing electric lights.

The Ceiling over the auditorium is fan-shaped, with the divisions embellished by shells, masks and swags.

The Circle Fronts are of modelled plaster, principally by Sidney Webb, and are most refined in detail.

Colour Scheme—The mural decorations will consist of a material by Rottmans, having a groundwork as seen by artificial light of old rose, with a raised "art nouveau" designed in gold, cerulean blue, Hooker's green and permanent red being sparingly introduced.

The decorative plasterwork (George Jackson & Sons) will be harmoniously treated with the above scheme, and an attempt made to modify the strong contrast between the circles and the walls usually so apparent.

The draperies and pelmets will be of pale moss green, richly embroidered, in conformity with the general scheme; the carpets and seats of similar colour.

The Retiring-rooms, in the rear of the boxes, will be of various colour schemes, in contrast to the auditorium; the royal rooms are in the Georgian style, having a special brocaded fabric on the walls.

The Crush-room will be in the Georgian style, with marble columns with bronze caps and bases supporting a modelled entablature and frieze; the walls will be suitably treated, and the floor of marble mosaic.

The Foyer is similarly treated, but the walls are panelled in hardwood, dull polished, six panels being occupied by full-length portraits of the following Gaiety favourites:—Nelly Farren as the Street Arab; Kate Vaughan as Morgiana in "The Forty Thieves;" Letty Lind as a Dancing Girl; Sylvia Grey in "Monte Cristo;" Connie Gilchrist in "The Forty Thieves;" Ellaline Terriss in "The Runaway Girl." The frieze above will be plain tinted, and the modelled ceiling entirely in ivory white.

The buffet, occupying a segment of the foyer, will be in hardwood.

The Balcony Foyer will be panelled in hardwood and tapestry fabric.

The Gallery Saloon will also be panelled for the reception of sketches in black and white by well known artists.

The decorative treatment for the corridors, as previously stated, will be somewhat restricted owing to the existing theatre regulations.

The architects are Messrs. Ernest Rüntz & Geo. McLean Ford, and in addition to the general structure the whole of the decorative work and upholstery are from their designs. The contractor is Mr. Henry Lovatt, of London and Wolverhampton. The clerk of the works is Mr. D. Davies, who occupied a similar position at the Adelphi, Apollo and Wyndham's Theatres.

It is anticipated that the building will be ready for occupation in or about the second week in August.

ARTISTIC FANS.*

THE paper I have the pleasure of submitting to you this afternoon is on a subject which, although it has been much discussed, has really not received the attention it deserves. Old china, miniatures, engravings and a host of other *objets d'art* all have their admirers; the artistic fan, however, though a fascinating object, has been undeservedly neglected by many connoisseurs.

The lack of enthusiasm as regards this interesting subject is to me incomprehensible; for the study of artistic fans is no narrow one. It necessitates a knowledge not only of the various fabrics used in the manufacture of this article of the toilet, but of the painters of various periods and nationalities who decorated them, and an accurate remembrance of the main incidents in history and mythology, in order to enable the student to understand the subjects depicted on the leaf.

What I may term the "genesis" of the fan dates to so remote a period that it cannot be accurately traced, and all that has been written and said on the subject is mere conjecture.

Uzanne, in his elegant and charming little book, entitled "L'Eventail," expresses himself as follows in regard to our knowledge of the origin of the fan:—

"The origin of the fan is still shrouded in the most unpenetrable mystery. It is in vain that pens have absorbed huge bottles of ink, and have composed ingenious essays, curiously interspersed with quotations from precious documents or citations in all languages to explain its origin. The point of interrogation is always omnipresent like a diabolical hieroglyphic sign, on which the erudition of archaeologists is sarcastically inscribed."

In view of this statement there is nothing left for me to do but to place before you some points of information, true or fictitious, historical or mythological, which are to be found in literature, and leave my intelligent listeners to separate for themselves the chaff from the grain, or fact from mere conjecture.

That fans are indeed a very ancient institution is proved by their mention in the Old Testament as implements employed for winnowing.

In Chinese records, moreover, it is stated that during the Chow dynasty, 1106 B.C., fans were used to keep the dust from the wheels of the chariots; at this time they were doubtless nothing more nor less than dried palm leaves, for ivory fans were not known in China until two centuries later, namely 991 B.C., and since then such diverse materials as dragon-skin, tortoise-shell, bamboo, oil-silk and rice paper have been employed in their manufacture.

Some of the older authors state that in China at a remote period fans or rather hand screens were made of peacock feathers, the tail feathers being mostly employed for this purpose. It is related, however, that in 650 A.D. the Emperor Kao-Tsong heard the cry of the pheasant which is an omen of good luck; he therefore henceforth resolved to use only a fan composed of the tail feathers of this bird.

A story is told of a mandarin's young wife who wished at the deathbed of her husband to swear that she would always remain true to his memory, but he said, "No, only promise me you will not marry again until the soil that covers my last resting-place is dry." The rest of the story is like the well-known tale of the widow of Ephesus. A lover appears, and the widow, true to her promise, daily visited the grave, but not to weep, for she was busily engaged in fanning the soil with her fan, so that it should dry up quickly and she could marry her lover without breaking the solemn promise made to her late husband.

The custom of using fans in Japan, as far as can be ascertained, dates back to the sixth century A.D., and in that country every person from the Mikado on his throne downwards in successive grades, noblemen, courtiers, priests, sages, women, dancing-girls, even children, all wielded a fan of special design according to his or her rank, profession or social standing. It has played an important part in life in Japan past and present, being an article of many uses and multifarious duties. As in Egypt, it was borne aloft in times of war as a standard. The "War Fan" was used by generals and commanders for directing the movements of the troops during action, and, if necessary, could be utilised as a shield for defence; it was strongly fashioned of double leather, sometimes even of wrought-iron lacquered, and it usually possessed a long iron handle.

In Japan a fan was wielded by the umpire of wrestling matches, and this custom is still in vogue. Lovers were wont to exchange fans as tokens of fidelity, and friends regarded the gift of a fan as a sign of liking and esteem. In the Land of the Rising Sun it is used to waft cool air to the heated countenance and to fan the charcoal flame used for cooking. Held above the head it shields the face from the fierce rays of the

* A paper by Miss Hannah Falcke, read before the Applied Art Section of the Society of Arts.

sun, and in the street it is waved in greeting or salutation. The nurse in Japan wafts a fan also gently to and fro over her infant charge to lull him to sleep and to keep off the insects.

At all times Japanese artists have delighted in expending their skill in painting on the open fan, and the present artists do the same. Their productions are sketchy, and perhaps, according to our Western notions, somewhat grotesque, but their touch is delicate and their colouring good. A charming custom prevails in Japan at artistic social gatherings. As a means of entertaining the guests and passing away the time, the brothers of the brush often sketch little scenes, groups and incidents of interest or history on fans, which are subsequently passed round and exchanged and carried away as treasured keepsakes.

I must not, however, enlarge further on the fan and its uses in the Far East, for it is a common article in the hands of every class, and has a place in every household. Indeed, it serves so many purposes that a volume might be filled with a description of its uses.

There are two hypotheses as to the manner and means that suggested the folding fan, and both have to do with the observation of nature.

According to one theory, it is said that an artisan of Tam Ba was seated one night at the door of his house idly fanning himself while watching the flight of the bats overhead. The idea suddenly occurred to him to fold the stretched material of the fan in imitation of the bats as they opened and shut their wings, and he thus originated the folding fan, which is called in Japanese "komori," a bat.

The other theory is equally fanciful, but perhaps the more probable. There is no doubt that the flat fan was originally simply a palmetto leaf, and the gentle breeze made by its moving to and fro on the parent tree may have suggested the use of a single leaf for the like purpose. It is said that the folding fan was likewise suggested by the palmetto leaf, for, undeveloped, it is pleated and packed, delicately and compactly, by nature's deft hands, and the clever Japanese, ever ready to seize and imitate something fresh, took advantage of the copy already prepared for them, and in 750 A.D. their supple fingers invented the folding fan.

Fans were already used in Egypt in the thirteenth century, B.C., as is clearly proved by the frescoes that ornament the palace Temple of Medinet-Haboo at Thebes; on these frescoes Rameses III is depicted, surrounded by princes and courtiers bearing hand-screens, semicircular in form, bright in colour and mounted on long handles. The fan at that period was, it must be noted, no feminine adjunct to the toilet, its use being only permitted to leaders of armies, princes and high dignitaries, by whom it was borne aloft as a sign of distinction, and, in the case of warriors, as insignia of command. Ostrich feathers were largely used for making these stately fans.

India, likewise, claims the right of having first invented the fan, and there is no doubt that, though we are not in a position to confirm or deny the assertion, the fan has for ages been used in this country of mystery and charm, of gay flowers and luscious fruits, of jewels, wealth and luxury. In a country so hot and enervating as India the fan was almost a necessity of life. In Hindostanee the fan is called "pank'ha," and to this day the term is applied to the huge swinging screens suspended from the ceilings in India and worked by natives during meal-times to cool the air for European inhabitants and Indians of wealth and high degree. In India fans were made of carved ivory, of tortoise-shell and sandal wood, of dried grasses, bamboo, palm leaves, straw, peacocks' feathers and muslin; also were they made of thin sections of wood joined in the centre, and with a handle at either end, so that when the two handles were brought together the fan opened like a circle, and when brought together in the opposite direction it closed up flat.

The fan was also known to the ancient Medes and Assyrians, and the Persians made use of the long-handled square or spherical fan of the hand-screen variety. The kings of the latter country when, taking the field against an enemy, were wont to be accompanied by a sacred fire carried on a splendid chariot drawn by four high-stepping, white steeds, and followed by a bevy of youths, 365 in number, clothed in yellow. So holy was this fire considered that it was thought that the breath of a man would defile it, and it was therefore always kept alive by a special fan. It is probable that the 365 youths were emblematical of the days of the year, and that the fire represented life.

From Asia, by way of Asia Minor or Egypt, the fan made its way into Europe.

Greece was the first country in Europe to adopt the fan, and that must have been at a remote date, for it is gravely asserted that the Sibyl of Cumæ was in the habit of wafting a fan to and fro whilst delivering her momentous oracles.

The first fan used by the Greeks was simple in form, but like most things Greek, very elegant. It consisted merely of a pair of birds' wings, joined and fixed on to a long handle. It was used by the acolytes in the temples to drive the flies

away from the sacrifice, and to cool the air. In the Temple of Artemis the vestal virgins utilised palm-leaf fans to fan the sacred fire, and branches of myrtle and the leaves of the Oriental plane-tree were likewise used for the same purpose.

It is a curious fact that, in contradistinction to the custom in vogue in Ancient Egypt and Japan, the fan in general was, in Greece, at first only used by slaves to cool the atmosphere, and thus contribute to the comfort of their masters.

A few days ago when passing through the Greek room at the British Museum my attention was specially attracted to the exquisite terra-cotta statuettes found in the tombs of Tanagra. Three of the female figures carried fans, two of them being of the palm-leaf shape and one circular in form. One little male figure also carried an enormous fan, round in shape, and covered by long feathers. These statuettes are, as you know, referred to the fifth and fourth centuries before Christ.

From Greece the fan by gradual stages crept on to Italy.

There are extant in our museums paintings on antique Etruscan vases of figure subjects, with accessories in the shape of fans. These are always of the hand-screen order, with long handles, and are square, pear-shaped, or semicircular, and covered with feathers. The presence of fans on antique pottery proves how ancient these ornaments must be.

At the dawn of Christianity the first converts at Rome were in the habit of using fans, and some documents of that era mention the circumstance that during the services held secretly in the Catacombs, deacons stationed at either end of the altar incessantly waved to and fro large fans to cool the close atmosphere and drive away the flies that might otherwise have settled on the sacred bread or have fallen into the chalice. This custom actually continued in vogue in the Church of Rome until the fourteenth century A.D.

Fans became very popular in Italy during the twelfth century, and were made of feathers either in bunches or fastened in a semicircle on to a frame. The feathers employed were those of the ostrich, peacock, parrot or Indian crow. They were of the hand-screen form, were made in the East and exported thence to Venice and other ports for distribution throughout Europe. The handles were made of ivory, or even of gold embellished with precious stones.

During the fifteenth and sixteenth centuries the fan in Italy became a most extravagant article, the kinds most fashionable being the feather, the folded and the hand-screen fan. Ladies were in the habit of wearing their fans suspended from the waist by a golden chain, as was the housewife's bunch of keys, and this mode may still be observed in some parts of Italy at the present time.

During the sixteenth century fans were articles of fashionable attire, not alone of ladies but of gentlemen, and were dainty little articles, the body being of paper beautifully painted on both sides and the small handle made of wood. The favourite subjects chosen for decoration were love scenes from literature and mythology, an explanation in verse being sometimes inscribed beneath.

More costly materials, such as kid or lamb-skin, vellum or satin, were also utilised for fans, and these were painted with no mean skill, the best artists not considering it beneath their dignity to decorate a fan. The sticks or bouts of the best fans were fashioned of tortoise-shell, mother-of-pearl or ivory, the latter being so beautifully pierced and carved as to resemble the finest lace. It was at this time that *Péventail plissé* was introduced into Italy.

In 1730 the fan in Italy was made entirely of ivory, carved or plain, and in some cases, as in the fan I now have the pleasure of introducing to your notice, three plaques of painted satin, beautifully executed, were skilfully appliqued on. This fan also is of the same date and both are known as *Péventail brisé*. The sticks and mount are in one, as you will observe.

By this time the fan had become so popular in Italy that it was equally common in the hands of the peasant and the duchess.

The two countries of Italy and France have ever had near commercial interests; thus it came to pass that the folding fan, called *Péventail plissé* or *éventoir*, was introduced to the French by the Italian perfumers in the time of Catherine de Medici, and soon became the rage, the hand-screen of Eastern origin being speedily abandoned.

France has produced some of the most beautiful fans possible from the fourteenth to the nineteenth century. The lightness and delicacy of the ornament, together with its beauty and elegance, seem to appeal irresistibly to a nation at once so tasteful and so sentimental. Indeed, the temperament of the French has shown itself at its best and their artistic skill at its highest in their treatment of fans, for in no country in the world has the subject been so lovingly and gracefully handled.

Almost from the time of their introduction into France the fan sticks were made of ivory, mother-of-pearl and tortoise-shell; they were richly carved and inlaid with gold, silver and other metals. Sometimes the sticks were made of gold and enriched with diamonds, rubies, emeralds and other precious stones, or with pearls; filigree silver was also in high favour.

The material of which the leaf was composed varied exceedingly, and comprised chicken-skin, swan-skin, kid and lamb-skin, as well as vellum, satin, silk and paper. It may be imagined that with such a choice of substances, many diverse effects could be obtained.

An old French book mentions that, in the reign of Charles V. of France, that monarch, about 1370, possessed a folding fan, bearing on its leaf the arms of France and Navarre, and having an ebony handle.

During the reign of Louis XIII., Anne of Austria introduced many Spanish fashions into France, fans made of scented wood amongst them. The fashion, however, did not last long, for the artistic eye of the French rebelled against the inferiority of the Spanish workmanship, the coarseness of the carving, the crudity of the colouring, and the ungracefulness of the drawing. Under these circumstances it is not surprising to learn that the trade soon dwindled, and finally collapsed entirely.

During the reigns of Louis XIV. and Louis XV., the arts and crafts flourished exceedingly, and fans were not neglected. The leaves of chicken-skin, vellum or parchment were painted in figure or pastoral subjects by such celebrated artists as Watteau, Lancret, Detroy, Vien, and even the celebrated Greuze; landscape and pastoral subjects were painted by Joseph Vernet, Boucher, Baudoin and Lebrun. All lent their splendid talents for the adornment of these ladies' toys.

The fan now shown on the screen is of the time of Louis XV., and this one, which is called the "French Marlborough Fan," exhibits on the side shown to you three vignettes, depicting respectively the parting of the Duke and Duchess of Marlborough on the departure of the former for the scene of war, the Duchess watching her husband from the tower, and the duke's tomb.

On the reverse side the nineteen verses of the famous satirical song, entitled "Malbrouk," are printed. They were composed after the battle of Malplaquet in 1709, when the duke was reported to have been killed. This song maintained its popularity in various parts of Europe for a century and more.

During the time of Louis XV. there lived a family of four brothers named Martin. One of them was an able chemist, and invented a wonderful varnish. It was delicate and transparent, and possessed the lustre and hardness of fine porcelain glaze. The brothers, being coachbuilders, at first employed this varnish to finish off the carriages they made, but later on it was used for the purpose of varnishing painted fans. It is asserted that the inventor of the varnish ornamented the fans as well as varnishing them, but this I think is improbable. In any case this varnish, called "Vernis Martin," was used to glaze all the best fans of the period.

Unfortunately the secret of its manufacture, jealously guarded during the inventor's life, died with him, and though many attempts were made to imitate it, they were unsuccessful. During this period the sticks were smaller and more delicate than in the preceding reign, and perhaps the richness and loveliness of colouring and design of the leaf was improved by the introduction of Chinese sticks, or sticks ornamented in the Eastern style. Some fans were painted by a French artist, finished by Martin and the sticks subsequently decorated by an Oriental painter. Other fans, as the one I now show you, were of *ivory brisé*, the leaf and stick being combined; this particular *eventail* is interesting from the fact that it tells its own tale. It is evident that the fan itself was of French workmanship; the decoration of the upper part was probably undertaken by a Flemish painter in France, the sticks or bouts were ornamented by an Oriental artist, and, finally, the varnish was put on, but evidently by an imitator of Martin's method, or by one of his pupils, as it lacks the translucent appearance of real "Vernis Martin." I also have pleasure in showing you another fan of the same period, but somewhat larger; the mount in this case, however, was the work of a French artist, as will be seen. The period of Louis XVI. was also a luxurious one. Specimens are very scarce at present, as they were small, delicate and easily broken. The sticks were beautifully carved in figures, horses and chariots, dogs, birds and trees, and then coloured true to nature. The leaf as a rule was of a light and flimsy material, sometimes spangled, and in very rare cases painted by artists of renown.

Then followed the dark and dreadful days of the Revolution, when Louis XVI., the heavy and foolish, and his consort Marie Antoinette, the beautiful and light-hearted, suffered death on the guillotine. All good taste died during this time, and the art of fan-making languished. Luxuries of every sort savoured of the hated aristocrats, and no woman would have dared to use a jewelled or gold-handled fan. Those fans that were made at this time were of coarse paper, and reflected the temperament of the people. *Liberté, égalité, fraternité*, was the cry, and crude drawings of current incidents figured on the fans. The meeting of the National Assembly, the murder of Marat in the bath by Charlotte

Corday, &c.—these incidents depicted on the fans showed, as in a mirror, the mind of the people. In this connection, it is interesting to note that, on one *eventail*, Charlotte Corday is represented carrying a dagger in one hand and a fan in the other.

Again there was a lull, and again there was a revival of the art of fan-making during the Empire period. The fans of this time were small, and either made of horn painted with flowers, or muslin or silk gaily spangled (like this one on the screen). A few, such as the two I now show you, were, however, larger.

There were fans also that reflected the feelings of the French for Napoleon, such as his portrait, with folded arms and downcast gaze, or his likeness in the well-known cocked hat and grey riding coat. There were fans, too, that exhibited a martial spirit, and these were decorated with cannon and other cruel instruments of war, the escutcheon of the Emperor, the flag of France or the fleur-de-lys. A few, on the other hand, were painted with classical subjects.

During this time also, the fan was used by hostesses as a token of greeting, salutation, or welcome to their guests. Many degrees of intimacy were thus expressed, from the formal stately wave of the fan to the playful rap on the arm or shoulder of the welcome friend.

In the year 1827 the fan was indirectly an important factor in the conquest of Algeria by the French. The Dey of Algiers insulted the consul of France by giving him a blow with his fan of peacock feathers. War was declared, and Algiers became the property of the French.

In 1829 the taste for luxurious fans revived, and fans in imitation of those of the time of Louis XV. again became the fashion, but they never attained their former excellence; the master hands were gone, the spirit that animated the period of Louis XV. could not be revived, and the result was a failure, because, although expensive materials only were used, the taste of the former periods was lacking.

Spain has ever been the land of romance and gallantry, and the home of song, music, and the dance. The mandoline and guitar are played by enamoured swains beneath the windows of their sweethearts. The music is accompanied by tender love songs or serenades, and dark-eyed beauties shielded from view by their large fans glance forth into the night to ascertain who it is that is serenading them. When the first fans were introduced into Spain, they were eagerly adopted by the lovely and coquettish ladies, and to this day the fan is considered an essential part of a woman's dress, and is her constant companion.

Though the Spanish fans are by no means models of artistic excellence, there is no country on the face of the globe where they are so gracefully wielded. The *abanico* is really an important weapon in the mimic warfare of coquetry and flirtation in the hands of an accomplished señora or señorita. Mrs. Salwey, in her clever book on fans, thus expresses herself on the fan of Spain and its uses:—

"The fan in the hand of a Spanish lady knows no rest; it is perpetually in motion, portraying the feelings and thoughts that are passing through the mind of its owner. It is her interpreter, often unconsciously. It is always in her hands; in church, in places of amusement, when visiting or walking, and on every occasion. There is a complete language of the fan which is studied with great care and persistence until it is thoroughly acquired, and it is almost a necessity to study this accomplishment."

Later on the fans, or *abanicos*, in Spain, following the lead of other European lands, were made to fold, and they possessed one distinct advantage over the others, namely, that they were made to open both from right to left and left to right. The little ivory fan I here show you is a specimen of this style, and has four distinct sides.

I find that during the fifteenth century, and even later, the fan was used in Spain by men as well as by women; indeed, at the bull fights, the fan was frequently employed by the toreros to flap in front of the bull and thus rouse his slumbering ire and cause him to charge his insulter. Be this as it may, it strikes me from what I have read on the subject that the use of the fan by toreadors on these occasions was really only a means of showing their courage in the face of extreme danger by an affectation of indifference and frivolity.

It is curious how a national sport, pastime or custom becomes impressed on the art of a country, or even on articles of jewellery or wear. Now, perhaps fans come under the heading of both "art" and "wearing apparel," and therefore the fan is in Spain impressed with the spirit of the country, for whereas other lands have more pleasing subjects to portray, the Spanish fans are mostly painted with scenes from the arena, and I fancy this subject does not appeal to tender-hearted Englishwomen. True, other subjects—the dance, the serenade and so on—are depicted on Spanish fans, but the bull fight is the most popular one. The mother-of-pearl sticks are gaily decorated.

A printed Spanish fan of the eighteenth century, though crude in colour and imperfect in drawing, is interesting from

the circumstance that it bears the words *Origen de los Abanicos*. Psyche is depicted asleep on a couch under a tree. Cupid is standing by bearing in one hand his arrows and in the other a wing torn from the shoulder of Zephyr, who is disappearing in the distance.

Of the German and Dutch fans I can have little to say in this paper as they are not particularly interesting. Perhaps I have not seen enough of them to be a good judge. They are mostly illustrated by pastoral subjects, but these are heavily treated. Historical subjects have also a place in the decoration of these fans.

English fans are said to date from the year 1307. Thus it will be noted that fans made their appearance almost simultaneously in the fourteenth century in France, Italy, Spain and Great Britain.

During Queen Elizabeth's reign fans became the height of fashion; they were of an extravagant description, the sticks being made of mother-of-pearl, inlaid ivory or gold and silver studded with pearls, rubies and emeralds.

After Queen Elizabeth's death twenty-seven fans were found to have been entered in the inventory of her wardrobe.

Now good Queen Bess had a strange but refined notion that a fan was the only gift permissible from a subject to his sovereign. Sir Francis Drake presented the queen with one. It is described as being of red and white ostrich feathers, and the gold handle was decorated with a half-moon of diamonds and pearls, which formed a frame for a miniature of herself.

Another fan presented by the Earl of Leicester was of white feathers. The handle was likewise of gold and was thickly jewelled, bearing a lion rampant with a muzzled bear beneath its foot; still a third fan was of swansdown, its handle representing a golden monster, with head and breast of mother-of-pearl.

I must not forget to mention that at this time fans were by no means monopolised by women, though the use to which they were put by men was by no means too gentle, for Aubrey says:—"The gentlemen had prodigious fans, and they had handles at least half a yard long; with these their daughters were oftentimes chastised."

As articles of use, wear or ornament become more widely known they become universally adopted, or, in the phraseology of the past, "the mode," and thus it happened in England that by the latter part of the sixteenth century fan-making had become an important trade in England, though the fans were not so artistically made as in France until the revocation of the Edict of Nantes, in 1685, when numerous French fan-makers came to England, and by introducing their industry improved the taste and style of fans here.

This fan shown on the screen is of English manufacture and dates from early in the nineteenth century. The fans of former centuries are a faithful mirror of passing events and a truthful recorder of history, music, politics, social customs, sports and poetry. There is scarcely an occurrence of importance that has not been painted or printed on a fan. Gay subjects, grave subjects, heroes of the sword and pen, each and all have been portrayed on fans. The most striking events of ancient history have been transferred to chicken-skin or vellum, or immortalised on silk or paper. An account of the fans of the eighteenth century would form a comprehensive history of the period, and the late Lady Charlotte Schreiber's wonderful collection, given by her to the British Museum, is representative of this time.

I feel that no paper on fans would be complete without some reference to this remarkable collection, but as the time at my disposal is drawing to a close, I must content myself with the mention of a few, together with the names of their makers and publishers. With the exception of one or two, all Lady Charlotte Schreiber's English fans were printed on paper or skin, plain, or coloured by hand. The *eventails* I am referring to comprise historical, geographical and botanical fans, riddle fans and fans representing scenes from Shakespeare, mythological subjects, portraits of Milton, Wellington and Napoleon I.

Very curious is one on which a punning bill of fare of a wedding dinner is printed. Melancholy soup with crooked sauce, the divine part of a man boiled, and a Dutch prince in a pudding are among the good things set forth on the menu.

The love scene is a pretty fan; it was issued by "Clarke & Co., fan-makers to their Royal Highnesses the Duchess and Princess of Gloucester, at their warehouse, No. 26 Strand. N.B.—Inventors of the Pockett Sliding Fans."

Lady Charlotte Schreiber's collection likewise contains a garden scene, which was issued by Chassereau, and which is dated 1741.

"Boys with tops" and "Children with battledores" are two pretty printed paper fans the production of "A. Poggi, St. George's Road, Hyde Park."

There is also a "History of England," a duplicate of which I am fortunate enough to possess.

There is a highly interesting allegorical fan on the marriage of the Princess Mary with William Prince of Orange.

This fan was published by M. Gamble, who thus advertised it in the *Craftsman* of August 25, 1733:—

"The Orange Fan, with a letter to the lovely She who has more than 30,000 charms. . . ."

"Once more the Orange joins the British Rose,
And fragrant sweets they mutually disclose.
Entwin'd by Nature's bonds, their charms unite,
And from the Foil the Jewel shines more bright."

Another fan on the subject, but differently treated, was produced by "Jonathan Pinchbeck, fan-maker, the Fan and Crown, New Round Court, Strand"

There is no doubt that these two fan-makers were rivals, as will be gathered by the following advertisement which appeared in the *Craftsman* of September 22, 1733:—"The Original Loyal Nassau Fan, or Love and Beauty triumphant." A fan representing Bartholomew Fair is inscribed:—"Published as the Act directs by J. F. Setchel, 23 King Street, Covent Garden."

The most artistic and neatest trade-card of a fan-maker is the following:—"B. Coker, fan-maker, Wholesale and Retail, 118 Fleet Street, London. Fans neatly repaired." This card is small, and is decorated with a draped classical figure holding a shield on which the above lettering is inscribed.

In trying to cover so extensive a field as the history of fans, I have of necessity been forced to be brief in my descriptions, but I trust that I have been able to give to my hearers some faint idea of the great interest of the subject.

There are so many points worthy of notice that I felt it was almost hopeless to touch upon more than a few of the most representative of these. The great and abiding charm of the fan is connected with its personal associations, and however ornamental it may be, however great its artistic value, usefulness is never entirely overlooked. The fan is an object loved by its possessor, and when we look at any collection of fans we cannot but feel how great is this personal charm.

Each age has left its mark in the pattern of the fan. Events of passing interest as well as those of historical importance have been recorded, and artists of repute have been found to ornament them. The variety of styles is so great that there cannot fail to be some to interest all tastes.

I hope that in the present day we shall never let this artistic feeling die out, for we may be sure that in the future, whatever fluctuations there may be in fashions, the fan will always hold a high position in popular esteem.

ARCHÆOLOGY IN DURHAM.

THE annual meeting of the Archæological and Architectural Society of Durham and Northumberland was held in Bishop Cosin's Library, Palace Green, Durham, last week. The Rev. Dr. Greenwell, president, was chairman.

It was decided to visit the following places during the ensuing summer:—Two days' meeting—First day, Hull, Hedon, Preston, Patrington, Welwick; second day, Barton-on-the-Humber, Thornton Abbey. One day meetings—1, Haltwhistle, Williamstown, Bellingham; 2, Warkworth, Guyzance, Felton; 3, Seaham, Dalton-le-Dale, Dawdon, Easington; 4, Tanfield, Kirklington.

The President said that when visiting Seaham, where they had an unrestored church, they would have the pleasure of meeting the Rev. A. Bethune, who was ninety-three years of age, who still conducted three services every Sunday, and is as capable as he was thirty years ago.

The President then delivered his annual address. In connection with the visit to Sockburn, says the *Durham Advertiser*, Dr. Greenwell told the legend of one of the Conyers slaying the dragon with a falchion, still treasured at Sockburn, and went on to impress upon his hearers that Durham is not part of England. It was the Palatinate of Durham, and the present king is Count Palatine of Durham, had his officials and chancellor, and so on. Hence they had this very remarkable fact in connection with their county, that they were separated from every other county in England by theirs being a kingdom in itself. Formerly, when the Bishop of Durham entered the Palatinate, the Lord of Sockburn presented to him the falchion, by reason of which the lord held his land. Had he not done so the bishop could have taken the land into his own hands. Unfortunately the king had not come to claim his ancient possessions in the Palatinate. Were he to do so, Mr. Edward Blackett would present His Majesty with the falchion. At the close of his review of last season's visits the President said their Society was in a very good financial state. They always experienced great difficulty in getting out their Transactions. There were a great number of members who were capable of writing excellent essays on various subjects but who would not do so. He could not tell why. But he had thought in order to stop the gaps which were always gaping that they might spend a considerable portion of their balance in this way. Some of the

most interesting things to be seen were a number of pre-Conquest stones in the shape of crosses, grave covers, &c., scattered throughout the counties of Durham and Northumberland, and he proposed to issue in connection with their Transactions illustrated descriptions of these sculptured pre-Conquest stones, commencing at Hartlepool and travelling northwards. These could be either bound up in the accounts of their meetings or separately into one volume. These stones could be reproduced either by some photographic process or drawn. It would be an exceedingly valuable book, and would be a work worthy of their Society. If the meeting assented the work would have to be put in hand at once. He proposed that, promising to write as many descriptions as he could.

Archdeacon Hamilton thought it a very desirable undertaking.

The proposition was carried.

The President said they would not do anything in a scamped way. Whatever they undertook would be thoroughly well done. Whatever could be produced by photography should be done, because they then got a representation of the subject as it is. The President paid a high compliment to Mr. Footitt as a draughtsman, remarking that it was impossible to find a man who worked more in the spirit of the old work. All of them might be acquainted with the "Rites and Monuments of Durham," a book written by a man, if not a monk, who must have been a novice here. At all events, he was very intimately acquainted with the monastery of Durham and everything that went on therein. He produced an account which it was patent at first reading had been written by a man who knew all the ins and outs of the place. He told them of the altars, the ceremonies and everything that went on in the cathedral before the Dissolution. That book was produced by the Surtees Society a great many years ago. They were indebted to the Surtees Society for a great many most valuable works connected with the history of England north of the Humber, and no more valuable book was produced than the "Rites." It was out of print and unobtainable except at high prices. A fresh edition had been taken in hand by the Surtees Society. The editorship had been undertaken by as capable a gentleman as could possibly have been selected—Canon Fowler. No man is better acquainted with monastic rites and ceremonies, and no man is better acquainted with the cathedral of Durham than was Dr. Fowler, who had spared neither money nor time nor pains over the new edition, which would really be a monumental work. With regard to the excavations at the cathedral, the road going through from the cloisters into the cemetery and the monks' ante-chamber to the chapter-house had been cleared up, and a good deal of old work had as a consequence been made visible. Dr. Gee, the new master of University College, took an enormous interest not only in the building, but in the history of Durham Castle, and was determined to draw up an account of the castle which he (the President) hoped would be reproduced in a separate book. Plans were being made by Mr. Hodges, one of their members, who some years ago made a very careful survey of the castle, and who had his notes ready, and would undertake to produce the book on a large scale and containing a very ample plan. Dr. Gee would assist in writing the history of the castle. Thus they would have produced a work of very great value indeed. It would be an expensive work, and he hoped members would assist to obtain subscribers. In connection with the work Dr. Gee had undertaken to have some excavations made. As those present knew, there were a great many places and features about the castle respecting which a little light was required, and a little digging might enable them to form some idea of what possibly the great castle built by William the Conqueror, on his return from Scotland after defeating the King of Scotland, and bringing the whole North of England into subjection was. On his return William found Durham was in a defenceless state. His euteuant, Robert Cummin, had been murdered in the bishop's house. All Cummin's men had also been murdered. William determined in that year, 1072, to build a castle at Durham. Of that castle there still remained the old chapel. He thought there were some other remains. They were not quite certain, still if excavations were made probably some light would be thrown upon what the original castle of William was. It had been altered at various times by Bishop Pudsey in the twelfth century, by Bishop Beck in the latter part of the thirteenth century, by Hatfield in the fourteenth century, and later by Fox and Cosin. It had consequently passed through a great number of alterations and a great number of additions had been made. Nevertheless it still possessed most of the characteristics of an important castle of the first magnitude. It was one of the great castles of the County Palatine of Durham against Scottish inroads. The County Palatine had the great castle at Norham, and the other great castle was at Durham. Besides, the bishop had a number of houses and places where he lived, but Norham and Durham were the great castles which protected the Palatinate and the rest of England against the raids and invasions of the Scots. In conclusion,

Dr. Greenwell wished long prosperity to their Society, hoping that they might all live to see a few more years of it.

The members, under the guidance of Mr. Freeman, then proceeded to the cloister garth, and were entertained by Father Brown's description of the recent excavations, and what had been found. He described from the "Rites of Durham" the beautiful lavatory which originally existed there for the monks to wash their hands when summoned to meals. The chief meal was at 11 A.M. It was very curious how for a simple purpose like that there came to be erected such a magnificent building as the lavatory doubtless was. From the number of pieces of shafts, rings and capitals found there had been an Early English building there, but what it had been there was at present no apparent sign. In the deep well which had been cleaned out there was discovered the grave cover of Henry of Horncastle (latter part of the fourteenth century). How that grave cover got down that well, which also contained a lot of Early English debris, burnt coal, &c., it was difficult to say.

ARCHITECTURAL ASSOCIATION OF IRELAND.

THE final meeting of the session of the Architectural Association of Ireland was held on the 21st ult. in the rooms of the R.I.A.I., 20 Lincoln Place. The president, Mr. Fred. G. Hicks, occupied the chair. In his opening address he laid some stress on the subject of examinations by the Royal Institute of the Architects of Ireland, which he was gratified to know was very favourably received by the members generally. A deputation was appointed to wait on the Institute in connection with this very important move. He felt quite satisfied that the time was not so far distant when the profession on this side of the water would have so benefited by the change as to reach the highest pinnacle of architectural renown. Architecture, like everything else in the country, was going to advance, and the rising generation must be, in a measure, responsible for this advancement. Let them look to it that their efforts should be worthy of them, and the great profession they had adopted. Education was the key-note of the age, and in this respect it was gratifying to know the Government contemplated spending some millions on technical education in this country. He hoped architecture and the other arts would not be lost sight of. A knowledge of them was quite as essential for the layman as for themselves, else how could they expect him to have a desire for the beautiful, or to appreciate it when he had got it? He looked forward to the time when the State would exercise some control over architecture and building. It might come with registration, if ever that came. He feared both were a very long way off, but public bodies should not be allowed to entrust architectural work to incompetent men or to erect buildings with public money that would be an eyesore for a century (that was if the building did not fall down). The lords of the soil in their own interests and their successors, to say nothing of the public, should have no dealings with the jerry-builder or the jerry-architect. If they wanted to develop building estates profitably let them appoint an architect of repute, by whom all designs must be approved. He was glad to say that this was done on some estates near Dublin, but he regretted on other estates builders and architects were allowed to do just as they liked, with very disastrous results. Good work had been done during the past session. He hoped there would be a good competition for the prizes afforded by the Association and by the individual firms in connection with the technical demonstrations which were being organised. With regard to his successor, Mr. Ashworth, the best interests of the Association would be safe in his hands.

TESSERÆ.

Roman Influence in France and England.

MANY English towns stand on the site of Roman towns, but very few, if any, English towns can trace the same uninterrupted connection with primitive times which is still plainly written on the ancient cities of France. It is by no means clear that the Roman towns in Britain so generally occupied Celtic sites as they did in Gaul; it is quite certain that few or no English towns can show the same continuous existence from Roman times which so many French towns can. A great gulf, an interval of historic darkness, a period given up to the conjectures and inferences of ingenious men, divides their latest recorded Roman existence from their earliest recorded English existence. No existing English, or even Welsh, bishopric pretends to trace an uninterrupted episcopal succession further back than the sixth century. That any English town retains a traditional, or even an imitative, Roman constitution, is a mere dream without a shadow of proof. Nay, it is not even certain that the sites of the ancient Roman towns were continuously inhabited. Many of them are utterly for-

saken; others have changed their names; of those which have kept their names several are suspected to have changed their sites. London retains its name, but learned antiquaries doubt whether the oldest English London occupied the site of Roman London. Except when it has been tampered with by recent changes, the episcopal succession in a French city has gone on uninterruptedly since the third or fourth century; the present cathedral stands on the site of a church of those primitive times; the extent of the diocese marks the extent of the Roman civil division of which the city was the head. Then came the Teutonic inroads—those of the Franks in the north, those of the Goths and Burgundians in the south. The connection with the seat of empire, with Rome old or new, first became nominal, and then was wiped out altogether till the day when the Roman diadem was set on the brow of a Frankish king. But the Gaulish hill-fortress, the Roman city, lived through the storm. It remained a seat of habitation and of dominion; it retained its name, its position as the head of a district; in the south it even retained large traces of its Roman municipal organisation. Above all, it retained its character as a seat of spiritual rule, the seat of a chief church and its chief pastor. The cities of Gaul have lived on uninterruptedly from the days of Sextius and Cæsar till now. The episcopal churches of Gaul lived on uninterruptedly from the days of primitive Christendom to the great Revolution. And with most of them the great Revolution itself was only a passing eclipse. The chief towns of France, in short, are places which have been abodes of man, seats of man's industry and government, such as industry and government have been at various times, for eighteen hundred or two thousand years, and for as many more prehistoric centuries as anyone chooses to add. Dynasties, governments, nations, languages, all have changed; but to this day the chief fort of each tribe overrun by Cæsar commonly remains the cathedral city of a diocese, and is often also the capital of an ancient province or a modern department.

The Acropolis at Athens and the Rock of Cashel.

Comparison has been made between the rock and ruins of Cashel and the Acropolis of Athens, the most famous memorial of antiquity which the world possesses. There exist many curious resemblances. Both were strongholds of religion, honoured and hallowed above all places in their respective countries; both were covered with buildings of various dates, each representing its peculiar age and style in art. And as the Greeks, for the sake of effect, have varied the posture of their temples so that the sun illuminated them at different moments, the old Irish have varied the orientation of their churches, that the sun might rise directly over against the east windows on the anniversary of the patron saint. There is at Cashel the great cathedral, in loftiness and grandeur the Parthenon of the place. There is the smaller and more beautiful church, Cormac's chapel, the holiest of all, like the Erechtheum of Athens. Again, the great sanctuary upon the Rock of Cashel was surrounded by a cluster of other abbeys about its base, which were founded there by pious men on account of the holiness and greatness of the archiepiscopal seat. Of these one remains, like the Theseum at Athens, eclipsed by the splendour of the Acropolis. The prospect from the Irish sanctuary has indeed endless contrasts to that from the Pagan stronghold, and such as are not without a certain harmony. The plains around both are framed by mountains, of which the Irish are probably the more picturesque, and if the light on the Greek hills is still the fairer, the native colour of the Irish is infinitely more rich. So, again, the soil of Attica is light and sandy, whereas the golden Vale of Tipperary is among the richest in the world. Both places were the noblest homes, each in their own country, of a religion which civilised, humanised and exalted the human race; and if the Irish Acropolis is left in dim obscurity by the historical splendour of the Parthenon, on the other hand the gods of the Athenian stronghold have faded out before the moral greatness of the faith preached upon the Rock of Cashel.

Lead Joints.

SIR,—In constructing a series of wide flights of square York stone steps (in the open), employer insists on the jointed ends being run with lead, and is desirous that the joints of Portland stone paving should also be made with lead. His idea is that horizontal joints made in cement are soon washed out by the action of rain; but as I have never heard of such a thing as he proposes doing, and have my own ideas on the subject, I shall be glad if your readers will give me their experience and views.

C. OF W.

GENERAL.

The Prince of Wales laid the foundation-stone on Monday last of the City of Westminster workmen's dwellings, to be erected in Regency Street. The site covers a superficial area of nearly an acre and a half, and the buildings will have a frontage to Regency Street of 305 feet, to Page Street of 175 feet and to Vincent Street of 228 feet. They will consist of three parallel blocks six storeys in height, including half basement and attic storeys, divided by roadways or playgrounds 40 feet wide. The rents range from 3s. to 4s. a week for one-room tenements to 11s. to 12s. for four-room tenements. Messrs. Joseph, Son & Smith are the architects, and Sir John Mowlem Burt is the contractor.

His Majesty the King of Sweden and Norway has graciously accepted from Professor Corfield, M.D., of University College, a copy of the Milroy Lectures on "The Etiology of Typhoid Fever," delivered by him before the Royal College of Physicians last year by special request of the Council of the College, Dr. Corfield having been for the past eleven years a Fellow of the Medical Society of Sweden.

The Duc de Loubat has presented 20,000 francs to the French Académie des Inscriptions et Belles-lettres for the purpose of completing the clearance of the soil of the Isle of Delos.

A Bill to provide for the registration of architects was brought into the House of Commons by Mr. Atherley-Jones and read a first time on Thursday in last week.

The Annual Dinner of the Artists' Benevolent Fund took place on Thursday, April 30, at the Royal Institute of Painters in Water-Colours, Piccadilly. Sir W. B. Richmond, R.A., presided.

The Royal Institute of Painters in Water-Colours, Piccadilly, have elected as members Mr. James Clark, Mr. Frank Reynolds, Mr. J. Sanderson Wells and Mr. Graham Petrie.

Lord Sefton has promised 2,000*l.* to the Liverpool Cathedral Fund, which now amounts to nearly 174,000*l.*

Sir John Aird & Co., the engineers, have met with an ample supply of water for the proposed King's Sanatorium for Consumption, near Midhurst. The springs are to run to a pumping-station and then the water will be pumped over a high hill, necessitating much labour. The resident engineer estimates that it will be eight months before the work of completing the water-supply for the sanatorium will be accomplished.

Mr. David B. Butler will read a paper entitled "Certain Vexatious and Fallacious Cement Tests now in Vogue," on Monday next before the Society of Engineers.

Mr. Walter Frederic Osborne, R.E.A., the portrait-painter, died last Friday at his residence, Dublin, at the age of forty-three years. He had exhibited frequently at the Royal Academy, Royal Hibernian Academy, and the Society of Oil-Painters.

The Count of Turin laid the first stone of the new Campanile of St Mark last Saturday. The stone, which was placed in the centre of the foundations, was an oblong of trachyte 2½ feet long, 1 foot deep and 1 foot wide. In the centre of the stone was hollowed out the space required to receive the parchment and the gold and silver coins commemorating the event. The Royal Academy fund towards the rebuilding amounted to 1,000*l.*, made up in the following manner:—53 members of the Royal Academy, 291*l.* *cs.* 6*d.*; 35 other artists, including architects, 87*l.* 7*s.*; 159 other subscribers, 621*l.* 12*s.* 6*d.*

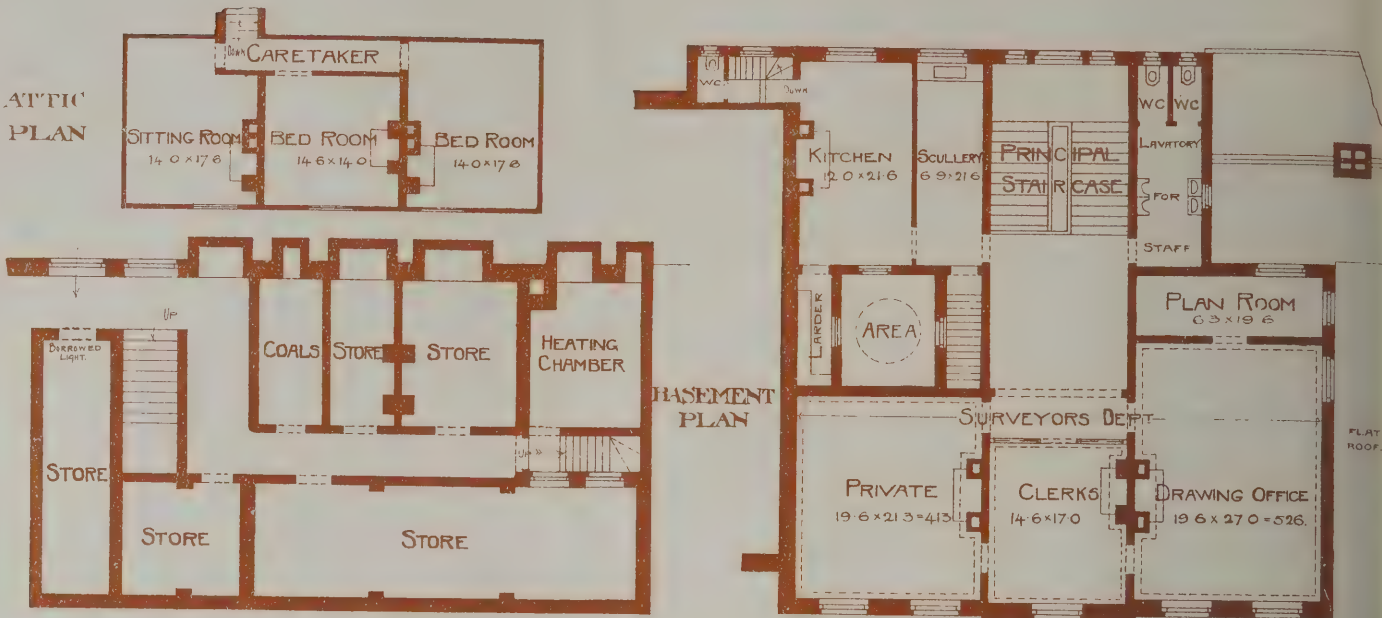

The Royal Marines war memorial, which was unveiled last Saturday, has been erected on a site in St. James's Park provided by the Office of Works. Two figures, designed and sculptured by Captain Adrian Jones, represent Marines Mr. T. Graham Jackson, R.A., designed the scheme of the pedestal. Bas-reliefs depict the action of Graspan and a scene recording an episode during the defence of the Legations at Peking. It was cast by Messrs. Hollinshead & Burton, of Thames Ditton.

The Edinburgh Architectural Association's fifth visit of the session will take place to-morrow (Saturday), and will be to Wemyss Castle.

Sir Weetman Dickinson Pearson, Bart., member of Parliament for Colchester, has been appointed a director of the National Provident Institution, to fill the vacancy caused by the death of Mr. William John Barron.

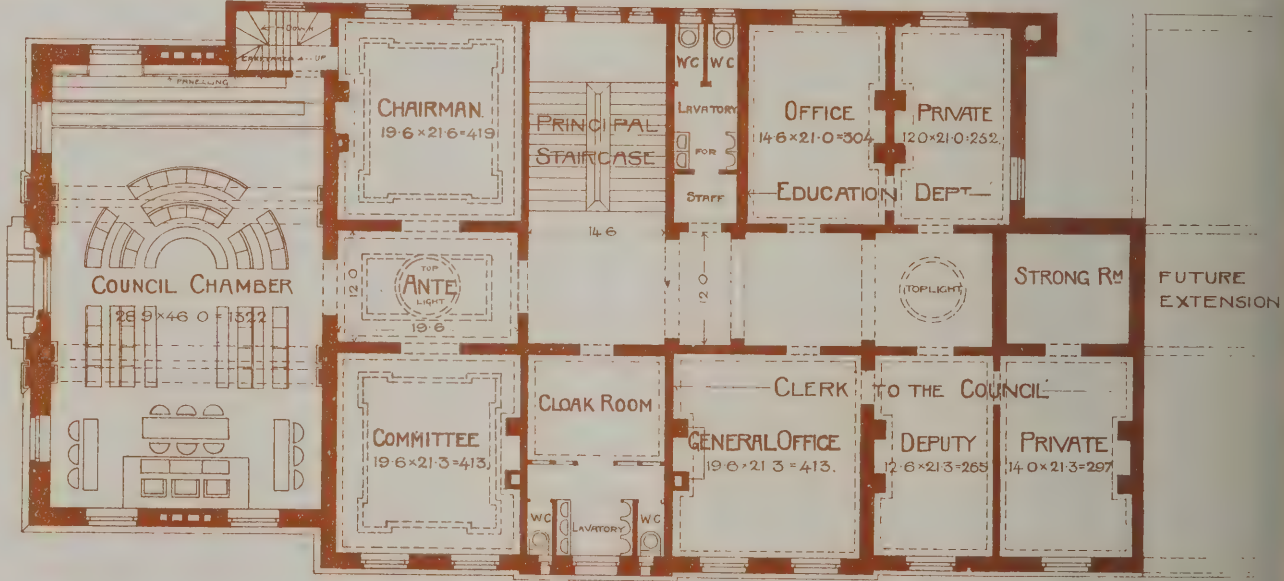

The Council of the Institution of Civil Engineers have made the following awards for papers read and discussed before the Institution during the past session:—A Telford Gold Medal to Mr. Maurice Fitzmaurice, C.M.G.; a Watt Gold Medal to Mr. Bertram Hopkinson, and a George Stephenson Gold Medal to Mr. Percy John Cowan. Telford premiums to Messrs. Charles Hopkinson, B.Sc., Ernest Talbot, Frederick Wilfrid Scott Stokes, Percy John Cowan, James Tayler Milton and William James Larke. The presentation of these awards, together with those for papers which have not been subject to discussion and will be announced later, will take place at the inaugural meeting of next session.

Architect and Contract Reporter.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

NEW BROMPTON (KENT).—May 30.—Designs and plans are invited in competition for public swimming and slipper baths to be erected in Windsor Road, New Brompton. Three premiums are offered, one of £20 to the author of the design which is considered to be the first in order of merit, one of £10 and one of £5 respectively for the second and third. Mr. F. C. Boucher, clerk, New Brompton, Kent.

STOCKTON-ON-TEES.—May 13.—Designs are invited for a girls' high school, to be erected as a memorial of Her late Majesty Queen Victoria, at a cost not exceeding 5,000l. Premiums of 25l, 15l and 10l respectively will be awarded. Mr. C. J. Archer, 77 High Street, Stockton-on-Tees.

WINWICK.—May 4.—For decorating the recreation hall at the Lancashire county asylum, Winwick, Warrington. Mr. Henry Ellis, clerk and steward.

WITHINGTON.—May 5.—For the erection of a master's house at the workhouse at Withington, Lancs. Mr. James B. Broadbent, 15 Cooper Street, Manchester.

YORK.—May 9.—For the erection of engine and boiler-houses, offices, &c., at the electricity generating station. Mr. A. Creer, city engineer, Guildhall, York.

CONSIDERABLE excitement has prevailed at Dover during the last few days in connection with a poll being taken upon the question of the purchase of the electricity undertaking by the Corporation. The result of the poll shows a majority of 772 in favour of the Corporation acquiring the undertaking.

THE new Wesleyan chapel and schools at Higham Ferrers were opened on Easter Monday. The premises consist of a chapel to seat 550 persons comfortably, and in emergency 600; a schoolroom or lecture-hall to seat 400, with five classrooms opening directly out of it. There are also two classrooms leading out of the chapel. The other rooms are chapel parlour, stewards' vestry, minister's vestry, choir vestry and infants' classroom, making twelve rooms available for classes if required. The style of architecture is sixteenth-century Gothic. The whole of the work has been successfully carried out by Mr. Robert Marriott, of Rushden, from the designs of Mr. Tom Dyer, of the firm of H. H. Dyer, Son & Winterburn, architects, of Northampton and Leeds. The entire outlay, including site, is 6,238*l*.

OUR attention has been drawn to a little discrepancy which appeared last week in our account of the opening of the new Baltic and Shipping Exchange, which we spoke of as having been built on the site of the old Baltic. The old Baltic, however, was of course situated in Threadneedle Street, some little distance from the site of the new building.

"MARMORITE."

A NEW decorative material of wide potentiality is being introduced to the English building world by the "Marmorite Artistique" Syndicate, of 30 Great St. Helens, who on Wednesday gave an exhibition of specimens at the Trocadéro Restaurant. "Marmorite" is a by-product of glass with an admixture of iron (the latter having a toughening effect), and, as its name implies, it bears a strong resemblance to marble, from which indeed, *in situ*, it would be indistinguishable. It can be made in any colour and practically to any size, takes a high polish, and is susceptible of ornamentation either incised or applied in any style. Admirable effects are produced by figure or other painting; and for outside application the colours can be burnt in and the decoration thus rendered indestructible. Among the examples shown were a fascia and piers, each in one piece, for a shop front, and decorated panels in a variety of styles, amongst them being a large number adapted to the purposes of advertisement, a use to which the material lends itself in a marked manner. "Marmorite" is eminently artistic in appearance, and possesses the additional advantage of being comparatively inexpensive, its cost, which however, of course, varies with the amount of applied ornament, being about 100 francs per square metre.

TRADE NOTES.

ARROLITHIC paving has been selected for the new surgery at His Majesty's dockyard, Devonport.

THE steelwork of the Falkirk Theatre, near Glasgow, will be almost entirely composed of Differdange beams supplied by Messrs. H. J. Skelton & Co, 71 Finsbury Pavement, E.C. It is believed that a great saving in space, certainly in cost, will be effected by this means.

WE are informed by Messrs. G. M. Restall & Sons, of Birmingham, that they have appointed Messrs. E. R. Burt & Sons, of the Lime Works, Camberwell, S.E., to be their sole agents in London for their fireproof Adamantine plaster and metallic Albion cement.

A LARGE clock, with Cambridge chimes, has been erected in the parish church of Ottershaw, near Chertsey, as a memorial to the late vicar. Messrs. John Smith & Sons, Midland Clock Works, Derby, carried out the work to the general designs of Lord Grimthorpe. The same firm are making a large clock for Accra Church, West Coast of Africa.

MESSRS. BENHAM & SONS, LTD, of 66 Wigmore Street, ask us to mention that all the kitchen fittings at the new Baltic Exchange have been supplied by them. Everything has been done in the most up-to-date style, and the fittings include a large central hot-plate for coal, steam-boiling pans and vegetable steamers, a coke grill, various hot plates and other fittings, extensive steam-carving tables for the serving-room, and various other fittings for still-room, sculleries, &c.

THE Yost Typewriter Company, Ltd., have recently taken in hand the task of providing the great ocean liners with capable shorthand writers and typists, whose labour-saving abilities are, for a reasonable fee, placed at the disposal of the saloon passengers. First the *Campania* was fitted in this way, then other vessels, and now the North-German Lloyd Company's fine new steamer, the *Kaiser Wilhelm II*, has been fitted with an expert shorthand linguist, with the most modern form of the Yost typewriter. The experiment will be watched with keen interest by all concerned.

BUILDING AND BUILDERS.

IT has been decided by the Margate Vestry to apply for a faculty for the enlargement of Holy Trinity Church and the provision of a peal of bells.

THE Macclesfield Town Council have called in Mr. R. E. W. Berrington, M.I.C.E., of Westminster and Wolverhampton, to advise in connection with the sewage disposal of the borough. Mr. Berrington has also been instructed to report as to the sewerage and sewage disposal of Littlehampton.

VARIETIES.

ON the 25th ult. the Bishop of Southwell dedicated the hamlet church at Cressbrook, in the parish of Tideswell. The new church is of the Early English style of architecture.

MR. WILLIAM E. FARRER, engineer and sanitary specialist, informs us that he has removed his offices and showroom from 36 Cannon Street, Birmingham, to Star Works, Cambridge Street, Birmingham.

THE new buildings for the Lichfield Grammar School, in the erection of which the present Dean of Lichfield and Mr.

R. P. Cooper, of Shenstone Court, have been actively interested, and which cost between 9,000*l.* and 10,000*l.*, were opened on Tuesday.

THE annual meeting of the Liverpool Engineering Society was held on Wednesday evening at the Royal Institution, Colquitt Street, Liverpool. Mr. E. S. Wilson, the retiring president, occupied the chair. In presenting the report of the twenty-ninth session the committee had pleasure in announcing an increase of membership, forty-three having been added, as compared with thirty-eight in the previous session. This brings the total membership of the Society to 514, including 406 ordinary members. The accounts showed the Society to be in a flourishing condition, there being a substantial balance in hand. The report was adopted.

THE death occurred on the 21st ult. under painful circumstances of Sir Thomas Thornton, LL.D., town clerk of Dundee. Sir Thomas was seized suddenly with illness while in the High Street the previous afternoon, and losing consciousness, never recovered. He had had great influence in the affairs of the city for the past forty years, and was one of the best-known men in Scotland. Born in 1829, he was admitted a solicitor in 1851 and was knighted in 1894. He was a lawyer of eminence, and was as well known at Westminster as in Scotland.

MR. H. C. LONGSDON, managing director of Messrs. W. Summerscales & Sons, Ltd., the well-known laundry engineers, of Keighley, has just been the recipient of a handsome silver dessert service in recognition of his valuable services as Mayor for the past three years of Keighley, Yorks. It bears an inscription as follows:—"This service of silver plate was presented to Mr. Henry Crofts Longsdon, J.P., and his wife, Annie Longsdon, mayor and mayoress of Keighley in the three eventful years 1899-1902, by some of their many friends, in grateful recognition of the energy and hospitality by which their term of office was made memorable."

WE have received a copy of the thirty-third annual issue of the City of London Directory (W. H. & L. Collingridge), which as usual presents a mass of useful information. The section relating to the public buildings of the City contains details as to the history and structure of the bridges and the better known of the City churches, and a brief account of some of the halls of the Livery Companies. The street improvements of the year are indicated in the large coloured map. There have been many alterations in the streets of the City during the last twelve months. Among the principal additions

may be mentioned the opening of Broad Street Place, the erection of the New Baltic in St. Mary Axe, the new Birkbeck premises in Holborn, important buildings in Old Jewry, King William Street and Threadneedle Street, and the further extension of Lloyd's Avenue. In addition may be noted the demolition of Newgate Prison and Christ's Hospital, and the extension of the City boundary in the Ward of Farringdon Without.

THE executive of the British Fire Prevention Committee announce its arrangements for the impending session, which will comprise some fixtures of more than ordinary importance. The International Fire Exhibition at Earl's Court, which has been organised under the auspices of the British Fire Prevention Committee, will be opened by H.R.H. the Duke of Cambridge, K.G., on May 6 noon. The committee's testing operations will recommence at their private testing station on June 1, and will this year comprise several tests with floors and partitions. The International Fire Prevention Congress, convened by the committee, will be opened by the Right Hon. the Lord Mayor on July 7. The associations of the chief officers of professional fire brigades hold their annual meeting in London at the invitation of the British Fire Prevention Committee on July 9. The National Fire Brigades Union will arrange its annual competitions in connection with the International Fire Prevention Congress to commence on July 10. The International Fire Brigades Council will meet, at the invitation of the committee, on July 11.

AT the annual general meeting of the Institution of Civil Engineers, held on Tuesday evening, Mr. J. C. Hawkshaw, president, in the chair, the result of the ballot for the election of members of Council for the sessional year 1903-4 was declared as follows:—President, Sir William H. White, K.C.B., D.Sc., LL.D., F.R.S.; vice-presidents, Mr. Francis William Webb, Sir Guilford L. Molesworth, K.C.I.E., Sir Alexander R. Binnie and Dr. Alex. B. W. Kennedy, F.R.S. Other members of Council:—Mr. Cuthbert A. Brereton, Mr. John Brown, C.M.G. (Cape Town), Mr. R. Elliott Cooper, Lieut.-Col. R. E. B. Crompton, C.B., Mr. W. J. Cudworth (York), Mr. C. W. Darley, Mr. G. F. Deacon, Dr. Francis Elgar, F.R.S., Mr. W. R. Galbraith, Mr. G. H. Hill, Mr. J. C. Inglis, Mr. G. R. Jebb (Birmingham), Mr. T. C. Keefer, C.M.G. (Ottawa, Canada), Mr. J. A. McDonald (Derby), Mr. W. Matthews, C.M.G., the Hon. C. A. Parsons, F.R.S. (Wylam-on-Tyne), Mr. A. Ross, Mr. W. Shelford, C.M.G., Mr. Alexander Siemens, Mr. H. C. Stanley (Brisbane, Queensland), Mr. John Strain (Glasgow),

ROYAL SCHOOL OF ART NEEDLEWORK.

ON Wednesday afternoon their Royal Highnesses the Prince and Princess of Wales visited Kensington for the purpose of opening the new premises of the Royal School of Art Needlework, which have been erected on a corner site having a frontage to the Exhibition Road and another to the Imperial Institute Road. The opening ceremony took place in the large hall on the first floor, where there was a large gathering of notabilities, among those present being the Duchess of Somerset, the Marchioness of Winchester, the Countess of Derby, the Countess of Ancaster, Sir Henry Fowler, M.P., Sir Philip Magnus, Sir Henry Roscoe, the Hon. W. F. Danvers Smith, M.P., Sir Edward Poynter, Professor Herkomer, Mr. Val Prinsep, Mrs. George Alexander, Mrs. Edward Stern, the Hon. Alexander Yorke, and Captain Burmester, the secretary. The new building is erected from designs by Mr. F. R. Wade in late Renaissance style. From the entrance hall, which is pillared and vaulted in graceful style, a marble staircase leads up to the principal showroom on the first floor. This extends the whole length of the building, and has a south aspect, and above this is the principal workroom. Both rooms are lighted by large and numerous windows. The remainder of the building includes a number of convenient showrooms and classrooms and other necessary offices.

DECAY OF METALS.

AT the meeting of the session of the Institution of Civil Engineers held on Tuesday, April 21, Mr. J. C. Hawkshaw, M.A., president, in the chair, the paper read was "The Decay of Metals," by J. T. Milton and W. J. Larke.

The durability of metals under the conditions in which they were actually used was of great importance, and must always receive as careful consideration from engineers as questions of strength or cheapness. Copper, brass, gun-metal and other alloys were chosen for use on account of their durability, but even these metals were sometimes found to corrode or decay under seemingly obscure conditions. It was to cases of such decay and to a discussion on their probable causes that the paper was devoted.

- The following examples of the decay were adduced:—
1. The pitting of the tubes of marine surface condensers.
 2. The decay of brass or yellow-metal bolts in composite vessels, and in the under-water fittings of iron and steel ships.
 3. The decay of the brazing metal in copper steam-pipes.
 4. The deterioration, as distinguished from oxidation, of cast-iron used for parts of marine engines, and also for other appliances which were in frequent or continuous contact with sea-water.
 5. The decay of some propellers made of the patent bronzes when fitted to copper-bottomed vessels.

In the case of condenser tubes it was apparent that some of the metal became eaten away into holes, while in the other cases mentioned the metal appeared to retain its original form. The authors termed the former action "corrosion," and the latter "decay."

Chemical analysis of the decayed portions showed that a change had occurred in the composition of the metal, but did not explain why its strength and properties were so completely modified. It showed that in copper-zinc alloys the process had been mainly one of dezincification, or loss of zinc, while in cast-iron, part of the iron, and possibly also of the manganese, had disappeared, the whole of the graphitic carbon remaining.

Although the decay of copper-zinc alloys had been known for many years, the first published research into its cause appears to have been made by Professor Arnold, who in 1898 investigated the case of the failure of a marine boiler steam-pipe. He pointed out that the brazing-metal of the pipe, when microscopically examined, was seen to possess a duplex structure, similar to that of Muntz metal, both constituents being definite chemical compounds of copper and zinc, but one richer in copper than the other; and he attributed the decay to local galvanic action set up between these constituents, whereby in the first stage the one less rich in copper becomes dezincified, and subsequently that richer in copper also lost its zinc, the whole then becoming a spongy mass of copper.

Microscopic study showed that the Muntz metal tube-plates, rods, &c., illustrated in the paper had been subject to similar decay to that pointed out by Professor Arnold, and also that in the decay of cast-iron the complexity of structure doubtless led to the same result, the decay in this case advancing along the lines of the graphite plates and leaving the phosphide eutectic portions till the last.

This explanation of local galvanic action, however, did not account for the corrosion and decay of condenser-tubes which

made of an alloy not having a duplex structure; nor did explain why cast-iron in some cases did not decay, even though its composition and structure were the same as in other cases where decay took place.

Condenser-tubes were usually made of an alloy consisting nominally, 70 per cent. copper and 30 per cent. zinc. The Admiralty specification was, not less than 70 per cent. copper and 1 per cent. tin, the remainder being of zinc; while one of the large mail steamship companies, as the result of considerable experience, had the tubes made of 78 per cent. copper, 21 per cent. zinc and 1 per cent. tin.

These were nominal compositions, for commercial copper and zinc were rarely pure. If the impurities became uniformly distributed through the mass of the alloy it would still be homogeneous, but if they had a tendency to segregate, as it was well known some elements did in steel, there would still be such a lack of uniformity as might set up local galvanic action and lead to local pitting or corrosion. Segregation was not only possible during the solidification of the alloy in the original casting, but might also occur while the metal was at a high temperature during the operation of annealing, which was several times repeated in the course of the drawing process.

If segregation occurred during solidification only, the drawing process would cause the impure portions to be much elongated in the direction of the tube's length, and the resulting corrosion would be seamy, whereas if it occurred also to a marked degree during annealing, the corrosion would affect the rounded areas. Examination of the insides of condensers revealed cases of deep corrosion of both kinds; but in addition it was seen that the general surface of the inside of the tubes had become partially dezincified to an extent sufficient to cause it to crack when the tube is flattened.

In order to determine whether the various impurities which are commonly present in copper-zinc alloys do tend to segregate or diffuse during annealing, some experiments, detailed in appendix, were made. These experiments incidentally throw some light upon the changes of structure which Muntz metal, and also the 70-30 copper-zinc alloy underwent, due to changes of heat treatment.

It was pointed out that considerable protection was given to copper-zinc alloys, when exposed to the action of sea-water, by the practice, adopted by the Admiralty, of requiring the addition of at least 1 per cent. of tin to all such alloys.

The conclusions arrived at were:—

1. *Iron*.—Beyond the very small portion which doubtless

existed in a state of solid solution in the brass, iron occurred in combination with zinc as small isolated particles, which were neither diffusible nor liable to segregation. These particles were probably a zinc-iron alloy.

2. *Lead*.—A small portion of this metal would also exist in brass in a state of solid solution, but beyond the saturation point, lead did not diffuse into brass. A small proportion, however, in solid solution materially increased the liability to corrosion.

3. *Tin*.—This metal could exist in small proportions in solid solution in brass and in Muntz metal. In the latter it probably entered into both micro-constituents, but when present it certainly occurred in the one which was richest in zinc, as was shown by the protective effect it gave to this constituent against corrosion in sea-water. In larger quantities tin would also diffuse into brass, the extent of the diffusion depending upon the temperature to which it was raised.

4. *Zinc*.—Zinc alloyed with copper in all proportions, and if it was not uniformly distributed through the metal, it tended to become so by prolonged heating.

Some experiments, detailed in a second appendix, were also made to determine the galvanic action between copper, iron, brass, Muntz metal, &c., when in contact with sea-water; and other experiments showed that weak applied currents, when long continued, had a decided corrosive action upon copper and its alloys when immersed in sea-water, the amount of corrosion—with the same current—being greatest in those containing the highest proportion of copper.

With a current of 0.001 ampere acting on an immersed area of 40 square centimetres in the case of Muntz metal, the wasting produced was confined to the dezincification of the constituent poorest in copper; but the same current, acting upon 60 square centimetres of ordinary brass condenser-tubes, gave rise to a fairly uniform corrosion, both the copper and the zinc of the alloy being dissolved.

Summarising the results of the investigation it would appear that—

1. Decay was more frequent in metals which had a duplex or more complex structure than in those which were comparatively homogeneous.

2. Decay was due to a slower or less energetic action than that causing corrosion, and, moreover, it required an action which removed part only of the constituents of the metal, whereas corrosion removed all the material attacked.

3. Both decay and corrosion might result from chemical

action alone, or from chemical and electrolytic action combined.

4. Pitting, or intense local corrosion, was probably often due to local segregation of impurities of the metal; but it might also in some cases be due to local irregularities of surface or structure producing local irregularities in the distribution of galvanic currents.

5. In the case of brass exposed to sea-water, tin was distinctly preservative, while lead and iron were both injurious, rendering the brass more readily corrodible. The percentage of the latter elements should therefore be kept as low as possible in the case of all metal intended for purposes where contact with sea-water was inevitable.

6. With a view to obtain a minimum of corrosion, the internal surfaces of condenser-tubes should be as smooth and uniform as possible, and in order to insure this the cast-pipe from which they were drawn should be smoothly bored inside, either before the drawing was commenced or in an early stage of the process, as was done in the manufacture of brass boiler-tubes.

7. The experiments with an applied current show that electrolytic action alone, even where exceedingly minute currents were in question, might result in very severe corrosion or decay. Every effort, therefore, should be made to prevent such action by careful insulation of all electric cables. Where galvanic action was inevitable through the proximity of different metals exposed to the same electrolyte, the currents resulting should be neutralised by the application of zinc plates in the circuit, so arranged that they would be negative to both of the other metals.

NEW OPERA HOUSE FOR BUXTON.

THE new opera house which has been built close to the entrance to the Pavilion Gardens at Buxton, is rapidly approaching completion, and, it is expected, will be quite ready for the opening which is fixed to take place at Whitsuntide. The old entrance and reading-rooms have been removed, and on the site has been erected a spacious and commanding building with a frontage of 73 feet to the Square, and a return front of 164 feet towards St. John's Road. The theatre is built on up to date lines, and with all the latest improvements. The floors, galleries, staircases and roof are all of concrete and iron, all passages and staircases are wide and commodious,

and patent exit doors provided. Large cloak-rooms and smoke-rooms are provided, and the comfort of the audience has had every consideration. The principal entrance is in the centre of the arcade. Polished mahogany doors filled with glass will open into a very handsome vestibule, where marble has been very extensively used. On either side of the grand staircase, which faces the entrance, are massive scrolls of polished alabaster supported on red marble bases, and at each end of these are white marble seats. The grand staircase, constructed of white marble, and to be covered with a rich Turkey carpet, leads to the cruciform room, panelled and filled in white silk tapestries. On each side are small lounges, from which the wide but short corridor conduct to the dress-circle seats and the private boxes. The walls are covered with white Carrara marble, with plinths and bases of Emperor red marble. The floors are inlaid mosaic. The ceiling is richly carved in raised plasterwork, with strikingly fine artistic panel in the centre, representing lyrical poetry, the side panels being treated with musical trophies and flowers. Over the entrance vestibule is the grand foyer, with bar for refreshments. Mirrors and old prints will adorn the walls, and luxurious lounges and settees help to furnish what will be a very delightful addition to the theatre. The upper circle is approached by a wide fireproof staircase. The ceiling is in the shape of an oval dome, formed into six painted panels representing music, painting, poetry, literature, dancing and comedy. The Buxton coat-of-arms, treated in monochrome on a gold background, will form a graceful feature over the proscenium arch. On each side of the proscenium are three private boxes. The drop scene, painted by Hemsley, has been painted to accord with the general design. The whole theatre will be brilliantly illuminated by the electric light, the fitting being specially designed to accord with the decorations. The cost will be about 20,000*l*.

THE LINOLEUM INDUSTRY AND CORK SUPPLY

THE British Consul at Naples, in his latest report, says that the linoleum industry is closely associated with the cork trade, the material being made of cork scraps and cuttings mixed with linseed oil. The first invention of it by Mr. Frederick Walton in England was brought out under the name of "Kamptulicon," but the improved product received the name of "Linoleum." There are some fifty establishments in all for

manufacture, of which thirty are in the United Kingdom, employing 2,500 hands, with a capital of over 1,000,000£, ten in many, many in the United States, a few in France and Asia, and one in Italy. This last is at Narni, in Umbria. A Lombard company with large capital buys up cork groves and the soft cork which is taken from the younger trees which grow in the groves by the seashore. They make a gum which is about half cork, and consume about 150 tons annually. They would do better business but for the high rates, the rate from Milan to Narni being higher than from Milan to the centre of Germany.

With the exception of Portugal, which is the principal cork-producing country, the cork supply of the world is grown on the Mediterranean littoral, Spain, Algeria, France, Tunis and being the countries which produce it. None is grown in Asia or Asia Minor, and an inconsiderable quantity in Turkey and Greece. Several of the Mediterranean islands, and notably Corsica, produce it in considerable quantities, the Corsican being included in the French returns.

Statistics vary from 80,000 to 120,000 hectares in their estimate of the land under this cultivation in Italy, but if the figure is uncertain the value of the cork exported in 1900 is actually stated at 900,080 lire (36,000£) besides the home consumption, which, in a wine-growing country, must be large and important. This remark applies to all the other cork-growing countries, except Algeria and Tunis, where the quantity of wine exported is small as compared with that of France, Spain, Portugal and Italy.

The industry represented is therefore a very interesting one, might produce very sensible benefit to the Italian Exchequer if the matter were taken seriously in hand. In order to do this effectually the State will probably have to protect the cork trees by re-enacting the old forest laws, by exempting them from cork cultivation from taxation for a term of years, by creating nurseries from which private persons may have young plants at a reasonable price. Few owners are in a position to plant at their own cost, for it takes thirty years before the date of planting before the tree can be stripped for the first time, and even then the first crop of bark is too soft for many purposes, and is useful only for packing fruit or for making into linoleum. After the first stripping the trees may be renewed of their bark every five years, and they become a valuable property.

The want of statistics as to the cork production of Italy shows how much this valuable crop has been neglected.

Sardinia and Sicily alone produce the greater part of Italian cork. The Calabrian forests have been almost entirely destroyed, the trees having been burnt for charcoal, and even Sicily imports a considerable quantity of cork both at Trapani and Marsala, and exports it at Catani.

The trees may be reckoned to produce 13 lbs. at 30 years of age, 53 lbs. at 50 years, and at 90 years as much as a hundred-weight. If, therefore, a tree is stripped every seven years, a better interval than five years, there would be a crop of bark from the same tree ten times between the ages of 30 and 93—that is to say, on the average the tree would produce 6 cwt. of cork in 60 years. The trees will produce cork in continually increasing quantity until they are over 200 years old.

In the year 1835 nearly all the cork used in the United Kingdom came from Italy, but since then the destruction of the cork-woods has caused us to seek other markets. The two principal causes of the destruction have been the making of the trees into charcoal and their destruction by fire to produce potash, of which the wood contains a large proportion. A German traveller writing recently on certain woods states that a company is exploiting them and carrying on a work of absolute devastation merely to obtain the valuable ashes, and that no one thinks of replanting the ground, which naturally gets washed away owing to the absence of trees.

Large forests containing a majority of cork trees are continually being released from the forest laws, and there is a great risk that the production of cork in Italy will soon be a thing of the past. In these days, when vast quantities of cork are used in the making of linoleum and in shipbuilding, its supply is a matter of primary importance. The great desideratum for the trees is land which contains potash, and the volcanic soil of Italy contains this in large quantities; so that land if not otherwise suitable might readily be prepared at a small cost by manuring it with volcanic ash, which is easily obtainable in inexhaustible quantity.

EDUCATION OF ENGINEERS.

At the Institution of Mechanical Engineers, Professor W. E. Dalby read a paper describing the methods under which the education of engineers is pursued in America, Germany and Switzerland. Reference was first made to the fact that in England, with scientific progress, changing methods of manu-

facture, and the advent of electricity as a necessary part of the engineering equipment of every mechanical engineer, there has been scarcely any change in the recognised method of training engineers. In recent years, courses of instruction in the scientific principles of engineering have multiplied at the universities and at institutions of kindred types and equal standing from a purely engineering point of view. At the present time, therefore, there is no difficulty in obtaining a scientific training of a high character. The weak point in the system is the want of co-ordination between the workshops and colleges. Many employers look askance at a college-bred youth, and there is no doubt that many college youths quite deserve it. But not more so than many who are trained entirely in the works. It is too often forgotten that a college cannot give a youth ability. All that can be done is to train what abilities he happens to bring to the college with him. Both in the States and on the Continent many of the specialised lectures are given by men in the full practice of their profession, and who are not regular members of the teaching staff. The best courses in this country are arranged on practically the same basis, but the longest being three years there is no time to develop the instruction into the specialised branches of engineering. At Boston, Cornell, Berlin and Zurich a student can get special instruction in the scientific part of locomotive and railway work. Not an institution in this country can offer similar instruction. The locomotive comes in for scant notice in the general course on the steam-engine. The advantage to railway companies would have been great if even one course of instruction in locomotive engineering existed where a laboratory was arranged in which an actual locomotive could be tested; such an establishment, for instance, as exists at Purdue University, or in connection with some of the locomotive departments of the American railways. The course, said the lecturer, should be arranged for men who have already had an undergraduate course of study and have served two or three years at a locomotive establishment. There is an essential difference in the method of training in America and Germany. In America the course of instruction is very exactly laid down, and the student is compelled to follow it step by step. Slight variations are permitted in the form of options, to use their term, in the later periods of the course. But whatever option is taken the student must go through with it. He gets his degree from the gradually accumulating results of terminal and sessional examinations, ending finally with a thesis. He is, in fact, put through a

thoroughly well-organised species of educational drill, and must work or fall out. In Germany the students of the great technical high schools enjoy the "Academische Freiheit" peculiar to the university system of that country. No student is compelled to take any special course. For his convenience definite courses are arranged and laid down in the school calendar, but the sequence of lectures therein stated are not binding. There is in no sense a prescribed course. The courses are only recommendations, and students may follow them or not as they please. Degrees are not granted by examination, chiefly oral in character, by the professors of the schools. At Zurich the course is partly prescribed, partly selected. The American courses are more practical in character; they include more laboratory training than is recommended in the German course, and devote a large proportion of the course to the teaching of handicraft skill. In Charlottenburg and Zurich no attempt is made to teach handicraft skill, and the bulk of the training is given in the drawing office, though in addition a considerable amount of time may be given to engine-testing. In both Charlottenburg and Zurich a student finds himself at the end of his course with a degree or diploma, age twenty-three, and no workshop training except a year, which is insisted upon as a preliminary to entry for some students at Charlottenburg. In America a student finds himself with a degree or diploma, age twenty-one, with what handicraft skill and workshop practice he has picked up in his college workshops. With these assets he has no difficulty in getting further practical training in the large works of the country. Employers take him without premium, and pay a wage sufficient for maintenance straight away, recognising that his knowledge places him in a different position to ordinary apprentices. In this way they get highly trained men into their works, and by their own observation soon discover whether the youth possesses, in addition to intellectual acuteness, the qualities which go to make a successful business man or a good organiser, and recruit their staff accordingly. The American, German and Swiss student start his course with a far better education on which to build than the case with us. Much time is wasted at colleges here of teaching things which should have been taught at school. The general opinion seemed to be that a course arranged so that the winter months are spent at college and the summer months in the works is a desirable one, and one from which good results may be expected, but no system will be of any avail without the whole-hearted co-operation of the employers and

EAST SUSSEX ASYLUM.

A new asylum erected by the East Sussex County Council approaching completion. The *Sussex Daily News* gives a description of the buildings, from which we take the following:—The estate lies about half a mile to the east of Hellingly station. The electric railway, which will connect the institution with the London, Brighton and South Coast Railway, will shortly be finished. The main block of the building is practically complete, and has only to be furnished to render it fit for occupation. So satisfactorily has the work progressed that the process of removing the patients to their new quarters will probably commence during July, and will proceed gradually until the whole of the patients chargeable to the administrative committee of East Sussex have been received. The numerous detached buildings are in a more or less advanced state of completion. Both the steward's and medical superintendent's residences, which are on the left of the drive, are almost ready for their tenants.

The church is probably the least advanced of any of the buildings. It is situate almost opposite the main entrance to the asylum proper, and will provide accommodation for several hundred patients. Some may be led to suppose that it is a place to send those mentally deranged to Divine service, but it must be remembered that the bulk of the patients are not condemned lunatics; their mental faculties are simply defective on certain subjects, and thus, generally, the large proportion are perfectly sane to all appearance. Among inmates of asylums it is quite possible to find men who are capable of discussing rationally every subject under the sun, and there is a marked and general tendency towards religious devotion.

In the centre of a little copse is a small but perfectly equipped isolation hospital. The four "villas" which are dotted about the grounds for the use of the more useful and less affected or better-behaved patients, who work in the fields, workshops or laundry, are nearly finished. It must, however, be distinctly understood that there are to be no social distinctions. The "villa" system is employed for its curative value alone. Each of these will accommodate thirty patients. A larger "villa" is also in course of erection for the accommodation of sixty children, who will receive as much education

as possible in useful employments. A number of comfortable cottages have also been built on land immediately adjoining the estate for the use of married attendants.

The largest of the detached buildings is the receiving hospital, which is situate about 500 yards from the main building, and will form the first stopping-place for the electric railway. It will contain accommodation for thirty male and fifty female patients. This represents the average proportion of lunacy among the sexes, for mental disease is more prevalent among women than men. The receiving hospital is a feature of the asylum; it is the first institution built for the purpose in England, though at some other asylums detached buildings have been converted into receiving hospitals. The hospital is divided into small wards, and here patients will be first dealt with. Here each individual case will receive careful attention. If there is a prospect of a speedy cure, the patient will not be sent to the asylum proper, but will be retained in the hospital until complete cure is effected and then discharged. In those cases where the mental trouble is of a more serious character, the patient will be removed to the main building as soon as the work of classification has been accomplished. The masons have practically finished their work on this building, and workmen are at present engaged in placing in the windows and floors.

In the asylum proper it will be possible to accommodate 380 males and 460 females. The building is built on the broad-arrow principle. At the base are the workshops and offices; the administrative block forms the centre bar, and the wards, which are in the shape of an irregular bow, constitute the apex, which faces directly south. The principal entrance is in the centre of the base, and to the immediate right and left are the offices of the medical superintendent and his assistants, a committee-room and photographic room; all these apartments are commodious and well appointed. The medical superintendent's office is in telephonic communication with every part of the asylum, and here there is also placed an ingenious electric indicator by which the medical superintendent can ascertain whether the night attendants are regular in their duties. The indicator is worked by "tell-tale" clocks, which are placed in each ward.

A layman would naturally wonder if the photographic room is for the benefit of patients who are amateur photographers. Though patients are encouraged in healthy recreations, photography is not one; but nevertheless it plays a useful and important part in facilitating identification—which naturally is

MAGNESIA BUILDING LUMBER.

This new article of commerce is a strictly first-class substantial structural material of rare merit, it being absolutely fireproof, while at the same time it has excellent non-heat-conducting qualities. It resembles wood in the way in which it can be worked up, while its physical character is such as to enable it to be employed for a great variety of uses, such as window frames, doors, partitions, sheathing, shingles, &c.

Magnesia Building Lumber is composed of the natural fibres of Magnesium Silicate carefully felted together through the employment of intricate machinery designed for the purpose, and these felted fibres then thoroughly cemented through an artificially created Magnesium Silicate being crystallised within, upon and around the natural fireproof fibres employed in making the felt.

The resulting Magnesia Lumber, as it is called, is so fibrous and tough in character that nails can be driven through it, close to the edge of the sheets or boards without splitting the same, while it can be tongued and grooved, planed, milled, shaped, moulded, or otherwise fashioned to accommodate itself to the necessities of ordinary treatment in the construction of buildings. It will not warp, shrink, or split, and can be painted, veneered, or otherwise treated as may be desired.

Its use is not confined to lining other materials. For instance, in the half-inch thickness, tongued and grooved, it can be used in place of the ordinary match-boarding. In fact, in numerous cases where wood is now used in building construction, this Magnesia Lumber can advantageously be substituted, and will render the work absolutely secure from fire.

The B. & S. Folding Gate Co.
19, 20 & 21 TOWER STREET,
Upper Saint Martin's Lane, LONDON, W.C.

attended with considerable difficulties where there are so many patients—and in indicating what progress is being made in each individual case. The progress or cure of the disease, as the case may be, is accurately reflected in the face.

The floor of the corridor leading from the main entrance is of prettily designed mosaic, and there is a handsome dado of ornamental tile. All the other corridors are paved with a new composition called "papyrolith," the chief ingredient of which is wood pulp. It has a warm reddish colour, and as its surface is brightly polished the general effect is decidedly good. The advantages claimed for it are that it is practically noiseless, impervious to water; that being without cracks and joints, there is no opportunity for the secretion of dirt or disease germs, and that it is also fireproof. Whether it will stand the supreme test of wear has yet to be ascertained. The workshops running along the base are virtually finished, and the same remark applies to the administrative block which forms the centre of the "arrow."

The kitchen would be quite worthy an up-to-date London hotel. It is a large, well-lighted apartment, and splendidly equipped with ovens and ranges, steam-jacketed carving tables and pans for making tea, coffee, beef tea, &c. In an adjoining room are appliances for boiling vegetables, and a large steam cupboard for potatoes, while a third room is to be used for the cleaning of the vegetables. Every reasonable means will be taken to insure the patients receiving their meals hot, and when it is remembered that the main building alone will accommodate 840 patients it may be easily imagined that this task will be onerous indeed. The food will be conveyed to the different wards by a cleverly constructed trolley, and will be passed out of hutches at each end of the kitchen, opening on the male and female quarters respectively. The upper portion of the trolley is composed of hot-water compartments for the food, and these may be removed, and the trolley adopted for conveying linen to and from the laundry.

There is also a model bakehouse, fitted with two of Perkins' patent steam ovens and kneading machines. The laundry is likewise thoroughly up-to-date. There are really three distinct laundries under one roof. In the larger one the patients' ordinary linen will be prepared, and two smaller ones will be used for officers' linen and foul linen. Each laundry contains modern machinery, driven by electricity, for washing and mangling, and they are also fitted up with drying cupboards. There is a spacious drying-ground paved with asphalt.

The nurses and male attendants' quarters are situate at

each end of the base—the males to the right and the females to the left—each connected by a corridor. Each attendant and nurse is allotted a separate bedroom, and there are also two large apartments, which may be used as recreation or sitting rooms. The chief nurse has separate apartments, and a billiard table will be put up in the men's wing. The men's rooms will be well furnished and made as comfortable and homely as possible. At the time our representative paid his visit a number of women were engaged in the nurses' wing in making underclothing for the patients.

In the centre of the administrative block is the recreation hall, which is the largest and certainly the most handsome room in the building. The hall is lofty and well lighted, the windows being fitted with pretty-coloured glass, and is provided with a stage and dressing-rooms complete. It is easily approached from either wing, and here patients will be entertained with amateur theatricals, concerts, dances, &c., all of which have a marked tendency towards aiding the physician in his cure.

The building has been rendered fireproof as far as possible and every precaution has been taken against fire. Hydrants have been fixed at convenient places all over the building, and in case of an outbreak it would be only necessary to connect a hose, so that several jets of water might be directed to a fire in the space of a very few minutes. A fire-brigade will probably be formed among the attendants in due course, but a steam-engine will not be necessary, as there is sufficient pressure to send water over the highest portion of the building.

The County Council met with a great disappointment in failing to obtain water on the estate, although boring operations were carried to a great depth. Consequently the asylum has been connected with the Hailsham waterworks, which are working an inexhaustible supply of pure water. The tanks are placed in a tower which rises to a height of 120 feet. The three tanks each have a holding capacity of 25,000 gallons, and the elevation is sufficient to carry to all parts of the building by gravitation.

The whole of the buildings are lighted by electricity, and the light is produced on the premises. The electric works are fitted with absolutely modern plant, and the power for driving the electric cars will also be generated here. Although there are fireplaces in most of the wards the heating will be by low-pressure steam in large gilled radiators. The boiler-house is fitted with two large Galloway boilers, which is considered to be the best boiler on the market.

THE WEEK.

FEW weeks back we published an illustration of Newspaper Buildings in Gilbert Street, close to the Strand. An action by the lessees has given occasion for a declaration of Mr. Justice BYRNE respecting an implied grant to light, a claim which is generally difficult to determine, and this case (*Financial Times v. BELL*) has led to a suspension of building operations for a year and a half. In 1896 an agreement was entered into by a Mr. MACRAE for the erection of printing works and offices, and on the completion of the buildings he or his nominee was to be granted a long lease. As the site was close to King's College Hospital he was threatened with an action for interference with light and air by the trustees. To avoid litigation he purchased from them an adjoining plot of ground. The buildings were subsequently demised by him to the company who were plaintiffs. Their contention was that the adjoining plot, part of which had been sold to the defendants by Mr. MACRAE's executors, was to be kept as vacant land, in order that there might be no interference with the light and air of Newspaper Buildings. The plaintiffs' claim was based on an implied obligation. Mr. Justice BYRNE held that when Mr. MACRAE purchased the vacant ground from the trustees he was not acting as agent for the plaintiffs, although no doubt he was director of the company and held a large number of shares. Nor was there any evidence of an intention to keep ground vacant for which he paid 10,000%. He had not entered into any agreement to that effect. There could be no implied grant of right to light or lightless at the time of the transfer of his interest in the dominant tenement the grantor was in a position to make an express grant of the easement over the servient tenement. In the present case the grantor of the dominant tenement had no such right over the servient tenement as to entitle him to make such an express grant or to create a right to light. His lordship therefore dismissed the action with costs against plaintiffs. An inquiry was also made as to the amount of damages due to defendants by suspension of their building operations. The case is of great importance in the laying out of building estates. It is too often taken for granted that certain plots which for the occasion may be laid out as attractive open spaces will always remain in that condition, as if the owner of an estate should have no thought beyond the interest of those who buy building sites. Unless there is a clause guaranteeing that the land is to be reserved and remain vacant the Courts are bound to hesitate before accepting implied grants, even when more is claimed than an easement.

THE recent litigation between Brighton and Hove has made it clear that in arrangements about drainage, drainage and other authorities are disposed to make general orders without having any definite idea of what is contemplated, as if sewers were elastic and could be easily adapted to meet all contingencies. Another case which did not rest on private Acts, but on the Public Health Act, has been heard before Mr. Justice SWINFEN EADY, but only partially, for all that was claimed was a declaration that the owners on a private estate could be connected with the sewer of an urban council. Section 22 of the Act says:—"The owner or occupier of any premises without the jurisdiction of a local authority may cause any sewer or drain in such premises to communicate with any sewer of the local authority on such terms and conditions as may be agreed on between such owner or occupier and such local authority, or as in case of dispute may be settled at the discretion of the owner or occupier, by a court of summary jurisdiction or by arbitration in manner provided by this Act." It is probable when the Act was drawn it was expected that the "premises" would only consist of a house or two, but there is no limit about the number. The owners of a large estate in Northumberland, which was to be laid out for building, claimed the right to use the Gosforth sewer. The Urban Council were advised that such a series of sewers as was contemplated would be outside the scope of Section 22. An action was brought by the owners in the case above stated. Mr. Justice SWINFEN EADY said a

large system of sewers was shown on the plan, and if carried out a large volume of sewage would have to pass through the Gosforth sewer, which might be of insufficient capacity. Having no facts before him his lordship declined to make a declaration, or to deal with the legal points. From his lordship's resolve it is evident that the right of the owner or occupier of any premises to drain into public sewers on complying with the regulations of the local authority has some limitation. The owners can have recourse to arbitration or to a court of summary jurisdiction, and it will be well to have so important a subject thoroughly considered.

A MEETING will be held at the Mansion House on June 29 to inaugurate the fund for commemorating the services of the late Sir HENRY BESSEMER, whose process for the manufacture of steel has led to the cheapening of the material and its employment in building construction. It is proposed to erect, and if necessary to endow, a department for metallurgical teaching and research work in connection with the University of London, equipped for the testing of ores and metallurgical products by modern methods, and for the investigation of new methods and processes. If possible it will also be arranged to have international scholarships for post-graduate courses in practical work in connection with proposals now under the consideration of the Board of Education. If sufficient funds are obtained it will be seen that much more will be accomplished than the raising of a memorial to BESSEMER alone. Indeed, it would be an advantage if by scholarships or in some other way the services of other men in connection with the steel industry could be commemorated.

THE Glasgow Dean of Guild Court has been able to assert its authority over no less a potentate than the Postmaster-General. It was proposed to erect a parcel post-office in Waterloo Street, but the postal authorities believed it was not necessary to comply with the usual regulations incumbent on ordinary citizens. Accordingly, no application was made for authority to build, and no plans were lodged in the Dean of Guild Court. All that was done was to seek authority to enclose and occupy parts of the streets adjoining the site. Some owners of property objected on the ground that there was no information about the length of time during which the streets would be occupied or closed. The Glasgow Master of Works also objected, for the closing of streets, he held, was only allowable in connection with a license to build, which had not been granted in this instance. The Lord Dean of Guild, having considered the subject, says that the Postmaster-General claims that he is not subject to the jurisdiction of the Dean of Guild or bound to apply to him for a warrant to build, but admits that the Dean has a common law jurisdiction in regard to the occupation of streets. It is new to the Dean of Guild to hear that he has a jurisdiction in regard to the public streets of the city apart from and without reference to any warrant for the erection of buildings. The Lord Dean, therefore, dismissed the petition of the Postmaster-General, and allowed costs to those who opposed the petition. The point is interesting, for in England it is generally understood that "any building, structure or work, vested in and in the occupation of any part of HIS MAJESTY'S Government" is exempted from the customary regulations for building.

A NEW street was recently constructed in High Wycombe by Lord CARRINGTON and presented to the borough as a memorial of the late QUEEN. It was decided that the new municipal buildings should be erected in Queen Victoria Road. Premiums of 100 guineas and 25 guineas were offered for designs. Mr. T. E. COLLCUTT was appointed assessor. By his award the first premium goes to Messrs. JOHN J. BATEMAN, CHARLES E. BATEMAN & ALFRED HALE, of 81 Edmund Street, Birmingham. The second premium was awarded to a design sent by "F. H.," of 10 Cheyne Row, Chelsea. The third position was assigned to Mr. J. EDWIN FORBES, 21 Waterloo Street, Birmingham, and the fourth to Messrs. WILLES & ANDERSON, of Adam Street, Adelphi, London.

TYPES OF COSTUME: ENGLISH, SIXTEENTH AND SEVENTEENTH CENTURIES.

PAINTING AT THE ROYAL ACADEMY.—I.

THE Archbishop of CANTERBURY must have surprised many of the guests at the Royal Academy Banquet on Saturday when he said:—"I should rejoice to see the painter's skill again at work more freely within our church's walls. Nay, I look forward hopefully to the time when that noblest and most inspiring form of bright adornment may be again so widely used that our churches shall once more be aglow with colour, and shall contain, as churches did in days gone by, some of the greatest pictures of our greatest men." Last year there were a few paintings which could be used for the adornment of ecclesiastical buildings, but this year, no doubt owing to the absence of all encouragement, the number is diminished to one, and this is likely to be passed over, for it bears the title *The Traitor*. It is a representation of the Last Supper, by Mr. G. E. HICKS, and is inspired by the words, "Lord, who is it? . . . He it is to whom I shall give a sop, when I have dipped it." The picture is small in size. Instead of following the precedents of Italian and other old masters, the subject is treated realistically, or, in other words, it is suggested that the disciples and their Master were reclining at the simple meal. There is no nimbus, and the SAVIOUR's head is covered by the hood of His mantle. It might be an ordinary supper of poor men but for the alarm on the face of JUDAS and the small money-bag before him. That so small a work should alone exemplify Christian art amidst so large an assemblage of paintings is a commentary on the Archbishop's speech.

The liberal use of old myths of pagan origin is an indication of the tendency of public taste at the present time. Greece rather than Palestine is gaining ascendancy. The influence of Lord LEIGHTON has not ceased to be effectual, for there are other artists who endeavour to follow his example. It must be acknowledged it is no freak of our day to regard mythology with affection. Mr. DRAPER's *Prospero Summoning Nymphs and Deities*, which is a design for a ceiling painting, suggests the Elizabethan precedents for such subjects. IRIS, CERES and the imperial JUNO herself were at the call of the magician. Mr. DRAPER's work, if carried out as indicated, will be an ornament to the building containing it, but it is odd to find the Drapers' Company preferring nude figures to draped. The *Iris* of Mr. J. M. SWAN, who is clad in yellow gauze and white, is, we suppose, the many-coloured messenger of PROSPERO, who with saffron wings diffused honey-drops and refreshing showers. Sir W. B. RICHMOND, in his *Phaeton: Sunrise*, shows how a myth could have originated. When viewed from a distance the sun-god in his chariot drawn by upspringing horses might be taken for the outline of a golden cloud. That is a concession to modern scepticism, but a Greek would prefer the old arrangement of GUIDO as seen in his *Aurora*, as being more in keeping with his thought. The *Echo and Narcissus* and *Psyche Opening the Golden Box*, by Mr. J. W. WATERHOUSE, possess rather more of the antique spirit. The artist's little women have a simplicity recalling the antique, but there is a risk of their becoming insipid through continual repetition. We may suppose that PSYCHE was more curious than wise, and that ECHO was foolishly enamoured of a shepherd. There are, how-

ever, mythic beings less languid and more worthy of representation. The *Sirens*, by Mrs. E. NORMAN, are evidence that in ancient as in modern times cannibalism was a cause of vigour. The women are in excellent condition. They vary in flesh tones from ETTA's sirens, for they seem to belong to a sunny clime, but they also are accompanied by relics in the form of bones from a recent meal. Would not details of that kind be better omitted from both pictures? Mr. ARTHUR HACKER's *Leaf-drift* might be sirens or nymphs lying asleep amidst leaves, but while the lady artist is careful to have rounded contours Mr. HACKER is not afraid to be anatomically true. The *Pyrrha* of HORACE, which Mr. J. W. GODWARD depicts, must have been related to the sirens, for the poet's votive offering after his escape from her was dedicated to the sea-god. In the picture we have no suggestion of the cave near the sea, for this graceful figure prepares herself for victory in Rome. It is well to have an illustration of HORACE, whose limited collection of poems abounds in subjects that might with advantage be utilised.

There are legends of a later sort which have been employed this year. Mr. JOY's *Flower of Wifely Patience* is the GRISELDA of CHAUCER, whose history was told to him by PETRARCH, who may have taken it from BOCCACCIO. But evidently it relates to a remoter age when more wilful princes lived. Mr. JOY's princess belongs to the same family as Mr. WATERHOUSE's mythic beings. She seems so much of a child, we are not surprised at the meekness with which she abdicates her position as a wife, and made preparations like the meanest servant for her successor. She is represented in the act of stripping herself, and there is a simplicity about the scene which adds to its pathos. We suppose there never was and never will be a time without people eager to drink of the water of Lethe. Mr. T. B. KENNINGTON has presented the legend with good effect, but his picture with its semi-nude figures was not sufficiently valued by the hangers, for it is placed too high. The President, in his *Cave of the Storm Nymphs*, has another version of the subject he used last year. His beings may not be Greeks, but they are of the same species:—

Fair as their mother foam, and all as cold,
Untouched alike by pity, love or hate;
Without a thought for scattered pearl or gold,
And neither laugh nor tear for human fate.

The light is strong upon the figures, and they are painted with unquestionable accuracy. Every trinket or bit of débris has also photographic fidelity; but the picture is academic although on a small scale, and we think more will be thought of the treatment than of the subject. We may also mention the *Nymph of the Pool*, by Mr. PERCY GIBBS, and *The Music of Pipe and Brook*, by Mr. WETHERBEE, as examples in which imagination is exercised.

Ancient history would likewise appear to be growing obsolete. People do not believe in the veracity of the records, and the incidents narrated have rarely the charm of the myths. Mr. T. R. SPENCE has had the courage to show *The Surrender of Capua, 210 B.C.: Passing Round the Poisoned Cup*. It recalls the scene of the white-robed senators of Rome, seated immovable as statues and await-

ing the arrival of the barbarians. But at Capua, or rather aserta, the invaders were Romans, and the Campanians were likely to have preferred richly-coloured raiment. It is not an heroic deed they were engaged in, for death at the hand of the lictors was inevitable. It is well to find the artist who is not afraid or ashamed to be considered an historical painter. The care taken with the architecture merits recognition; so noble a building is rarely seen on canvas. Mr. MATTHEW HALE'S *The Conqueror's Horses* is really an important historical picture, for it depicts the Norman cavalry leading their horses through the sea at Pevensey on December 28, 1066. According to the chronicles the archers landed first, then the cavalry in boats of mail with helmets of polished iron, and bearing long and heavy lances and two-edged swords; they were followed by the pioneers, carpenters and smiths, who on land erected three wooden castles; and last of all came Duke WILLIAM. The spectator is supposed to view the scene from the English coast. There is a good deal of shortening required in representing the horses, but the tinting is so dexterous that difficulties which had to be overcome are likely to be ignored. If informal it is spirited in action, and the instinctive gaze of the horses on the strand before them has a realism which merits recognition. The cavalry incident which took place some seven centuries afterwards is observed in Mr. JOHN CHARLTON'S *Rosbach*. The charge in question is memorable, for, as the Baron DE MONTMIRAIL says, "un pouce de terrain, un instant perdu," could have enabled the Allies to form their line; but FREDERICK THE GREAT'S instructions were precise. The movement was directed by SEIDLITZ, and was so sudden that Mr. CHARLTON is justified in showing the majority of the squadrons as impulsively shouting.

Records of some modern historic events are to be observed on the walls. Mr. ERNEST CROFTS portrays the funeral of Queen VICTORIA, and has vividly realised the impressive spectacle as it passed along Piccadilly. A part of the procession on Coronation Day has been selected by Mr. J. B. BEADLE. Mr. BACON'S subject is the *Homage-paying, Westminster Abbey*, when the late Archbishop of CANTERBURY succumbed to the excitement of the occasion. The three pictures possess qualities in common, and it would be well if they could be placed together.

We presume the painting, *Mrs. Siddons in the Studio of Sir Joshua Reynolds*, by Mr. ORCHARDSON, should be considered as an historical work. The first President of the Academy was an admirer of the actress, and it is not unreasonable to believe that she might vary the tedium of a sitting by a little declamation, especially as nearly all those present were in some way connected with the stage. Mrs. SIDDONS cast off the heavy robe worn when she was painted, in which Sir JOSHUA'S name was to appear. She stands clad in a simple, tight-fitting gown of white, and yet becomes impressive, for, with her arms extended above her head, she looks like a priestess proclaiming the wrath of the gods against some evildoer. As a contrast with her tragic figure, we see Mrs. JORDAN seated—not the comédienne of later years, but the actress who was perfect in Ophelia, Helena and Viola, and who, as CHARLES LAMB says, spoke the words of her parts as if they were watered by tears. Another portrait-painter's work is commemorated in Mr. C. HINDLEY'S *Rembrandt*. We see the painter, in splendid costume, before one of those old ladies who seemed to be favourite sitters with him, but who do not seem to enjoy her position. Did some actress pose for Mr. BOUGHTON'S *Imogen*? It is not the princess that most readers of the play create for themselves and to whose youth and beauty so many of the *dramatis personæ* are made to testify, but the attitude is easy, if suggestive of the age, and although the Roman chiton is more fresh than is to be expected when worn by one who for two nights together made the ground her bed, yet that also recalls the age. But we must not be hypercritical when artists appear to consider that SHAKESPEARE spells bankruptcy to them.

Mr. VAL PRINSEP is one of the few painters in whose works there is no iteration; he does not care to remain in the same groove two years in succession. Last year he painted *The Virgin at Bethlehem*; this year, *Venetian Women after their Day's Work*. He professes to have drawn inspiration from DE MUSSET'S expression, "Dans Venise rouge," but THÉOPHILE GAUTIER was more conformable

to local colour when he said, "notre appartement faisait partie d'une simple maison crépie de rose, comme la plupart des maisons de Venise." We find a group of Venetian women, some of whom are clad in red or red and black, harmonising with the walls. Two or three are asleep, and there is a general air of content at the day's toil being over, although it was no doubt short. It is not often that so large a picture in which red is the prevailing colour is equally reposeful. Instead of diminishing the effect of the pictures around they appear to be more garish. There is, however, a risk that so masterly a work from its simplicity may be undervalued. The Venetian labourers look dignified if compared with the *Nomads*, a group of gipsies with their horses and waggons which Mr. STANHOPE FORBES has contributed. It is also quiet in treatment, and all the figures are modelled with power; it is, however, true to nature, and the unclean wanderers can never be considered picturesque unless by the aid of accessories which do not belong to them. Another incident of country life is Mr. MACBETH'S *Lunch at a Coursing Meet*. It is rarely of late we see a picture which wholly satisfies by this artist. Parts approach perfection, but there is always something counteracting. The luncheon is merely an accessory, as it were, for it is seen in a barn in the background. The prominent figure is a handsome girl with a basket of sandwiches, on which a splendid hound is pouncing. There are colours in the girl's dress which are trying to the sight. The figures are not well combined, and yet many portions are excellent. Admirers of the artist will probably prefer the etching by him of the picture which is in the Black and White Room. A single figure by Mr. MACBETH, *In the Smugglers' Mist*, is found amidst strong rivals in the third gallery, and is worthy of the position. We see a dark-haired woman in a scarlet jacket on a cliff surrounded by mist and engaged in drawing up small kegs of brandy. Modelling, colour and finesse are united. It has for neighbours a brilliant view of the Venice canal by Mr. HENRY WOODS, a *Pot-Pourri* by Mr. ABBEY, in which we see an abundance of rose leaves heaped on white clothes on the floor, as well as on the table in a room that was once a crypt and has been lately whitewashed, an act of vandalism which we hope is imaginative and required only for pictorial purposes. Sir ALMA-TADEMA in *Silver Favourites* proves by his dainty girls in ancient Roman costume, his fine marble piscina with its graceful curves, and his dark blue sea, that his hand is as dexterous as ever. Mr. E. J. GREGORY is again exasperating in his *Rediviva: Great-Grandmother's Wedding Dress*, a girl not remarkable for beauty, wearing a big bonnet and a white embroidered dress to her own satisfaction. Mr. G. D. LESLIE is, as usual, without any enterprise, for *The Lily Pond* seems to be a part of a series with which we are long familiar. There is a boat lying close to steps and children wearing the white, grey and blue dresses we have seen before. The masonry, bank and water are old acquaintances. If groups of spectators are to be taken as a test, *The Prodigal Daughter*, by JOHN COLLIER, should be considered as one of the prominent pictures of the exhibition. Last year the artist showed a plague-stricken woman made more ghastly by the faint light in which she was seen. This year we have a humble room, illumined by a small paraffin lamp, invaded by a brigandish young woman who stands with her back against the closed door. The entrance we suppose was so sudden, neither the father nor the mother knows how to act, and whether she is to be welcomed or rejected. The significance of the picture is perhaps enhanced by the suspense, but the effect is also increased by the strongly-marked light and shade due to the lamp. Mechanical results produced in that way please certain observers from their definiteness, but they are generally followed by a reaction, and Mr. COLLIER is too able an artist to depend upon them. Another picture which will excite attention is Mr. BYAM SHAW'S *The Fool who would please Every Man*—an illustration of ÆSOP'S fable. The rustic who was so amenable to advice carries the beast that should carry him in what appears to be a market-place, thronged with men, women, children, soldiers and civilians. Every figure is painted with care and has a distinct characterisation. The colours have to be varied, but the effect is not disagreeable. It may not exemplify pictorial composition in the usual acceptance of the phrase, but there is no doubt

of its thoroughness and spirit. Another work no less remarkable is Mr. J. C. DOLLMAN'S *Mowgli made Leader of the Bandar Log*. His *Kismet* of last year was a revelation of unexpected power, and this year's picture is still more remarkable evidence of development. The monkey has often appeared in paintings, but in this picture we have a host of them engaged in the important duty of selecting a leader. The legend may have been familiar for generations in India, for we cannot suppose it is a sarcasm on elective assemblies. Mr. DOLLMAN has, at least, gone through his work seriously, and not one of the little beings can be considered ridiculous. MOWGLI, the boy familiar with elephants, realises his helplessness, but no look or act leads his observers to imagine he is unworthy of the onerous post, and he deserved the honours he received from the elephants for his bravery. The picture is undoubtedly the most original in the exhibition, and the lighting recalls the scene of the conference. Strong light of another kind is exhibited by Mr. LA THANGUE in his *Mowing Bracken*, which is presumably a Sussex incident. But three of his four pictures are derived from Provence. *The Provençal Winter* will make many people desirous to escape to a land where roses and fuschias grow, oranges abound, and the seasons appear to be reversed.

ENCYCLOPÆDIA BRITANNICA.*

AMONG the auxiliaries of literature the index-maker was always one of the least appreciated. This is easily explained. A great many, if not the majority, of books are at most read through once and are rarely referred to afterwards. When a work was to be carefully studied the reader was advised to prepare his own index to it. Knowing how little value was set upon his labours, and the poor price paid for it in most cases, the index-maker often scamped his abstracting. Indeed, it was an opinion among publishers as well as some classes of readers that the shorter the index the more it was efficient. Many of the most important English books are not even provided with a brief index. STUART MILL'S "Political Economy" is one, his father's "Analysis of the Human Mind" is another. There is only an insufficient index to the "Logic," and, in consequence, summaries have been brought out to serve instead. In some instances it may be said that inefficiency arose from independent thinking, as in that of MILL, but writers who have had to depend upon the authority of books have suffered so much from the absence of indexes, or through those which are imperfect, they have been careful to provide against similar charges being made against themselves. CARLYLE often used very strong language on the subject, and he not only attached an index to each of his works, but they were all collected and rearranged in a separate volume. Without an index, remarks FULLER, "a large author is but a labyrinth without a clue to direct the reader therein. I confess there is a lazy kind of learning which is only indical, when scholars (like adders which only bite the horse's heels) nibble but at tables which are *calces librorum*, neglecting the body of the book." There is no class of book which does not gain by a clue of the kind. Dr. JOHNSON, who probably performed a good deal of unknown drudgery over indexing, wrote to RICHARDSON, the novelist, suggesting one for "Clarissa." As he said:—"I wish you would add an *index rerum*, that when the reader recollects any incident he may easily find it, which at present he cannot do, unless he knows in which volume it is told; for 'Clarissa' is not a performance to be read with eagerness and laid aside for ever, but will be occasionally consulted by the busy, the aged and the studious." RICHARDSON is still without his index, in common with all his successors, except CHARLES DICKENS, to whose writings there is an index-dictionary which is an invaluable aid.

With a work so comprehensive as the "Encyclopædia Britannica" an index is indispensable. It was objected that by adopting the alphabetical arrangement for a work of that class a treatise on any subject had to be broken

into fragments. The index, however, gives some compensation, for it collects the parts and thus enables a reader to co-ordinate them into a whole. The advantage is also gained of being directed at once to the particular matter about which one may be seeking knowledge without undergoing the labour of reading through a long article. It may be said that, apart from its utility as a guide, an index to an encyclopædia enables a reader to be impressed with the extent of knowable things in the world, and although he may not be able to take all knowledge as his province, he can conceive its vastness and diversity. In such indexes, as SHAKESPEARE foresaw, "there is seen the baby figure of the giant man." It is difficult to explain how this is done in the multiplex volume before us without reprinting at least a page. But it may be indicated in an imperfect way by a comparison of a few items of the index of the ninth and tenth edition of the "Encyclopædia Britannica" with that of the eighth edition, which was prepared by the Rev. J. DUNCAN. The more modern work consists of 1,058 closely printed pages. As there are five columns in each we have 5,290 columns of small type. In the index to the eighth edition there are only 928 columns. If we regard the different sizes of the type we may calculate that the latest index contains at least six times as much matter as its immediate predecessor. The increase is partly owing to the more systematic and exhaustive manner of showing respect for details; but we must also remember that in the years which have elapsed between the publication of the two indices knowledge has grown from more to more to an unprecedented extent, and that all the advances are recorded in the "Encyclopædia." It would be a profitable task for any student to compare the two carefully, for in that way he would come to understand what modern omniscience involves. But a slight effort may be made by glancing at some of the headings relating to architecture and building to suggest the character of the work. The test, no doubt, is as inadequate as the old pedant's brick was to represent his house, for it cannot be asserted that architecture as a fine art has made extraordinary progress, and in building the old ways are still respected. In the index to the eighth edition architecture is treated under the following heads; we omit the references to volumes and pages:—

Architecture—French Academy of; Mexican; Peruvian; Chinese; Egyptian; Nubian; Hindu; Grecian; Roman; Italian; Gothic or Pointed; principles of architectural composition; glossary of terms; Assyrian; of Pompeii; Spain; America; Alison on the beauty of Grecian; Coulomb's statical problems relating to; improved by the Crusades; its position among the arts; Lombard style; garden architecture; in the reign of Queen Elizabeth, &c. See Arch, Building, Carpentry, Chimney, Dome, Free Masonry, Roof, Stone Masonry.

In the new edition the following articles are given:—

Architecture—Anglo-Saxon; Arabesque; archæological discoveries; Assyrian; Babylonian; bibliography; Byzantine; Chinese; on coins; colour in; of Coptic churches; Cyclopean; Egyptian; Elizabethan; and ethnology; Etruscan; French; Georgian; German; glossary; grotesque in; Indian; iron work; Jewish; Mediæval societies; megalithic; modern English; modern European; and music; Norman; orders; Palmyrene monuments; Persian; Phœnician; prehistoric; pyramids; Raphael; Renaissance; Ruskin's works; Saracenic; societies; street; Tudor; Vitruvius's work; Zodiacal symbols.—American; ancient; sky-scrapers.—Gothic; England; France; Germany; Italy; Spain; transitional style.—Greek; Corinthian; Doric; early; Ionic.—Roman; Colosseum; columns; domestic; orders.

On building in the eighth edition the following articles appeared:—

Building—Transmission of sound by stone; deadening of sounds in rooms; calc-tuff as a building stone; Purbeck and Portland stones; expansion of building materials by heat; strength of different kinds of wood; and of stone.

It should be remembered that men like THOMAS YOUNG, TREDGOLD and ASHPITEL contributed articles on construction, some of which were found in the earlier editions as well. But what different proportions does building assume in the index to the latest edition:—

Building—and architecture; beams; brickwork; cabinet-making; carpentry; casements; cements; clubs; architecture;

* An Index to the complete *Encyclopædia Britannica*, being the eleventh of the new volumes which constitute in conjunction with the existing volumes of the ninth edition the tenth edition of that work. (Published by the *Times*, London.)

cost of, in London; floors; gasfitting; gilding; glazing; house-painting; joinery; joints in carpentry; legislation concerning, U.K.; masonwork; materials in Rome; method in Paris; modelling; mouldings; mural decorations; paving and draining; plasterwork; plumberwork; protection against fire; railway cuttings; sawyerwork; slatework; smithwork; stairs; steel construction, N. York; stone joints; ventilation; in United States. Building stones:—Dartmoor granite; Haute Savoie, France; classification of.

A single article sufficed for archæology in former editions. Now there are special articles on various periods as well as on remains in several countries, or in other words, the science has attained twenty times the former magnitude.

It is, however, when we consider topics of a different kind that progress is more manifest. Electricity, for example, needs three columns of the index. Steel, for which ten lines sufficed, has now nearly a column. The importance of sanitary science in our time, as compared with that of Dr. LETHABY and Dr. LANKESTER, is revealed by the index. Even in subjects belonging to metaphysics, psychology, logic and philosophy in general we realise how the intellect has been active. Political science, if not as certain in its conclusions as physical science, demands almost as much attention. McCULLOCH would have thought the world was near its end if he saw the number of articles which relate to socialism and communism, as if he had not repeatedly denounced them in former editions of the "Encyclopædia." Theology also could not resist the forces which have been at work. If not a progressive science, it is shown to be a widely related one, and is expected to be submitted to evolution, development, symbolism, philanthropy, system, and to stand on a philosophical basis. There is, in fact, nothing in which men take an interest which is not found in the volumes, which are universal in their aims, and beyond all the preceding efforts come nearest to the ideal of ALSTEDIUS, the Saxon, when he wrote:—"Encyclopædia est systema omnium systematum, quibus res, homine dignæ, methodo certâ explicantur."

THE PRINCIPLES OF ARCHITECTURAL DESIGN.

By PERCY L. MARKS.

CHAPTER XI.

SYMBOLIC ART.

AMONGST the numerous resources possessed by a designer for giving variety to architectural façades, the introduction of symbolic emblems and figures is second to none in value.

By this means the intention of the building can be aptly expressed, even where it may be difficult to do so by the general lines of the façade, and without having to resort to the use of inscriptions as the sole means of interpretation.

To mention two concrete examples—the first called to mind—the Trinity Almshouses in the Mile End Road, London, express their purpose in any case, and, aided by the symbols at the entrance, &c., convey the impression that the inmates have been associated with the sea—similarly with the sea-horse effigy at the Admiralty, London.

Again, where on the façade of a building, a series of medallion portraits of artists is displayed, the natural inference is that the structure is an art gallery.

But the use of symbols and symbolism (*συμβάλλω*—to throw or take with), has a much wider significance, and the subject is as interesting as it is ancient—almost archaic. Most names of people and places transmitted to us from thousands of years ago bear a hidden meaning—sometimes discoverable and in other cases lost. Whilst a journey over this ground would be very attractive, it is not appropriate for this series, and must therefore be relegated to some other occasion.

Symbols admit of the following classification:—

Those expressed in (a) names; (b) digital numbers; (c) animal forms; (d) colours; (e) geometrical diagrams; (f) common objects; (g) mythological forms; (h) vegetable forms.

The first two classes will not be enlarged upon in this

series; but, in passing, the following examples may be given:—Derivatively, the name *Abraham* means *the father of nations*; the word *Hebrew* refers to descendants of *him who passed over* into Canaan; *Mesopotamia* refers to the district *between the waters*. Respecting digital numbers, each one in turn has probably at some time or other been represented as of symbolic value. In fact, the *sans-culottes* and their fellow-citizens at the time of the great French Revolution went further, and would designate one individual as "the man of 28th February"—or of 1st April, as the case might be.

These two classes of symbolic possibilities do not, however, come within the architect's professional ken; but when the succeeding classes are considered, a close connection with the designer's opportunities is at once observable; the use of symbols—from an architectural standpoint—being to embody ideas or to suggest ideas which the building itself should develop.

But care must be taken that the symbol is neither involved nor too far-fetched, except in cases where a prescriptive use is attached; for if a symbol is to act as an index to a building, it is useless to write it in a language that may not be understood. To give examples—everyone recognises the sign of the three golden balls as representing pawnbroking, simply on account of its prescriptive force, for otherwise it is not at all self-explanatory; the fact that it is a reminiscence of the Lombards, who were the prototypical money-lenders, is not universally known, and even then this is only an intermediate stage in the explanation of the symbol, which, pursued to its reputed origin, is to be found on the armorial bearings of the MEDICI family, who included some of the wealthiest of the Lombard merchants; the three golden balls on the coat of arms are said to be a punning device on the family name, for three golden pills. This is more than probable, as puns and acrostics have the complete sanction of antiquity to recommend them.

If, on the other hand, a blindfolded figure holding a balance is seen on a public building, it requires but little perspicacity to understand it as symbolising Justice. The cat as an emblem of Liberty is not as apparent, though it is so recognised, and its position erstwhile in a niche in the wall of Newgate Gaol had a peculiar inappropriateness, tinged, perhaps, with malicious humour.

There is one quality in art that has not been enlarged upon in this series, and, as a matter of fact, scarcely admits of diffuse treatment, and that is the quality of *mystery*; nor is there any intention to do more than refer to it here to emphasise the objection to its use in connection with symbols; the latter, as above remarked, cannot be too luminous. Mystery has a value of its own in pictorial design generally, and in architectural design when concerned with religious and memorial buildings, as it creates or fosters a feeling of transcendentalism, which, under such circumstances, is appropriate.

The art of obtaining an effect of mystery is considerably more negative than positive in its nature. Mystery is obtained by the suggestion of hidden possibilities, and the "dim religious light," of which so much is made, is a powerful factor in perfecting a scheme where mystery is to play an important part. In Westminster Abbey there are vistas and passages as full of mystery as of beauty; and though there may be some who will disagree on the next point, yet the writer is free to confess that, for his part, numerous as his visits to St. Paul's Cathedral have been, he cannot discover the slightest suggestion of mystery from any standpoint in the body of the building, except when gazing upwards into the dome.

And it may be stated here that age is not a necessary attribute of mystery; that it occupies a prominent place in relation to it may be granted, but that is all. In the case either of the Assyrian winged man-bull or of the Egyptian sphinx, if these were created afresh to-day, but line for line in full agreement with those in existence, the air of mystery would still be perfect.

Colours have symbolic meanings, when used either independently of, or in connection with, common objects; and as Heraldry has provided a method for representing the several colours, irrespective of actual pigments, architects are able to make full use of them as symbols, if desired.

Briefly noted, the heraldic names and representation of colours are:—

Red	blazoned as	gules.
Blue	"	azure.
Black	"	sable.
Green	"	vert.
Purple	"	purpure.
Gold	"	or.
Silver	"	argent.
Orange	"	tenne.
Blood-red,	"	sanguine or murrey.

Since the sixteenth century these colours have been engraved on a system of lines and dots, said to be the idea of a certain Signor PETRASANCTA. Thus (see fig. 74)—

Gules (red)	is represented by	vertical lines.
Azure (blue)	"	horizontal lines.
Sable (black)	"	cross-hatching of the above.
Vert (green)	"	diagonal lines from right to left.
Purple (purple)	"	do. from left to right.
Or (gold)	"	the use of small dots.
Argent (silver)	"	a blank shield.
Tenne (orange)	"	cross hatching of vert and gules.
Sanguine or murrey	"	do. vert and purple.

Heraldic Colours

FIG. 74.

It is sufficient, in concluding these remarks on the engraving of heraldic colours, to call attention to the fact that directions are read as from the position of the shield when borne by the owner and blazoned personally.

A reference was made before in this chapter to the early use of acrostics. These have not any particular architectural bearing, but "rebus" have been not infrequently used as a variety of decorative sculpture. The famous one of Prior BOLTON in the church of St. Bartholomew the Great, London, may be instanced. This fine old Norman structure is situated in West Smithfield; in the south triforium is Prior BOLTON's window, a simple, shallow oriel, with stone-carved panels beneath the lights; the central panel bears the semblance of a *bolt* driven through a *tun*. Another rebus called to mind is that of Friar ISLIP, where a man is portrayed *slipping* down a tree.

In the succeeding pages are given two alphabetical lists of symbols; the first indexing the symbols used, and the second indexing the characters and characteristics symbolised. In many cases the emblems that are used bear reference to one or other of the Saints, who, however, are but slightly dealt with in this series, though their symbols are used. Since preparing these lists, the writer has become cognisant of a book by Mr. E. A. GODWIN ("Saints and their Symbols"), which enters with some degree of minuteness into that branch of symbolism, and which will prove a valuable work of reference for the purpose. For the present work, it is considered adequate to give a generally useful list, without trenching on the ground so ably covered by Mr. GODWIN.

(To be continued.)

IRISH ARCHÆOLOGY.

A SERIES of lectures has been given in Dublin by Mr. George Coffey, M.R.I.A., Keeper of the Irish Antiquities, National Museum, Dublin, on "Pre-Christian Civilisation in Ireland." The lectures are in connection with the memorial of the late Miss Margaret Stokes. In his opening lecture, Mr. Coffey said that within such a narrow limit of time as was at his disposal he could only give them a mere view of the fringe of this subject, and in commencing he would try to give them a general sketch of the Stone Age in Ireland. They had up to the present no definite facts as to when man first appeared in Ireland, but they had evidence of the association of man with the great Irish deer or elk. In a cave in Waterford a large number of bones of the elk had been found, and these bones had been split down—evenly, and in the same cave sharpened stone implements had also been found abraded at the ends, thus proving that human agency had been at work. They had another portion of evidence as to the presence of man at this remote period—the configuration of the coast as they went north from Dublin. Beneath the raised beaches in many places were peat beds containing the roots of old trees—yew and oak. In Down and Londonderry, the great flint counties of Ireland, there were many places covered with splinters of flint and the remnants of what were almost beyond doubt implements in the Stone Age. Since that time they would find something of the arts when man gradually changed his habits from being only a hunter and raised crops and reared domestic animals. Mr. Coffey then caused to be shown on the screen a number of ancient stone axes, arrow-heads and various implements which were greatly admired, as were also the lecturer's interesting description of the various stages in the chipping, grinding, sharpening and polishing of these primitive tools and weapons. Proceeding to deal with the cromlechs, or ancient burial-places in Ireland and elsewhere, Mr. Coffey pointed out that these peculiar structures were, without almost an exception, erected either on the coast or a very short distance inland, more particularly where a river renders access from the sea an easy accomplishment. It was evident, he said, that the central parts of Ireland were covered with dense forests of yew and oak at that period. The lecturer also referred to several coast settlements of ancient people in the Stone Age, which had been definitely located, notably that at Whitepark Bay, where many valuable relics had been discovered. The lecture also included an account of primitive milling, and quite a number of fine photographs were shown, with pictures of early pottery.

In his second lecture Mr. Coffey dealt principally with what is distinguished as the Bronze Age, a cycle supplanting the more ancient and primitive Stone Age, when most of the weapons of war and chase and implements of industry, circumscribed so much as the latter branch of life undoubtedly was, were fashioned out of the nearest and most crude substances. The lecturer expressed the opinion that the Stone Age, as calculated by all available evidence, might be said to have come to an end in Southern Europe between 2500 and 2000 B.C. A remarkable thing with regard to the appearance of metal was that metal was found in a state which marked a transition stage from the Stone Age culture to the Metal Age culture, practically, over the whole of prehistoric Europe. With regard to the beginning of metal in Europe they could no longer say that it was derived from the East. The evidence was just as strong for the origin of metal in Europe as in the East; but whether it originated in the East or in Europe they could not really say. It might perhaps have had two or three centres of origin. The first appearance of metal was found in the form of copper. It was quite possible that man had discovered the use of copper at different periods in Europe, and that that might account for the fact that they had at these different centres, as it were, a story of progress all to itself. A large number of interesting pictures of axes and other implements were thrown on the screen representing the copper "interregnum," and the lecturer stated that Ireland and Hungary were the two countries in Europe which had the largest collections of copper implements. The copper picks in Ireland had never been found with handles, but specimens of the same implement had been found in Spain with wooden handles, preserved to an extent which gave a thorough illustration of the manner in which such articles were fashioned. Mr. Coffey proceeded to sketch with much attractive vividness, illustrating his remarks with many instructive pictures, the merging of the "copper" period into the Bronze Age. The copper axe preserved all the distinctive features of the stone axe, and these features were maintained in the implement of bronze and gradually developed and improved upon. It was almost impossible to say when tin was introduced, but in the development of the bronze period they found that the "amalgam" was in the proportion of 90 per cent. copper and 10 per cent. tin. It was also very difficult to get the exact stage when the wood was inserted and secured in the socket of the axe or spear, instead of the axe or spear blade or haft being inserted in the wooden handle. From this point Mr. Coffey

gave some interesting details as to the development of the axe and spear, and the arrival and improvements in form of the dagger and sword. Taking all the evidence into consideration, he thought the centre of the Bronze Age might be placed at between 1000 and 800 B.C. The moulds for these weapons were first of all cut out in stone—sandstone for preference, but from the formation and finish of later weapons they could safely say that the use of clay moulds came to be recognised and generally used. Stone moulds and the remains of clay moulds had been discovered in various places. Referring briefly to the question of gold ornaments which had been discovered in Ireland and some handsome specimens of which were thrown upon the screen, the lecturer said the question had been asked, Was this Irish gold? Most people were sceptical, but he always replied that if it was not Irish gold they had a much more difficult question to face.

The third lecture dealt with the ancient Celtic views concerning the soul and their influence on the burial customs of the people. We know from Lucan's *Pharsalia* and other sources that a belief in personal immortality was an essential element in the old Druid faith—one so prominent that it seemed to have impressed all the writers of antiquity who have touched upon the Celtic peoples. This lecture further described the wonderful subterranean structure known anciently as *Brugh-na-Boinne* (the palace on the Boyne), at Newgrange, in county Louth, a memorial of Druid times which dates back many centuries before the Christian era, and is as unique and interesting in its way as the far better known relics at Stonehenge, though, probably, the majority of educated Irish people have scarcely heard of, much less visited, it. The last lecture dealt with the remains of the Iron Age, which followed on that of bronze, bringing us down to much later times, and also with the distinctive features of Celtic decorative art before as yet it was influenced by the introduction of Christianity, and, consequently, of new motives in art.

PAINTING IN IRELAND.

AT the annual drawing of prizes of the Art Union of Ireland the following address by the president, Lord Powerscourt, was read:—Among the events of the artistic year here in Dublin have been the first of what we hope will be a series of winter exhibitions of pictures by Old Masters. There were collected examples of Gainsborough, Sir Joshua Reynolds and Romney, the three portrait-painters whose works are the most appreciated in the present day, and specimens of whose talent command the highest prices when they come to the hammer. Romney especially, with his light and graceful touch, is a master whose paintings are eagerly sought after by the millionaire, who pays twenty to thirty times or even more than what the artist received for them from his easel. It was to most people who saw the collection which had been got together to adorn these walls a great surprise to find that even now, when it was thought that from adverse circumstances much of the art which formerly existed in Ireland had disappeared, there was still to be found a number of gems of the highest merit which were still preserved in Ireland. I imagine that this winter show, especially as it was accompanied with afternoon tea and music, must have helped the finances of the Academy to a considerable extent. With respect to the present exhibition, it seems to me that there is a decided improvement over former years in the quality of the works exhibited by our native artists. But there are a few pictures lent from over the water which must first claim our attention. Perhaps the most remarkable is the powerful portrait of Lord Russell of Killowen, by Mr. Sargent. It shines like a gem across the room, and you can almost think you hear the great lawyer addressing you. There is also near it a fine portrait of Lady Ulrica Duncombe, by Mr. Shannon. These two are well worth the careful study of our native students; in this latter picture the flesh tints are extremely delicate. One of Mr. Hayes's breezy seapieces, perhaps his masterpiece, occupies the centre of the wall. On the same wall is a fine picture by Mr. Alfred Grey, "The Home of the Red Deer." The sun shining through the mist is very well portrayed; it is the best work I have seen from his pencil. There is a striking likeness of the late Marquis of Dufferin, full of truth and strong colour. Among the pictures most worthy of remark are the two works of Mr. Orpen, "A Window in London Street" and "A Mere Fracture," in the former of which the composition and the fine finish is worthy of all praise, and the latter is also a most careful and conscientious piece of work. Mr. Orpen is making a name for himself, and will go far. Mr. Shore has progressed very much in his representations of shipping. I think his work of this year is the best we have seen; in marine painting Mr. Pearsall shows also some beautiful examples. Mr. Orpen's work, with its accurate delineation of all the detail and truth in form and colour, reminds me much of the pictures of Zoffany, a painter of the last century, whose

works command high prices at public sales. Mr. Harry Scully has also a very nice picture, No. 97, "The Cloister and the World;" the architecture is extremely well done and the figure of the monk tells its tale most graphically. He has also another work of merit in a different style, "The Lowing Herd Winds Slowly o'er the Lea." Mr. Nassua Blair Browne also shows some clever works, especially "The Winter's Store;" the horses feeding on the haystack are well drawn and the foreshortening very good. For winners of small prizes I admired No. 19, "Calves," by Miss Thompson; No. 24, "The Wood of Annagh Ross;" No. 146, in the outer room, "Sir John Rogerson's Quay," a familiar scene in Dublin; No. 194, "A Golden Harvest," by Mr. Gregor Grey; a strong portrait, No. 204, by Mr. Allan, and many others. Mr. Walter Osborne's portraits need no praise from me; they speak for themselves as good likenesses and work of a facile brush. Mr. Alexander Williams also has faithful representations of Killarney, and many studies of Irish scenery which he exhibits in London and elsewhere. The other important event in art in Dublin is the recent reopening of our National Gallery. Under the direction of Sir Walter Armstrong and the genius of the architect, Mr. Manly Deane, a member of our Academy, the Gallery has been almost entirely reconstructed, with the exception of the great hall and the adjacent rooms, and series of galleries have been added which give opportunity for the placing of pictures of different schools of art, Italian, Dutch, English and others in such positions as that the visitor can now see every work in the best manner and in good light. I think that we have now got a gallery which will vie both in excellence of arrangement and in the merit of the works which it contains, even with a good many of the continental galleries, and certainly with those of such cities as Liverpool, Manchester, Edinburgh and others in the United Kingdom. Dublin may now really be proud or possessing a home for art, and a collection in it which is worthy of any city in the Three Kingdoms, and will hold no mean place even in the museums of art of Europe. This ought to be an encouragement to Irish artists to go on and emulate the fame of those who have gone before them, and although I hear many say that art is going down in this country, I think that the Academicians and others who have contributed to the show in these rooms prove that there is still the artistic spirit in Ireland which has always been attributed to the natives of this island. Since writing the above I have been shocked and grieved beyond measure by hearing of Mr. Walter Osborne's untimely death. It is most sad, and the more so as his reputation as an artist was rising every day, and his works were appreciated not only here but in London also as being of a very high class. Besides having lost one of our most distinguished painters, those, like myself, who knew him, have lost a dear and good friend. He was marked out for distinction, and I deplore more than I can say the sudden termination of a successful career.

PLAYING CARD DESIGNS.

THE Worshipful Company of Makers of Playing Cards announce their annual competition in designs. The "H. D. Phillips Prize" of 10*l.* 10*s.* is offered for the best design for backs of playing cards intended for presentation by the company to its guests at the inauguration banquet of the master and wardens. Three other prizes, of 5*l.* 5*s.*, 3*l.* 3*s.* and 2*l.* 2*s.* respectively, are offered by the company for the three next best of such designs. Novelty of idea will be regarded as an important element in the competition. To enable competitors to avoid repetition in design, they may inspect the cards issued by the company since 1882 in the Guildhall Library, or a photograph of those cards may be obtained, on payment of 1*s.*, from Mr. W. Hayes, the clerk of the company, Guildhall, London, E.C., to whom applications for any further information may be made.

The British Government have decided that a sum of 30,000*l.* shall be included in the Estimates for the year 1903-4 for the purpose of the St. Louis Exhibition. A decision as to what further amount shall be provided is deferred until it is ascertained to what extent a larger sum may be required. The office of the Commission is at 47 Victoria Street, S.W.

Sir Henry Lawrence, sub-treasurer of the Inner Temple, has stated that the Temple Church has been examined by an architect, and the matter is under consideration of the Benchers of the two Inns. The carving and decorations of the porch were considerably decayed, and would, sooner or later, have to be renewed. It was a question whether this would have to be done now or ten years hence. There was, however, no structural damage, and nothing to imperil the safety of the building. All the decayed work only dated back about sixty years, when there was considerable restoration of the church and unsuitable stone was used.

NOTES AND COMMENTS.

THE last number of *L'Art* suggests the aristocratic character of its upholders. There is an etching of a farmhouse in Normandy by Her Royal Highness the Countess of FLANDERS. There is a reproduction of a painting of a bull-dog by the Princess WALDEMAR OF DENMARK, and a pastel portrait of Colonel BURNELL by the Baroness LAMBERT. But the most important in an artistic sense is a scene from "Cinq-Mars," by Prince JACQUES DE BROGLIE. It shows a dining-room in the Château of Chaumont, which belonged to CATHERINE DE MEDICIS. The architectural part is represented with the utmost exactitude, and the numerous figures would do credit to any water-colour artist of the day. In addition to the plates in the number, an additional etching of a lion "Au Désert" is presented to subscribers. An article on HORACE VERNET as a caricaturist comprises memoirs of the French architects FONTAINE, HUYOT, VAUDOYER and LE BAS, who were subjects of his humour. The number is a remarkable one, and testifies to the undiminished spirit and tact of the editor, M. PAUL LEROI.

THE English visitor to Verona generally turns to the chapel, with its rough red sarcophagus, which is assumed to be the tomb of JULIET. There is continual disappointment, but as long as the old horse-trough remains it will be an irresistible attraction. Of infinitely more importance, in an historical and architectural sense, is the arena, which is supposed to date from the end of the third century. It could accommodate about 20,000 spectators on its seats or steps, and an equal number could watch the performances standing. Visitors from this country are annoyed when they find they have to pay half a lira for admission. The reason is the ruins are private property, belonging to the MONGA family. The municipal council are desirous of putting an end to the present state of affairs, and it is believed negotiations have been concluded which will make the old amphitheatre, which is next to the Colosseum in importance, the property of the city, and it will be open to all without any fee. The arena measures 242 by 146 feet, but the outer dimensions are 500 by 404 feet, the plan being elliptical. From the four bays remaining of the outer enclosure it is possible to form an idea of the appearance of the great structure.

IN 1885, when the late ACHILLE HERMANT was added to the roll of foreign members of the Royal Institute of British Architects, we published the house in the Rue Legendre which he designed for his residence and office. It adjoined the dwelling of BASTIEN LEPAGE, the painter. As we said, "M. HERMANT departed from the usual practice, and, instead of a very tall building, he erected a house of a size that would be sufficient for his own requirements. Compared with many in the neighbourhood it could be called a cottage. It might be said that the key to the arrangement of the elevation was found in the initial letter of his surname. As the letter H is made up of straight lines, so the house was made to exemplify lintel architecture. With the exception of the basement, arched openings are absent." Modest as was the mansion, M. HERMANT conducted an important business within it. He was one of the best-known and respected architects in all Paris, and as such was often consulted during lawsuits. He had reached, however, his eightieth year, and though hale and hearty, he succumbed under a brief illness. He had obtained various medals from the Salon and other exhibitions, and designed several private as well as public buildings in Paris. He wrote many essays and papers, especially upon the legal responsibility of French architects. One of his sons, M. ABEL HERMANT, has already won a distinguished position among French writers by his novels and plays. M. JACQUES HERMANT co-operated with his father and will carry on the practice, and M. PIERRE HERMANT is a composer.

ILLUSTRATIONS.

SHALDON CHURCH, DEVON.

THIS new building was consecrated by Bishop RHYL last July, being the first church that was newly consecrated in the reign of EDWARD VII. It is built of

five different kinds of stone, which give colour to the walls, and no plaster has been used in the building. The church consists of chancel and nave, measuring 130 feet in length, the width across the aisles being 45 feet. There is a south lady chapel that is separated from the chancel and aisle by wrought-iron grilles.

All the ceilings in the church are simply vaulted in stone of two colours. The vault of the aisle ceilings is in the form of a half-arch, formed into panels by ribs and purlins of Bere stone. The barrel vault of both nave and chancel is divided up by wide ribs and purlins, these being nearly 2 feet in width. The vaults are constructed so that the thrust is self-supporting, but flying buttresses give additional security to the structure. The west window is 23 feet wide, and is supported on a segmental arch across the nave, under which the font is placed. An alabaster figure of St. JOHN as a youth holding a shell forms the font. The chancel screen is of stone, the upper portion of which is to be rearranged. The central figure is of bronze. The figures of stone and alabaster were executed by Mr. HITCH, of London. The cost of the building in its present stage has been about 10,000/. Mr. EDMUND SEDDING, F.R.I.B.A., is the architect.

REDGARTH, CORK: GARDEN FRONT. THE HALL. DRAWING-ROOM. DINING-ROOM.

THIS building has been erected by Mr. ARTHUR HILL for his own residence, and the views suggest that a modern type is not unacceptable in Ireland. As the scenery about Cork is picturesque, there is an advantage in having a satisfactory house in one of the desirable positions.

RAVENSLEA, NIGHTINGALE LANE, WANDSWORTH COMMON.

THE materials of which this dwelling-house is built consist of red brick and Bath stone facings, with red Aberdeen granite columns supporting the porch. The roof is tiled and there is an oak verandah at the rear. There are four reception-rooms and a billiard-room, all having 2-inch six-panelled mahogany doors on the ground-floor, with all necessary offices. The bedrooms are eight in number besides two attics. The whole of the apartments are plainly but tastefully decorated, and the building, which stands in about an acre of ground, cost altogether about 5,500/. The architect is Mr. HERBERT BIGNOLD, and the builder, Mr. A. BOON, who is also the freeholder of all the adjoining property, resides in the old mansion belonging to the estate, which is known as the "Furze."

GRAND HOTEL, CHARING CROSS: THE BRIDGE.

BY an oversight this work has been overlooked, although arrangements were made for its illustration soon after it was set up. The bridge continues to be unique, although many structures to serve as means of communication across streets are to be seen in the Metropolis.

THE LESLIE ARMS HOTEL, CROYDON.

THE WHITE BEAR HOTEL, PORTSEA.

IN the ground floor of this building, including the name-fascia, BURMANTOFT'S faience has been employed with advantage. There is not only an attractive appearance, but cleanliness is easily obtained. The adoption of the material imparts a variety in a district in which there is an excess of sameness.

THIRKLEBY CHURCH.

THIS little church, of which an illustration appeared last week, was built by Lady FRANKLAND RUSSELL, in memory of the late Sir ROBERT FRANKLAND RUSSELL, Bart. It stands upon the site of a former church, which was erected some time during the last century—a poor design in the Italian style. The present church has accommodation for about two hundred worshippers. It is built entirely of stone, arcaded inside, and has a lady chapel on the south side of the chancel.

THE ARCHITECTURAL ASSOCIATION.

THE concluding meeting of the session of the Association was held on Friday evening last at 9 Conduit Street, W., Mr. H. T. Hare, president, in the chair.

The following were elected as members:—Messrs. R. Laensler, C. R. B. Murphy, J. P. White, Geo. Hornblower. Mr. A. Dicken was reinstated a member.

On the motion of the President votes of thanks were accorded to the Royal Institute of British Architects for the velfth grant of 100*l.* and for the use of the meeting-rooms, to the School of Design visitors and to the Technical Education board for the facilities afforded to members in workshop demonstrations.

It was announced that the members' supper would be held at the Hôtel Great Central on Friday, May 15.

Mr. A. NEEDHAM WILSON read the following paper, entitled

Architecture and the Public.

It may be considered that in selecting such a subject as "Architecture and the Public" I may be travelling over well-worn ground. I hope to avoid the charge, for a threadbare fabric is scarcely improved by further embroidery of the old pattern, but may present new aspects if held in differing lights. It will be my endeavour to offer for your consideration these differing lights, in the hope that the aspects may occasion some opening for useful discussion. As I look back over the period during which I have dwelt in the architectural world (a longer period than I like to contemplate sometimes) it appears to me that I have witnessed a remarkable change. The old order of things has passed away, and the architectural era I now live in is a very different one to that which witnessed my architectural birth. I do not intend to emulate either the keen insight or the eloquence of Professor Pite's review, read before the Institute recently, and that masterly *résumé* is probably too fresh in your minds to require any enlargement from me. We have passed through many stirring influences. We underwent the ordeal of the *Æsthetic* era in emerging from the Victorian—we had a severe attack of the "Queen Anne"—and recently we have suffered more or less from a strange disease now as the "New Art," from which we are scarcely convalescent. We have fortified our constitutions with the school of Norman Shaw. We have trembled in the throes of the Gothic Revival and the influences of the Oxford Movement, and we have seen as the outcome a new and, I venture to think, a sturdy development of Ecclesiastical architecture. And a greater appreciation of the Renaissance stock has encouraged the grafting of some vigorous shoots on that fine old tree.

New methods of training have been established, and the powers that be have been more or less alive to the necessity of keeping abreast of the rapid changes of this strenuous age and he demands thereby created. It is pleasant to feel that our Association has been and is anxious to meet those demands and to furnish the rising young architect with the equipment necessary to encounter them. Is it too picturesque or overdrawn to imagine English architecture as a giant awaked from sleep, and ready and anxious to battle successfully under the new conditions amidst which he finds himself, still stretching his powerful limbs and yawning a little? I believe, by the way, architecture is generally represented as a lady—but let that pass.

If it be granted that we are living in a transitional age, and that the old order of things has passed away, that as a nation we are awaking to the knowledge that we can no longer plod along in our old stubborn way, but must bestir ourselves unless we would be left behind and unheeded in life's race, are we architects fully alive to the fact?

New inventions, new ideas, new demands, new conditions, new uses for materials crowd upon us and increase daily. We have a differently constituted public to cater for, with an education which makes them infinitely more difficult to please than formerly, and yet have we succeeded in awakening generally a greater appreciation of the beautiful in art as far as we are concerned? Have we succeeded in more than meeting the demands of sanitary and constructional enlightenment? Are we leading or being led? Is architecture to-day an educational force calculated to elevate and teach and brighten the existence of the masses, or to relieve the dull grind and monotony of the great middle classes, or the sordid and deadly dull existence of the workers? Are we as fully equipped for this position as we ought to be, or even alive to the necessity, or is it all the idle Utopian idea of the dreamer, and shall we meet it with the reply that it cannot be done at 5 per cent.?

Further, has the status of the architect at all improved, or is he still considered a visionary, an unpleasant necessity, or an unmitigated nuisance, whose services may be dispensed with if possible? Can he command, any more than before, the tribute of brains and genius ungrudgingly given to the successful painter or sculptor, or can he appeal to the popular imagination with the expression of those brains and genius as can the

engineer? It may not be the ambition of all to appear in the illustrated papers or the cheap sensational dailies, or to be the cause of a torrent of dull statistics served up in attractive form for popular consumption in cheap magazines. But every architect in his soul must hanker even modestly for that deference, that indefinable bowing down, as it were, to the great ideals (which he often feels he so unworthily represents) from an appreciative public. But have we an appreciative public—one that can recognise genius when it exists?

It can scarcely be claimed that we are artistic as a nation. Art with us is not spontaneously produced, it is rather the result of forced effort; it is not the natural outcome of inherent liking—which will evolve art unconsciously without knowing that it is art. As a nation we do not produce art unconsciously, and as a nation we are not aware of the fact. The painter appeals more directly to the public than either the architect, sculptor or craftsman; not because the public appreciate painting as an art, but because it presents subjects which they like to see pictured in a way they understand. They are probably equally pleased with coloured photographs. In spite of our schools of art and all the machinery for inculcating a true and natural appreciation of painting as a means of representing the beautiful, how many of the vast crowds who throng the galleries of Burlington House are capable of judging whether a picture is good or bad either in drawing or colour? If they take any interest at all, it is only a languid sense that the subject pleases them in some undefined manner. And if this may be said of painting, wherein a serious effort has been made to train the public mind, how does it apply to the work of the sculptor and the craftsman, and still less the architect?

Yet I think even I can detect a growing appreciation of art for art's sake, as expressed by the painter, the sculptor and the craftsman, an appreciation that is gradually spreading, and even now with the public is supplanting what I may term the oleographic epoch. I hope I can detect signs of an appreciation of better things in domestic decoration, furniture and ornaments. Is it too optimistic to trust that the era of hideous flowered wall-papers, marble mantelpieces, grained woodwork, ugly mahogany, glass lustres, dyed grasses and wool mats, and their deadly dull atmosphere of sordid respectability is giving way to a craving for something better? The dull monotony of the struggle for existence is leading to a yearning for that which will brighten the grey and leaden hue of the lives of the great mass of the people. In their ignorance it may have taken a trend which we frequently deplore. It may be too often found expressed in tinted glass of an assertive nature, circular stone columns with real carving at the angles of the everlasting bay window, cast-iron monstrosities of various forms, and the weird introduction of so-called "half-timber." But we have not as yet succeeded in abolishing the deadly dreariness of the interminable streets of "villas"—long, wearisome vistas of endless monotony—the drab of which must be reflected in the lives of the unfortunates who dwell therein. Yet even the speculative builder caters for tenants with some approach to what he fondly imagines is art, finding that the "half-timber" is worth an additional 5*l.* on the rent. Shall we see the day when these interminable rows of dwellings, ground out of the speculative builder's mill, will give place to cheery and well-designed groups of houses facing their common green quadrangle?

Well, I venture to assert, not until we architects have a hand in the matter. Not until we have succeeded in moulding the popular mind into a far greater appreciation of the beautiful as expressed in architecture; not until we have suppressed the prejudices against us, and created such a demand that it will be as natural to employ an architect as it is now for the builder to draw himself one set of plans for a hundred houses. For any building of importance, and for many a private house, the services of the architect are felt to be a necessity, though this feeling has scarcely reached the stage when the architect will co-operate with the engineer and the contractor as a natural thing, when the public will insist that its engineering works must no longer be blots and eyesores, but possess a definite beauty.

I venture to think that as architects we hardly grasp the importance of the influence of our work upon the social well-being of the people. Do we not design too much for ourselves and our self-gratification? I suggest that we count too much upon the solid insular reserve of the Briton, and too little upon the emotional side, which it is our national characteristic to repress. As a case in point, may not the indefinable religious atmosphere of a church stir the emotions, or fail to do so, according to its sense of fitness for its sacred purpose? The man who can evolve deep devotional feeling in a cold, bald surrounding must be a devotee, and how few modern churches impress the worshipper with that sense of almost reverential awe which surely a church should create? If the emotions may be stirred by music, why not by architecture? However dull, however hardened a man may be, surely he must be unconsciously influenced by his environments and

may I suggest in this we have a means of educating our fellow men to a fuller and healthy appreciation of our work? It seems to me that this is a great responsibility, and one far greater than that hinging on questions of stability. This sense that the work of one's brain is an educating power for good or ill, to be handed down to future generations, and either held up to public derision or pointed at as something to be admired, or else utterly ignored. I think I would prefer to have my work held up as a something to be avoided than not have it noticed at all. And yet how many buildings in this unwieldy Metropolis attract even a passing glance from the hurrying thousands? Whose fault is it? It is easy to rail against the supineness of the public, but is that the true explanation?

And yet I suggest that there are signs that the public are slowly awaking to the fact that there is such a thing as beauty in building. They may not as yet have the trained appreciation which teaches them what should constitute beauty, but I think most architects will be prepared to endorse the opinion that they have to cater for much more critical clients than was formerly the case. Further, I will go so far as to maintain that the public are beginning to realise that a building may actually be ugly. Their ideas of beauty and ugliness may not coincide with either yours or mine, but the fact that they are not always prepared to accept the architect's dictum, though adding to one's difficulties, may surely be welcomed as a distinct advance and one that offers a fine educational field.

Some may not consider this "a consummation devoutly to be wished," and may hold that a new terror is added to the profession when every man who believes he can edit a newspaper or write a play better than anyone else will add a little dabbling in architecture and a dangerous knowledge of construction and sanitation. Picture the time when the egg-and-tongue wall-paper border will no longer be fixed upside down, or when it will no longer be held that warm carbonic-acid gas lies on the floor. I fear our profession will be robbed of its humours. But do we not see on every hand this awakening knowledge and keener interest in our work? If only it all can be turned in the right direction, I venture to prophesy that no registration of architects will be necessary to protect the public against incompetent or unqualified men, but that the public will no more employ such men than they would an incompetent or unqualified lawyer.

Why, even the Press—not a bad barometer, by the way—has been reflecting the movement, and, when reporting upon the opening of a new building, has even illustrated it occasionally, and actually in some instances mentioned the name of the obscure individual who has conceived it and carried the work of his brain into concrete form. Through what anxiety, what difficulties, what exacting labour, weary days and weary nights, obstacles innumerable, it matters not; but the public are actually aware that a brain has conceived the building, that it has not developed spontaneously under the hands of the builder, and so the name is given, as subsidiary to the builder perhaps, but still it is given.

I do not wish it to be thought that the aim and end of an architect's career is to be mentioned in the papers. I merely mention the matter as a sign of the increasing interest of the public in the creations of our brains.

We are perhaps too ready to dwell on our grievances against the public—sometimes real, sometimes imaginary—and into these I do not, as I said, propose to enter. But what I would ask is, Have the public any legitimate grievances against us? Personally I hear of them constantly. "Oh, you architects are so impracticable. You allow matters of convenience and common sense to become a secondary consideration in your over anxiety to give undue prominence to your beauty. You always insist on having what you want, not what we want. You know nothing of ventilation; you never consider the domestic working of a household; and you can never carry out your work for the price named, and your fees are most exorbitant; the next time I am fool enough to build I will get a builder to work on my own ideas;" and so on.

I dare say all of us have heard something of the kind, and beyond a momentary feeling of irritation have put it aside as something utterly irrational. Probably it is in most cases, but may there not be a sufficient substratum of truth to require consideration?

The many-sided character of the profession shows no tendency to diminish, but rather to increase, and the exigencies of a modern architect's practice call for a dozen experts merged into one. He never knows what the scope of that practice may demand; anything between the designing of an altar-cloth or chalice-veil to the settling of some intricate legal difficulty or the cure of a smoky chimney. He must be a sanitary specialist, a ventilation specialist and a constructional specialist; capable of supervising or arranging the installation of electric power or light, acetylene gas, heating apparatus or laundry machinery, lifts or cooking plant.

He must be *au courant* with the latest fad; must advise on all forms of decoration; be an artist in colour schemes; under-

stand the stoking of a kitchen range, or laying out a garden. He must have an all-embracing knowledge of the nature and properties of materials, and, if we are to judge by the advertisements for assistants in the professional journals, must be quantity surveyor as well. Small wonder if, in his anxiety to find scope for a little design and comply with the innumerable by-laws, building Acts and vexatious regulations, he occasionally puts drawing-room handles on a classroom door, passes Swedish timber as Russian or omits to specify a sti for the scullery copper. I am not quite sure that we are up to the full demands of the age, or that we are taking steps to keep ourselves fully abreast of it, or that not only ourselves, but those who will take up our pencils in the time to come, are efficiently equipped for the modern architect's career.

I do not think as yet we fully recognise the changing conditions under which we practise, and unless we do, soon foundation will continue to exist for the charges levied against us.

(To be concluded.)

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE annual report of the Council which was submitted at the meeting on Monday stated that the losses by death have been as follows:—Fellows: Edward Birchall, Francis Edwards, Charles France, Thomas Oliver, John Bond Pearce, Francis Cranmer Penrose, William Salway, Thomas Rogers Smith, Coutts Stone, William Wimble. Associates: Young Bolton, Albert Charles Breden, Richard Philip Day, Henry Dunkin Shepard, James Foster Wadmore. Retired Fellows: Samuel Stenton Markham, George Truefitt. Hon. Associate: Colonel John Davis. Hon. Corr. Members: Eugène Müntz, Emerich Steindl. By the death of Mr. Penrose the Institute has lost one of its most distinguished and venerated members. The first paper of the present session was read by him with unimpaired vigour and enthusiasm; now the Council with sorrow have to record his death. In Professor Roger Smith the Institute has lost a familiar friend, a loyal supporter, and a wise counsellor.

The present subscribing membership of the Institute consists of 627 fellows, 1,117 associates, 43 hon. associates—total of 1,787. During the official year since the last annual general meeting 30 fellows have been elected, 68 associates and 2 honorary associates. One hon. corr. member has been elected—Constant Moyaux (Paris). The number of candidates for the progressive examinations continues to increase.

The Council desire to point out the new category of "Exempted" under the "Intermediate" heading. An arrangement has been made with University College, Liverpool, whereby any probationer of the Institute who, having been through the full two years' course in architecture, has obtained the professor's final first-class certificate, and whose work done during his course at the college is found satisfactory by the Board of Examiners, may be exempted from the intermediate examination; the Institute being represented by a member of the Board of Examiners at the examination held for the purpose of granting certificates by the authorities of University College, Liverpool.

The statutory examinations, qualifying for candidature as district surveyor in London and for candidature as building surveyor under local authorities, were held in October. Certificates of competency to act as district surveyors in London have been granted to William George Perkins and Arthur Halcrow Verstage (A.). The Council, with the approval of the London County Council, have decided to hold these statutory examinations for the future only once a year, *i.e.* in October.

The Council sent an address of congratulation to His Majesty the King on the occasion of his Coronation. A scheme for decorating the front of the Institute for the Coronation on June 23, designed by Mr. G. F. Bodley, R.A., was being put into execution when the unhappy news of the King's illness was made public. The scheme was, however, carried out in order that Mr. Bodley's artistic design might be realised. A portion of the materials were utilised as decorations for the Coronation on August 9. On the occasion of the Coronation the King honoured the Institute and the profession at large by conferring a knighthood upon the retiring President, Sir William Emerson.

During the official year the Edinburgh Architectural Association has been admitted into alliance with the Royal Institute. The Council have much pleasure in recording the fact, as now there is no non-metropolitan architectural society of any importance which is not constitutionally associated with the Institute, and thus have been furthered the unity of organisation and the centralisation of architectural influence which have been the aims and policy of the Institute since 1889.

In the last annual report the Council stated that the committee of the Architectural Association and themselves had adopted the recommendation of a joint committee of the two bodies, that the Institute and the Association should combine

in a building scheme to house both bodies under one roof. The Architectural Association, however, having decided to take over the premises of the Royal Architectural Museum, consideration of this joint building scheme has been abandoned. The question of new premises for the Institute is one which the Council have always before them; but they feel that it is wiser to wait for a favourable opportunity of securing a site that meets with all the requirements of the Institute than to commit themselves to any undertaking to inaugurate a building scheme within a definite period. As a favourable opportunity may not occur in the immediate future, the Council have made certain improvements in the meeting-room which they hope tend to the comfort of members as well as to the convenience of the working of the Institute. The Council have decided to issue an album of photogravure reproductions of portraits of past Presidents, with spaces for future plates.

The practice committee, as will be seen from their report, have done excellent work this session for the Institute. To them is due the book on dilapidations published this year. The Council especially tender their thanks to the chairman, Mr. Douglass Mathews, and to the sub-committee, consisting of Messrs S. Flint Clarkson, Sydney Perks and C. H. Brodie, upon whose shoulders the labour of preparation chiefly fell. A form of contract, for use where quantities form a part of the contract, prepared by the practice committee, has been issued as an Institute publication.

With regard to the point raised on the discussion of the last annual report as to the possible effect of the decision given in the case of *Hobbs v Turner* upon the validity of the Institute form of contract, the Council have been advised by the Institute's solicitors that it is unnecessary to alter the present form in view of that decision.

The Ancient Lights Bill, approved by the Council of the Institute and the Council of the Surveyors' Institution, is now in the hands of Mr J. Fletcher Moulton, K.C., M.P., who has kindly undertaken to be responsible for its introduction into Parliament.

At the general meeting of March 2 the President made an announcement with regard to the question of registration, to the effect that the Council were still opposed to any such scheme of registration as that set forth in a previous Bill dealing with the same subject.

The operation of part of the proviso of by-law 9 lapses this year on May 18, viz.:—"Provided always that when the Council of the Institute receive a unanimous recommendation formally submitted by the Council of any allied society that a practising member of the profession is eligible and worthy of being elected as a fellow, the Council shall, during the five years from the date of approval of this provision by the Privy Council, have power to elect him if in their opinion his work be of sufficient merit." The second clause, "The Council shall also have the power to elect annually to the fellowship without ballot the President or President-elect of any of the allied societies who may be eligible or apply for admission," is not subject to the five years limit.

In the last annual report reference was made to the question of the appointment of assessors in competitions, and it was stated that a select committee of the Council were considering the various matters referred to them. The Council duly received the report of their committee, and were brought to the conclusion that the appointment of assessors was best left entirely in the hands of the President of the Institute, and that, even were it desirable, there was little chance of success in trying to establish the jury system in this country. A practical result of these deliberations was (1) a revised edition of the "Suggestions for the Conduct of Architectural Competitions," and (2) a confidential set of suggestions for the guidance of assessors. A copy of the "Suggestions for the Conduct of Architectural Competitions," with a circular letter, was sent during the summer to every town council, urban district council and rural district council in the United Kingdom.

The Council have empowered the competitions committee, so as to avoid delay, to take independent action where necessary in respect of any competition within the scope of the "Suggestions." To prevent possible misconception among members, the Council desire to state that in the great majority of cases the unsatisfactory points in conditions are of so obvious and simple a nature as to be adequately dealt with in the routine of the Secretary's office without troubling the committee to meet.

The Council also desire to refer to the Competition Reform Society, with whose aims they are quite in sympathy. The Society reports to the Secretary of the Institute any competition matter that may need investigation. The matter being thus placed in the Secretary's hands becomes an entirely Institute question, and in furnishing such material for Institute action—material which it would be often impossible to obtain officially—the Competition Reform Society is doing exceedingly useful work.

Mr. E. T. Hall and Mr. Thos. W. Cutler have been

appointed by the Council to represent the Institute at the annual congress of the Sanitary Institute to be held in Bradford in July.

Mr. Alfred Culshaw has been appointed by the Council to represent the Institute at the annual congress of the Royal Institute of Public Health to be held in Liverpool in July.

The President's first "At home" on January 12 was largely attended, nearly 400 members being present. The feature of the evening was a collection of drawings by the late Mr. J. F. Bentley. The second "At home" will be held on Monday, May 11, when a collection of drawings by the late W. Eden Nesfield will be exhibited.

In presenting the statement of income and expenditure and the balance-sheet for the year ending December 31, 1902, and the estimate of income and expenditure for the current year, the Council have again the pleasure to draw attention to the continued financial prosperity of the Institute. The balance of income over expenditure of 1,028*l.* 15*s.* falls somewhat short of the estimated balance, but the unforeseen expenditure for the Coronation decorations accounts for the difference.

Owing to the many additions made in recent years the property of the Institute was found by the Council to be considerably under-insured. The Council at Michaelmas therefore took out a fresh policy with the Westminster Fire Office to the total value of 22,700*l.*

DISCOVERIES IN CRETE.

A CORRESPONDENT of the *Times* in the Balkan Peninsula writes from Sofia, April 22:—The excavations begun towards the close of last season at Hagia Trias, near Phæstos, on the southern coast of Crete, by Professor Halbherr, have been resumed this spring under the direction of M. Hatzidakis, the ephor of antiquities at Candia. It will be remembered that at this spot Professor Halbherr made the very interesting discovery of another Mycenaean palace similar to those at Knossos and Phæstos. The palace is conjectured to have been the maritime residence of the kings of Phæstos, for the sea, which is now some two kilometres from the site, has probably receded considerably since Homeric times. The recent excavations have revealed a large structure containing the usual "megaron," or hall for men, another "megaron" for women, baths and "apothekoi," or storerooms. No cisterns or water-pipes have yet come to light. The principal movable objects discovered by Professor Halbherr last year have already been described in the *Times*. In addition to these a large number of clay seals have been found here, as in other Cretan dwellings of this period, and some dozen inscribed tablets exhibiting the mysterious linear or pictographic signs, which as yet have defied interpretation. Among the bronze objects recovered are several statuettes, votive effigies of oxen and goats, a spearhead and ten double axes of the usual Cretan type, together with two small votive double axes. Nineteen tablets of bronze, in the shape of rectangular plaques, have also been found; these apparently served as standard weights, or were employed in commercial transactions. A large amount of pottery has also been recovered. The excavations, which have been suspended during the Easter holidays, will shortly be resumed.

THE ROYAL ACADEMY.

IN responding for "The Royal Academy" at the banquet on Saturday, Sir E. J. Poynter, president, said:—After having spent the evening in making heavy demands on so many of our guests, beginning with His Royal Highness the Prince of Wales, all of whom I thank most unfeignedly for the cheerful readiness with which they took upon themselves the onerous task involved in making an after-dinner speech, it falls to my turn to speak in response to the toast which His Grace the Primate of England has proposed in such kind words, and to thank him in the name of my colleagues and myself, and also for the most interesting and valuable speech with which he accompanied the proposal. The inevitable changes have taken place in our body since last year, and we have to mourn the loss of two of our members, whose names will be absent from our summer exhibitions henceforth. Early in this year our respected member, Mr. Wells, succumbed to a failure of the heart, with which he had recently been threatened. Beginning his career with miniature painting, an art which, on the introduction of photography, declined to almost total extinction, he lived to see it revive and grow to a flourishing condition which, as our exhibition shows, gives promise of rivalling this exquisite art in its palmiest days. Meantime Mr. Wells took to oil-painting and gained a high position as a portrait-painter, numbering among his sitters many of the most distinguished men and women of the time. Of an extraordinarily clear and logical mind, he had mastered all the details which go to make the history and status of this institution with an exactness which rendered him a most valuable and at

the same time a most formidable debater at our councils and assemblies, and the Academy will miss his guiding counsel on many an occasion. Our other loss is an especially sad one, inasmuch as it is of a much younger man, Matthew Ridley Corbet, who had been but just elected an Associate of this Academy. In the selection of his works, which were to be seen with those of three other of our recently-deceased members at the last winter exhibition, he shone out as one of the most poetic of our landscape-painters, with a rare sense of style. With a highly artistic nature, not given to discouragement indeed, but peculiarly sensitive to sympathy from his brother artists, his election to this body gave him the highest gratification and encouragement, and he was, I believe, destined to become one of its chief ornaments. We have suffered a further loss in the death of one of our honorary members, the venerable Mr. Penrose, who was "antiquary" to the Academy. He was distinguished as an architect who in his early days had by his survey and exhaustive measurement of the Parthenon developed a theory which established the extreme subtlety of Greek methods of construction. Later in life he was for many years architect to St Paul's Cathedral. His death made a vacancy among our honorary members, and it is a great gratification to me to announce that Lord Dillon, the president of the Society of Antiquaries, has honoured us by consenting to become our "antiquary." Another honorary membership, that of "Professor of Ancient Literature," has been vacant since the lamented death of the late Bishop of London. I am sure that every one in this room will congratulate the Academy on the distinction which has been conferred on it by the consent of the Right Hon. John Morley to fill this vacant but, like the other, purely honorary post. These honorary memberships are an ancient institution of the Royal Academy, and were established, the first one—that of Secretary for Foreign Correspondence—in the year after the Academy was founded in 1768, and Mr. Baretti was appointed to it. Three others were founded in the succeeding year. Dr. Johnson was made Professor of Ancient Literature, Oliver Goldsmith, of Ancient History, and Richard Dalton was the Antiquary. In 1784 the Rev. William Peters, an original member of the Academy, was made chaplain, an office now held by His Grace the Archbishop of York. As may be supposed, these offices are now purely honorary in every sense of the word; they have been held in succession by some of the most distinguished men of their time. I have spoken of but one feature of our late winter exhibition. The invariable kindness shown to the Royal Academy by owners of valuable pictures enabled us to put before the public a display which was found, I believe, more than usually interesting, and of which, besides the works referred to above, the important features were a series of landscapes of the older English schools and a choice collection of works by Albert Cuyp. His Majesty the King, by lending to our exhibition the two magnificent pictures by Tintoretto from Hampton Court, gave students and the public a better opportunity of knowing these great works than could be acquired in the galleries of that noble palace, where their great size prevents their being placed to advantage. In thus enabling our students to study at their leisure the masterpieces of past times the owners of our great historical collections confer a real benefit by putting before them a high standard of example, for this rather than the opportunity for historical or comparative criticism is the true object of these exhibitions, and the Royal Academy is proportionately grateful to those who so liberally consent to part with these treasures. In connection with the winter exhibition I must not forget that most interesting room filled through the kindness of Mr. Arthur Evans with the records of his recent discoveries in the island of Crete, discoveries which take us back to the origin of Hellenic civilisation and justify the poetic myth of the Cretan Dædalus as the fountain-head from which the unsurpassable art of the Greeks originally sprang. We regret that Mr. Evans is not with us to-night, but he is absent in Crete, pursuing his remarkable discoveries with the help of public subscriptions, on which he is wholly dependent. An object of more surpassing interest to the cultivated public and more worthy of their support can hardly be conceived. The disastrous event which occurred in Venice last summer—the fall of their ancient landmark, that Campanile which we all knew so well—awakened the sympathy of the whole civilised world. The Venetians, I think, have shown their appreciation of the English feeling towards themselves by accepting a contribution towards its reconstruction which was initiated by this Academy, and subscribed to by many artists and lovers of the beautiful; a contribution which was intended as a tribute from us to that beautiful City of the Sea—mother of the most superbly decorative school of painting which ever existed, and in itself a gem of art and in the infinite beauty and variety of its aspects a never-ending source of attraction to the painters of all countries. I will keep you but a short time on another subject. I have already alluded to the forthcoming St. Louis Exhibition, and the active part which H.R.H. the Prince of Wales is taking in its promotion

in this country. Our cousins in the United States are most desirous of making the arts a leading feature of the exhibition, and are most ambitious of success. I know also as a fact that they have a most sympathetic desire that England should take a leading part in the art section, and they have allotted ample space to our country in the splendid building which they are erecting for the purpose. My hope is that our artists will make every effort to help them to realise this friendly intention, and, further, that our long-suffering patrons of art will once more listen to our appeal and not hesitate to spare some of their most valued treasures. It will be the business of the fine art committee to make our collection as representative of the best, and only the best, side of British art as possible, and it is only by the generous help of the owners of such pictures that we can hope for success. The fine art committee has been promised a liberal grant by the general committee, and I will conclude in the words of His Royal Highness by "expressing the hope that the representation of this country may be worthy of the British Empire." Your Royal Highnesses, my lords and gentlemen, I thank you for the kind attention you have given to my words.

CUMBERLAND AND WESTMORLAND ANTIQUARIAN SOCIETY.

A MEETING of the members of the Cumberland and Westmorland Antiquarian and Archaeological Society for the reading of papers was held in the Art Gallery at Tullie House, Carlisle. The president, the Bishop of Barrow, was present during the latter part of the meeting, and presided for a short time, but prior to his arrival the chair was occupied by Mr. T. Hesketh Hodgson, of Newby Grange, chairman of the Council of the Society.

The papers read included, says the *Carlisle Journal*, one on Cleator Church by Mr. J. H. Martindale; Askham Registers, by Miss Noble, Beckfoot; a paper by Mr. Collingwood with reference to recent diggings at Keswick in search of Derwent-water Castle, conducted under the superintendence of himself and Mr. T. H. Hodgson, but with unsuccessful results; the Danish Camp at Gosforth, by Dr. Parker; some notes on mound opening, with a description of one recently opened on Siziergh Fell, by Professor T. McKenny Hughes; and Lammerside Castle, by Mr. H. S. Cowper, F.S.A. Bishop Nicolson's Diaries, Part IV., was submitted by the Bishop of Barrow, but not read. He stated that they dealt with the great row which took place between Dean Atterbury and the Rev. Dr. Todd, vicar of Penrith, with regard to the Cathedral Statutes of Henry VIII, the validity of which Dr. Todd denied.

Memorials in Churches.

Canon Bower read a paper on "Portrait Medallions, Busts and Modern Effigies in the Churches of the Diocese." He said at the ninth annual congress of archaeological societies held in London in December, 1897, it was resolved to recommend to the committee appointed to prepare a catalogue of effigies to include in their lists effigies of all dates, all busts and portrait medallions. A paper on the old effigies had been printed in Vol. XV. of the Society's Transactions, and he was now attempting to catalogue all modern effigies, busts and portrait medallions. Canon Bower then explained the steps which he had taken to obtain the list, and said effigies were to be found at Bromfield, Cartmel, Carlisle Cathedral, Crotthwaite, Heversham, Lowther, Wetheral, Wreay, Ulverston and Lanercost. Busts at Allhallows, Bampton, Cartmel, Carlisle Cathedral; St. Cuthbert's, Carlisle; and Lowther. Medallions at Allonby, Dalston, Holme Cultram, the Cathedral, St. Cuthbert's, Carlisle; Grasmere, Lanercost, Keswick (St. John's), Wreay, and Whitehaven (Holy Trinity). He gave a description of all these effigies, busts and medallions, and intimated that he would be glad to hear of any others.

Local Worthies Buried in Westminster Abbey.

Mr. J. P. Hinds read a paper on "Local Worthies Buried in Westminster Abbey." He said it seemed to have been generally understood for some years that George Graham, the watchmaker and clockmaker, was the only Cumbrian who had been buried in Westminster Abbey, but search in a copy of Colonel Chester's edition of the registers of Westminster Abbey had yielded a certain number of names connected, nearly or remotely, with Cumberland. There were also names connected with Westmorland and Lancashire North of the Sands, which it had seemed worth while to include in the notes for his paper. The most appropriate name to begin with was that of the undoubted Cumbrian George Graham, the clockmaker, who was born at the Rigg, Kirklington, July 20, 1673, and who died in London November 16, 1751. His grave was almost exactly in the centre of the Abbey nave, next to that of David Livingstone. Another man who might safely be reckoned as a Cumbrian was Sir Joseph Williamson. He was

born at Bridekirk, of which place his father, Joseph Williamson, was vicar about the year 1625. After being amanuensis to a Mr. Tolson, who at a later date represented Cockermouth in Parliament, Williamson was admitted by Tolson's influence into Westminster School. Thence he went to Queen's College, Oxford, and obtained his B.A. degree in 1653 and his M.A. in 1657. Soon after the Restoration he became secretary to Sir Edward Nicholas, Secretary of State. A few years later he became Clerk to the Council, and in 1671 or 1672 he was knighted. He was one of the plenipotentiaries at the Treaty of Cologne in 1673, at the Treaty of Nimeguen in 1679, and again at Ryswick in 1696 or 1697. In 1674 he became principal Secretary of State, and continued in that office till February 1678-79. In 1677 he had been elected President of the Royal Society. He was in Parliament for some years, though not for a northern constituency. In 1679 he married Catherine Stuart, daughter of George, Lord D'Aubigny, and sister of Charles, third Duke of Richmond and sixth of Lennox. She was the widow of Henry O'Brien, Lord Ibrackan, and was Baroness Clifton in her own right. By this marriage he acquired considerable wealth in addition to what he previously possessed. There were several persons who held, or had held, official positions in the diocese whom it might be convenient to group. The first in order of date was Sir Christopher Perkins, Dean of Carlisle from 1596 until his death in 1622. James Usher, Archbishop of Armagh, held the bishopric of Carlisle *in commendam*, and was buried April 17, 1656. On May 22, 1731, was buried Dr. Samuel Bradford, Bishop of Rochester and Dean of Westminster. He had been Bishop of Carlisle from 1718 to 1723. The next name in the group was one much more widely known, that of Francis Atterbury, who had been Bishop of Rochester and Dean of Westminster, but who died in exile after having been deprived of his preferments. He had been Dean of Carlisle from 1704 to 1711. He was buried on May 12, 1732. The last of the group was Samuel Goodenough, Bishop of Carlisle, who was buried on August 18, 1827. Two of his grandchildren were also buried in the Abbey. Perhaps this was the best place to insert the name of Thomas Greateorex, organist of the abbey, who was buried on July 25, 1831. When a young man Greateorex was ordered to a northern climate for his health, and obtained the position of organist of Carlisle Cathedral, which he held from 1780 to 1784. The next series of names consisted of members of county families, but he did not pretend to assert that every individual mentioned was a resident in the district. There were several of the Howards. Two sons of Sir William Howard, of Naworth, brothers of Charles, first Earl of Carlisle, were buried, Colonel Thomas Howard on July 21, 1678, and Sir Philip Howard on April 15, 1686. Thomas was noted for his duels, and Philip was M.P. for Carlisle from 1661 to 1681. Mary, Duchess of Richmond, Colonel Thomas Howard's widow, was buried November 28, 1685. Three children of Charles, the first earl, were buried, viz. Charles, an infant, April 4, 1670; Katherine, March 23, 1681-82, and Frederick on October 11, 1684. Three children of Edward, second Earl of Carlisle, were also buried, viz. Anne on August 26, 1685; Mary on November 3, 1694; and William, who was M.P. for Carlisle in 1695 and 1698, on July 24, 1701. There were two members of the Lowther family. Mrs. Mary Lowther was buried on October 23, 1724. She was the daughter of Colonel John Lowther, of Lowther, and sister of John, first Viscount Lonsdale, and she married, as her second husband, her relative John Lowther, son of Robert, of London. Her son, Major-General Anthony Lowther, was buried on January 22, 1745-46. There were several members of the Tufton family, but only one Musgrave. Christopher Musgrave was buried on September 16, 1718. He was the youngest son of Sir Christopher Musgrave, of Edenhall, the fourth baronet. Christopher Musgrave was born in Carlisle and was M.P. for the city in the second Parliament of William III and the first of Anne. He succeeded his elder brother Philip as Clerk of the Council, and was for twenty-five years one of the officers of the ordnance. There were two of the name of Graham, one of Westmorland and one of Cumberland. Dorothy, the wife of Colonel James Graham, of Levens, and the daughter of William Howard, fourth son of Thomas, first Earl of Berkshire, was buried on December 17, 1701. Charles Graham was buried on June 17, 1685. He was the eldest son of Sir Richard Graham, third baronet of Esk and Netherby, who had been created in 1681 Baron Graham and Viscount Preston. There were three Aglionby names, but it was not much more than conjecture which allowed one to connect them with Cumberland. William Aglionby was buried on December 1, 1705. He had been envoy to Spain (twice), to Savoy and to Switzerland, in the reigns of William III. and of Anne. The only authority he could find for considering him to be of a Cumberland family was Cox's "Magna Britannia." His daughter Sybilla was buried on June 11, 1706, and a conjectural brother of his, Henry, had been buried on April 6, 1643. There was one very eminent name which belonged to one or other of the counties of Cumberland or Westmorland, that of Joseph

Addison. His father Lancelot, Dean of Lichfield, was born in Westmorland, and his ancestors had been settled at Meaburn Town Head, Maulds Meaburn, sixty years or more before his birth. But Mr. Jackson, in his "Papers and Pedigrees," and perhaps elsewhere, expressed the belief that the family was previously Cumbrian, belonging to Low Wood Nook, near Bothel. Joseph Addison was buried on June 26, 1719. His sister, Mrs. Dorothy Combes, was buried on March 10, 1749-50. The next four names might safely be claimed as those of persons belonging to the district. The Rev. Henry Wharton was buried on March 8, 1694-95; Ephraim Chambers, the author of the "Cyclopædia" and a fellow of the Royal Society, was buried on May 21, 1740. He was born at Kendal, where his father owned and occupied a small farm, and was educated at Kendal Grammar School. John Leake, M.D., was buried on August 16, 1792. He was born at Ainstable, the son of a clergyman, and studied medicine abroad. William Dobson was buried on March 13, 1813. He was the son of Christopher Dobson, of Edenhall, and was spoken of at the time of his death as a man of mechanical ingenuity and a classical scholar. There were four other names about which more or less doubt might be expressed. John Fox, Prebendary of Westminster, was buried on September 27, 1623. He was a son of John Fox, goldsmith, London, who founded the Grammar School at Dean, near Cockermouth. He had the authority of Archdeacon Sherwen for saying that, although there was no legal proof, Fox's Cumbrian descent might be looked upon as morally certain. Mrs. Mary Trohear was buried on July 21, 1775. Her will was proved by Raisley Calvert, of Greystoke, to whom and to his heirs, without naming any relationship, she bequeathed her personalty, except a legacy, and all her freehold estates in Bassenthwaite and Underskiddaw, or elsewhere in the county of Cumberland. Agnes Marton was buried on January 27, 1787, and her sister Jane on October 15, 1798. They were daughters of Oliver Marton, of Capernwray Hall, Lancashire, by his second wife Jane, daughter of Roger Wilson, of Casterton Hall, Westmorland. Since the publication of the book from which he had extracted the names, the Rev. John Troutbeck, D.D., one of the minor canons of the Abbey, had been buried there. He was born at Blencowe on November 12, 1832, and died on October 11, 1899. Dr. Troutbeck was for more than twenty years a member of this Society. The existing burial registers only began in January, 1606-7, and on consulting Dart's work he found two more names which might be added. Sir Thomas Wharton, second Baron Wharton, was buried in the chapel of St. Michael in 1572. He had formerly been M.P. for Cumberland, and in 1547 had been Sheriff. Margaret Clifford, described as "daughter to Henry, Earl of Cumberland," was buried in 1596 in St. Edmund's Chapel. A Cumberland man had a monument in the Abbey, but was not buried there. Dr. John Thomas, Dean of Westminster, and afterwards Bishop of Rochester. He was born in Carlisle in 1712, and his father, the Rev. John Thomas, afterwards became vicar of Brampton. Bishop Thomas's mother was the daughter of Richard Kelsick, of Whitehaven. He was educated at Carlisle Grammar School, died in 1793, and was buried at Bletchingley. The bust in the Abbey had a lifelike appearance, and the countenance bore a resemblance to the first Lord Brougham. In conclusion he said if his paper had done nothing else it might be held to have shown that George Graham was not the only Cumbrian buried in Westminster Abbey.

The Roman Vallum.

Mr. T. H. Hodgson submitted a report with reference to further explorations of the Roman vallum between Newtown and Headswood. The result was that they had traced the vallum to the cliff overhanging the valley of the Cambeck, but there seemed to be no prospect of being able to trace it across this valley. The steep banks had been evidently subject to much erosion, and the low-lying holms were subject to such frequent and heavy floods that all traces must have been long since washed away, and the site buried under the alluvium brought down by the river.

Find at Thirlmere.

The most interesting of the exhibits was a pair of bronze armlets recently found at Thirlmere, and shown by Mr. Marshall, Castlerigg Manor. The story of their discovery was told by Mr. Collingwood, who stated that they had been found at the foot of Rough Crag by Joseph and Solomon Crisedale, while getting material for repairing the roads. Mr. Marshall acquired the armlets from the road surveyor for the district, Mr. W. Hodgson, and they had been pronounced to be Late Celtic, which practically meant that they belonged to a period over a thousand years ago. At the place where the armlets were found, under an almost perpendicular crag, 400 feet high, there could never have been a burial-place, and the presumption was that the armlets must have been worn by some person who had fallen from the crag above and perished on the spot. In order to find an explanation he had examined the summit of the crag. High up on the face of Rough Crag a niche in the

rocks could be seen, and it could be reached by a curious path traversing the cliff from a ledge high up on the eastern side, and apparently artificial. The path led up to a platform, from which rude steps led to a grass slope, whence the summit of the crag could be reached. Any person falling from this platform would have alighted at the spot where the armlets were found, and as the armlets must have been worn by a lady they had all kinds of romantic possibilities presented which some ingenious novelist might make good use of.

Other exhibits were a stone celt from Walney and various prehistoric objects shown by Mr. H. Gaythorpe, F.S.A., Scot.; a stone implement from Moresby, shown by Dr. Parker; an ancient sword recently found on the shore near Workington, shown by the Rev. C. T. Phillips; a sculptured head from Ormside, belonging to the late Rev. J. Brunskill, and an earthenware urn found between Great Salkeld and Lazonby, shown by the Rev. A. G. Loftie.

The Bishop of Barrow, as president, was requested to forward to the family of the late Mr. J. A. Wheatley an expression of the Society's sympathy with them in their loss, Mr. Wheatley having been one of the original members of the Society. The Bishop was also asked to forward a similar expression of sympathy to the family of the late rector of Ormside, who was also one of the original members. It was intimated that the first summer excursion would be to the Alston district on June 25 and 26.

NORFOLK AND NORWICH ARCHÆOLOGICAL SOCIETY.

THE annual meeting of the Great Yarmouth committee of the Norfolk and Norwich Archæological Society was held on May 1 at the town hall, Great Yarmouth, under the chairmanship of Mr. R. H. Inglis Palgrave, F.R.S.

Mr. G. H. L. Blake, joint hon. secretary, having read the report of the Society's operations during 1902,

Mr. E. M. Beloe, jun., of King's Lynn, read an interesting paper upon "Norfolk Norman Fonts," illustrated by lantern slides.

Mr. F. R. B. Haward, architect (Messrs. Olley & Haward) also read a paper on "The ancient oak hammer-beam roof recently brought to light by the pulling-down of, and alterations to, the Duke's Head hotel, Hall Quay, Great Yarmouth." He said:—In making a survey of the premises known as the Duke's Head hotel prior to pulling-down, and upon examining the roof, which must have originally covered a large hall, attention was at once drawn to a series of octagonal columns and caps, which a further inspection proved to be the upper members of the principals, or supports, of an old hammer-beam roof. When pulling-down operations commenced, it was hoped that the roof would be sufficiently intact to be capable of restoration, but on clearing away the two storeys of bedrooms which had been built in the roof, it was found that this plan was impossible to carry out, as only one of the principals was at all complete. This principal owed its preservation to the fact that it had been used as the basis for a partition, and had been cased in on either side. The remaining four principals had been cut away right up to the tie-beam. Remains of a fine old moulded brick arch were discovered at the east end of the hall, also indications of a spiral stair, which might originally have led to a gallery. Before removing the roof a record of it was taken by photograph and measurements, and the interesting parts of the roof have been erected and thus preserved in the bottling store at Messrs. E. Lacon & Co.'s brewery, this firm being the owners of the property of the Duke's Head hotel. The roof appears to have covered an extensive hall, 40 feet long by 24 feet wide, 21 feet high in the walls, and 40 feet to apex or top of roof. The use that the hall was originally intended for is uncertain, though the general character is civic. The apparent argument in favour of its having been constructed for ecclesiastical use is that it stands east and west. The possibility is that the hall was either attached to a private house or has been a guildhall of some company, and this would be illustrative of the prosperity of the town at an early date. This last assumption is based on a paragraph in Palmer's "Perlustration of Great Yarmouth," which reads as follows:—"Adjoining and to the south of the Barge hotel is an Elizabethan house long occupied as an inn called the Duke's Head. It has a cut flint front with stone dressings. The rooms are wainscotted in panels divided by pilasters, with ornamental chimneypiece from the ceiling to the floor. The woodwork has been painted, but the rooms are otherwise in good preservation. In one of the rooms there is a chimneypiece elaborately carved. On the front of this house there is a stone tablet inserted, bearing the date 1609. The King's Head was, in the last century, the property of the Eldridge family. In the latter part of the last century the Ship Masters' Society held their meetings at the Duke's Head. From this inn, more than a century ago, the London stage-

coach, when first established, set out on its journey." The mouldings of the roof are of a very interesting nature, and clearly show the roof to be of late Decorated work. Those on the curved struts are very elaborate, and it is interesting to note the way these mouldings have been carried on and cut into the tie-beam. The posts, like those of the Tolhouse roofs, are octagonal, having moulded caps, but no bases. The stone corbels at the feet of the principals were too mutilated to discover their original shape, but traces of carving were visible. Other remains of window and door jambs in stone were found; these were moulded, and of the same period as the roof. The construction of the roof is curious, having a double principal rafter; thus the hammer-beam had a great weight placed upon it, being only supported by the curved strut, which rested upon a stone corbel, and although tension was preserved by a wall-piece spiked to the hammer-beam, yet this hammer-beam did not appear to enter into the wall far enough to take the foot of the principal rafter, as is usual. The second, or inner principal rafter was probably an after-thought to strengthen the roof and keep it from spreading; as the joints between it and the hammer-beam, the beam and top collar, are all halved and oak-pinned. The probable date of the roof is about 1450, although the mouldings are of an earlier character.

The reading of the foregoing paper was accompanied by the exhibition of two lantern-slides, which had been prepared by Mr. F. H. Sayers.

ROYAL INSTITUTE OF ARCHITECTS OF IRELAND.

THE conversazione of the Royal Institute of Architects of Ireland took place on the 30th ult in the buildings of the Royal Hibernian Academy of Arts, and was (says the *Irish Times*) a brilliant success. His Excellency the Lord Lieutenant honoured the Institute with his presence, and there was a numerous company of guests representing every social and professional class in Dublin. The idea of holding the conversazione in the Royal Hibernian Academy buildings was a singularly happy one, and the readiness with which the Governors of the Academy agreed to it is a proof of the cordial relations that subsist between the representatives of various arts in Ireland. The doors opened at 8.30 P.M., and soon the several halls of the Academy were gay with an assembly representing every interest, social and professional, in Dublin. The picture was an animated one, revealing great wealth and variety of colour, and the many handsome works hung in the galleries formed a framework which set off the picture to the best advantage. The connection between the painter and the architect is both historical and close, and the association of the two was as appropriate as it was happy. During the evening the guests enjoyed the many pictures to the full. The conversazione, therefore, served the double purpose of a pleasant social evening and an object lesson in the development of modern Irish art. It will no doubt do something to increase that growing interest in native work of which we have recently had so many indications equally in painting and in literature. His Excellency the Lord Lieutenant, who arrived shortly before 9 o'clock, was attended by Captain the Hon. Gerald Cadogan, A.D.C. He was received by the president of the Irish Institute of Architects, Mr. George C. Ashlin; Mr. W. Kaye Parry, hon. secretary; Mr. Charles A. Owen, hon. treasurer; and the following members of the Council:—Messrs. J. Rawson Carroll, Charles J. MacCarthy, Albert E. Murray, William M. Mitchell, J. Howard Pentland and George P. Sheridan. His Excellency went through the salons and examined the various paintings with much interest, spending a considerable time before a clever picture by the late Walter Osborne, R.H.A.—No. 70, "On the Sands—Evening." In common with all who were present, Earl Dudley expressed admiration for this work of one of the most eminent Irish artists who have exhibited in the rooms in Lower Abbey Street. A silent, but none the less impressive, tribute of regret for the departed painter was the crêpe rosette attached to the picture by his brother academicians. His Excellency remained for over an hour, and was cordially greeted both on his arrival and departure. During the evening the fine string band of the 21st (Empress of India's) Lancers played very tastefully the following selections under the direction of Mr. Edmund Hinton (bandmaster):—March, "Prodana Nevesta" (Smetana); serenade, "Italienne" (Czibulka); selection, "The Country Girl" (Monckton); intermezzo, "Sunset" (Matt); selection, "Dorothy" (Cellier); valse, "Mon Rêve" (Waldteufel).

The band selections were interspersed with harp solos and vocal contributions by several young ladies. Miss Florence Kerin, a charming performer on the Irish harp, played several solos, and Miss Madeleine Macken sang an old Irish folk song with effect. A vocal trio, "Go where glory waits thee," was tastefully rendered by Miss Kerin, Miss M. Macken and Miss

J. Macken, and Miss A. Magrath played the pianoforte with marked ability. Refreshments were served in one of the salons, the Trocadéro Company being entrusted with the catering.

HOLLINGBURY CAMP, BRIGHTON.

A LECTURE was delivered at the meeting of the Brighton and Hove Natural History and Philosophical Society last week by Mr. Herbert S. Toms, sub-curator of the Brighton Museum, on "Hollingbury Camp." Having, in a few introductory remarks, recalled to the minds of his hearers that Hollingbury Camp had lately become part and parcel of the municipal property of Brighton, Mr. Toms, says the *Sussex Daily News*, gave a brief description of the camp. It is situate about 400 yards east of the Ditchling Road, and about a mile N.N.E. of the spot where the Corporation tramway branches into the Drove. It consists of a comparatively shallow ditch with a rampart standing some 3 or 4 feet above the level of the surrounding hill crest, and enclosing an area of about six acres. Its shape roughly approximates a square with the corners rounded off and the sides bulging outwards. There are four entrances, and near the centre of the gorse-covered interior are the remains of pits and a small mound, closely resembling the burial-mounds of the Bronze Age. The period to which the camp belongs is still in the realm of conjecture, but all authorities who had grappled with the subject agreed in relegating the camp to an antiquity ranging from the Stone Age to the Roman occupation of Britain, and in regarding it, together with similar entrenchments capping the South Downs, viz. Cissbury, Chanctonbury and the Dyke Camp, as having been thrown up for the purposes of fortification. General Pitt-Rivers strongly maintained that these Sussex earthworks, including Hollingbury, are not of Roman but prehistoric origin. He observed that the whole hill-top, or the whole available portion of it, appeared to have been fortified by a line of ramparts drawn along the brow, in the position best suited for defence, and with but little regard to the amount of space enclosed, whereas the Roman practice was to regulate the outline and arrangement of the camps in accordance with the strength of the force intended to occupy them, and with a chief regard to the considerations of discipline and interior economy. Considerations of the supply of water and fuel were, in these camps, invariably sacrificed to the necessity the people appeared to have been under of occupying the strongest features of the country. He did not meet with a single example in Sussex of a fort having a supply of water within the enclosure, and the majority, like Cissbury, were at a considerable distance from a spring. Nor could fuel have been obtainable anywhere in the immediate vicinity. This, according to Vegetius, was a primary requisite in the selection of a Roman camp, and among camps of undoubted Roman construction no instance of a neglect of these principles had been found. The strength of the ramparts in the Sussex forts corresponded inversely to the natural strength of the position. In some places where a steep declivity presented itself, there was no rampart, implying that the defence of those places must have been confined to a stockade. The ditch, generally on the outside, was sometimes in the interior of the work. Outworks were thrown up upon commanding sites within 200 or 300 yards of the main work. The ramparts at the gateways were increased in height and were sometimes thrown back upon the causeway over the ditch. This was not a characteristic of a Roman gateway. The occupants of these works frequently dwelt in pits, which was not the Roman practice. These entrenchments were, moreover, in an especial manner associated with evidence of the manufacture of flint implements, found scattered in great abundance upon the surface, whereas the Romans did not use flint for their tools and weapons. Mr. Toms went on to refer to General Pitt-Rivers's subsequent excavations at Cissbury, Highdown, Mount Caburn and Seaford Cliff, indicating them to be of pre-Roman origin, after which he compared Hollingbury with the Bronze Age camps of Wilts and Dorset in order to disprove the belief that Hollingbury was of Roman origin. Like Hollingbury, these Wilts and Dorset camps were thought to be Roman because of their rectangular shape, but the excavations which he (Mr. Toms) had the honour of personally conducting at those camps conclusively proved them to be the work of the Bronze Age. Passing on, Mr. Toms, with the aid of several diagrams, proceeded to show that Hollingbury owed its present aspect to the action of the weather, which caused the sides of the trench and rampart to fall into the trench, the bottom of which would very soon be covered with chalk rubble, and the sides partly so. Then a finer mixture, washed and drifted into the trench, would accumulate, and over all turf would grow and mould accumulate by vegetable decay, the tendency of all this being ever in the direction of softening and reducing the outlines of the earthwork, and eventually almost their obliteration. Coming to the question of how to determine the age of a camp, he showed that this could be done by careful excavation and analysis of the deposit with which the trench had become

filled during the lapse of ages. Relics in the bottom of the trench or in the body of the rampart would obviously belong to the period of the first construction of the entrenchment, and the objects found would naturally be of more and more recent date in the later and latest deposits. The relics in the trench would, in fact, be found to be arranged, so to speak, in chronological order. Dealing next with the best method of excavation by means of which to determine the age of Hollingbury, he showed the importance of first preparing a carefully contoured plan, and then pointed out the right and wrong ways of excavating sections of the earthworks. The proper way was to take the turf off first and then work down layer by layer, removing and recording the depth and position of the pottery, &c., found in the upper layers before digging into the lower layers. If necessary the whole of the ditch and rampart should be explored in a similar manner, and after the earthworks had been explored the interior area of the camp should be similarly trenched for traces of occupation. As the evidence bearing upon Hollingbury's age still lay hidden beneath the soil, they could only conjecture the nature of the objects forming the clue, but from a comparison of the results of excavations made elsewhere they might safely say that this question would be mainly solved by the shards of broken pottery invariably found in great numbers in earthworks of this kind. Pottery alone, however, was not a safe criterion by which to determine the age of an earthwork. Other evidence, however slight, of the metallic or non-metallic periods was required to confirm the conclusion to which the pottery pointed. Finishing his paper with a consideration of the connection which it was supposed that the earthworks of the South Downs had with each other in the defence of the country, Mr. Toms inclined towards the views of General Pitt-Rivers, which were opposed to the hypothesis of older archaeologists that these entrenchments formed part of a triple series of forts. Confirmation of this view they imagined could be found in the position of the gateways of these forts; but General Pitt-Rivers thought there was nothing in the position of the gateways or works themselves incompatible with the hypothesis of their having been isolated works, erected by several distinct tribes, as a protection against the incursions of their neighbours. The earthworks of the South of England, General Pitt-Rivers believed, led us rather to infer the existence of frequent intestine wars, in which each section of the community fortified itself against its immediate neighbours, than of any extensive and combined system of national defence. Another weak point in the evidence of connection supposed to be afforded by the position of the gateways, which had hitherto been overlooked, was that sometimes a footpath or road led into, across and out of the camp, the points of entrance and exit being through a depression in the rampart which looked so uncommonly like one of the old gateways as to raise a question whether these entrances formed part of the original design of the earthwork. The only way to settle the difficulty was by excavation at these points, but as none of the Sussex forts had been thoroughly and systematically investigated, the question of the original number of entrances and their hypothetical bearing upon the relation of the camps must remain in abeyance until such had been done.

ST. BARTHOLOMEW'S HOSPITAL.

THE Lord Mayor's committee of inquiry into the affairs of St. Bartholomew's Hospital met on Tuesday at the Mansion House, the Lord Mayor presiding. The meeting was held for the purpose of receiving the report of the sub-committee on administration and finance, of which Sir Thomas Jackson was the chairman. After a lengthened consideration of the report the following resolution was unanimously agreed to:—"That this committee, having carefully considered the report of the sub-committee on the financial and administrative management of the hospital (which is summarised in the 'conclusions' given below), are of opinion that the governors have completely vindicated the reputation, character and administration of the hospital, and are fully justified in appealing to the public for funds to enable them to utilise the land acquired from Christ's Hospital, and to provide the new buildings urgently necessary to bring the hospital up to modern requirements in all respects." The conclusions at which the sub-committee had unanimously arrived were summarised in the report as follows:—"(1) That the hospital is properly and economically administered, and that an increase rather than a reduction of expenditure must be looked for; (2) that any prospective increase of rental will be more than absorbed by the deficit caused by the purchase of land from Christ's Hospital, and consequently (3) that no part of the outlay that will have to be incurred for new buildings can be provided out of the hospital's funds except by additional borrowing that would entail a further loss of income." It will be remembered that on March 2 last the Lord Mayor's committee passed a resolution to the effect that it was desirable in the public interest to retain St. Bartholomew's Hospital on its present site. The building sub-committee has yet to consider the plans for the new buildings.

ART GIFTS TO BIRMINGHAM.

A MEETING of the Birmingham City Council was held on Tuesday, when the Lord Mayor announced important gifts of pictures to the Corporation Art Gallery. The offers were made in the following letters:—

101 Harborne Road, Edgbaston.

My dear Lord Mayor,—On behalf of the Right Hon. W. Kenrick, Mr. C. A. Smith Ryland, Mr. John Feeney and Mr. Cregoe Colmore, as well as for myself, I wish to offer for presentation to the Corporation as a gift to the Art Gallery a collection of drawings and studies which will be acquired for that purpose. The collection comprises about 260 drawings, studies and sketches by Dante Gabriel Rossetti, 226 by Sir Edward Burne-Jones, a portrait in pastel by Ford Madox Brown, a portrait by Frederick Sandys and a water-colour drawing by G. P. Boyce. A large number of the drawings and studies require to be mounted and framed. This work is being proceeded with, but it will be some little time before the collection will be ready for exhibition. It is thought best, however, not to defer the offer which we have the pleasure to make.—I am, yours very truly,

J. R. HOLLIDAY.

Brookfield, Belbroughton, near Stourbridge.

My dear Lord Mayor,—I understand that several of my fellow-citizens are proposing to give to Birmingham a unique and invaluable collection of drawings by Rossetti and Burne-Jones. Although my own offer of certain pictures to Birmingham, which remained open for two or three years, has been finally withdrawn, I wish to use the present occasion for asking you to do me the honour of accepting, on behalf of the city, and without being subject to any conditions at all, the series of four pictures by Sir Edward Burne-Jones entitled "The Pygmalion Series." They are at present on loan to the Nottingham Art Gallery, but they can be brought to Birmingham, where they have already been exhibited, in the course of a very few months.—I am, my dear Lord Mayor, yours very faithfully,

J. T. MIDDLEMORE

The Council passed a cordial vote of thanks to the donors for their valuable gifts.

Mr. Whitworth Wallis, the keeper of the Art Gallery, states that the collection of gifts consists of 280 drawings, in pen and ink, pencil, charcoal and colour, by Dante Gabriel Rossetti. They form studies for many of his well-known pictures and designs for stained-glass windows, together with finished water-colour drawings, and it would be quite impossible, even at enormous cost, to form such a collection at the present day. There are in addition 226 studies in chalk, pencil and colour, by Sir Edward Burne-Jones. These are studies for many of his important works, together with studies of the nude, draperies, &c. Further drawings are by Frederick Sandys, Ford Madox Brown, and others who are followers of the pre-Raphaelite movement. The collection is absolutely unique, and its formation has been the work of years. To emphasise the great importance of this gift, Mr. J. T. Middlemore, M.P., presents Sir Edward Burne-Jones's famous series of "Pygmalion and the Image." Mr. Middlemore has already presented William Holman Hunt's masterpiece, "The Finding of the Saviour in the Temple," together with designs for stained-glass windows by Sir Edward Burne-Jones.

STRATFORD-ON-AVON LIBRARY.

AT the annual meeting of the Shakespeare's Birthplace Trustees at Stratford-on-Avon on Tuesday, the chairman of the executive committee, Mr. Edgar Flower, referred to the reported intention of the trustees to destroy Shakespearean relics. The trustees, he said, were charged with the intention to pull down ancient cottages adjoining Shakespeare's house to make room for a Carnegie library. Nothing could be further from the fact. It never for one moment entered the minds of the trustees that the library was to be on the site of the cottages given to the birthplace. They were given for the sole purpose of extending the garden and so isolating the precious building, and they were, as everyone could see, mere modern cottages of no historic or sentimental value. Mr. Carnegie's gift of a free library was quite a distinct matter, unconnected with the Birthplace Trustees, but one in which they naturally took a lively interest, as the site was adjacent. It had been persistently stated that a palatial modern structure was to be erected. All that was intended was the careful restoration of an ancient, but dilapidated and wretchedly modernised house, and the filling up of a vacant piece of ground adjoining the School of Art (a space caused by a fire) with a building suitable for its purpose and situation. He asked what would be the position of the trustees if they had not accepted Mr. Carnegie's generous gift and had let the cottages remain, if a fire were to break out in the adjacent buildings, especially after the warning they had had when a neighbouring shop was burned to the ground? On that occasion, if the wind had been in another direction, the birthplace would have been in imminent danger. Sir

Theodore Martin, one of the trustees, writing on the subject, said:—"The first duty of the trustees I hold to be to obtain as complete isolation as possible of the Shakespeare House, and I am delighted to hear that by the generosity of Mr. Carnegie it has been made possible to secure that isolation. If this cannot be effected without removing existing buildings, well, let them be removed. Where is the vandalism of pulling down such houses?" Nothing, however, would be done without careful and earnest consideration. Mr. Flower added that the trustees were as anxious as any one to preserve Shakespeare relics in the town.

It was reported that 27,802 persons had visited the birthplace during the past year. A number of valuable gifts were reported.

GENERAL.

Mr. E. J. Physick, sculptor, has been commissioned to execute the memorial of Dr. Parker for erection in the City Temple. The design will be executed in white marble, with a polished granite background.

The Academic Council of Venice have unanimously passed a vote of thanks to the British Royal Academy for its generous contribution towards the expense of rebuilding the Campanile of St. Mark.

Mr. Thomas M. Rooke was elected on Monday a full member of the Royal Society of Painters in Water-Colours.

Mr. T. R. Shervinton, M.Inst.C.E., aged seventy-six, late consulting engineer to the Japanese Government and Companion of the Imperial Japanese Orders, The Rising Sun and The Sacred Treasure, died on the 30th ult.

The Chantry Trustees have made four purchases from this year's Academy. The paintings are Mr. David Murray's "In the Country of Constable," 600 guineas, and Mr. Adrian Stokes's Alpine landscape, "Autumn in the Mountain," 300*l*. The sculpture is a female figure, "Remorse," by Mr. H. H. Armstead, R.A., 900*l*, and a group of children by Mr. Colton, A.R.A., called "The Springtide of Life." Last year the Chantry Trustees bought no pictures.

At the Annual General Meeting of the members of the Manchester Society of Architects on April 30, the following officers and members of council were elected:—*President*.—J. W. Beaumont, F.R.I.B.A. *Vice-Presidents*.—John Ely, F.R.I.B.A.; W. A. Royle, F.R.I.B.A. *Hon Secretary and Treasurer*.—Paul Ogden, F.R.I.B.A. *Assistant Hon. Secretary*.—George Brown. *Members of Council*.—*Fellows*—Alfred Darbyshire, F.R.I.B.A., F.S.A.; J. B. Gass, F.R.I.B.A.; Edward Hewitt, F.R.I.B.A.; Jesse Horsfall, F.R.I.B.A.; J. D. Mould, F.R.I.B.A.; A. J. Murgatroyd; Isaac Taylor; John H. Woodhouse, F.R.I.B.A.; P. S. Worthington, M.A., A.R.I.B.A. *Associates*.—A. E. Corbett, A.R.I.B.A.; L. H. Dutch, A.R.I.B.A.; A. H. Mills, A.R.I.B.A.

A Portrait by Beechey has been sold by auction in Paris for 33,000 francs. It formed part of the Lelong collection.

The Court of Common Council have given authority for the erection, at an estimated cost of about 7,000*l*., of a crematorium at the City of London cemetery at Little Ilford, in accordance with plans approved by the Home Secretary.

Mr. J. J. Burnet, A.R.S.A., has been appointed assessor for the selection of ten or twelve architects who are to prepare plans for the Manchester Infirmary. He has had practice in hospital planning, and among his buildings are the Western Infirmary extensions, the Pathological Institute, erected partly by the Western Infirmary and Glasgow University; the University buildings for the Professors of Practical Surgery and Anatomy; and the proposed extension of the Kilmarnock Infirmary. Mr. Burnet is also acting as arbiter, in conjunction with Dr. Donald Macintosh, M.V.O., for the Stobhill Hospital.

Professor Hans Bohrdt has been entrusted by the German Emperor with the execution of the wall-paintings in the officers' casino at Wilhelmshaven.

The Representatives of the University of California who are engaged in exploration in Egypt have adopted the plan of photographing each tomb when it is opened before any of the remains are dispersed.

A Memorial of Gustav Freytag, the novelist, who wrote "Debit and Credit," "The Lost Manuscript," "Pictures from the German Past" and other works, is to be erected in Wiesbaden, where he died in 1895. The statue is to be the work of Professor Schapers. It was intended to have a fountain as part of the memorial, but the municipality refused to grant a water-supply.

The Late Mr. Charles William Mitchell, of Jesmond Towers, Newcastle-on-Tyne, an artist in figure painting and portraits, and a director of Sir W. G. Armstrong, Whitworth & Co., of the Elswick Ordnance Works, has left property valued at 922,542*l*.

Mr. F. J. Dick, assistant engineer to the Commissioners of Public Works in Ireland, has been appointed engineer.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

COMPETITIONS OPEN.

THE Worshipful Company of Paviers offer premiums of 100 guineas, 30 guineas and 20 guineas respectively for essays as to the best means of preventing the inconvenience and loss at present occasioned by the disruption of carriage and footways in cities and boroughs arising from the operations of gas, water, electric-light and other companies. Conditions of the competition can be obtained on application to Mr. William P. Neal, C.C., clerk to the Company, Pinner's Hall, Old Broad Street, E.C.

IRELAND.—June 18.—The Trustees of the Limerick free library and museum invite designs from architects in independent practice for the proposed Carnegie library and museum to be built in the People's Park, Limerick. Prizes of 75*l.* and 5*l.* respectively will be awarded to the designs placed first and second in the competition. Mr. W. M. Nolan, town clerk, Town Hall, Limerick.

NEW BROMPTON (KENT).—May 30.—Designs and plans are invited in competition for public swimming and slipper baths to be erected in Windsor Road, New Brompton. Three premiums are offered, one of 20*l.* to the author of the design which is considered to be the first in order of merit, one of 10*l.* and one of 5*l.* respectively for the second and third. Mr. F. C.oucher, clerk, New Brompton, Kent.

STOCKTON-ON-TEES.—May 13.—Designs are invited for a girls' high school to be erected as a memorial of Her late Majesty Queen Victoria, at a cost not exceeding 5,000*l.* Premiums of 25*l.*, 15*l.* and 10*l.* respectively will be awarded. Mr. C. J. Archer, 77 High Street, Stockton-on-Tees.

WYKE.—May 21.—For the erection of seven houses at Carr House Gate, Wyke, Yorks. Mr. Raymond Berry, architect, Commercial Street, Halifax.

IMPROVED CONTINENTAL SERVICES.

It would be an advantage for the country if all railway companies were as eager to adopt improvements and to turn opportunities to account for the benefit of the public as the Great Eastern Railway Company. Their continental system is every year increasing in efficiency. By a new express service passengers travelling by the Harwich-Hook of Holland Royal British Mail route now arrive at Berlin much earlier than hitherto; a passenger leaving Liverpool Street station at 8.30 P.M. can reach Berlin at 6.43 next evening. Corridor carriages and restaurant cars run between the Hook of Holland and Berlin. By this new service communications with other North German towns, with Saxony, Austria, Russia and Sweden, have been much improved and accelerated. Passengers from the northern and midland counties of England leaving in the afternoon can travel direct to Harwich alongside the steamers, thus saving the trouble and expense of crossing London. A dining-car and through corridor carriages run between York and Harwich; also through carriages to and from Manchester and Liverpool, *via* Lincoln, Birmingham, London and North-Western and Midland Railways *via* Peterborough. On the return journey to England a corresponding saving of time will be effected by the new service

TENDERS.

WALL'S AUTOMATIC BURGLAR SASH-LOCKS.

JUST as the improvement in the defensive armour of our Navy must be in advance of the improvement in the destructive force of projectiles, so should the protective devices in the windows and doors of our houses be in advance of the resources of the enterprising burglar. It must, however, be confessed that in the past the burglar has had the advantage. But at last the position is about to be reversed, a result due to the skill of Mr. Osborne Wall, who has invented what he calls an automatic burglar-proof sash-lock.

The device consists of a spring-actuated bolt fastened upon the top of the upright of the lower sash. When the window is closed the bolt rests in a socket in the lower end of the upright of the top sash. To open the window the bolt is withdrawn by pulling a milled-edged handle at the end of the bolt, and both sashes can then be moved any distance. At the end of the bolt is a roller disc, which enables the bolt to run freely up and down the face of the upright of the top sash.

The window may be left open at night for ventilating purposes with perfect security. This is effected by boring a hole 4 or 5 inches distant from the first hole. Into this second hole the bolt is automatically shot and the window, though open, is locked. The top sash may then be lowered 4 or 5 inches, or both sashes may be moved, leaving the window open, say, 2 inches at the bottom and 3 inches at the top. An opening of 4 or 5 inches is suggested, as through such a narrow space it would be impossible for a burglar to introduce his body.

The position of the bolt being at the intersection of the sashes, it would be impossible for a burglar to reach it by thrusting his arm through the opening at the bottom or that at the top of the sash.

The window may with safety be left open less than 5 inches without being locked, for if a thief came along and tried to raise the sash it would lock automatically at the 5-inch hole, the bolt shooting into its place as soon as it came opposite to it. The housekeeper or housemaid may now with an easy

mind leave the windows open, so that a room may be aired while her duties call her upstairs or elsewhere, knowing that though the window be open, it is also locked. If a person outside his house notice a window open he has only to move the sash, and the window is locked automatically inside. He need not enter the room to lock it.

WILSON'S PATENT "MULTILUX" WINDOWS

The above illustrates an office where the light coming from the sky falls on to the floor and is absorbed, thus leaving the back part of the room dark. The illustration below shows the same room with WILSON'S PATENT MULTILUX WINDOW fixed. This refracts the rays of light and throws them horizontally, thus preventing them falling on to the floor, and lighting up the whole room.

WILSON & CO.

24 HARRISON STREET,
GRAY'S INN ROAD,
LONDON, E.C.

To prevent a burglar pulling back the bolt, even if he broke the glass pane to get at it, a small padlock put through a staple beneath the handle may be employed. This would be found an extra security in cases where a householder was away at the seaside or visiting friends.

To meet the burglar's device of inserting a knife between the sashes to turn the catch, or of inserting a steel saw between the sashes to cut the catch, methods employed against the ordinary sash lock, the inventor employs a loose collar revolving around the bolt at the point of intersection of the sashes. This collar prevents the saw "biting." The more the burglar saws the more the collar revolves without effect. Another advantage is obtained from the pressure of the bolt against the upper sash—it prevents the rattling of the sashes when they are loose. This sash-lock is simple in construction and effective in action. In appearance it is neat and ornamental. A model window to which the lock is affixed is on view at Wall's Fountain Pen Depot, 56 Gracechurch Street, London, E.C.

A NORTHERN INDUSTRY.

WE recently had the opportunity of visiting the showrooms and works of Messrs. Dinning & Cooke, for so many years established at Percy Ironworks, Newcastle-on-Tyne, and were particularly interested in the new showrooms devoted to stable and harness-room fittings, where are displayed all the various devices and arrangements for the safety, health and comfort of the horse that the long experience in this branch of their business has enabled them to perfect. In the largest of the showrooms and for the better display of these they have constructed a range of five full-size stalls and three loose boxes, each one a model of construction and perfect in fittings, without unnecessary ornamental designs, and yet each exhibiting different patterns and arrangements, so that a wide selection is offered to suit individual tastes and requirements, from a plain stall division, consisting of plain heel-post and ramp, cleaded with wood, to the more elaborate, fitted with brass-mounted heel-post and ventilating panel with blind plate, sliding barrier, &c. The sliding barrier is drawn out at the heel-post and the ball end dropped into a socket fixed in the wall of the stable, converting the stall into a loose-box, and also confining the horse should it break loose during the night.

One stall is fitted with extended heel-posts to carry another

floor or roof, which can be seen in the illustration, taken from a photograph of part of the showroom.

Cast-iron is used as the best material for stall-post, loose box, pillar ramp and stall rails, mangers, channel gutter, &c.; while wrought-iron is utilised for ventilating panels, hayricks, &c., the mangers being coated with vitreous enamel, insuring cleanliness.

Care has been taken that the importance of good ventilation and drainage should receive proper attention. Proper drainage is effected by an enamelled iron channel, which is graduated, allowing the stable floor to be laid level from head to foot of stalls, and is fitted with loose cover in short lengths, by which the channel can readily be cleaned and obstructions removed, and ventilation secured by various forms of ventilating windows, admitting air without draughts, fixed at the stall-heads.

Concrete flooring is principally shown and the walls covered with enamelled tiles. Both being non-absorbent and easily cleansed a sanitary stable is insured.

The stalls are fitted with a noiseless tying apparatus

attached beneath the manger top. The strap works over an anti-friction roller, and the weight is enclosed in cast-iron shield which contains a buffer, and in the loose boxes a brass traveller runs along a steel rail which gives the horse plenty of freedom with security. The doors of the loose boxes are fixed at an angle, centre hung and open both in and out, and are fitted with a special deadweight catch, a security against accidental opening.

A part of the showrooms is reserved for harness fittings, a heavy harness bracket designed to hold a complete set of cart harness calling for special attention, in addition to ventilating malleable iron brackets for riding and driving harness.

THE INTERNATIONAL FIRE EXHIBITION AT
EARL'S COURT.

H.R.H. THE DUKE OF CAMBRIDGE, K.G., opened on Wednesday the attractive Exhibition which this year occupies London's pleasure at Earl's Court.

In the various halls and galleries are shown a comprehensive collection of fire-resisting building materials, fire-alarms, and numerous appliances for combating and extinguishing fires, while in the Empress Theatre and the Loan Collection will be practically displayed or exhibited the primitive engines and other fire paraphernalia of our ancestors.

The Exhibition has been organised under the auspices of the British Fire Prevention Committee, and a powerful and influential honorary advisory Council has been formed with, for president, H.R.H. the Duke of Cambridge, K.G., and vice-presidents, the Right Hon. the Lord Mayor of London, Sir Marcus Samuel, the Duke of Marlborough, K.G., president National Fire Brigades' Union, and Mr. Edwin O. Sachs, chairman British Fire Prevention Committee. In addition there are a score of sub-committees, including the best technical brains of the United Kingdom, of the leading European nations, and of the United States. On July 6 an International Fire Prevention Congress will be held at Earl's Court, and extend over several days.

In the German Court, which occupies the whole of the

Ducal Hall, will be found the highly interesting historic and artistic collection from Germany, for the loan of which the Government of that country were gracious enough to give special permission. In the galleries surrounding the Imperial Court other foreign nations are fittingly represented, and here also will be found the British Loan Exhibits on entering by the "Monolith of Fame."

In the Empress Theatre, twice daily, will be given the thrilling and practical sensation of "Fighting the Flames" on a most elaborate scale. Stately buildings, with imposing fronts, represent large business thoroughfares through which passers-by and traffic hurry on duty bent. Fire breaks out, and from beginning to end all the scenes of a great conflagration are vividly enacted, without exaggeration and without omitting a detail. The firemen are practical and experienced fire-fighters, selected from leading brigades, and the appliances and equipment are of the most approved pattern.

In the northern end of Elysia, the Garden of Variety, is located a village of the Upper Nile, which has been imported to Earl's Court by permission of the Egyptian Government. There the "fellaheen" can be seen amid the typical local colour and surroundings of the sacred river tilling the soil with crude implements, irrigating the arid pastures laboriously, or engaged in the pastimes of his people. In the covered bazaar the various Egyptian handicrafts are in full swing, jugglers and acrobats show their skill, and the youths contest with their "nabbouts," i.e. double-handed sticks. Buffalo, cattle, camels, gazelles, Pharaoh poultry, Arab dogs, &c., add a verisimilitude to this faithful reproduction of the East.

Behind a representation of Old Temple Bar a reproduction of the Great Fire of London, 1666, at midnight may be seen. There are numerous other side-shows of more than ordinary interest, and the illusory scenery which forms the boundary of the grounds represents with remarkable effectiveness Warwick Castle on the Avon and Bothwell Castle. The exhibition, which is both interesting and instructive, should, given fine weather, be a great success.

An interesting feature of the Exhibition is the fully-equipped station of the London Salvage Corps, which has been erected on the grounds. A full staff of men, horses, &c., will be kept there, and will "turn out" to any fires occurring in the district. Lieutenant-Colonel Fox selected the stable fittings, &c., for the station from the St. Pancras Iron Work Company, Ltd., and the excellent appearance of the stables generally reflects great credit upon this firm.

CLOISSONNÉ MARBLE MOSAIC.

ARROLITHIC, LTD, formerly Mainzer & Co, Ltd., 18 Berners Street, W., have forwarded us a sheet of mosaic patterns illustrating (Mr. Mainzer's patent) the application of the cloissonné principle to mosaic pavements, which has the two-fold object of limiting the cracking of floors of wide dimensions by subdividing large surfaces into sections by the insertion of metal strips, which can be so arranged as to form at the same time an ornamental pattern, as shown on the following sketch

FIG. 1.

(fig. 1), which has been actually carried out for the aisle pavement laid in two colours in St. Edward's Church, Selly Oak; and for outlining the ornament in the mosaic, which gives it the appearance of cloissonné, producing a pleasing artistic effect. The thickness of the brass can be varied as required from 1-16-inch to $\frac{1}{8}$ -inch, and is $\frac{1}{2}$ -inch in depths. Border patterns can be treated in the same manner, as illustrated in fig. 2.

We wish to call particular attention to pattern No. 203, which attains both objects at the same time, viz. forming a corner ornament, with an elongation forming a mitre which

counteracts the expansion and contraction of the cement. Various applications of the process are on view at the offices of

FIG. 2.

the company, 18 Berners Street, Oxford Street, W., and are worth inspection by all architects and artists.

THE Local Government Board have sanctioned the scheme submitted by the Oakengates, Warwick, Urban Council for the borrowing of 18,500*l.* for purposes of the sewerage and sewage disposal, including the cost of the land for the outfall works at Oakengates. The scheme first proposed involved an expenditure of about 40,000*l.*

TRADE NOTES.

MR. W. ALDERSON, of London, a native of Reeth, North Yorks, set a new public striking clock in motion on Wednesday at the Reeth Congregational church. There is a large illuminated dial facing the market square. The clock was made by Messrs. Wm Potts & Sons, clock manufacturers, Leeds and Newcastle, who erected one at Fridaythorpe church, near Driffield, last week.

CAEN WOOD TOWERS, the historic mansion at Highgate, now the property of Mr. C. F. Cory-Wright, J.P., has been entirely redecorated and the floors covered with Mainzer's improved parquet, and the conservatory has been paved with Arrolithic mosaic of special design. The alterations have been carried out under the supervision of Mr. G. E. Nield, A.R.I.B.A., The Outer Temple, 222 Strand, W.C.

THE London County Council have erected extensive car sheds in Clapham Park Road for the accommodation of the electric cars, which will commence running on the 15th inst. after the opening trip by H.R.H. the Prince of Wales. They have been fitted throughout with Kinnear's steel rolling shutters by the "B. & S." Folding Gate Co. of Great Tower Street, Upper St. Martin's Lane, W.C., who are also supplying them for the car sheds at Bexley Heath. Other orders recently received include the Lancashire and Yorkshire Railway Co. for Bankfield Warehouses, Liverpool, and at Fulham two large ones are being fixed at the Imperial Saw Mills.

MESSRS. EASTON & CO., LTD., successors to Easton, Anderson & Goolden, Ltd, engineers, Broad Sanctuary Chambers, Westminster, announce that they have appointed Messrs. J. Lomax, Kendal & Co., of St. James's Square, Manchester, as agents for their electric and hydraulic lifts for the cities of Manchester, Stockport and Salford, and that all communications relating to lifts should be addressed to them. They point out that this agency is entirely separate from the superheater and general agency for Lancashire and the adjoining counties, which is conducted by Mr. G. D. Seaton from No. 49 Deansgate, Manchester.

THE annual meeting of the shareholders of the London and Lancashire Fire Insurance Company was held on the 30th ult. at the Law Association Rooms, Liverpool, when the chairman of the company, Mr. Edward H. Harrison, was in the pleasant position of being able to speak in very glowing terms not only

of the business done in the past year, but also of the great strengthening of the company's financial position which has taken place. As he explained:—"Having passed 100,000% additional to the reserve fund, the company is now within measurable distance of that fund becoming the round million sterling which is a company's natural ambition." The dividend has risen from 12 per cent. to no less than 28 per cent., while the sum of 50,000% has been set aside to establish a pension fund.

ELECTRIC NOTE.

THE Ramsgate Corporation, whose electric-lighting order expires very shortly, have before them the offers of two companies to take the powers over, and they have just decided to enlist the services of an electrical engineer, upon whose advice they will act. The position is a somewhat difficult one, inasmuch as the local gas undertaking is municipally owned, and from its profits handsome sums have been paid in relief of the district rates.

BUILDING AND BUILDERS.

THE foundation-stone of a Congregational Sunday school was laid at Garstang on the 6th inst. The school is to be built on a site adjoining the present chapel. The cost, exclusive of furnishing, will be a little over 1,000%.

ON the 4th inst. Alderman Alliston (chairman of the City police committee) laid the foundation-stone of the new police-station at Moor Lane. The old station at Moorgate only accommodated thirty-seven constables, whilst the new building will be large enough for sixty-seven. It will include a reading-room and a billiard-room, and the whole erection will cost 20,000%.

AT a meeting of the Stepney Borough Council in camera negotiations were set on foot for the acquisition of an extensive site on the Thames at Limehouse. The site is estimated to cover 60,000 square feet, and can be adapted both for purposes of storage and the erection of tenements to accommodate between 600 and 700 of the working classes. It is calculated that the site will cost between 20,000% and 30,000%.

THE gas and water committee of the Barrow Corporation will recommend at the next meeting of the Council that

Liberal Commission allowed to BUILDERS AND
ARCHITECTS for introduction of Business

Total Security, £3,700,000.

Messrs. Hannay & Clarke's tender, amounting to 42,303*l.*, be accepted for the supplying of cast-iron pipes in connection with the Duddon water scheme, and that Messrs. John Aird & Son's contract for the laying of the pipe track, amounting to 26,471*l.*, be also accepted. The track will be about 16 miles in length. The heaviest work in connection with the scheme will be the construction of a masonry dam to raise the level of Seathwaite Tarn, the source of the river Duddon.

ARRANGEMENTS have been made for a special visit of the delegates and subscribers of the Hospital Saturday Fund to Llandudno to-morrow (Saturday) on the occasion of the opening of Marle Hall by the Lord Mayor (Alderman Hallowell Rogers), who will be accompanied by the Lady Mayoress. A short time since the Hospital Saturday committee acquired the freehold of Marle Hall at a cost of 6,000*l.*, and they have expended some 7,000*l.* in what is practically the rebuilding of the structure for the purpose of a permanent convalescent home for women. The building will now accommodate eighty-five patients, as compared with twenty-seven hitherto accommodated there, and a further twenty-seven at a neighbouring house. The party is expected to number about 400, and for their accommodation a special train will leave New Street station at 7.30 A.M., calling at Monument Road and Smethwick.

VARIETIES.

A NEW Independent Methodist church at High Park, Southport, was opened on the 2nd inst. The total cost of the building and land has been 1,614*l.*

CHRIST CHURCH schools, Heaton, Norris, have been extended, and the new portion, which has cost some 2,000*l.*, is now open.

THE new Baptist Church House, which forms so conspicuous and pleasing a feature of the newly-widened Southampton Row, has been opened. The building has been erected to the designs of Mr. A. Keen.

THE Bishop of Derby dedicated a clock tower and peal of five bells presented to St. Andrew's, Swanwick, by the ex-high sheriff of Derbyshire (Mr. Fitzherbert Wright) in commemoration of the Coronation.

A NEW school, erected in connection with the Baptist chapel, Mills Hill, Chadderton, near Oldham, has recently been opened. The school has cost about 2,228*l.*, and consists of a

central hall with two classrooms at either side. It will accommodate about 500 pupils.

THE competition for the Wavertree Baptist church and schools, Liverpool, has been decided in favour of designs submitted under motto "New Era," the authors being Messrs. G. & R. P. Baines, 5 Clement's Inn, Strand, London, W.C. The assessor was Mr. Henry Hartley.

COMPENSATION to the extent of 7,770*l.* has been awarded in the London Sheriffs' Court to Mr. J. Tyler, an ironmonger, for the compulsory acquirement of his premises, 15, 35, 41 and 43A Wandsworth Road, which are needed by the London County Council in connection with the scheme for widening Wandsworth Road.

ABERGWILI PALACE, Carmarthen, the country seat of the Right Rev. John Owen, Lord Bishop of St. Davids, has been practically destroyed by fire. The chapel was irreparably lost, with its handsome stained windows, but some of the paintings were saved. His lordship's library was also saved. Most of the furniture was thrown into the garden.

THE Duke of Devonshire laid, on the 25th ult., the foundation-stone of the new technical institute and free library at Eastbourne. The site has been presented by the Duke in commemoration of his year of office as mayor in 1897-98. The contract price is 34,700*l.* The architect is Mr. Philip A. Robson.

THE section of the District Railway between South Harrow and Ealing is expected to be ready for electrical working in the course of a few weeks. The electric traction of the main line depends upon the completion of the power-house at Chelsea, and that of the Metropolitan Railway on the station at Neasden.

ENTRIES for the London Cart Horse Parade in Regent's Park on Whit Monday close on Monday, May 11, but the lists will be kept open for seven days longer on payment of the late fee. About 400*l.* will be awarded in prizes to deserving drivers. Full particulars and forms can be obtained of the Secretary at the offices, 12 Hanover Square, W.

THE St. Pancras Borough Council have informed the London County Council that, with a view to linking up the north and south tramways, and subject to any street widenings that might be necessary, St. Pancras is prepared to give its consent to a tramway along Tottenham Court Road, contingent upon the County Council obtaining Westminster's consent to continue the same class of tramway to the Embankment.

AN open competitive examination for not fewer than twenty-four situations as assistant examiner in the Patent Office will be held by the Civil Service Commissioners in July next. The examination will commence on the 21st of the month, and forms of application for admission to it will probably be ready for issue in the course of a few days. They will be obtainable on request addressed by letter to the Secretary, Civil Service Commission, Burlington Gardens, London, W.

THE members of the East of Scotland Engineering Association visited on the 2nd inst. the new dock works in progress at Grangemouth. The company were conducted over the works by the engineers and the contractors, Messrs. Charles Brand & Sons, engineers, who explained the various features of interest, including the suction dredging, sinking of the monoliths at the entrance, caisson gate, &c. The members were then entertained to tea, and an inspection of the work at the junction of the old and new docks concluded a most instructive and enjoyable excursion.

THE Bridge House Estates Committee of the City Corporation, under whose direction the Tower Bridge was built, have under consideration a proposal for improving Southwark Bridge. Owing to the steep incline on the City side, the bridge is not much used by heavy vehicles, and many propositions have been made in the past for reducing the gradient. One of the schemes considered by the Corporation was the building of a viaduct, which it was intended should span Upper Thames Street, but the idea was abandoned. The new proposal will, it is believed, practically involve the rebuilding of Southwark Bridge, which in its present condition leaves much to be desired.

NEW CATALOGUES.

MESSRS. JOSEPH CLIFF & SONS, Baltic Wharf, Waterloo Bridge, have just issued the new sink section (forming the second section) of their new complete catalogue which is in course of preparation. It is handsomely produced, printed in tints, and contains numerous illustrations of the various kinds of sinks made by the firm. The variety of forms is very great, all purposes being provided for, and dimensions and all necessary information are fully given. It is noticeable that in all designs shown, while cleanliness and excellent sanitary conditions are the prime desiderata aimed at, attractiveness of appearance is by no means disregarded.

IN the compendious catalogue just issued by Messrs. Beck & Co., Ltd., hydraulic, sanitary and general engineers, of Great Suffolk Street, S.E., illustrated descriptions are given of the machinery manufactured by the firm, which embraces water meters for the measurement of hot and cold water, sluice valves, reservoir fittings, water cranes, standposts, hydrants, surface boxes, cast-iron tanks, pipes and specials, fire extinguishing apparatus, stop and bib taps, ball valves, sewerage ironwork and fittings, gas valves, pumps and pumping machinery, cast-iron flanged pump pipes and fittings, steam and boiler fittings, valves, patent visible-drop and other lubricators, hot-water valves and boilers, engineers' tools, shafting, &c.

METROPOLITAN ASYLUMS.

THE hospitals committee of the Metropolitan Asylums Board have presented a report, from the point of view of risk from fire, on the subject of the use of temporary buildings for hospital purposes. It has already been decided by the Board to demolish two out of eight wooden huts at the Northern Hospital, and the question of replacing those eight huts by permanent buildings is before the Board. The demolition of a temporary hut at the South-Western Hospital and of one of the temporary huts at the South-Eastern Hospital is proceeding, and the question of reconstructing in permanent materials a part of this latter hospital is under consideration. At the North-Eastern Hospital the Board have approved of steps being taken for pulling-down the wood structures there and for completing the reconstruction of the hospital in permanent materials, and the whole matter of the preparation of a scheme is before the works committee at the present time. Alluding to the recent fatal fire at Colney Hatch Asylum the committee said it seemed to them, speaking generally, that, as between a lunatic asylum and an infectious hospital, the circumstances of fire risk in wooden buildings were more favourable to the hospital. They did not advise, at the present at all events, any further demolition of existing temporary structures, but they were of opinion that the accommodation which the temporary structures afford at the Fountain and North-Western Hospital should be looked upon in the light of a second line of defence, and be used only for purposes of emergency and when the number of cases rose considerably. Following this principle they proposed to empty the Fountain Hospital and the temporary buildings at the North-Western Hospital of

patients as circumstances of infectious disease made it practicable, and to utilise permanent accommodation to the fullest possible extent. The empty buildings would be kept aired, clean and ready for use at short notice, so as to provide for quick expansion of accommodation in time of increased needs. The principles proposed by the committee as to the utilisation of temporary buildings for fever patients and as to the emptying of the Fountain Hospital and the temporary wards at the North-Western Hospital were approved.

STRAND IMPROVEMENTS.

A LETTER has appeared in the *Times* from Mr. Hamo Thornycroft, R.A., in which he says the work of widening the Strand between the two well-known island churches—St. Mary's and St. Clement Danes—is now sufficiently advanced to satisfy any observer of the vast gain that has been effected in the main thoroughfare to the Courts of Justice. But it has also revealed very clearly the one weak point in the scheme of improvements, viz the narrowing of the street at its eastern end, where it joins Aldwych. The reason for this narrowing at this point can only have been for the sake of economy; but now that one can stand on the ground and see how the plan will work out it is very clear that it will be a fatal mistake and one that will wreck the symmetry of the whole effect.

The way out of the difficulty is, however, comparatively easy. It is simply to make the Strand the same width from the eastern end of St. Mary's to the junction with Aldwych, a distance of 130 yards. This would give three permanent—and, I venture to say, very important—advantages; first, in bringing the beautiful and symmetric church of St. Mary's into alignment with the centre of the thoroughfare; secondly, in making the direction of the thoroughfare aim at the front of the church of St. Clement's, and not at one corner of it, as it most awkwardly does at present; and thirdly, it would secure for the future a good view of the Courts of Justice to all coming along the Strand from the west.

The first two of these results are very desirable, for the new arrangement, as at present indicated by the newly-laid pavement, seems only to have accentuated the singularly awkward angle at which the two churches are set in relation to the line of the street; and I am confident that unless the line on the north side of the street is thrown back, as suggested, the general effect of the "improvements" at this point will be

a constant eyesore, not a crookedness which is picturesque, but an unfortunate crookedness, yet one which happily there is still time to avoid.

As I have said, the only valid objection that can be made to the proposal is on the score of economy, as it would curtail the frontage some 60 feet in the new street Aldwych; but I have no doubt whatever that the gain in the fine, generous open space and a symmetric effect in the great thoroughfare of the Strand would more than compensate for the outlay. The change could now easily be made; later, when buildings have been erected, it would be a costly matter.

NATIONAL REGISTRATION OF PLUMBERS.

THE annual meeting of the members of the Edinburgh and East of Scotland District Council of the National Registration of Plumbers was held in Dowell's Rooms, George Street, Edinburgh, on the 30th ult., Councillor Purves presiding. Mr. James Marchbank, S.S.C., submitted the annual report of the Executive Council, who reported satisfactory progress with the work carried on in connection with the registration movement. The Registration Bill advanced to such a stage that there was a reasonable prospect of the Bill becoming law before the session closed. Unfortunately, owing to the pressure of other business, the Government were not successful in getting the Bill pushed through. There was, however, every indication in favour of it becoming law at an early date. On November 6 last Mr. Long, secretary to the Local Government Board, received a deputation in favour of the Bill, and the Council felt confident that the hearty support given by Mr. Long to the principle of the Bill would be of invaluable service. This report and the report by the treasurer, Mr. Rutherford, were adopted. Office-bearers were elected as follows:—Hon. president, Sir James Russell; president, Councillor Lang Todd; vice-president, Councillor Purves; secretary and registrar, Mr. Marchbank, S.S.C.; treasurer, Mr. J. Rutherford, jun.; auditor, Mr. D. E. Wallace, C.A. The Chairman, in the course of a few remarks, referred to the success which had attended the registration movement. Public opinion had reached the House of Commons, and, while there might be opposition in England, he was certain that they would be able to prove conclusively that this registration movement was no selfish one of theirs. It was a movement for the public benefit and for the preservation of health.

AUSTIN'S

NEW IMPERIAL PATENT

SUPERFINE FLAX LINE

The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded), the Manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years, and the Proprietors continue to give their personal attention to the manufacture of these goods.

They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.

They can be obtained of all Rope-makers, Ironmongers, Merchants, Factors and Wholesale Houses in town and Country.

N.B.—Please note that all our goods, as advertised above, are labelled either inside or outside with our Trade Mark—"The Anchor."

STOCK EXCHANGE, JOHANNESBURG.

The foundation-stone has been laid by Lord Milner of the new Stock Exchange, which will occupy a site 180 feet square, bounded by Fox, Sauer, Main and Holland Streets, on a portion of what was formerly known as Marshall Square. The building will be four storeys high, the basement ceiling being about six feet above the pavement level. The total floor-spaces will measure about $3\frac{1}{4}$ acres, and will contain 3,000,000 bricks, 20,000 cubic feet of stone, 500 doors, 600 windows, 60,000 feet of 9-inch by 3-inch joists, and 16,000 square feet of glass.

The main entrance in Holland Street will be wide and spacious, and lead into the entrance-hall 35 feet by 17 feet, with semicircular ends, and the ceiling will be formed with a dome and two half-domes over the circular ends. Here clients can interview their brokers and obtain the latest quotations of the share market.

An inner vestibule leads into the main hall, which is in the centre of the building, and will be 90 feet by 70 feet, divided into nave and aisles by arcades of columns and arches. The nave will have circular ceiling richly panelled and decorated in plaster relief and colour. The ceiling of the aisles will be a series of flat domes on arches covered with gold, and though all is not gold that glitters, it will be in this case. The windows in aisles and clerestory will be filled in with stained glass, especially rich colour being reserved for the high windows in the ends.

An extensive use will be made of scagliola in imitation of choice marbles, so that practically the columns, walls and window openings will resemble varieties of marble in various colours. The floor will be solid oak blocks, divided into panels with teak or Jarrah wood, and being laid on concrete it will form a pleasant and quiet floor to walk upon.

A second entrance is provided from Fox Street, and the entrances and vestibules will have marble or tile wall-linings and floors. A gallery will be provided at one end to seat spectators.

A post and telegraph office will be situated near the Fox Street entrance for the use of the public, with a private space for members, who will enter direct from the Exchange Hall. The secretary's office will be placed on the opposite side, and have access from the hall, and also from the corridor for the convenience of the public. At one end of the hall will be the safe deposit, fitted by Messrs. Milner & Company with all the latest improvements, and made thoroughly fireproof.

All round the main hall on the various floors there will be ranged about 200 offices for members, fronting to the streets, and over 40 strong-rooms fitted with Chatwood strong-room doors.

The whole building will be heated by steam pipes and radiators, especial attention being paid to the ventilation of the Exchange Hall and offices. Four staircases and three electric-passenger elevators give access to every part of the building. The lavatories and sanitary arrangements are of the latest improvements, and are conveniently placed in various parts of the building.

The exterior is treated in a free Classic style, based on the architecture prevailing in England about the end of the seventeenth century. The whole of the basement and principal features will be carried out in stone; the plain wall spaces will be red-faced brick.

The building was put out to competition by the Stock Exchange, and was won by the architects Messrs. Leck & Emley, who have the carrying-out of the building. The contractor is Mr. Charles Woods (who is under contract to finish the main hall by the end of the year), and the clerk of works, Mr. S. Burnett. The cost of the building will be about 125,000*l*.

THE SURVEYORS' INSTITUTION (IRISH BRANCH).

THE annual general meeting of the Irish Branch of the Surveyors' Institution was held on the 2nd inst. at the offices, 110 Grafton Street, Dublin.

Colonel H. G. S. Alexander, F.S.I., chairman of the branch, presided.

The attendance of members was large, the following being noted as present:—

Frederick A. B. Turner, Toler R. Garvey, W. E. Holmes, Savage French, A. H. Wynne, P. F. Chenevix Trench, George F. Stewart, D.L.; Hugh Galbraith, George F. Trench, T. C. Townshend, Matthew H. Franks, E. C. Hamilton, W. A. Barnes, T. Loftus Townshend, James C. Trench, Tissington W. G. Tatlow, Averell Lloyd, Charles Dickinson, R. C. Townshend, R. E. Hodson, William J. Roe, E. A. Penrose, W. R. Penrose, Francis M.G. Denny, P. Fitzgerald, G. R. M. Hewson, R. E. Maunsell, C. G. C. Hemphill and A. B. Watson, LL.B., secretary.

The Secretary read the annual report, which referred to the

STRIPSO

In 7, 14, 28 and 56 lb. kegs.

Quickly and thoroughly removes **PAINT, VARNISH, STOVE ENAMEL, RUST or GREASE**, however old or thick, without injury to the Wood or Metal, leaving the surface perfectly clean and ready for applying new Paint or Varnish.

Saves more than half the ordinary cost of stripping Paint and Varnish.

C. CHANCELLOR & CO., 13 CLERKENWELL ROAD, LONDON, E.C.**WHAT WE SAY****VELURE**

A new and perfected JAPAN PAINT, superseding varnish, with remarkable spreading, elastic and weather resisting properties. One coat equals two coats of ordinary paint and one of varnish. In 120 colours. Any shade matched. Sanitary—washable. Will not crack, chip, peel, blister, or fade. Twelve months' guarantee given by the manufacturer.

Saves time, labour, varnish and money.

C. CHANCELLOR & CO.,

13, CLERKENWELL ROAD, LONDON, E.C.

WORTHOne Gallon will
Cover about 90
Square Yards.**TRYING.****FINISHED LIKE A MIRROR.**

Your white Velure is the best we ever tried on the Yachts. Two coats really finished like a mirror. It far surpassed any enamel or ivory japan we ever used. I have done all the Windows in the house with it.

HUGH DORRIAN, Yacht Builder.
Nunsquarter, Kirkcubbin, Co. Down, June 24, 1901.

**BETTER FINISH. BETTER WEAR.
FEWER COATS. LESS MATERIAL.**

WHAT CUSTOMERS SAY**H.M. THE KING.**

I have had it used at Sandringham for H.M. the King and found it most satisfactory. It was used on some large additions last year.

C. SMEDLEY BECK, Architect.
11a, Prince of Wales Road, Norwich, Jan. 21, 1903.

ARCHITECT.

I am exceedingly pleased with the result of the Velure I had last year. Our doors look and feel like ivory, and show every appearance of great durability. I find that they keep very clean, and do not take the dirt.

A. E. PURDIE, F.R.I.B.A.
Meadow Grange, Blean, near Canterbury, Jan. 2, 1902.

IN A STEAM DISINFECTOR.

I am pleased to state that the Velure has been a perfect success so far. It has been subjected to great heat, steam pressure, and withstood the expansion and contraction of the iron, and there are no cracks or flaws to be found, the surface being perfect. It was applied by unskilled labour, the hospital porter doing the work.

J. BROOK, S.I.C., A.S.I., Surveyor, R.D.C.,
Stratford-on-Avon, 5th December, 1902.

UNDER WATER.

Velure gives a beautifully smooth surface, which remains hard under water, and does not foul easily.

JOHN MACKENZIE, Sail Maker.
Sandbank, Argyllshire, Sept. 26, 1901.

**STANDS ANY AMOUNT OF EXPOSURE TO SUN OR FROST,
HEAT OR DAMP, WITHOUT CRACK OR BLISTER.**

past year as one of exceptional strain and anxiety, due to the projected change in the land laws vitally affecting the professional existence of Irish land agents, and calling for unsparing effort from all responsible for the guidance of the branch. The report in its details dealt chiefly with the action taken by the committee on behalf of the interests of members as affected by the previous and present Land Bills.

Its adoption, having been moved by the Chairman and seconded by Mr. George F. Trench, was unanimously carried.

On the motion of the Chairman, seconded by Mr. Alfred H. Wynne, Mr. William Rochfort, F.S.I., Cahir Abbey, Cahir, was unanimously elected chairman for the ensuing year.

Mr. Toler R. Garvey proposed that Mr. Thomas Courtney Townshend, F.S.I., Dublin, be elected vice-chairman. The motion was seconded by Mr. George F. Stewart, and was also passed unanimously.

Mr. P. Fitzgerald, Limerick, then moved that Mr. George F. Stewart be appointed to represent the Irish branch on the Council of the Surveyors' Institution of Great Britain and Ireland. The appointment was cordially approved by the meeting and confirmed.

Messrs. Charles Dickinson and J. R. C. Townshend having been nominated scrutineers, the meeting proceeded to the election of members to serve on the executive committee. Subsequently several provisions of the Land Bill were fully discussed and the following resolution was unanimously passed:—

"That, while recognising the great merits of the Land Bill recently introduced into Parliament, we desire to call the attention of the Government to the fact that while it employs public credit and public funds for the advantage of two classes—landlords and tenants—it overlooks the claims of a third—the land agents—who will be financially ruined in exact proportion as the Bill is successfully carried out, and that we call upon the Government to grant us compensation for the loss of our profession and income."

Mr. T. C. Townshend having been moved to the second chair, Mr. George F. Trench proposed, and Mr. Hewson seconded, a vote of thanks to the outgoing chairman, Colonel H. G. S. Alexander, for his untiring attendance and valuable work during the year. The vote was passed most cordially, and suitably acknowledged by Colonel Alexander.

Subsequently the scrutineers reported the result of the ballot for the executive committee as follows:—

Colonel H. G. S. Alexander, H. D. M. Barton, W. A.

Barnes, Charles Brownlow, James D. Crosbie, W. D. Talbot Crosbie, Charles Dickinson, P. Fitzgerald, Matthew H. Franks, Hugh Galbraith, Toler R. Garvey, G. R. M. Hewson, W. E. Holmes, Lieut.-Col. Henry Irvine, R. W. Jameson, J. Stewart Kincaid, Maurice Knight, Averell Lloyd, Arthur J. Owen, J. E. Penrose, Robert Sanders, George F. Stewart, Alexander Tailyour, J. Garnett Tatlow, E. Shaw Tener, H. C. Tisdall, P. F. Chenevix Trench, F. A. B. Turner, Arthur P. Vernon, Gilbert de L. Willis, A. H. Wynne, E. Synge.

SALFORD'S ELECTRIC SUPPLY.

THE 14th inst. has been selected for the inauguration of the important new electricity supply works which have just been completed, the old establishment having proved inadequate.

A site for new works was selected in Frederick Road (formerly known as Strawberry Road), and it is these which will be started on the date mentioned. The works have been constructed under the directions of Messrs. Lacey, Clirehugh & Sillar, consulting engineers. A plant of 10,000 horse-power has been provided, this being sufficient to supply the requirements of the tramways and lighting systems for five years to come. A complete cable system for both tramways and private supply has also been established. A loan of 398,275*l.* for the purposes of the scheme has been sanctioned by the Local Government Board. Most of the plant at the Frederick Road works has been in position for some time, and the station has been at work for considerably over a year, the old Walness Road station having been shut down in May last. The system adopted is the direct-current system, with a declared pressure of 220 volts for lighting, on the three-wire system. Power can be supplied to motors at 440 volts, and to the tramways at 500 to 550 volts. The station is of simple design, consisting mainly of a boiler-house, containing a single row of sixteen boilers, and an engine-room equipped with a parallel row of eight generating sets. At each end of the buildings are economiser and pump-rooms, and the plant can be divided, in case of need, into two complete and independent systems. The boiler-house, which is 221 feet in length, contains, as already mentioned, sixteen boilers. These are of the Lancashire pattern, with Galloway tubes (they have been supplied by Messrs. Galloway, Ltd), and each is 35 feet long by 9 feet in diameter. They are arranged in eight pairs, each pair feeding one engine or supplying steam to the main range as desired.

They are fitted with coking mechanical stokers, which are worked by an overhead shaft, driven by a Westinghouse motor. The coal required for the boilers is stored in steel bunkers, which extend the length of the boiler-house. Adjoining the boiler-house is the Bury and Rochdale Canal, and from the barges in the canal the coal is raised by electrically driven cranes, which run on rails over the bunkers. From the bunkers, which have a storage capacity of about 1,600 tons, the coal is fed to the mechanical stokers by means of shoots, each of which is fitted with a measuring device. Similarly, the ashes from the boilers are raked into hoppers, and by means of an automatic ash-conveyer and a shoot are deposited in the canal barges without being handled. There are four economisers, two at each end of the boiler-house. They are of the Green type, and comprise 400 tubes each. Feed water is obtained from the canal, with the town mains as an alternative supply. Each of the two pump-rooms contains three electrically driven feed pumps. The steam piping consists of steel, with copper bends; the flanges are of steel, rivetted and welded. Each pair of boilers is connected with an engine by a pipe 8 inches in diameter. The engine-house has an imposing row of eight generating sets, each of 800 k.w. These, as well as the machinery in other parts of the station, have been constructed by manufacturers either in Salford or in Manchester. The lofty engine-room is spanned by a 30-ton single-motor electric travelling crane running on rails at a height of 34 feet from the floor level. Along one side and both ends of the room is a gallery, at a height of 15 feet, which renders supervision of the generating plant easy. The gallery communicates with the switch-room at one end and with the stores at the other. The headquarters of the electricity department adjoin the new generating works, with the frontage into Frederick Road. Here, besides the offices of the borough electrical engineer (Mr. C. D. Taite) and his staff, are committee-rooms for the use of the electricity committee of the Corporation.

THE MEANING OF "SCAFFOLDING."

A NUMBER of appeals under the Workmen's Compensation Act, says a legal correspondent of the *Manchester Guardian*, engaged the attention of the Court of Appeal, and though several of their decisions were of general interest, one of them stands pre-eminently forward in importance, both because of its unexpectedness and because of the number of employers and workmen affected by it. An

ordinary step-ladder, such as is used by painters—and if so, then any kind of ladder—may be "scaffolding" within the meaning of the Act, said the Court of Appeal. This decision brings within the Act all workmen who are engaged in house-repair—and painting or whitewashing may be "repair"—provided that the house exceeds 30 feet in height, and provided that a ladder is used, whether inside or outside, for the purpose of their work. That is to say, a master painter who contracts to whitewash or paint a dining-room ceiling, and whose men use ladders for the purpose of reaching their work, may be an undertaker within the meaning of the Act, and so liable to pay compensation to his workmen. For amongst the employments to which the Workmen's Compensation Act, 1897, applies is employment "on, in, or about any building which exceeds 30 feet in height and is either being constructed or repaired by means of a scaffolding."

To the ordinary person this wording seems clear enough, as there are few who, on seeing a building in the course of construction or repair, would not consider themselves competent judges as to whether scaffolding was being used in the operation or not; but to employers of labour and workmen, to legal and insurance men, and to all who come into contact with the working of the Act, its meaning has ever been a source of trouble and uncertainty, and still remains involved in doubt. And why? Because "scaffolding" is not defined in the Act, and the Courts have refused to give a definition of it, with the result that the question has again and again arisen, whether it bears its ordinary popular meaning, or includes any temporary structure of any kind used to enable a workman to work at an elevation. The history of the litigation that has centred around the word is interesting and instructive indeed. The Court of Appeal early held that whether a structure amounted to a "scaffolding" within the meaning of the Act or not, was a question of fact for the arbitrator to determine, and that his finding could not be upset on appeal, except on the ground that there was no evidence to support it. This decision was as unsatisfactory as it well could be. So long as it was purely a question of fact whether a structure constituted a scaffolding or not, arbitrators were at liberty to find that exactly similar structures were scaffolding in one case and not in another. Such an anomaly did, in fact, arise. In *Maude v. Brook* an arbitrator held that loose boards placed upon trestles about 4 feet high to enable plasterers to reach the top of the walls of a room were "scaffolding," and the Court of Appeal refused to disturb his finding. Shortly afterwards, in *Fergusson v. Green*,

where the structure was identically the same, another arbitrator held that it did not constitute scaffolding, and again the Court of Appeal refused to interfere with the finding.

When the question came before the House of Lords, as it did in *Hoddinott v. Newton, Chambers & Co.*, it was hoped that the question what constitutes a "scaffolding" would be settled once and for all. But the hope was disappointed, as the House of Lords refused to define the word. They did, however, decide that such questions as to what is a scaffolding are not solely questions of fact but mixed questions of fact and law, upon which, after the facts have once been found, the Court of Appeal is "bound" to express an opinion, and Lord Brampton gave some very clear directions as to the kind of facts it is necessary to find before deciding in law that a particular structure is a "scaffolding."

Now let us return to the Court of Appeal to see how they have reviewed the questions of law, as the House of Lords said they were bound to do. Since the case just mentioned was before the House of Lords three cases bearing on "scaffolding" have been before the Court of Appeal. In *Veazey v. Chattle* a workman was injured while engaged in the repair of the roof of a house by means of a ladder and a "crawling-board," which consisted of a wooden plank about 20 feet long and 10 inches wide, across which were nailed ridges of wood for the purpose of giving a foothold; on the underside of one end was fastened a cross-piece of wood which fitted over the ridge of the roof and kept the board in position. At the time of the accident the workman was on the roof fixing the crawling-board, while the lower end of the board was being steadied by an assistant standing on the ladder. The County Court judge found that the ladder and crawling-board were suitable for the particular purpose for which they were used, and held as a matter of law that such a combination might be a "scaffolding," and further, as a matter of fact, that it was, and the Court of Appeal (Lord Stirling dissenting) said that he was justified in so holding. Following this case came *Marshall v. Rutherford*, where a workman was injured while employed on a house which was being repaired by means of a ladder, the lower end of which rested on the ground and the upper end against the parapet of the building. The County Court judge found that the ladder was not a "scaffolding," and the Court of Appeal held that he was entitled so to find. "Unless we can say as a matter of law," said the Master of the Rolls, "that a ladder used under the conditions which existed in this case must be a scaffolding we cannot reverse his decision," a "review" of a

question of law upon which the Court of Appeal is to be congratulated.

Then last week the converse of this case came before the Court of Appeal in *Elvin v. Woodward & Co.*, where a pair of ordinary painter's steps were used to paint the wall of a house which was being repaired, but from which the main scaffolding used in repairing it had been taken down. In the opinion of the County Court judge such steps afforded no evidence that the house was being repaired by means of a "scaffolding," but he added that if the Court of Appeal were of opinion that such steps were a scaffolding he would award the workman 12. per week; but as he was not of that opinion he made an award in favour of the employers. The appeal to the Court of Appeal was allowed and compensation awarded (Lord Stirling again dissenting), on the ground that as it was impossible to say as a matter of law that a ladder was not a scaffolding, there was some evidence that it was. The Master of the Rolls, however, said that if the County Court judge had merely made an award in favour of the employers he would have found it impossible to disagree with him, because there seemed to his lordship to be evidence upon which he could have found either way.

Thus in one case an appeal against a finding that a ladder is not "scaffolding" fails because it is impossible in law to say that it must be "scaffolding"; in another the appeal is allowed because it is impossible in law to say that it cannot be "scaffolding." Either a ladder is or is not "scaffolding," and, according to the remarks of Lord Brampton mentioned above, it would appear that it is not. However, this is one of the questions of law which the Court of Appeal ought to "review" and finally determine, and they appear to be shirking their duty in refusing to do so. And the result of their refusal is that now, after the Act has been in force for nearly five years, and after appeal upon appeal has been heard, the position is exactly the same as it was before *Hoddinott v. Newton, Chambers & Co.* reached the House of Lords. As the law at present stands, whether a particular structure is "scaffolding" or not depends almost entirely upon the view taken by the arbitrator in the first instance. If upon the facts he is at liberty to come to one or the other conclusion in law, compensation must be given to one workman and refused to another who are working under exactly the same conditions. The right to compensation will therefore depend, not upon the law of the country, but upon the particular view of that law taken by the County Court judge of the district in which the accident happens.

THE WEEK.

THE works of over 400 engravers and etchers will be seen in the loan exhibition which is arranged in the Victoria and Albert Museum, near the Imperial Institute. As they are hung in chronological order the visitor to the gallery will be able to derive an accurate idea of the history of the art. It is to be understood that every example is by a native of this country or by a foreigner who resided here. Plates by REMBRANDT, MARC ANTONIO, MORGHEN, VOLPATO, AUDRAN and other masters are not to be found in the collection. There is, however, a title-page by GEMINI, which was published in London in 1545, and FRANZ HOGENBERG'S print of Queen MARY, dated 1555. The sixteenth, seventeenth, eighteenth, nineteenth and twentieth centuries have all contributed. Of course, the specimens obtained will not always be approved by amateurs. GEORGE CRUIKSHANK, for instance, is not at his best in the *Worship of Bacchus* and his illustrations of "The Life of GRIMALDI," and *Omnibus*. HABLOT K. BROWNE (PHIZ) not only was an etcher, but he executed some engravings; there is no work by him here, although he helped to popularise the art. The KING has lent *The Great Executioner*, by Prince RUPERT, and there are three others of the Prince's mezzotints. By HOGARTH are six or seven plates, and there are four by Sir ROBERT STRANGE, who was one of the greatest of the British masters. The splendid mezzotints by the engravers who worked after REYNOLDS will delight many visitors. Plates from the Etching Club series lead the way to the etchings by Sir FRANCIS HADEN, Mr. WHISTLER, Mr. LEGROS and later artists. Mr. A. H. HAIG has lent four of his architectural plates. An interesting feature of the exhibition, especially for novices, is a display of tools and materials used in etching and engraving. The exhibition will repay many visits, and the only regret it can excite is that space was not available for a larger collection. But nearly 1,000 examples are to be seen in addition to the exercises of the students of the engraving school of the Royal College of Art. The collection is an argument for greater encouragement of the art by the Royal Academy.

THE House of Commons on Monday, by a majority of forty-seven, declined to allow the second reading of the Old Bridewell Burying Ground Bill. From its position in Dorset Street, near Blackfriars Bridge, the ground is very valuable. Since it was closed as a burial-ground by order of the Home Office it was used for various purposes, and at present it serves as a builder's yard. The Bill was opposed by the City Corporation and by members connected with the Metropolis. It appears there is some doubt whether it was ever a public burial-ground, but the circumstances are considered to be sufficient to allow the Disused Burial Ground and Open Spaces Act to be applied to the land, and the Bill was rejected on the ground that the House of Commons declined to sanction a private Bill in contravention of general public statutes concerning open spaces for the express purpose of enhancing the value of a private estate.

A FEW weeks ago we recorded the commencement of an action by M. BOUGUEREAU, the French painter, whose *Printemps* is in the principal room of this year's exhibition at the Royal Academy, against some porcelain manufacturers in Limoges. He was offended because they copied a head from his picture, *La Vierge Consolatrice*, in the Luxembourg Gallery. The head by itself could not, he maintained, afford any adequate idea of his work, and therefore was unfavourable to his interests as an artist. A law-suit about such an offence was novel, and the Court has taken a month to arrive at a decision. The judgment states that when a painter has alienated his work, or, in other words, has sold it to the State, he cannot interfere if copies, however imperfect, are made in large numbers. But he is still entitled to the right to preserve the idea expressed in his picture unaltered. In M. BOUGUEREAU'S picture there were two women and a dead child. The character of the painting could not be inferred from a single head. M. BOUGUEREAU

did not claim damages, as all he sought was the recognition of his right, and the manufacturers were therefore only ordered to pay the costs of the action as a penalty.

It is remarkable to find that Americans can compete with Germans in the reproduction of pictures. A copyright case heard before Mr. Justice GRANTHAM shows the kind of success which attends such feats. Messrs. WOLFF & Co. claimed damages from Messrs. PLIMPTON & Co. for infringement of copyright. Mr. SCHAUER brought out prints in colours from a painting called *The Awakening*, and the prices charged to Messrs. WOLFF were 30s. and 10s. each, to the trade 52s. 6d. and 22s. 6d., and to the public 105s. and 45s. In America the prints were copied successfully, and the copies were sold in this country for 1s. and 2s. each. There could be no disputing the infringement, and the case was settled by defendants agreeing to pay a further 25% over and above the 25% paid into Court, as well as plaintiffs' taxed costs on the High Court scale. A perpetual injunction was granted restraining the sale of infringements, and copies now in possession of the defendants were to be surrendered. In England publishers say they are compelled to have recourse to Germany for the production of prints, as the prices asked for such work in this country would not allow of sufficient profit. The Americans, however, can contrive to manufacture plates, of which the excellence was admitted, at less than a tenth of the German prices. It is not merely in the production of steel bridges and machinery that the contest between America and Germany is remarkable.

So few people in Paris are able to occupy the whole of a house, it becomes an important question to those who propose to take appartements whether the other parts of the building are in a sanitary condition. Indeed, the majority of tenants would hesitate if they were invited to investigate the premises. Although sanitary conditions are lax in the city, it is found that many houses in all districts do not show a compliance with them. According to official returns, out of 79,742 "immeubles," or mansions, no less than 25,000 are tabulated as "médiocres" and 7,026 as "mauvais." In 11,050 the water was a mixture and several depended mainly on filtered Seine water. The occupiers are therefore likely to approve of the project of M. PAUL STRAUSS. He proposes that every house is to have its "livret" or record, corresponding with those which are essential for every individual Frenchman. A tenant would be able to demand an inspection of the document, and by means of it would realise the extent of the risks he was likely to encounter.

ACCORDING to the report of the Board of Manufactures in Scotland there were 57,255 free admissions to the National Gallery, Edinburgh, last year. There were 3,517 visitors who paid 6d. and 2,202 attendances by copyists of pictures. The School of Art is in a transition state. The resignation of the headmaster affected to a considerable extent the attendance of the students during the autumn and winter session, but in the spring and summer session the number enrolled was fully up to that of the previous year. Several important changes and reforms in the arrangements and conduct of the school were made. A Students' Sketch Club was also organised for home work and outdoor sketching classes were established during the summer session, all of which proved very attractive and successful. For some years past the numbers of students entering the school for elementary instruction have been gradually decreasing, owing to elementary art being now taught in all ordinary schools, in day and evening continuation classes, and in technical and other similar institutions. The Board, taking this into consideration, came to the resolution that while general subjects of art study should continue in future to be taught in the School of Art as formerly, the study of advanced art in all its branches should be made a special feature of the curriculum. Arrangements were accordingly made for a complete reorganisation of the school. During recent years the works sent up to the national competition in London by schools of art in Scotland have been gradually growing fewer in number. Several schools have now ceased to compete, and comparatively few works were this year sent from the Edinburgh school.

TYPES OF COSTUME: ENGLISH, SIXTEENTH AND SEVENTEENTH CENTURIES.

PAINTING AT THE ROYAL ACADEMY.—II.

WE mentioned last week some of the pictures which were supposed to be derived from ordinary life. A few others deserve notice. *The Chess-Players*, by Mr. MELTON FISHER, shows two girls engaged in the game, and would be considered as a very rich example for its colours and costume. *The Back from the Fair, Co. Donegal*, by Mr. BARTLETT, is not suggestive of wealth, but poverty, and expresses that mixture of sadness and resignation which is now coming into favour as an element of Irish character. Mr. CALDERON'S *Lot 97—The Grey Mare*, is one of the truest pictures of country life to be seen in the exhibition. The splendid horse, that is not without a touch of vanity, shows the artist's power as an animal painter. The crowd of people who have come to the farm to witness the auction might have been derived from a photograph of an actual sale. There is some of the pathos of agricultural work suggested by Mr. F. G. WAUGH'S *Early Toilers*, a ploughing scene before there is daylight. Mr. MOUAT LOUDAN'S nameless picture, which is suggested by the verse of OMAR KHAYYAM, "Alas! that spring should vanish with the rose," is one of the most delightful of this year's paintings. Two girls in richly-embroidered dresses are seated under trees, and look out of the canvas with the utmost simplicity. There is nothing in the subject that has not been expressed repeatedly, and yet it can never tire, especially when rendered as in this case. The technique is of high order, for the effect is gained by thin painting on coarse canvas. Mr. SPENLOVE SPENLOVE'S *Pilot's Funeral: Southwold, Winter*, is pathetic, and yet seems to be real. The long low row of cottages, with snow on the roofs, the long line of walling, all seem from their quiescence to be in keeping with the incident.

A great change has taken place in the manner of regarding portraits. Not many years ago they were looked upon as intruders. Painters of historical pieces, of genre or of landscape, and especially those whose pictures were rejected or were not hung in desirable positions, used to make estimates about the large area on the walls assigned to portraits. Visitors in general complained about the "nobodies" who were obtruded on their attention, and about whom they were indifferent. Portraits are now believed to constitute an important class of art, and the space assigned to them is considered to be well disposed. It is not to be inferred that the subjects are more interesting than formerly, for the majority of the men and women represented cannot be claimed to have attained distinction by their abilities or their public services. Likenesses are tolerated because it is now imagined that in them, more than in any other kind of painting, there is displayed that daring manipulation which is thought to be as remarkable as the feats of a conjurer. The most impressive effects are assumed to be produced by a few strokes of the brush, and amazement at the legerdemain takes the place of the grumbling formerly excited by the works of painters who were masters of the art.

The large work which is Mr. FILDES'S only contribution this year, *Mrs. James Reynolds and her Daughter Leila*, appears, if compared with some examples by other artists, to be a little old-fashioned. We suppose more time and labour have been expended on it than on any other of the

numerous portraits in the exhibition. The posing is pictorial, or, as some would say, formal. A lady richly clad is seated on a sofa looking at a locket which she wears, and which, we may presume, represents her husband, while the child's gaze is in the same direction. The white dress of the child with a scarlet scarf, and the costume of the mother, which is brilliant in colour, are almost Eastern in effect. It is an elaborate and conscientious painting, and at one time would be accepted as a masterpiece. But the indifference shown to the new spirit or dogmas of portraiture will cause its excellence to be questioned. *Mrs. Huth Jackson*, by Mr. F. D. MILLET, is in a similar manner, for the subject is clad in red, and is placed in front of a large screen copied most exactly. But the picture is small, and in an exhibition where so many figures are immense that consideration is enough to merit favour for it. The excellent likeness by Mr. FRANK DICKSEE, *Lady Aird*, which is also in the first room, cannot be looked upon as a type of modern treatment, for it does not impress us as a hurried product; but it is a masterpiece for its truth, naturalness and quietude. We see a lady unostentatiously dressed, with a fur cloak, seated in a well-furnished room as if she had just returned from shopping or from a round of visits. There is no posing or obtrusiveness. The portrait becomes the more noteworthy because the artist usually is captivated by many colours, and, it must be said, is not always able to control them. It is only necessary to compare it with *A Duet*, Mr. DICKSEE'S principal contribution, a lady at a spinet, while another holds a lute and sings, to see how much can be gained by restraint. Although Mr. SARGENT has six portraits, regrets have been heard from his admirers that he has not a larger number. The two we prefer are his *Mrs. Joseph Chamberlain* and *G. McCorquodale, Esq.* Both are vivid and appear to have been struck off without much labour. But the *Earl of Cromer* does not do justice to the intellectualism of the Egyptian ruler. Mr. SHANNON is almost on a level with the American artist. The hard blue dress in his *Mrs. Ansell* is enough to deter people from appreciating that portrait, although the vigour is unquestionable. But there can be no objection to the treatment in *Mrs. Lazarus and Daughter*, or the *Mrs. Henry Riviere* with its very dark tapestry background. Mr. OULESS has seven portraits in his customary style, of which *The Earl Cawdor* is the most effective. Mr. SOLOMON confines himself to three portraits; the *H. J. Levy, Esq.*, and the *Mrs. Benjamin Lazarus*, denote increased skill. Mr. HUGH RIVIERE has been successful with his *Professor Kennedy*, of University College. *Major-General Baden-Powell*, by H. VON HERKOMER, shows the soldier sketching with his left hand, and is a suggestive representation of a man who has nothing of the pipe-clay officer about him, and who is well adapted to be an innovator if not a reformer. *Vice-Admiral Lord Charles Beresford*, by Mr. C. W. FURSE, is a half-length portraying the officer in full uniform but bareheaded, leaning on the rail of a ship. The manliness or breeziness of the commander is suggested, but it is overborne by the extent of the conventionalism, and to be complete a storm should be suggested, or at least a battle in progress. *Mr. Aston Webb, A.R.A.*, is the work

of Mr. C. E. BROCK, but is also over-emphatic in its professionalism. The portraits of *Lady Lucy Hicks-Beach*, *Miss Deena Tyrrell* and *Sir Frederick Falkiner, K.C.*, demonstrate the loss which Ireland has sustained by the death of WALTER OSBORNE. His works secured attention whenever they appeared of late in the Academy exhibitions, and it was reasonable to conclude that if favoured with the adequate support which is attainable in England, he would have competed successfully with any portraitist of our time. The portrait of Mr. LEHMANN, by himself, recalls the kindly old artist whose works have often appeared on the walls of the Academy.

Landscapes, we hope, will always be abundant in an Academy collection, as they are this year. Mr. LEADER'S *Southward from Surrey's Pleasant Hills* is of the simplest, but everybody must enjoy the vast prospect which is unfolded. It is a typical English scene. Mr. MACWHIRTER'S *White Queen* is, of course, one of his delicate Scotch trees that seems to rule over the country around. If in the north wood was more abundant and attained English proportions the artist's occupation might appear to be at an end. But *The Rugged Hills of Skye* and *The Silent Night* are enough to show that the artist could conquer in other fields. Mr. DAVIES'S *Old Monmouthshire Canal* suggests a country that has not been greatly used by the landscapist. Mr. J. W. NORTH, from whom so much was expected, is allowing his invention and observation to lie fallow, and if he does not always confine himself to the same scene, he restricts himself to the same colours. *The West-country Woodland* differs from its predecessors by the introduction of a great mass of barren rock on the left side. But the woodland is familiar, and the figures on a broken tree might be taken for a clump of green and gold vegetation. Some of the pleasure which Mr. DAVID MURRAY'S landscapes impart is owing to the ease with which they appear to have been derived from nature. They might be copies rather than compositions. This year in *June* he shows trees abounding in blossom and growing in meadows near a river and with a church in the background, such a landscape as might be found in any county. Mr. MURRAY'S *In the Country of Constable* shows a Suffolk scene with a canal and trees, but there is no imitation of CONSTABLE'S manner of treating land, water and sky. Mr. W. L. WYLLIE'S *Peace Driving Away the Horrors of War* is sure to give rise to many interpretations, but all will acknowledge the evidence of versatility which it affords on the part of a painter whose pictures are generally surrounded by the gloomy atmosphere of the lower Thames and the Tyne. The sun, we know, shines on the just and the unjust, and the earth is indifferent whether it produces fields of corn or affords a tomb for an army, as at Waterloo. On the left of the picture we see dead warriors, while their companions appear to be making the final arrangements for their burial. Birds of prey abound, and in the distance a city is on fire with ruined buildings. On the right men and women are labouring in the fields and the limits between peace and war are defined by a double rainbow. The picture is, therefore, symbolic. Whether landscape art lends itself to that purpose may be doubted. Mr. WILLIAM LOGSDAIL continues to be faithful to Venice. His *Summer Evening* is a view on the canal near the church of S. Giorgio Maggiore.

Mr. GEORGE CLAUSEN'S work still remains in the experimental stage. He is satisfied with endeavouring to interpret very limited aspects of nature, but often contrives to make them impressive. The elements of *Dusk* could hardly be simpler, for all we see is a hayrick rather clumsily piled, which looms out of the darkness by means of the streaks of golden and coloured light which are observed beyond it. It is an illustration of something witnessed, but is rather disappointing. Mr. H. W. DAVIS by his *Apple Blossom: Upper Wye*, would delight a Japanese. The trees and country denote the hand of a landscapist, while the sheep are introduced with special skill. *Warkworth Castle* has long been a favourite subject, especially since the time of Sir WALTER SCOTT, but we doubt if a more masterly view has been produced than that by Sir E. A. WATERLOW. The old building still asserts its supremacy over a border-land that was well worth fighting for, either for conquest or defence. Mr. J. FARQUHARSON has often given snow scenes. In *The Shortening Winter's Day* the monotonous

white is varied by patches of glow which are pleasing. Blossoms are again found abundantly in Mr. A. PARSON'S *Pear Orchard*. Mr. J. H. C. MILLER'S *The Kremlins of Crougham* is a noble study of the summits of cliffs rising through a mist. *The Golden Hour* of Mr. WESTLEY MANING is an excellent effort to depict a sunset scene. But the long barren trunk on the left excites a desire to conceal it with paint. It is a sign that the old conventionalism of a dead tree in the foreground is not at an end. Not even Mr. WATTS can escape from it, for his *Parasite* is the trunk of a tree surrounded with ivy, with a barren one beside it in its naked decrepitude. Mr. ALFRED EAST in his *Tintern* gives a panoramic view of the valley of the Wye. The scene is so beautiful, we are bound to overlook the rigid line of the railway bridge which forms so prominent an object in the landscape. Mr. H. S. KORTRIGHT'S picture *The Peaceful Hour* is expressive of its subject, because he realises the fact that it is only by the introduction of buildings of some kind stillness can be made plain to us. In this case there are old barns and farm-buildings, but they serve their purpose as well as the view of London, with its towers, domes, theatres, and temples, did for WORDSWORTH when he wrote his sonnet on Westminster Bridge.

This year the absence of Mr. HOOK is noticeable. But there are several paintings which seem to be inspired by his spirit. Mr. J. R. REID shows one of his picturesque little harbours in the *Home Squadron*, but he likes to represent the sea at rest. Mr. HEMY, on the contrary, cares only for a sea that has motive power in it. His *Youth* is a picture of a yacht race, and derives the title from the young fellows sailing the boat. It could with no less fitness be called *Speed*, for the yacht has the effect of rapid flight. This no doubt is in some measure caused by the skilful way in which the boat is placed near the side of the canvas, as if the bow had passed beyond the frame. This picture is at least equal to the sea-scene which put the seal on Mr. HEMY'S reputation after long years of waiting. There is a wise northern proverb about giving "our ain sea-guts to our ain sea-men;" it seems to have inspired his *Sea-gulls*, in which is shown a fishing incident, but modern birds do not wait for food to be offered to them. As Mr. HEMY rightly depicts them, they are quite prepared to snatch it from the fishermen's hands. Another fine seascape is Mr. PETER GRAHAM'S *Washed up by the Restless Waves*, a subject he has often treated, but never with more force than in the picture to be viewed in the exhibition. The waves are not in serried files, but dash themselves in tumultuous masses against the rocks, while the gulls look on as if the concussion between land and sea was intended for their amusement.

Incidents that have taken place out of doors, landscapes and seascapes, are so much the vogue, there is no opportunity for a painter who would paint grand interiors or represent buildings. If another DAVID ROBERTS were to arise, it is doubtful whether any of his great cathedral studies would gain admission. Mr. BACON, in *A Romance*, neatly portrays a French salon in the eighteenth century, and Mr. TALBOT HUGHES in *Played out* has a gay and festive scene in a hall of dazzling light where stakes are high, but the rooms are no more than backgrounds. Mr. FULLEYLOVE represents the interior of the *Dome of the Rock, Jerusalem*, with customary skill and knowledge. But the most ambitious architectural effort is found in Mr. ALBERT GOODWIN'S *The Gate of the Inferno*. It is not the first time the artist has measured himself with JOHN MARTIN as a creator of stupendous structures. DANTE, who is generally so definite, is almost silent about the entrance to his Inferno. He gives us the inscription which was written in sombre characters over a door or gateway, but what was the character of the structure is left to our imagination. It is not his sight which was exercised but his ears. The sighs, the weeping and the piercing cries compelled the poet himself to weep, and the tumult of divers tongues, horrible expressions, words of dolour and the smiting of hands overcame him, and he asked VIRGIL not to explain the architecture, but the meaning of the sounds. All we know is that the structure was to endure for ever. It is not within the province of architecture to raise an emotion of terror. It is difficult to design a prison that will frighten culprits. The belief that a

merciless governor presided over one is found to be more effective than any masonry. Mr. GOODWIN therefore attempts an impossible feat. His building retains some characteristics of the Classic style such as might have floated before the vision of the poet, and the pale grey stonework is enshrouded in mists, but it would be difficult for a student of DANTE to show a connection between it and the poem. There are windows which are no doubt intended to exclude the light, and it would be easy to imagine from the treatment that a part was undergoing repair. But if that were the case the building could not be the work of divine power, sovereign wisdom and primeval love. As a contrast with this vision we may refer to the President's *Bells of St. Mark's Campanile*. Here, fortunately, we have the utmost precision, and the painting will be a valuable record of the belfry before the destruction of the tower. Sir E. J. POYNTER always treats architecture as an expert, and we wish he would test public taste by an architectural subject in which figures would have only minor importance.

THE PRINCIPLES OF ARCHITECTURAL DESIGN.

By PERCY L. MARKS.

CHAPTER XI (continued).

A.

SYMBOLS AND THEIR SIGNIFICANCE (see fig. 75).

Anchor	Hope.
Anvil	Blacksmith.
Apollo	Music.
Ark, Noah's	Safety (illustrated at <i>c</i>).
Ass carrying blindfolded person	Ignorance.
Atlas carrying the World	Newspaper called <i>The World</i> (illustrated at <i>e</i>).
Bacchus	Conviviality.
Balances	Equinox.
Balances carried by blindfolded female with a sword	Justice.
Balls, Three golden	Pawnbroker (illustrated at <i>z</i>).
Banyan tree	Empire.
Barrel	Brewer, vintner (illustrated at <i>n</i>).
Bear	Stock Exchange, Russia, furriers.
Beehive	Industry, schools.
Black (pigment)	Mourning.
Blue (in Christian art)	Hope.
Blue, Azure (in Christian art)	Immortality.
Book, Open	Study.
Box-shrub (in Christian art)	Resurrection.
Britannia	England (illustrated at <i>y</i>).
Bull	Stock Exchange.
Calliope the Muse	Heroic poetry.
Camel	Endurance, Africa.
Cannon	Military buildings.
Cap (blue, with white border)	Liberty (England).
Cap (on a pole)	Liberty (illustrated at <i>a</i>).
Cap (red)	Liberty (France).
Cap and bells	Folly.
Cat	Liberty.
Chameleon	Air.
Circle	Eternity.
Clio the Muse	Historical poetry.
Club (Saint holding a fuller's club)	Fullers, St. James the Less.
Club (Saint with club or staff, and a carpenter's square)	Carpenters, St. Jude.
Cock	Vigilance, St. Peter.
Combs	Hairdressers, woolcombers, St. Blaise.
Cornucopia	Plenty, fruiterers.
Cow	Dairies.
Crescent moon and star	Turkey.
Crocodile	Egypt.

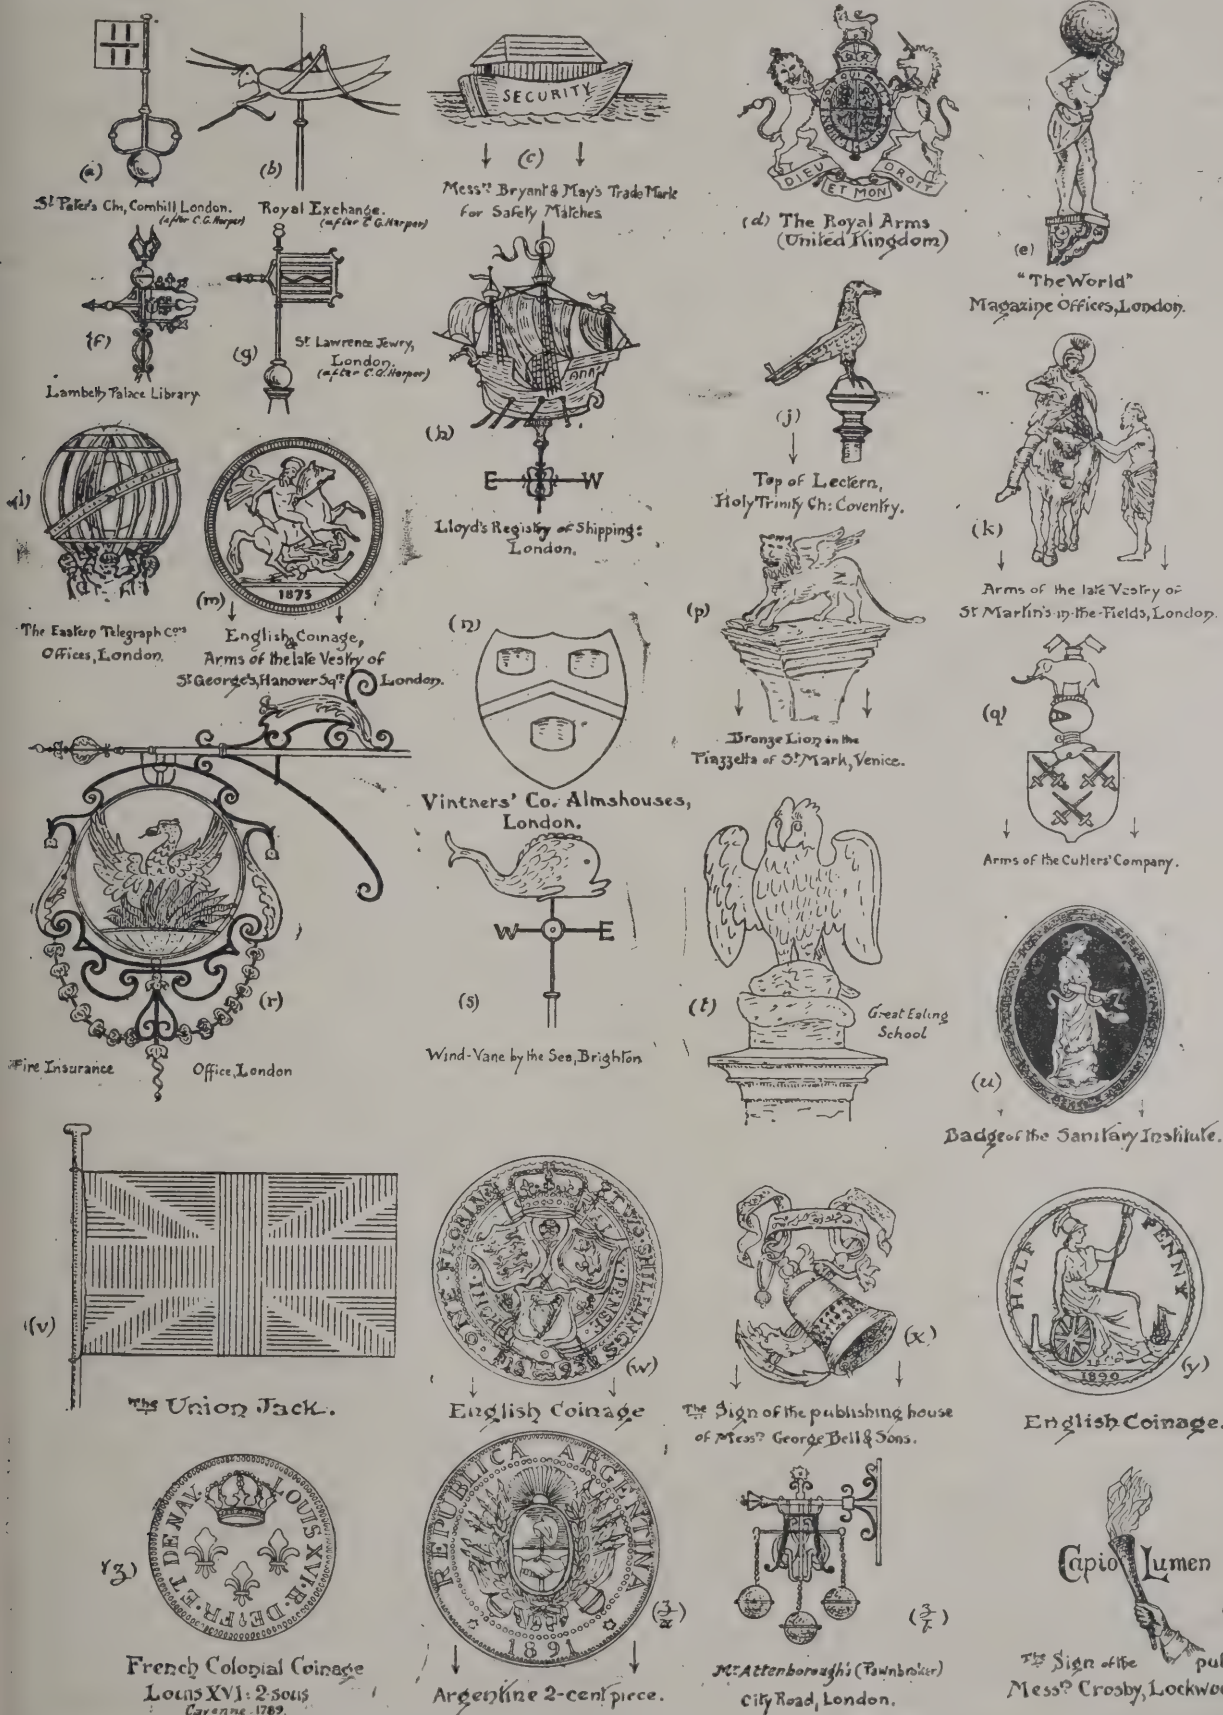

Crook (curved)	Bishop.
Crook (floriated)	Archbishop.
Cross (Latin)	Christ.
*Cross (St. George's, red on white field)	England, ambulance work.
*Cross (saltire, white on blue field)	St. Andrew, Scotland.
*Cross (saltire, red on white field)	St. Patrick, Ireland.
* Illustration of Union Jack at <i>z</i> , drawn according to heraldic blazonry.	
Cross (triple)	St. Peter, fishmongers.
Crown and sceptre	Sovereignty (illustrated at <i>w</i>).
Crowns, Three	Munster.
Cupid	Love and courtship.
Cuttle-fish	Printers, newspaper offices.
Cypress	Mourning.
Diana hunting with bow and arrows	Shooting-box.
Dog, Bull	Vigilance, security.
Dogs	Kennels.
Dolphin	Tidal rivers, sea (illustrated at <i>s</i>).
Dove	Peace.
Dragon	Wales.
Eagle (in Christian art)	St. John the Evangelist (see illustration <i>j</i>).
Eagle (in heraldry)	Fortitude.
Eagle (in mundane affairs)	Empire.
Eagle, Double-headed	Dual empire, Austria.
Electric bolt grasped in the hand	Electricity.
Elephant	Asia, cutlers (illustrated at <i>q</i>).
Equilateral triangle (in Christian art)	The Trinity.
Feathers, Three ostrich	Prince of Wales.
Figurehead	Navigation.
Fish (in Christian art)	Christ.
Flag (half-masted)	Mourning.
Flag (red)	Battle.
Flag (stars and stripes)	United States of North America.
Flag (white)	Peace.
Fleur-de-lys	French sign (illustrated at <i>z</i>).
Forge	Blacksmith.
Fox	Cunning.
Globe (in Christian art)	Eternity.
Globe (in mundane affairs)	Travel; Newspaper office (illustrated at <i>e</i> and <i>l</i>).
Goat	Wales.
Grasshopper	Grocers, badge of Sir Thomas Gresham (illustrated at <i>b</i>).
Green (in Christian art)	Faith, Immortality, Resurrection.
Green (pale, in Christian art)	Baptism.
Gridiron	Curriers, St. Lawrence (illustrated at <i>g</i>).
Guns	Military buildings.
Hahnemann (the German physician)	Homœopathy.
Halberd	Military buildings.
Hammer	Smiths, auctioneers.
Hand, blood red and erect	Baronetage, Ulster.
Hand issuing from a cloud	The Deity.
Hand with electric bolt	Electricity.
Handcuffs	Prison.
Harp	St. Dunstan, Ireland (illustrated at <i>d</i> and <i>w</i>), Leinster.
Heart (flaming)	St. Augustine, charity.
Heart, pierced with arrows	Sorrow.
Hebe (figure holding a cup)	Youth.
Helmet	Military buildings.
Hen and chickens (in Christian art)	Providence.
Hercules	Strength.
Hind with arrow through the neck	St. Giles, cripples' homes.
Holly	Resurrection.
Horse	Courage, speed, stables.
Horseshoe	Good luck.
Hour-glass	Time.

Hygeia (female figure holding a salver to catch the serpent's virus).
Hymen (man holding bridal torch and veil).
Iris (see Fleur-de-Lys).
Ivy.
John Bull (a farmer type).
Kangaroo.

Health (illustrated at *u*).
Marriage.
Eternity.
England.
Australia.

Key (or two keys).
Lamb (in Christian art).
Lamb led by a child (in Christian art).
Lamp.
Lamp, Red.
Laurel.
Laurel wreath.

Fishmongers, St. Peter (illustrated at *a*).
Christ.
St. John the Baptist.
Study.
Doctors, chemists.
Mourning.
Victory.

Signs and Symbols.

Leek	Wales.
Legs, Three radiating and courant	Isle of Man.
Leopard	Bravery.
Lily	France, purity.
Lion (in Christian art).	St. Mark (illustrated at <i>p</i>).
Lion (passant regardant on shield)	England (illustrated at <i>d</i> and <i>w</i>).
Lion (rampant on shield)	Scotland (illustrated at <i>d</i> and <i>w</i>).
Lion (saliant)	Valour.
Lion (sejant)	Counsel, barristers.
Lotus flower (or plant).	Regeneration.
Lyre	Music.
Mace	Authority.
Man with winged heels	Mercury, the gods' messenger (see below).
Marigold (in Christian art)	The mother of Christ.
Mask	Comedy.
Mercury (statue)	Messenger, electric cable office.
Mitre	Archbishop (illustrated at <i>f</i>).
Myrtle	Union, concord.
Neptune with trident	The sea.
Nimbus	Sanctity.
Oak	Mourning.
Olive branch	Peace.
Olive tree	Prosperity.
Organ	St. Cecilia, music.
Owl	Bakers' sign, wisdom, schools (illustrated at <i>t</i>).
Padlock	Locksmiths.
Palette and brushes	Painters' sign.
Palm branch	Triumph, victory.
Palm branch held in the hand (in Christian art)	Martyrdom.
Palm tree	Tree of life.
Parsley wreath	Victory.
Peacock (in Christian art)	Incorruptibility.
Pelican (in Christian art)	Christ, sacrifice.
Pelican (in mundane affairs)	Charity.
Pestle and mortar	Apothecaries' sign.
Phoenix (in Christian art)	Resurrection.
Phoenix (in mundane affairs)	Regeneration or resurrection, chemists' sign, fire insurance (illustrated at <i>r</i>).
Pole with gilt knob at end	Hairdressers' sign.
Policeman	Guardianship.
Pomegranate	Union, concord, Spain.
Portcullis	Security.
Purple	Justice, royalty.
Quails	Plenty.
Ram, suspended	Tailors' sign.
Raven	Providence, Denmark.
Red	Charity.
Rose (colour)	Martyrdom.
Rose (flower in Christian art)	Incorruptibility.
Rose (flower in mundane affairs)	England (illustrated at <i>w</i>).
Saffron colour (in Christian art)	Confession.

(To be continued.)

THE ARTS IN ENGLAND.*

WHEN MILTON attempted to write the history of early England he became dissatisfied with his undertaking, owing to the difficulties he encountered from the authorities on the subject. As he said, "The age whereof we now write hath had the ill hap, more than any since the first fabulous times, to be surcharg'd with all the idle fancies of posterity." It was a penance to him, he stated, merely to think of the works of some of the later monastic historians, but he underwent the toil of sifting their fables in order to save others from such unpleasing labour, "except those who take pleasure to be all their lifetime raking in the foundations of old abbeys and cathedrals."

* *The Arts in Early England*. Vol. I.—The Life of Saxon England in its Relation to the Arts. Vol. II.—Ecclesiastical Architecture in England from the Conversion of the Saxons to the Norman Conquest. By G. Baldwin Brown, M.A. (London: John Murray.)

It is still as difficult as in the seventeenth century to define the chronological sequence of events prior to the Norman Conquest. But in a great measure, owing to the investigations of those who have been raking amongst old abbeys and cathedrals and other ecclesiastical institutions, it is possible to explain relations between life in those distant days and our own. Many of the foundations then laid continue to be the support of things which are most dear to us. In spite of all importations from abroad, we are yet mainly Anglo-Saxons as a people, and the determination of the identity is an important exercise.

The task of bringing past and present into connection is mainly modern. Many prejudices had to be overcome before it could be attempted. Since the Reformation it was held to be a sign of patriotism to insist on independence of Rome, not only in the present, but in the past. It was believed there was an original Christian Church founded here in apostolic times. Even if that were the case, it would in no way prevent the formation of other bonds with Rome. The imperial city might be considered, after the downfall of Athens, as the capital of civilisation. The world—that is to say, Western Europe—derived from it not only law, but much else of importance. We find men going there from remote places, although it may not be clear to us what was the object of their journey. As the late E. A. FREEMAN used so often to repeat, "All roads lead to Rome," and, indeed, so much was sought there, it is no wonder that a great deal was credited to the city which never belonged to it. From Rome issued not merely material highways, but what we may call intellectual highways, and for the latter it sometimes happened the centre from which the lines diverged was sometimes no more than an abstraction.

Professor BALDWIN BROWN has produced a pair of fascinating volumes relating to the arts in early England, because to a large extent he recognises the direct or indirect influence of Rome. Although he holds that Rome or Roman may have been occasionally only an idea, "certain elements," he says, "of the civilisation which we call 'Roman,' and which we find pervading all the lands of the empire, had, in fact, their origin and the source of their power in the actual city of the seven hills: such elements were law, and the military and administrative system in general, but it must not be supposed that Rome herself was the fountain-head of all the intellectual and religious movements which pulsed throughout that vast domain." In all such cases it should be remembered that inspiration could not be always direct. There were likely to be many intermediaries, and in the course of the conveying and transferring changes were certain to occur. In respect to buildings this is demonstrated plainly. The forms which are characteristic of Saxon architecture do not bear a close resemblance to what is seen in Rome. But if an ordinary Englishman who could not draw endeavoured to make a builder in a distant colony realise the styles which are now in favour in London, there is no doubt any structure raised as a consequence of the instruction would be no more than a caricature. The English buildings may simply have been derived from similar caricatures erected by Roman colonists in England. There is much to be said for the opinion expressed by THOMAS RICKMAN ninety years ago. Speaking of the architecture in early England, he asserted:—"Although some fine specimens of workmanship have been dug up in parts, yet by far the greatest part of the Roman work was rude, and by no means comparable with the antiquities of Greece and Italy, though executed by the Romans. When they left the island it was mostly likely that the execution of the Britons was still more rude, and endeavouring to imitate, but not working on principle the Roman work, their architecture became debased into the Saxon and early Norman, intermixed with ornaments perhaps brought in by the Danes." This may not be clearly expressed, but there can be no hesitation about RICKMAN's meaning.

Any remains of the early architecture in England which happen to survive are parts of churches. With a people like the English we suppose in all times buildings of that class will be the best representatives of contemporary architecture. The chapters in Professor BALDWIN BROWN's first volume therefore "deal with some of the facts of religious and social life that underlie the early

history of English art." Some readers may be alarmed at the word "religious," imagining the book is an attempt to establish some theory about the primitive Christianity of England. But, so far as we can see, the author has no aim of that kind. Religion was closely bound up with life in England, and out of it arose much which is secular. This will be observed by the mere titles of the chapters in the volume:—The Country and the Town a Thousand Years Ago—The Castle, the Church and the Monastery—Christianity in Roman and in Unromanised Lands: the Conversion of England—The English Missionary Bishop and his Monastic Seat—The Saxon Monastery in its Relation to Learning and Art—The Village Church: the Circumstances of its Foundation—The Village Church: its Constitutional History—The Village Church in its Relation to the Life of the People. These headings are sufficient to show that a developing process was in operation. The parish, for instance, in the sense that we now interpret the word, was a late arrangement. On the authority of BOUX, there was no parish known in any of the French cities prior to 1032. As late as the time of the Council of Trent there were dioceses in Italy which were without parishes, and we believe that at the present day a Florentine child can be baptized only in the baptistery near the cathedral. The parish and diocese coincided in their boundaries and the bishop was thus the parish priest. According to BINGHAM, the revenues of the whole diocese were in the hands of the bishop, and there were no priests, deacons or clergy for particular churches in the city or diocese. They were all served from the mother church. Consequently, in a country like Ireland the administrative unit was not a town or a district, but rather a tribe or a clan, and in the time of St. PATRICK there were, it is said, over 300 bishops in the island.

In England, where there was more stability than in Ireland, there seem to have been villages which were the capitals of a tribe, or, it may be, of a family and its retainers. Sometimes the village church would be regarded as essentially the property of the nearest land proprietor. A few years ago, it will be remembered, there was long litigation because the Duke of NORFOLK treated the chancel of the church at Arundel as if it were his private property. It contained the monuments of some of his ancestors, and he separated it by a wall from the rest of the building. Archæologists who were unaware of the history of English churches looked on the act as illegal; but the Courts took a contrary view, and the old chancel is now locked up as a private chapel. The case exemplifies many things found in the Professor's first volume. No doubt the power of the clergy was enough to restrain private owners from any arbitrary exercise of ownership in respect of church buildings. But the right existed and still remains. There was one instance with which the late Sir GILBERT SCOTT was connected in which the owner of an estate, or lord of the manor, believing he was affronted by the vicar, threatened to deprive him of a church by its demolition, and it was, we believe, mainly through the architect's diplomacy that the evil was avoided. Wilful men of that class happily are rare, and the English church was allowed to become the centre of local life to the great advantage of high and low.

The second volume is as architectural as the first is constitutional and social. The various types of structures, from the beehive huts on islands off the west coast of Ireland down to the churches in which the Normans endeavoured to improve on what stood in this country, are illustrated and described. The principle of evolution is kept in view, and the change from the homogeneous to the heterogeneous, or, to put it in the author's words, "the exigencies of form produced originally by the exigencies of construction, is gradually modified by subdivision and by the defining and accentuating of parts." We give one abstract descriptive of a familiar characteristic in order to suggest the author's manner of treating his subject:—

Long-and-short work is the best known and most easily diagnosed of all Saxon symptoms. The following is the method of it:—An upright pillar of stone, square in section and in height, varying from about 2 feet to 4 feet, is placed at the angle of the structure. It may be that of the tower, the nave, the chancel, or the porch, and over it is laid a flat-slab of stone which grips into the wall and shows the length of its sides along the two faces. The correct designation of the work, when the whole of it is seen, would be upright and flat

rather than long and short, but the latter term becomes appropriate when, as is often the case, the surface of the walls is plastered. With a view to plastering, which was a common, perhaps a normal, finish to Saxon walling, the wall face was set back some half-inch or so from the surface of the upright stones on the quoins, and the plaster brought up flush with the edge of these. The parts of the flat slabs that lay along the walls were cut back level with the wall faces and covered with the plaster, so that only that portion of them was visible which corresponded with the widths of the uprights. This portion was in height only the thickness of the slab, and appeared "short" in comparison with the "long" upright pillars. Fig. 34 exhibits the technique in an example where the plaster has been stripped from the stonework. Were the plaster present the tailing of the flat piece into the wall would not be seen. This quoining is an excellent Saxon criterion, for, so far as the writer's knowledge goes, it is never used in Norman work in the Duchy, or indeed anywhere on the Continent, though there are occasional survivals of it in Norman work in England. An equally significant feature, and one that can be caught in a passing glance, is the so-called pilaster strip. This must be carefully distinguished from the buttress. Saxon walls in general are unbuttressed, though the buttress occurs in three Kentish examples, St. Martin and St. Pancras, Canterbury, and Reculver; also in the enigmatic church of St. Peter-on-the-Wall, Essex, and round the apse at Brixworth. These buildings are all presumably early.

It will be observed there is no indifference to the details of construction in the passage. The volume can be considered as practical in the sense that it would be possible to make drawings which would be indicative of construction from the descriptions alone. There is, however, nothing to daunt the intelligent reader who is not an architect. Page after page can be perused with ease, for the style is clear and precise. The two volumes fill a void in professional literature. There are some excellent histories of earlier and later periods of architectural history. But either the difficulty of piercing the obscurity or the fear that readers were indifferent has prevented the preparation of any adequate treatise on the pre-Norman period, when it may be said the foundations of what is best in modern English life were laid. Thanks to Professor BALDWIN BROWN's courage and research, the chain of history has been completed, and both Englishmen and foreigners can now realise the part which has been taken in the evolution of architecture during fifteen hundred years.

IRISH BUILDING STONES.

ON Monday at the Imperial Institute a lecture was delivered on "Ireland's Mineral Resources" by Mr. St. John Lyburn, the mining expert of the Department of Irish Agriculture and Technical Instruction in charge of the collection of Irish building materials and minerals now at the Imperial Institute. The lecturer declared that the mineral resources of Ireland were deserving of the attention of capitalists. Iron ores were also known throughout the country, but transit difficulties stood in the way of proper development. The other minerals which might be worked to advantage in Ireland were lead ore, zinc, copper, gypsum, barytes, rock-salt, pottery clay, and there were besides a large number of granite, limestone, sandstone and marble deposits. He believed there was a great future in store for Ireland in the development of its granite industry. What was wanted was first inspection and then prospecting, to be followed by vigorous development where the discoveries justified such a course. Mr. H. Plunkett, vice-president of the Department of Agriculture and Technical Instruction in Ireland, said that it was not those who talked about industries, but those who took part in their development who were the men that Ireland wanted at the present time. The mineral resources of Ireland which appeared to him to be the most important at the moment were the building materials, the most attractive of which were the marble and granite. When Ireland possessed such a variety of marble and granite of great beauty of colour, it must be a matter of surprise to many that these stones were so little used in England. The reason was a very simple one. While there was a demand for them there never had been any concerted attempt to develop them in a large way. They could not be developed with small capital or in single localities, but he believed the time had now come for developing these resources in a large way. His Department was satisfied that in many districts all the unskilled labour that was required could be provided, and in time all the skilled labour that was necessary to put the requisite capital to a profitable use. There was undoubtedly a very useful movement in the way of the industrial development of Ireland, and he believed that Ireland was going to do its share in upholding the industrial and commercial life of the United Kingdom.

NOTES AND COMMENTS.

THE annual dinner of the Society of Architects will be held this evening. Mr. SILVANUS TREVAIL will preside. Several distinguished guests have accepted invitations. The President will at Thursday's meeting give his impressions of architectural rambles on the Continent. On May 23 there will be a "field day" at Rochester, with Mr. GEORGE PAYNE, F.S.A., as leader. The party will leave Victoria Station at 9.30 A.M. During the day Eastgate House, the Cathedral, Restoration House, the Castle, and the old Corn Exchange will be visited. There will be also an excursion to Cobham. The return is due at Victoria at 9.25 P.M.

ALTHOUGH the first number of the *Burlington Magazine* (Savile Publishing Company, Ltd.) was excellent, it has been surpassed by the second. The reproductions of paintings by FRANCIA, LUINI and an unknown Flemish master are successful renderings. There are others from drawings, old engravings, silver plate, &c. Sir E. MAUNDE THOMPSON explains the drawings of pageants known as the Warwick MS., and which form part of the Cottonian collection in the British Museum. They are invaluable as illustrations of costumes, armour, &c., and photography in such cases is more true than any engraving, as will be seen by a comparison with STRUTT's plates. Mr. PERCY MACQUOID treats of the "Evolution of Form and Decoration in English Silver Plate." Mr. WEALE continues his description of works in the Bruges Exhibition. Mr. PHILIP NORMAN narrates the history of Clifford's Inn, and appeals for its preservation; but when lawyers have determined on a project of legal education, for which the price of the old Inn is needful, lovers of antiquity have no chance of a hearing. The *Burlington Magazine* is the most interesting of the new ventures of its class.

THERE are a great many judges who believe that ADOLPHE MENZEL is the foremost illustrator of our time. We speak of him in the present tense, for although he was born six months after the Battle of Waterloo, he is still competent to produce fine drawings. Whether his natal year had any influence on him perhaps he could not tell, but a great many of his drawings have been given up to the illustration of war, and especially of FREDERICK THE GREAT. It is doubtful whether RAUCH's splendid monument in Berlin can equal as a memorial the numerous plates which MENZEL has devoted to the warrior king. He must, however, have regretted that he was unable to witness with bodily eyes the events he commemorates, for Herr MENZEL is, above all things, a lover of truth. A vast number of his drawings, from which engravings were made or photographs taken, will shortly be on view in London. They go back from recent times to his early years, and they will show the progress he attained, not only by hard work but by an endeavour to make every drawing better than its predecessor. The art of illustration receives so much attention among us, we have no doubt the veteran artist's work will be welcomed by those who labour in the same field.

THE Italian explorations at Haghia-Triada in Crete, which were recommenced in February, have brought to light a great many small examples of various classes of ancient art, besides the remains of a palace resembling the Knossos building. About two hundred stamps of baked clay were found, and they are supposed to be novelties in Greece, although familiar in the East. What purposes they served is unknown. Twenty plaques bore characters similar to those which Mr. EVANS was the first to bring under notice. Among the "finds" are four plain vessels of copper, ten female figures of copper, a dozen figures of sacrificial victims in bronze. There are also lamps in clay, steatite and stone, weights, vessels with figures of warriors, &c.

A CASE was recently heard before Mr. Justice FARWELL which demonstrates that the Public Health Act cannot be employed to support the claims of individuals. A Mr. HUBBARD erected a stable and coachhouse in Corporation Street, Loughborough, which a neighbour, Mr. MULLIS, alleged was contrary to the provisions of the Public Health Act, and was, moreover, outside the building line as marked

by the plaintiff's front wall. An application was made to take down the building, but as defendant refused, an action was taken. The defendant stated that the plans were submitted to the local authority, and the only amendment in them was the covering of a manure-pit. When plaintiff complained the authority refused to take proceedings. Mr. Justice FARWELL said the case was the first attempt ever made by a private individual to make use of a public Act passed to protect public rights for the purpose of asserting a private right, and in his opinion such attempt could not succeed. The urban authority was constituted for the purpose of safeguarding the general rights of ratepayers within its area, and not for the purpose of protecting the particular rights of next-door neighbours. If the next-door neighbour had any common law rights these were left untouched, and he could assert them. If he had no common law rights it seemed to him (the judge) that the legislature by the Public Health Act intended not to create rights in individuals, but general rights for the benefit of the inhabitants of a particular borough or district. Under these circumstances the action failed, and must be dismissed with costs.

CATHEDRAL SERIES.—WORCESTER: CLOISTERS AND SOUTH TRANSEPT.

CARVED OAK PULPIT AND SCREEN, BOTHBURY CHURCH, NORTHUMBERLAND.

THE RAILWAY HOTEL, NORTHALLERTON, YORKS.

THIS hotel, situate immediately adjoining the North-Eastern Railway Station, has recently been completed for Messrs. PLEWS & SONS, of Darlington, &c.

A portion of the old house still remains (as may be seen from the accompanying illustrations), but this, together with the whole of the extensive stable block and out-buildings, has been entirely remodelled and brought up to date. The lower portion of the building, to the level of the first floor windows, is faced with the Huncoats Company's Accrington red "plastic stamped" pressed bricks, relieved with Burmantofts buff terra-cotta. The bay windows and principal doorways are entirely of terra-cotta with bold enrichments. The upper portion, to level of overhanging eaves, is hung with red tiles, with intermediate courses of fancy tiles, and the whole of the roofs are covered with red tiles, all supplied by Mr. J. C. EDWARDS, Ruabon. The bar and tea-room (32 feet by 16 feet), divided by a glazed screen 7 feet high, is fitted out in stained and polished mahogany. The Bowes "well" fires have been used to all the principal rooms, and are in colours to match the decoration of the several rooms. The entrance halls, vestibules and bar are laid with MAW & Co.'s black and white tiles to an approved design, the floors of tea-room and smoke-room being of wood block on concrete, beeswaxed and dull polished. The whole of the windows externally, above the transoms, and the doors and fanlights over, internally, on the ground floor, screens, upper panels of doors on first floor, borrowed lights, &c., are of leaded lights of suitable design in plain white Venetian and sheet glass, the panels of the doors on ground floor being lettered in copper. The bar and tea-room windows are of brilliant cut and embossed glass with gilt lettering, the whole being supplied by Messrs. WM. MORRIS & Co., 252A Fulham Road, Kensington, London.

The stable fittings were supplied by Messrs. YOUNG & Co., London. The whole of the building is lighted by electricity, the fittings to the principal rooms being of oxidised silver.

The hanging sign of copper with *repoussé* lettering, the arc-lamp brackets and wrought-iron gates were supplied by Messrs. N. & E. SPITTLE, Birmingham. The spandrels to porch and to frieze of oriel bay window are executed in boldly modelled plaster by Messrs. G. JACKSON & SON, London.

The contract for the furnishing was placed in the hands of Messrs. MAPLE & Co.

The whole of the work has been executed from the designs and under the personal supervision of Mr. W. HARGREAVES BOURNE, A.R.I.B.A., architect, Darlington.

CHICKSANDS PRIORY, SHEFFORD, BEDS.: THE ENTRANCE HALL.

ARCHITECTURE AND THE PUBLIC.*

(Concluded from last week.)

ONE of the problems of the age is undoubtedly the domestic servant difficulty, and I venture to suggest that we have so little grasped the fact that we neither design our houses to minimise the evil, introduce labour-saving appliances, nor so decorate as to lessen work. I do not think we are far-seeing enough. We design for the moment—perhaps on the principle that "sufficient for the day is the evil thereof." The time seems to be approaching when the middle class will not be able to procure domestic servants at all, and when that time comes we cannot expect everyone to build afresh or to live in flats. The ingrained liking in every Englishman for his own little castle will not be eradicated readily, and the problem is to make that castle practically independent of domestic labour.

Small wonder that the lady of the house, overwhelmed by her domestic worries, rails against the architect who has aggravated them.

Are we ahead, not abreast, of the demand for technical education in these days? Are we conversant with the recent scientific discoveries? Are we making proper use of new inventions and applications of materials? Are we taking the measures we should to minimise fire risks? I do not know that we are. I will not extend the list, lest I try your patience.

Hedged about as we are with difficulties, hampered at every turn, we can neither experiment on our clients nor at their expense. Our opportunities of testing materials are limited, and we fear to attempt new departures lest they prove failures, and bring down upon us the wrath of our clients. No wonder we are dubbed old-fashioned, and accused of lagging behind the age. If I am correct, and I admit my assertions may be disputed, I do not think we should be hampered. With all respect, I would offer one or two suggestions to the Institute, not at all as criticisms, but as expansions of its usefulness.

1. Cannot some of its funds be devoted to such valuable tests of materials as, for example, those recently applied to brickwork, which, I believe, are now taken as the standard? I cannot but feel that the Institute could further the welfare of the profession to a much greater extent than it does in this way. I venture to think that a series of tests of cements, especially as to their expansive properties, would be invaluable; and further, in view of the behaviour of steel girders and stanchions during a fire, how far concrete with steel rods can be substituted. The question of fire protection is so important a one to the public that some definite data for those who are endeavouring to combat the difficulty would surely be highly welcome.

2. Cannot evidence as to the behaviour, advantages or disadvantages of certain materials, fittings and appliances be collected and published?

Manufacturers are doing much to keep level with the times, and all sorts of new ideas are showered upon the practising architect. If one of these ideas commends itself to me, if I think it grapples in a common-sense manner with some difficulty, or is an improvement on a preceding invention, I should like to make use of it, but in nine cases out of ten I dare not. I have no evidence that it is a success. If I boldly adopt it and it turns out satisfactorily, well and good, but if otherwise, I have to endure the rage of a client who instantly puts me down as incapable or crazy.

It is too much in the nature of an experiment. I would suggest that such ideas, such inventions should be considered, and if thought to be of value to the profession should be thoroughly tested, that evidence of their behaviour should be gathered, and that such information should be accessible to members of the Institute. I am not sure, but I think manufacturers would welcome such a test, and the profession might be spared a considerable amount of rubbish, and while avoiding the necessity of constantly falling back on things which are nearly obsolete, would encourage the manufacturers to a wholesome emulation.

I am quite prepared to be told that all this is utterly impracticable. Perhaps so—but I am certain of this, if the Institute do not establish something of the kind some other body will.

I need only mention one matter to illustrate my point. I suppose one of the greatest difficulties we have to encounter is the work of the plasterer, and recently attempts have been made to find efficient substitutes, but as far as I know with only moderate success. Here, then, is a field for investigation.

3. Cannot the Institute afford facilities for the testing of materials at a cheap rate to its members? Here is a matter in which our governing body have already been forestalled.

The National Physical Laboratory is prepared to undertake such tests at a moderate charge, I believe—to a limited extent—but I suggest that this is a boon which membership of the

Institute should confer, and would be of more practical value than knowing how the Greeks set out a volute.

If I wish to specify a cement, if I want to know the strength of a particular type of brick, if I am doubtful as to the quality of my timber, or if I want to know whether the plasterer has introduced garden mould into his rough stuff, I think my Institute should afford me the necessary facilities for ascertaining the information.

4. Cannot an elementary knowledge of chemistry be introduced as one of the subjects for examination?

I cannot conceive of any subject more important to the practical architect, and yet one more generally neglected. I think the advantages of even an elementary knowledge of such a subject are so very obvious that I need not weary you by recapitulating them, but I imagine chemists must stand appalled at the alarming ignorance of men who deal with substances without knowing their properties.

As an example, why should it gravely be proposed to dispose of the vitiated air in a room by "drawing off" carbonic-acid gas from the floor, under the impression that it is heavier than air? A little elementary knowledge would prove that warm carbonic-acid gas is lighter than cold air. Where air and carbonic-acid gas are of the same temperature, it is perfectly true that the latter is some two and a half times heavier, but having regard to the high co-efficient expansion of gases, it should be obvious that carbonic-acid gas, as produced from human bodies and artificial lights, is at a high temperature, and therefore so far expanded that it rises readily through cold air.

Are we not far too dependent upon so-called experts, who themselves lack the definite technical training which should make their services of any real value?

It is in considering such questions as these that it appears to me an intelligent knowledge of chemistry and physics, as applied to ventilation, materials and hygiene, should form part of the technical training in the equipment of the architect of the immediate future. Therefore, I would ask the committee of the Association to consider the advisability of establishing a simple laboratory and the necessary instruction.

If the architect is hampered by insufficient technical training, how much more is he hampered by the lack of any such training at all in the workman—not only the artisan, but the labourer?

As a case in point, may I instance a labourer who in filling up with dry rubbish under a tile floor included enough lime to blow up the floor and cause considerable worry—which, of course, recoiled on the architect. I maintain that no architect should have to stand over a workman to prevent such results of ignorance. Ignorance like that should not exist, and I for one would welcome any system of technical training which would not only create efficient workmen, but give them an intelligent interest in their work. Perhaps then we might have less deficient workmanship, less friction, and the long-suffering architect would not be goaded to the last pitch of exasperation.

Perhaps, too, in time our employers will come to realise that the scale of remuneration is not always such that it should command the services of many experts in the person of one man, who, if he is to earn a decent livelihood, must so overburden himself that he cannot give the attention he would wish to minute details. At present the public little realise the immense amount of labour represented by an architect's services, their idea of his labours generally being comprised in the notion that he sits down in an easy chair for an hour or two and produces a pretty sketch, for which no brain-work is required. When it is realised that the services of such an expert as an architect are a valuable commodity, it may be that it will be made worth his while to devote such services to fewer things at a time with advantage, I venture to think, to both parties.

If an architect could but take up his job, make it his pet, live in it and revel in it, as a painter does his picture or the sculptor the work of his chisel; if he could make it the fitting home for the work of these artists or the craftsman—untrammelled by sordid considerations—I think we should hear less of the grumbling, and perhaps receive a word of grateful appreciation with the final cheque, more than repaying the months of anxious thought and unwearying devotion, and endless trouble and worry.

It is coming to this, that with the multifarious requirements now demanded of the architect, life will be too short to cram into it the requisite amount of study, and we shall have to specialise more and more. It may be that our system of training is too general and too superficial, and the problem will be to develop the particular bent, to encourage the special talent of the young beginner. I am not sure, myself, that our present system of training is by any means perfect. I think far too much time is spent over "the orders," to the detriment of more important subjects. What does it matter that the student should determine the proportions of the Parthenon to a hair's-breadth, and be called upon to judge between the measurements of various authorities? Are we to breed architects or mere antiquaries? What does it matter if a

* A paper read before the Architectural Association by Mr. A. Needham Wilson on Friday evening, May 1.

student does not know the difference by name between an "apophyge" or a "cyma recta," or that he cannot give offhand the name of the man who designed the Parthenon? Is he less likely to turn out a practical architect because he does not know these things? Does it give him greater power of design, or a keener sense of the beautiful? I do not wish to deprecate for one moment the advantage of a good sound grounding and solid knowledge of all on which we base our modern architecture, but I do strongly deprecate the trifling with unimportant details to the exclusion of more urgent matters. As I said, if the particular bent of the student can be determined after a period of general training, then will be the opportunity to insist upon a proper understanding of the minute details connected with that bent. I cannot but feel that in our anxiety to emphasise the artistic side of the profession we have swung a little too far, and the public have developed some impatience with us and our methods, and it is high time to show them we can be artistic and practical as well.

Further, we are a humble minded folk much to our detriment. We have not sufficient self-assertion or combination. We take little heed of criticisms or attacks, and we rarely concern ourselves as to whether they are justified. We live too much in a little world of our own, and scarcely realise that we are a vitalising force, and should make ourselves a vital necessity and a tremendous educational power. There is too much individualism amongst us. Why should any one of us be left to fight out as best he can some vital point, intimately affecting the weal or influence of the profession as a whole? Why should a single individual be left to fight for a principle? He should have the whole weight of the profession and its leading body at his back, provided the cause is just. Far too often have we to acquiesce in some palpable injustice because we dare not, cannot stand alone.

What weight do we carry as a body? If some glaring vandalism is contemplated, who attaches any weight to our feeble protests? Things are perpetrated which should raise a storm of righteous indignation, and we shrug our shoulders and placidly go on our obscure way. Our streets are made hideous by every Philistine method that can be compassed by the wit of man, and we content ourselves with a nervous grumble. Now the public are beginning to open their eyes to the sordid dinginess and dead level of monotony which surrounds them and the rampant ugliness on every hand. They are casting about for means of delivery from this blighting ugliness of commercialism which crushes them down, and it is for us as a body to proclaim ourselves their emancipators, to set ourselves at their head. It is for us to raise the oriflamme of a new era of brightness and beauty adapted to the practical needs of the age before municipalism sweeps us one and all into a chaos of general commercial utilitarianism.

In conclusion, I feel some apology is due for the unintentional prominence of the personal pronoun in these notes, but on such a subject it is unsafe to dogmatise, and better to stand or fall on the merits of one's personal opinions. I am quite prepared to have them mercilessly criticised, and I do not claim that they are particularly new, and if any of them are I will cheerfully accept the statement that they are quite worthless. If I have but offered, however crudely, a field for useful discussion from wiser heads than mine, I shall be more than content.

Lord WINDSOR, in acknowledging the invitation to the meeting, said he did not feel he had any right to address the members after the admirable paper they had heard, but for the reason that the subject was not a purely architectural one—i.e. wholly technical—the public had been prominently introduced. He had had the opportunity—a rare one—of calling in the efforts and knowledge of architects in a private capacity, but to an extent which did not fall to the lot of most people. This was for the building of a house in the country and in London, and, so far as his experience went, the result of the work in the concrete form would redound to the credit and raise the fame of the architects engaged for generations. There was one point he would refer to. It was one common to the education of the present day in its various branches, namely, it all tended to extreme specialisation. They knew that scientific men were unable, as their predecessors were able, to follow scientific pursuits within a large area, and as each one desired to attain the highest point in the investigations he was engaged in, he was almost compelled year by year to specialise more than his predecessors, and to devote himself to one narrow branch. He (the speaker), from what he had heard in the paper, imagined that this state of affairs was true to some extent nowadays in the practice of architecture. He could quite believe, therefore, that the difficulties were very great when the architect was obliged by the public to make himself acquainted with the large number of subjects which he would have a right to believe should be treated by a specialist. At the same time, it would be a pity to narrow more than could possibly be helped the great conception of architecture. It was well to remember the Italian Renaissance, a great time in the history of building of two schools. In Italy certainly the Florentine school proved

that their buildings were not only the work of the greatest architects, but the greatest painters and sculptors, and it could not be doubted that the extreme beauty of the creations of that time were attributable to the wide knowledge of those men engaged in building and the various branches of art. Thus it seemed that the nearer the relation of the arts the more was it possible to have good architecture and to produce great and lasting monuments of art.

Mr. FRANCIS HOOPER, who proposed a vote of thanks for the paper, said he had had the pleasure and satisfaction of taking part in some of the tests of brickwork undertaken by the Institute; the results were valuable, but little appreciation was shown for the efforts of those who conducted them—men who had few spare moments.

Mr. MURRAY seconded the motion, supported by Messrs. W. A. Pite, W. Banks Gwyther, R. H. Weymouth and A. F. Munby.

The PRESIDENT read the report of the scrutineers and the result of the ballot for the committee for session 1903-4:—*President*.—Henry T. Hare. *Vice-Presidents*.—R. S. Balfour, Arnold Mitchell. *Committee*.—W. A. Pite, Louis Ambler, A. N. Prentice, E. Guy Dawber, W. Howard Seth-Smith, E. L. Lutyens, John Murray, J. S. Gibson, F. D. Clapham, R. H. Weymouth. *Hon. Treasurer*.—Francis Hooper. *Hon. Librarian*.—J. MacLaren Ross. *Hon. Secretaries*.—H. P. G. Maule, Henry Tanner, jun.

A vote of thanks was passed to the scrutineers and the meeting then terminated.

A DUBLIN CHURCH BUILDING CASE.

A REMARKABLE action was heard before Mr. Justice Madden in Dublin on May 5, 6 and 7. It was brought by one of the Roman Catholic priests of that city, the Rev. J. E. O'Malley, P.P., against the archbishop, the Most Rev. Dr. Walsh. The plaintiff claimed 4,727*l.*, which was paid to and for the use of the defendant by the plaintiff as his agent, and at his request. The plaintiff had been appointed in 1892 parish priest of St. Agatha's, which was then in want of a church. In 1894 a parishioner, Miss Eliza Walsh, died leaving by will a large legacy to Father O'Malley and to the Archbishop with which to provide for the erection of a church in the parish. The plaintiff took steps immediately to carry out this desire, and he selected a site in Richmond Place, which was then occupied by a laundry carried on by the Discharged Prisoners' Aid Society. The arrangement was that premises no less suitable for the business should be provided in exchange. Accordingly, plaintiff arranged with the late Alderman Meade to purchase premises in Henrietta Street for 2,500*l.* Machinery was put in, the removal was duly made and the negotiations and agreements met with the approval of the Archbishop. The costs in all amounted to 4,700*l.* odd. At a later date the Archbishop alleged that he had not sanctioned the application of any of the trust money of Miss Walsh to the Henrietta Street premises.

The Commissioners of Donations and Bequests brought an action against both the Archbishop and Father O'Malley with the view of having the trusts of the will carried out and administered by the Court. The Master of the Rolls decided that the trust funds had not been properly applied to the purchase of the Henrietta Street premises, and gave Father O'Malley credit for 3,225*l.*, and the balance between that sum and the original total of 4,725*l.* was the sum the plaintiff was now actually suing for. That balance amounted to 1,472*l.*, which the plaintiff had paid out of his own pocket. The plaintiff had spent, at the request of the Archbishop, 4,727*l.* 15*s.* 3*d.*, and he had been allowed all but the 1,472*l.* Father O'Malley could not raise that money by appeal to his parishioners or the public without the sanction of the Archbishop.

The plaintiff gave evidence in support of the case. In the course of the cross-examination he was asked about the preparation of plans of the church.

Who did you employ to prepare the plans?—Mr. Lowey.

You described Mr. Lowey as greater than Michel Angelo, greater than Gandon, and the Parnell of architecture?—I suppose I did.

And that this gentleman, Mr. Lowey, solved a problem that was annoying Michel Angelo all his life, inasmuch as he united the five orders of architecture in one tower?—No answer.

Counsel read a letter of October 28, 1895, from Father O'Malley to the Archbishop, in which he described Mr. Lowey as the ablest architect in the city, and said he proposed to build schools under the proposed church to accommodate 2,400 children which would be value for 19,000*l.*, and "the carcass" of the church, that is the four walls and the roof, would cost 23,000*l.*

You said the thing did not quite deserve the fuss that had been made?—There was a lot of talk about the matter. I never got leave to publish a plan of the church, and I never

sent the specifications to Dr. McGrath, the Archbishop's secretary, as stated in one letter. The church plan is the finest ever presented to the Archbishop of Dublin, or for the matter of that to an archbishop anywhere else.

Where did you propose to get the 40,000l.?—That is for me to make out.

Were you sure you could get the 40,000l.?—I was.

You say in that letter—"I have been doing nothing but talk." Is that the 40,000l.?—No.

Counsel read a letter from Father O'Malley to the Archbishop, dated November 4, in which he said, "I have learned a great deal of frauds and tricksters and contractors and architects, &c., which in the next three months I may find to be of some gain to your Grace, that is, assuming you are not well up in that already." Counsel further read a letter from Father O'Malley to the Archbishop, dated November 8, in which he said, "There is not a church in this country like it, or, so far as I can see, anything on the Continent either." He added that 30,000l. would be able to do the whole thing, including the portico, and he asked about the date for laying the foundation-stone. He added that it was absolutely necessary to get the money together at once, and that he had got another will within ten days leaving him 14,000l. Is that where you were to get the 40,000l.?—I won't tell you anything about it.

Weren't you intending to build a cathedral also?—From the fact that I wrote it was in my head.

Did you ever say where the cathedral was to be?—I won't tell you.

Just as a mere bit of curiosity. Suppose a little bird were to tell me where the cathedral was to be?—Then it would be unnecessary to get an answer from me.

Didn't you say it was to be in the centre of Stephen's Green?—Yes; you seem to know all about it.

And Mr. Lowey was to build it?—Yes.

A man, you said, that James Gandon might take lessons from, and that Angelo himself might confer with. Was that all true?—So far as I knew, it was.

"A man who would give an entirely new face to ecclesiastical work." All that was to be done near William Street?—Yes.

When Mr. Drew was referred to he wrote that he only knew your great architect as a ganger on a railway?—I heard he wrote a disparaging letter.

Counsel read further letters from Father O'Malley to the Archbishop, in which he spoke of submitting Mr. Lowey's plans to the "Architectural Primate of Ireland;" that referred to the President of the Institute of Architects.

In further cross-examination witness said that the Archbishop asked him to mention a single ecclesiastical edifice designed by Mr. Lowey. He mentioned one, but did not remember it now. He mentioned Findlater's Church.

He was clerk of works on it?—Yes, that is the man that builds it. I don't know whether Mr. Lowey was a member of an institute of architects. I know he was an articulated architect. The Archbishop asked me for details of the work. I could not give him details. If you knew what it was you would ask. It was a series of drawings the full size of the entire buildings—a thing that would load a horse.

I believe you said you would have to charter a donkey cart to carry them?—No; a horse's cart. The paper drawing should be the full size of every block of stone in the building for the workmen to work on.

On a scale of 12 inches to the foot?—Certainly.

Counsel read another letter from Father O'Malley to the Archbishop directing His Grace's attention to a paragraph in the *Freeman* about Armagh Cathedral, and adding that it ought to be a warning to builders about Gothic architecture. "The roof is within measurable distance of the floor, and in my opinion Maynooth Church will be in a few years also." In another letter of Father O'Malley's to the Archbishop he spoke of Mr. Lowey as "a living Council of Trent in his line," and he estimated the builders' cost of the proposed new church at 43,000l. and the architect's cost at 32,000l.

So you would save 11,000l. if you built the church yourself apart from a contractor?—I believed that.

Counsel quoted from the Archbishop's letter:—"As regards your intention of taking steps towards the erection of a church on a plan not approved of by the diocesan authority, I will not again say to you that you are not to do it. But the time plainly has come to say to you that if you do anything of the kind the consequences will be very serious indeed. As regards the deed sent to me some time ago, I am not going to waste my time writing over again what I have already written about it." Was not that the conveyance of the Henrietta Street premises that he had refused to sign?—Yes. That was the extraordinary thing. He refused, and would not explain why he refused after telling me to do it.

During all this time what had you been doing with Miss Walsh's trust money? You were paying it away actually by cheques?—All the cheques are there.

Did you not know that it was your duty to lodge that money in the joint names of yourself and the Archbishop as joint trustees?—Most certainly I didn't.

Mr. Justice Madden: There is no allegation whatever that any of this money was spent in any way other than for the expenses of the church.

There is no suggestion that this gentleman misappropriated any of the money. (To the witness)—You wrote this further letter on December 6, 1896:—"So far as my intentions are concerned, I will build no church but the one designed by Mr. Lowey"?—Yes. The Archbishop had an alternative of getting a plan of his own.

Your complaint is that the Archbishop won't allow you to collect money to build a church that he won't approve of?—No, but pay obligations that he told me to undertake.

Could not these obligations have been well discharged if you acted reasonably and under his control?—No. He got me to implicate myself, and I insist upon these being paid. When they are paid he can build the church.

Your case is that because the Archbishop didn't authorise a collection he became personally liable?—Yes, because if he authorised a collection there would be no liability at all.

Is it your view that you were to be entitled to commence a collection for any project no matter how wild or extravagant?—I would not propose a wild or extravagant project.

Is your answer, then, that you were not to be entitled to commence a collection that was for a wild or extravagant project?—There was no such distinction as that at all. Here was an absolute commission to buy a thing, and I executed the commission.

Did you ever submit to the Archbishop an estimate of the cost of this proposed church?—I didn't, beyond what we had yesterday, and furthermore, by the ordinary law of the Church I am not bound to do it. The building of a parish church is vested by the Canon Law in the parish priest.

Did the Archbishop call upon you to submit to him an estimate of the cost of the church?—He wrote it to me in letters, and, as far as I know, he has no authority by the law of the Church to make that demand; and in the position I took up in these letters you read yesterday, I was acting according to Canon Law. I asked him what was the connection between bishop and priest so far as this business was concerned, and he gave no answer.

Mr. Justice Madden: How can you get his sanction except by submitting a scheme to him?—He is empowered to pronounce for the necessity of a church, and then the money strings are in his hands, but the estimate and the style and all that is the work of the parish priest.

The amount to be raised from the parish for the building of a church, is that a matter over which the bishop has no control?—Strictly speaking, he has not by the law, but in this case the practice now is that the bishop gives leave and supplies the money, that is, in the sense in which I explained it.

Is it your view then that the Archbishop has no control over the expenditure to be incurred by the parish priest in the building of the church?—By the law, as I know it, he has not.

But you still say that he has power to prevent you from commencing the collection?—Oh, yes. That is a special clause in the law of the Irish Church.

By means of what information then is he to regulate his discretion when he determines whether you ought to start a collection or not?—That the church is to be built.

Must he not know something about the cost for which the collection is to be started?—As far as I know the law, it does not give him that power.

Although he has got no power to inquire into the expenses of the church, he has still power to veto your collection?—Yes.

And although he has no power over the expenditure he is still to be personally liable?—If he allows the collection, and allows the parish priest to take the risk of it and work it himself, he is under no liability. But if he orders the parish priest to sign papers and the rest of it and then suddenly changes and says "I won't allow it," he cannot do that.

If he prevents you from commencing a collection for a project of yours over which he has no control?—Over the details.

So far as the price is concerned he is still to be liable?—If he allows me the usual means of doing it, or any parish priest, the parish priest takes the risk then. In this case I was his agent for the purchase of the plot, and I was acting under his orders, and I was bound to obey him.

You know the law of the Church?—A little of it; but not as much as he.

Supposing, now, that there was a difference of opinion between you and His Grace, who was the more likely to be right?—I only know one law, the law of Maynooth, and I told him so.

And is it the law of Maynooth that you are going by and expounding?—Yes.

Will you point out to me or give me the reference to any statute of Maynooth which allows you to incur any expenditure,

no matter how great, without the controlling authority of the bishop, or the ordinary of this diocese?—There is nothing in the statute of Maynooth treated that way at all.

Where do you get the law, then?—What the law states when a church is going to be built is, "Let there be a collection made," and it does not say who is to make it.

Did the Archbishop serve you with what is called a precept, dated December 17, 1898?—He did.

Counsel read the precept as follows:—"To the Rev. John E. O'Malley, parish priest of the parish of St. Agatha, Dublin.—Sufficient time having now elapsed to enable you to take all requisite steps for the building of a suitable parish church of St. Agatha's, in place of the present building, I hereby enjoin upon you to take without further delay the steps which are prescribed by the statute 194 of the National Synod of Maynooth to be taken in all cases in which a new church is to be built. You will therefore on or before January 17, 1899, deposit, or cause to be deposited, here for my approval an architect's plan of a suitable church for your parish. As I cannot approve of any plan for the building of a parochial church unless I have before me an estimate on which I can rely of the cost of carrying the plan into execution, I have to require that any plan which you may submit for my approval shall be accompanied by one or more such estimates. Before my definitive approval can be given there must be a tender from some responsible builder undertaking to carry out the work for a specified amount; but, in the first instance, it will be sufficient to have an estimate the accuracy of which is attested by any architect who has superintended in his capacity of architect the building of any similar church or churches in Ireland or elsewhere. The carrying out of these preliminaries will necessarily involve some expense, and it should hardly be necessary for me to add that I am prepared, for my part, to sanction the outlay requisite for this purpose from the fund that is at present available towards the building of the new church; but this, of course, is on the condition that a statement of the expense to be incurred shall in the first instance have been submitted to me, and shall have been sanctioned by me in writing. You are furthermore required to furnish me, on or before the same date, with a duly vouched account of the moneys received by you, as one of a number of trustees, of whom I am one, as rent for the premises leased by those trustees to the Corporation of Dublin. In connection with all this matter, I have finally to call your attention to the Statute 193 of the Maynooth Synod, and to require of you to let me know, on or before next Wednesday, the 21st inst., the name of whatever public bank you may have selected, in compliance with that statute, for the opening of the account to which it prescribes that all moneys received by a parish priest for the building of a church shall be lodged."

Father O'Malley: I had been so badly treated before that that I determined to have no more money negotiations of any sort until this was settled.

In other words, you disobeyed that precept?—Yes.

Here is your answer on December 19, 1898:—"My Lord Archbishop,—I beg to acknowledge the receipt of your Grace's communication of last Saturday. The reply is not yet finished, but will be forwarded to you the moment it is completed by your Grace's very respectfully, John E. O'Malley." Were you in course of finishing your reply?—I cannot remember now. I suppose I was.

On December 24, you wrote:—"My Lord Archbishop,—I am and always have been desirous of carrying out both the Canon and civil law in relation to the matter between your Grace and myself." It is a very long document, and I won't read more than is necessary. (Reads)—"But suppose I refuse point blank, without giving any reason whatever, to take any further personal part in the discharge of this charity, am I guilty of any disobedience, and, if so, to what or to whom?" Was that the view you took, to refuse point blank?—No; I said if I did.

In the previous part of your letter you say:—"I was under no obligation at all even to show the plot previous to purchase to your Grace as Archbishop, but only as trustee of Miss Walsh"—I asked that to be informed by him. The previous part of the letter is asking for information. It is an interrogative letter from the beginning.

"The Bishop does not approve. I stand still. The Canon Law prescribes nothing further. I am not disobeying." Do you say that is merely an interrogative letter to ascertain from the Archbishop what your duty and the law was?—Yes.

And when he told you your duty, were you prepared to obey him?—Of course I would.

Did you obey him?—He never told me my duty. He never answered that letter.

Did he not tell you to send him an estimate?—Precisely. But was I bound by the law of the Church to do so?

You refused to send an estimate?—Yes, until I knew everything.

Did the Archbishop answer that letter of yours?—He wrote me a letter acknowledging that, saying, "I have received your letter and note your strange ideas of ecclesiastical duties."

After plaintiff's re-examination counsel for defendant asked the judge if the case had been made out. His Lordship said it would be more satisfactory to hear the whole of the evidence before he decided whether there was a case to go to the jury.

Mr. O'Connor, K.C., stated the case on behalf of the Archbishop. He said that although this action was only a money demand, it was, indeed, a melancholy case, as every case must be to some extent when it involved a dispute between a priest and his superior in the Church. He was not instructed to make any accusation whatever against Father O'Malley, except to say that he was of exceedingly unbusinesslike disposition.

The Archbishop then gave evidence. He said:—When I appointed Father O'Malley parish priest I told him there was a church badly needed in the parish, and that I would expect him in the ordinary course to build a suitable parish church. I gave him no further directions.

Do you remember his communicating with you with reference to certain plans for his new church some time in the year 1895?—Yes; he came to me in the month of October in that year to speak to me about the plans.

Mr. Henry, K.C. (reading):—"My dear Lord Archbishop,—May I request the favour of a short interview at the very earliest possible day to submit to your Grace a plan of the new parochial church? I want to show it to the people, to begin right in earnest to make the collection at once." Did he wait on you in pursuance of that?—Yes.

What took place at that interview?—He told me that he had put himself in communication with an architect of great eminence, a Mr. Lowey. I cannot be quite sure whether he hadn't written to me before coming a letter in which he mentioned Mr. Lowey's name. If not, the first time I heard of Mr. Lowey it was at this personal interview with Father O'Malley on October 21. I asked Father O'Malley was he quite sure that this gentleman was an architect at all. I said I had had a great deal of experience in building churches, presbyteries and schools of different architects in Dublin; that I thought by that time I was fairly well acquainted with all the leading architects of the city, and that I had never heard of this gentleman. And I added that on looking into Thom's Directory in the list of architects this gentleman was not mentioned there. What I am not quite clear of is whether I had looked into the Directory before Father O'Malley came, or whether I looked into it then and there. It is a book I always have in my study. At any rate, I looked at the list of architects and Mr. Lowey's name was not mentioned there, and I told that to Father O'Malley.

What did he say?—He said it made no difference whether a man's name was in Thom's Directory or not if he was a great architect, as this gentleman was. I then asked him could he tell me of any building that Mr. Lowey had erected, and Father O'Malley said he was very glad that I asked that question, because that was Mr. Lowey's strong point; that he had been architect of a great number of buildings, and that Mr. Lowey told him that the cost of them if totted up would amount to either six or seven millions. I am not quite sure of the figure. I asked him to name any of these buildings that he said Mr. Lowey had told him about. He said he could. He said there was a great hospital in London which cost 750,000*l.*; it was somewhere about Lambeth, he thought. I asked him was that the great hospital in Westminster opposite the Houses of Parliament. He said he did not know, but that there was some great hospital that cost 750,000*l.*; and I rather think he said that it covered 70 acres of ground, but I am not quite sure of that. I asked him were there any other buildings. He said the Parliament houses in Melbourne, the Parliament houses in Sydney and the Parliament houses of the Dominion of Canada. I said it would be rather troublesome and difficult to make inquiries about places that were so far away, especially as he was anxious about getting on with this church as soon as possible. I asked him, Could he mention anything nearer home? and especially I asked him about churches. I told him that we were very exact about having an ecclesiastical architect when a church was to be built, that a gentleman might be very good in building Parliament houses, and yet not be very capable of building a church. Well, he said that was another strong point of Mr. Lowey's, that there were two churches he could mention to me in Dublin—churches that he was sure I knew very well, and that Mr. Lowey was the architect of both. The first of these was the church known as Findlater's Church in Rutland Square, the other was St. Patrick's Cathedral—not the original building of it, but the restoration of it under Sir Benjamin Lee Guinness. I told him that I felt there was some mistake about this, that he ought to make inquiry, and that he should bring me some proof. I told him I would make inquiries myself. He said not to mind troubling myself, that he would furnish me with all the necessary proofs. Before going away he said, "There is not an architect in Dublin who is fit to point Mr. Lowey's pencil." That terminated the interview.

Was Michel Angelo mentioned at that interview at all?—

Yes. He said that Mr. Lowey had succeeded in solving the problem that Michel Angelo had spent years of his life trying to solve and had given up in despair in the end. I asked him what the problem was, and he said it was to build a tower combining all the different orders of architecture. My remark on that was that I thought that was not very difficult; that I believed I could do it myself if I could build a tower at all. Then he undertook to give me a solution. He said it was a technical matter, and that probably I could not understand it. He said he did not quite expect that I could; it was something about building a tower on its own axis.

Mr. Justice Madden: Did he descend to any such practical matters as estimates?—Oh, no, he didn't go as far as estimates.

At that interview did he also mention a project for building a large school under the church?—He did.

I believe that was to accommodate some 2,400 children?—He merely mentioned the project in a general way, and he afterwards wrote me a detailed letter about that wonderful school.

It was to train the entire north side of the city of Dublin?—He said it was to train the north side of Dublin from the Tolka to the Custom House; it was to be a day school and a night school, and the night school was to serve half the north side of the city.

In further examination, His Grace said that Father O'Malley gave him a long list of people who, he intimated, could testify to Mr. Lowey, but he didn't give testimonials from them. All through Mr. Lowey was mentioned as the architectural primate of Ireland, and Father O'Malley wrote or said that Mr. Drew would be very happy to call upon him (the Archbishop) and give him his opinion of Mr. Lowey's eminence in his profession. Mr. Drew never called. On November 19 Father O'Malley wrote, stating that the London hospital with the building of which Mr. Lowey was connected covered 70 acres, that his part in it was confidential, and that the confidentiality was created by a written contract, but that the parties concerned would give their names privately if he (the Archbishop) wished. Mr. Drew said the general conception of the building was magnificent—was very fine, but that all the details would require to be gone over by a practised or trained architect; that it was the details that were in the plan he objected to, and required other details to be substituted for them. He (the Archbishop) called for a responsible builder's estimate of the work. Father O'Malley wrote to him stating that the contractor's price for the work was 46,669*l.*, and the architect's price 35,234*l.* Father O'Malley suggested in that letter that he should be allowed to be his own contractor, and that he and Mr. Lowey should carry out the work. In a subsequent letter Father O'Malley said these figures were not correct, that he found he had made a mistake, and that he found that the 46,000*l.* was 4,000*l.* too high.

Mr. Henry: You were familiar with the parish of St. Agatha, the class of the people, the number of parishioners, and the resources of the parish?—Yes.

Was the sum proposed to be expended quite out of proportion to those resources?—Quite out of proportion. Father O'Malley described the condition of the parish accurately when he said that if a debt lay upon that parish it would remain there.

Were you prepared, if a reasonable plan at a reasonable cost had been submitted, to approve of it, and authorise the construction of the church?—Of course.

Mr. Justice Madden: You got eight thousand pounds to commence with, and I suppose about two or three thousand more would do?—I should say up to fifteen or twenty thousand, if we decided to be very liberal. Father O'Malley had told me on three or four occasions that he had a number of wills that were coming in. He said there was a will leaving him 14,000*l.* in certain eventualities. There was another occasion on which he said there were two old ladies, from one of whom he was to get 5,000*l.* and from another 5,000*l.*, so that I might be liberal in allowing a church to be built on a larger scale than usual when these promises were realised.

Ultimately, after a number of months, almost years, of correspondence with him, on July 15, 1896, did you write:—

"My dear Father O'Malley,—Three or four times the length of time which you have mentioned to me as requisite for getting the statement of the cost of the projected church have now expired. The delay threatens to become indefinite. In the meantime, there is sad need both of a church and of a school. Can we not begin to do something practical." That was your letter?—Yes.

Then on July 21, 1896, did you get an extraordinary letter in reply, bringing in Mr. Landles?—Yes; he said he gained 450*l.* by doing a sum in arithmetic.

In that letter in reply to yours asking that something practical should be done he lays down a number of conditions:—"Secondly, that the plans as shown be really carried out." Were those the plans that had been submitted by Mr. Lowey involving this expenditure of nearly 40,000*l.*?—Yes,

and plans which Mr. Drew said should be modified in detail by a practical architect.

In further examination His Grace said that in that letter Father O'Malley requested that full and complete discretion in the raising, disbursement and management and control of funds during the erection of the church should be entrusted to him. He did not give Father O'Malley any such discretion. He wrote to Father O'Malley on August 11, 1896, a letter in which he stated:—"As regards your intention of taking steps towards the erection of a church on a plan not approved of by the diocesan authority, I will not say to you again that you are not to do it. But the time plainly has come to say to you that if you do anything of the kind the consequences will be very serious indeed."

Mr. Henry: Shortly after that did the question arise as to the Walsh trust, and did proceedings then begin towards the end of 1896?—Some months after that.

The proceedings that you refer to commenced after you got a letter revealing for the first time that Father O'Malley was spending the Eliza Walsh money in Henrietta Street. You didn't know that up to that date?—No.

From the time that Mr. Lowey's plans were submitted to you was any other plan or estimate laid before you for your approval by Father O'Malley?—No other plans were laid before me but Mr. Lowey's at any time—I must correct that statement. Before Mr. Lowey's plans were produced, at a very early stage in the transaction, Father O'Malley had got plans for a church from a well-known Dublin architect, Mr. Hague. He brought these plans to me, and I approved of them. But that fell through somehow. That was before Mr. Lowey came on the scene. This was long before the interview of April 29.

On December 6 he clearly defines his position. "So far as my intentions are concerned, I will build no church but the one designed by Mr. Lowey. The old house, which is no good to me, must be removed completely first of all, and I must have absolute control of everything connected with the raising of the new building, this either from you or Propaganda. Otherwise there will be no church in my time." Up to the present time, until this case came into court, did you ever hear a suggestion that the sanitation of this house was such that it could not be used for a presbytery?—Oh, never.

Did the correspondence continue off and on practically during the year 1897 without practically anything being done?—It did.

Mr. Henry: You also got a letter offering to allow you to build the church, but that matter was to be subject to his (Father O'Malley's) control?—Yes; he proposed an alternative arrangement—that either I should allow him to build on Mr. Lowey's plan or that I should take over the obligation for the church myself, in which case I should build the church subject to his (Father O'Malley's) approval.

I want to ask your Grace some questions with reference to the law of the Church on the subject. With reference to building a church in a parish, what is the duty of the parish priest before he begins building?—His duty is to get the permission of the bishop of the diocese.

It has been suggested by Father O'Malley that that is a modern provision dating from the Synod of Maynooth?—He is completely wrong in that. It is the law of the Universal Church; it is the Canon Law that no church can be built in any diocese without the leave of the bishop.

Quite apart from any legislation of the Synod?—Yes. The universal statute law of the Church, the Sixth Book of the Decretals, contains a most express Canon on this subject. The particular decretal that I refer to was made in the time of Boniface VIII., who was Pope in the reign of Edward I., who was, I believe, a great lawyer also.

Is the bishop under any obligation to approve of the plans when submitted to him, or is it a matter for his discretion?—It is a matter for his discretion. His duty is to act reasonably and prudently; on that matter, as in all other matters of the kind, there is an appeal from the bishop to the archbishop, and from the archbishop to the Holy See.

And in the requisition that you made with reference to the submission of plans to you and the other requirements, were you acting in accordance strictly with the Canon Law and with the statute of Maynooth?—Yes; on two grounds. First, as regards the general Canon Law, there is an express injunction that the bishop shall not approve of any church without seeing that sufficient provision is made for the endowment and for the requirements of religious worship in the place. As the only endowment that we have in Ireland are the offerings of the faithful, it is under modern conditions the duty of the bishop to see that the cost of the church shall not exceed what the resources of the parish can reasonably be expected to bear.

And was it in pursuance of that duty that you called for the estimates from Father O'Malley?—Yes; under the regulations of our Synods it is necessary to have the plans of the church approved of by the bishop before any progress is made in the work, before the bishop lays the foundation-stone of the

church. Under the statutes both of Thurles and Maynooth it is the duty of the parish priest to submit the plan of the church for the approval of the bishop.

Is there a diocesan regulation in the Archdiocese of Dublin on the subject?—There is a diocesan regulation issued in conformity with the regulations of Maynooth. I can only speak for my own time in this, but I have no reason to suppose that my practice has not been the practice of my predecessors. In no case have I ever given sanction for any ecclesiastical building of a large character, especially a church, unless the plans were submitted to me in the first instance.

And a considerable number have been built in your Grace's time?—A considerable number of churches, schools and presbyteries; and this has been the only case in which there has been any difficulty such as has arisen here.

Mr. Justice Madden, in the course of his charge to the jury, said:—Here was a poor parish, and here was a nice nest egg for a new church, 8,000*l.* One would think nearly enough, but His Grace would go to 15,000*l.* or 20,000*l.* The jury did not live in the moon, and they knew that St. Agatha's was not a very wealthy parish. He really agreed with a great deal in the very eloquent speech of Mr. Chambers about enthusiasm. It had his warmest sympathy; but judges and jurors were most unsympathetic people. They only dealt in pounds, shillings and pence and hard facts. He was bound to say that His Grace had told them that Mr. Lowey's plan was according to Mr. Drew a fine one. He did not know who Mr. Lowey was, or whether his name was in Thom. Perhaps the plans were very fine, but then they worked out to 40,000*l.*, without what Father O'Malley called "trimmings." Now he had had the pleasure to preside on building cases, and there was no greater enjoyment in life. He knew what builders' "trimmings" meant. What was His Grace to do? He was sure Mr. Lowey was a Michel Angelo, and a great man, but his church for St. Agatha's would mean a charge on a poor parish of 50,000*l.*, which at 4 per cent. would mean 2,000*l.* a year, and the evidence was that that 2,000*l.* a year should be paid out of the offerings of the faithful before paying the clergy. Naturally His Grace said such a thing was impossible. The plans might be the finest and noblest, but where was the money to carry them out? Was it unreasonable on the part of His Grace if he did withdraw his consent to raise money for such a project? It was for the plaintiff to prove that. The onus rested with him. The whole business was an unfortunate illustration of the truth of the lamentable consequence of a business transaction being carried out in an unbusinesslike way.

The jury found for the defendant, and expressed the desire that the scheme for building the church might be carried out.

The evidence has been taken from the verbatim reports in the *Freeman's Journal*.

Mr. Lowey has written the following letter:—

Colonial Chambers, 62 Dame Street, Dublin:

May 6, 1903.

In to-day's report of the above case it would appear that some well-meant but ill-considered letters were referred to, which had been written by Father O'Malley to His Grace relative to me, for which I venture to say public opinion will not hold me responsible. So far from pressing my services on Father O'Malley in this matter, it was only when he had again and again requested me to make a sketch design for the church that I agreed to do so. One outrageous and lying statement was made which I cannot allow to pass; I was referred to as a gangster. I most emphatically deny that I was ever engaged in such a capacity, and hurl back the base and unfounded assertion with the contempt it deserves. I further defy any of the maligners to prove the most infinitesimal stain upon my character, either moral or otherwise. I never stated that I was architect for Findlater's Church; neither was I clerk of works, although I have filled a similar position on many works of greater magnitude.

For the enlightenment of any who may still doubt the fact of my being a qualified architect, I beg to say that I served my articles in the office of an eminent Northern architect some fifty years ago with satisfaction to my master and honour to myself. Although so many years have intervened, fortunately the document is still preserved, and can be inspected by the incredulous. I fail to see why my name should be dragged up again in this action, as I had determined several years ago to have nothing further to do with the church in question.

Kindly give place to this letter in to-morrow's issue, where it can be read with the report of the case, and oblige,—Yours faithfully, Edward S. Lowey.

P.S.—I have just observed an additional series of mis-statements relative to me in connection with numerous public buildings at home and abroad, some of which I had not even heard of until now. I have been engaged on many competitions. Amongst others, two large fever hospitals—one at Tooting, the other at Hither Green, London. Probably it was to either of those Father O'Malley alluded. Finally, on looking over Thom's Directory of 1895, I find my name "does" appear, practising then as now at 62 Dame Street.—E. S. L.

RESTORATION OF THE TEMPLE CHURCH

IN an article on the restoration of the porch and turret on the north side of the Temple Church, which is to be directed by Mr. Jackson, R.A., the *Standard* says:—

The danger of the porch is evidently due to the imperfection of modern stonework. The magnificent Norman doorway—with its groined mouldings and half-length figures in bas-relief, three of which may or may not be intended for Henry II., his Queen, and Heraclius, the Patriarch of Jerusalem—stands, barely touched by time, as sturdily as of the day when it was built. It may require a touch or two here and there, but, as a whole, it bears remarkable witness to the honesty of the ancient masons. But the arches of the porch do undeniably need support of some sort, and that because of the friable nature of the stone used on them within the last sixty years. The ecclesiastical restorers who came before, Scott meant well, but in many instances they seem to have been most unfortunate in their contractors. Their handiwork about the Temple Church—to go no further back than the beginning of the last century—comprised a general repairing, commenced in 1811 through the energy of the Master, Thomas Rennell, who was also Dean of Winchester and the son-in-law of Blackstone; the more important efforts of 1825 and onwards, when Sir Robert Smirke renewed the whole south side and the lower portion of the Round; and, finally, the active period from 1840 to 1845, when his brother, Sir Sydney, and Decimus Burton directed operations. The results of the last spell of architectural industry are familiar in the conical roof over the Round, an original feature replaced by a happy inspiration, and in the pleasant marigold window revealed above the porch, not to mention the lowering of the floor and the removal of much barbaric plaster and paint from the columns. The porch itself was freed about this time from encumbrances, the bare existence of which seems almost incredible in these days of ecclesiastical propriety. Travellers in Italy are not unfrequently aghast to perceive some exquisite interior, adorned by priceless frescoes, in constant peril from a collection of crazy cottages huddled under the outside walls. But the Temple Church, particularly at the west end, must have made the thoughtful grieve, with even more urgent cause, for its liability to destruction. The porch, a survival of the old cloisters which perished in the fire of 1678, actually had a house imposed upon it somewhere about 1700, completely blocking the marigold window from view. Another edifice stood against the northern arch, with a stationer's shop cheek by jowl with it, and even underneath the roofing. The firm, whether known as Penn & Lloyd or Lloyd & Gibbons, appear to have been regarded by the Inner Temple as most desirable tenants for considerably over a century. Both inns seem, indeed, to have clung tenaciously to various small buildings which nestled under the church; thus the upshot of a vigorous dispute between them in 1634 was merely the removal of a cottage inhabited by a seamstress. Fortunately an ampler public spirit prevailed in the nineteenth century, and though the Benchers may have been victimised by their subordinates in the work of restoration, they did not grudge expense. Britton, the well-known author of the "Architectural Antiquities of Great Britain," writing in 1807, felt constrained to admonish them that "whereas the patriotic conduct of some public societies is entitled to general panegyric, the niggardly procedure of others provokes our astonishment and censure. As the societies of the Middle and Inner Temple are equally interested in the stability of their public buildings, we are surprised that they do not remove the several petty shops which are built against the sides of the church, and which not only disfigure the building, but are injurious to its walls and foundations." He handsomely added, however, in a later edition, that he perceived an earnest of better things in the appointment of Mr. Smirke, and by the time that the era of reconstruction was over both inns had certainly dipped deep into their treasures. The repairs of 1825 and the following years cost upwards of 35,000*l.*; those begun in 1840, on a modest estimate of some 3,000*l.*, entailed in the end the disbursement of 53,000*l.*

The weather-beaten turret, with its somewhat dumpy spire, has assumed a deceptive appearance of antiquity. It does not figure at all in the prints of the Temple Church published during the first half of last century, and it is absent from the elaborate ground plan supplied by Bond to Britton's portly volumes. It belongs, therefore, to the Smirke period, as we may call it, and though it exhibits a certain feeling for twelfth and thirteenth-century taste, it cannot be regarded as other than an excrescence when architecturally regarded. The turret, nevertheless, may be considered to justify its existence by its usefulness. Originally, the bell or bells of the Temple Church hung, beyond all question, under the Round. A steeple was subsequently built for them, and in it they had become so cracked and useless by 1675 that John Playford, the clerk of the church, felt it incumbent upon him to petition the Benchers that the two should be cast into one. As he observed in the temper of a true economist, the process ought to produce an

excellent bell that would be "heard into all the courts belonging to both societies."

The Temple Church has been, on the whole, most fortunate in those who have used chisel or trowel upon it. Even during the Commonwealth period, when many ecclesiastical buildings went to ruin, the Benchers were careful to keep it in good repair. Earlier still, the doughty Dr. Micklethwaite, as became a staunch supporter of Laud, succeeded in effecting the minimum of change in the Puritan direction, though he could only carry his point by keeping the doors locked and the keys in his pocket. The real time of neglect, as distinguished from the reign of bad taste, exemplified in the seventeenth and eighteenth centuries by the erection of shops without and the application of whitewash within, was that of the Restoration. It was then that the worthy Playford complained not only of cracked bells, but of a rotten pulpit, and of doors in the screen so decayed that the chest with the Communion plate should be considered very insecure. But by 1682 Sir Christopher Wren, in conjunction with Grinling Gibbons, had been commissioned to renew the woodwork, and the building was repaired at the same time from end to end. The Temple Church has, indeed, exercised its inevitable fascination even upon many eminent lawyers who have not been considered exactly conspicuous for their piety, and secured their enthusiastic services. Judge Jeffreys, for instance, devoted much patient attention, and according to one story, musical knowledge as well, to the settlement of the rival claims of "Father Smith" and Harris to supply a new organ, having been called in as arbitrator, after trials of skill lasting over a twelvemonth had failed to determine the matter. Similar patriotism would, no doubt, be forthcoming again, even if projects so extensive took shape as the reconstruction of the fine chapel of St. Anne, which formerly stood on the south side of the church at the junction of the Round with the choir, and which, after it had been degraded to secular uses by the Fines Office, perished nobly in 1678, when it was blown up by gunpowder to save the main fabric. But the experiment of building a fresh adjunct, the last fragments above ground of which disappeared nearly a hundred years ago, would be very hazardous, and its advocacy has never emerged from the purely sentimental stage. The vast majority of the members of the inns and of the public outside them are well content, in all probability, with the policy of wise conservatism pursued by the Benchers.

ARCHÆOLOGY IN NORFOLK.

AT the annual meeting of the Great Yarmouth committee of the Norfolk and Norwich Archæological Society Mr. E. M. Beloe, jun., delivered a lecture upon Norman fonts in Norfolk. The lecture was illustrated by a series of photographic slides. The first slide was a map of the county showing the districts covered by the lecturer, including the churches of Burnham Deepdale, Hunstanton, Fincham, South Wootton, Castle Rising, Great Snoring, Ingoldisthorpe, Shernborne, Sculthorpe, Bagthorpe and Toftrees. The Burnham font was a most interesting object, and bore representations of the twelve months of the year, which were depicted by means of figures engaged in agricultural pursuits. The lecturer exemplified the influence of Byzantine art upon western craftsmanship by means of a series of slides, illustrating Norman work which he had photographed in the Eglise aux Dames at Caen. Each of the four sides of the font at Fincham bears scriptural subjects. That on the north is the Temptation, in which are depicted Adam and Eve and the serpent; that on the east the three Magi, robed in Eastern costumes; that on the south the Nativity; typified by the manger, ox and ass's head, and by a large flaming circle representing the Star of the East, very similar in design to that on the Franks casket in the British Museum. On the fourth side is illustrated the rite of baptism, depicted by a man immersed in a square font, with above a figure of the dove, emblematic of the third Person in the Trinity. At Hunstanton the font is plain and uncarved, but well-proportioned and having the original legs. That at Great Snoring is also a plain specimen. South Wootton font differs from all other specimens illustrated in its bold design. It bears on its four corners monster grotesque heads, and it is supported by nine legs. The fonts at Sculthorpe, Toftrees and Shernborne were very similar in their designs, and the lecturer placed upon the screen a diagram in which were collected the various geometrical patterns carved upon these fonts, in order the better to compare them and to prove that they must probably have been the work of the same artist. Additional curiosity was aroused on the subject by another slide prepared from a textbook on Byzantine art which showed precisely the same pattern. Symbolical scenes and scriptural subjects are to be found only upon two other fonts in the series dealt with. On one side of Sculthorpe font is the Adoration of the Magi, and on that of Shernborne is an unusual representation of the Temptation, in which instead of Adam and Eve being on either side of a tree, and Eve receiving the apple

from the serpent as at Fincham, the figures of Adam and Eve are almost hidden in the foliage of the tree. Ingoldisthorpe font was originally a square one, but is now a specimen of Mediæval vandalism, the corners having been hewn off to form an octagon, this having evidently been done in the Perpendicular period when the Seven Sacrament fonts were so common. Of these octagonal fonts the lecturer, parenthetically, showed slides of two specimens; Walsoken and Cley-next-the-Sea. Throughout the series, Mr. Beloe observed, there was a total absence of representations of fabulous monsters such as appear upon fonts of this period in other counties, which bear mermaids, as upon that of St. Peter's at Cambridge, and Sagittarius, as on that of Hook Norton, Oxon. The lecturer drew attention to the artistic feeling which was characteristic of the whole series of fonts, particularly those of Shernborne, Toftrees and Sculthorpe, and all bore treatment very different from the rude and crude Norman work found in other parts. Throughout the lecture Mr. Beloe impressed upon his hearers the curious manner in which scriptural representations were stereotyped, some of them, as those of the Temptation and the Adoration of the Magi, being found upon glass vessels and sarcophagi discovered in the Catacombs, and upon the high crosses of Ireland.

The Chairman offered a hearty expression of thanks to Mr. Beloe for his interesting lecture, and for his entertaining and instructive exhibition of photographs. To those who, like so many of them, had to study architecture and archæology at home, it was very delightful to have had an opportunity of accompanying Mr. Beloe in his pursuit of so fascinating a subject amongst the Norfolk churches.

Mr. Beloe, in acknowledging the vote, said that he was glad if his effort had been rewarded by securing their interest. He had at any rate shown them that there was much to be done in the way of illustrating the rich fund of archæological subjects of their county by means of photography, and he hoped he had demonstrated to many of them that it was perhaps better and more profitable to take photographs of churches than only of hedges.

TESSERÆ.

The Purpose of Art.

THE artist's business is to give, by any means, however imperfect, the idea of a beautiful thing; not by any means, however perfect, the realisation of an ugly one. In the early and vigorous days of art she endeavoured to praise the saints, though she made but awkward figures of them. Gradually becoming able to represent the human body with accuracy, she pleased herself greatly at first in this new power, and for about a century decorated all her buildings with human bodies in different positions. But there was nothing to be praised in persons who had no other virtue than that of possessing bodies, and no other means of expression than unexpected manners of crossing their legs. Surprises of this nature necessarily have their limits, and the arts founded on anatomy expired when the changes of posture were exhausted.

Angevin Churches.

The Angevin style is altogether rather curious than beautiful. The main difference between Mediæval and Classic art is commonly said to be that the one follows the multiplying, the other the magnifying principle. A Gothic building, and to some extent a Romanesque building also, is composed of a vast number of small parts, of tall and narrow divisions, stages on stages, ranges of arcades and windows one over another. An Angevin nave altogether forsakes this principle. It consists of a few large members instead of many small ones. The usual threefold division of height and of width is lost. Instead of nave and aisles, we have one enormously wide body. Instead of pier-arch, triforium and clerestory, instead of the soaring pillars of many churches where the triforium is left out, an Angevin elevation consists of a broad sprawling arch, with its imposts remarkably near the ground, and over it most probably a couplet of windows, of the form usual in the later Romanesque style, but of extraordinary size. There may be tastes to which these seem elements of grand simplicity, but they seem little more than an elaborate mode of destroying the effect of the building in every way. A single body of this extraordinary breadth must have extraordinary height to match or it will look positively low.

Established Types in Egyptian Art.

According to a passage in Synnesius, the profession of an artist was only allowed to be exercised by persons properly qualified, lest in ignorance they should transgress against the old laws which regulated the representation of the gods and sacred subjects. Plato also says the artists were not allowed to innovate, "hence the art remains the same, the rule of it the same." This, then, may be taken as the real cause of the

ong duration of Egyptian art under its peculiar form or style. Some stress has been laid on the recorded fact that: the Egyptians were ill-favoured in point of personal attractions, and that they were without the advantages enjoyed by the Greeks of having public games and exercises. But even if these statements of the want of beauty among the general population are trustworthy, they are insufficient to account for the stationary condition of their sculpture. The true ground of the unprogressive character of their art as regards its style is found in the nature of their institutions. That the Egyptians were not incapable of conceiving an ideal of beauty is shown in some of the heads of colossal and other statues that have reached us, where within the limits to which we have adverted a very decided character of beauty of expression and even of form is met with.

Statutory Registration of Qualified Architects.

SIR,—This subject has been under consideration in this country for upwards of twenty years, and whilst the general body of the profession have been in favour of the principle of statutory registration, side issues have from time to time been raised that have prevented the attainment of the main object.

Feeling that this was the case, a circular was recently issued only to fully recognised members of the profession, asking in each case for their individual approval or disapproval of the principle of the statutory registration of duly qualified architects.

The response has been most gratifying to the supporters of the principle. Something like two-thirds of the entire profession have responded, numbering thousands; and of these, only 168 are against registration, and all the remainder for it. A considerable majority of members of the Royal Institute itself are in favour, and most of its allied provincial societies almost unanimously so. Of the remainder of the profession, some are too distant to reply in time, others do not take the trouble to reply at all, but personally express themselves to be in favour of the movement.

With these facts before me, as one who signed the original circular letter, I ventured at the annual meeting of the Royal Institute of British Architects to question the wisdom of the attitude assumed by the Council of this body, as expressed in the circular issued by them to the Allied Societies in the provinces. I was supported in my contention to the extent of being nominated there and then, directly from the meeting, for a seat on the Council, so that all provincial and other members might have the opportunity of officially recording their verdict upon the subject by voting in support of my candidature if they desire registration and against it if they do not.

It is for the purpose of explaining precisely how matters stand that I issue this circular. I have no quarrel with the Council of the R.I.B.A., nor with any of its members. I recognise that they have a right to their opinions on this or any other question, as much as I and those who think with me have a right to ours. And it is only when they give quite a different rendering to what I believe to be the general wish of the profession, and say that they do so in their representative capacity, that I join issue, and place my services at the disposal of my professional confrères, that the question may be fairly tested.

So that the issue may be quite clear, I beg to announce myself as a strenuous advocate for the statutory registration of properly qualified architects. The details I do not attempt to go into at present, nor is it necessary; but when they have to be considered, I desire that the Royal Institute shall have the chief place assigned to it, in the consideration and promulgation of them.

Upon this issue I ask for the vote and interest in my candidature of every Fellow and Associate who desires to give the subject of registration their active and practical support.—I am, Sir, yours faithfully,

SILVANUS TREVAIL, F.R.I.B.A.

Palace Chambers, Westminster, S.W.:

May 14, 1903.

GENERAL.

Mr. James Guthrie, R.S.A., has received a knighthood in connection with the King's visit to Scotland. He was born in 1859 at Greenock, and has been a frequent exhibitor at principal exhibitions in Great Britain and on the Continent. He was made an Associate of the Royal Scottish Academy in 1888, and four years later was elected an Academician, being the first of the young Glasgow artists to be so honoured. He

succeeded Sir George Reid in the presidency of the Academy this year.

The Prince and Princess of Wales, as a result of their inspection of the collections of Irish marbles and building-stones exhibited at the Imperial Institute by the Department of Agriculture and Technical Instruction for Ireland, have ordered some columns of Irish marble for the decorations of Marlborough House. The marbles are Connemara or Irish green, Galway black, Irish grey (Cork), Sunset (Middleton) and Clonowen Fossil.

An Exhibition of works in ivory is about to be opened in the Musée Galliera, Paris. One of the purposes of the display will be the revelation of the best examples by the carvers of Dieppe. Several sculptors who employ ivory will also contribute.

The King of the Belgians has conferred the distinction of Officer of the Order of Leopold upon Lord Balcarras, M.P., F.S.A., Mr. Isidore Spielmann, F.S.A., and Mr. James H. Weale, for their services in connection with the Exhibition of Early Flemish Art recently held at Bruges under the auspices of the Belgian Government.

M. Rodin has completed the model of the memorial of the late Puvis de Chavannes, and the committee, on which there are several painters, have approved of it.

The French Commission for the Reconstruction of Hospitals has appointed a sub-committee to investigate the question, "Whether it will be necessary to institute special hospitals for cases of tuberculosis, similar to that built at Brévannes, or whether it will be sufficient provision to build in the new hospitals isolated pavilions reserved for such cases."

Mr. John Temple Leader, of Florence, has bequeathed to the committee of the Association "Per Erigere la Facciata del Duomo di Firenze," for the central door in bronze, 7,200*l.*; and it was his request that the inscription, the conjoint gift of Giovanni and Luisa Temple Leader, with their coat of arms, should be inscribed on the central door of the Duomo.

A Petition has been presented to the Legislature of Massachusetts, U.S.A., praying that the standard dimensions for face bricks shall be fixed at 8 $\frac{3}{8}$ by 4 $\frac{1}{4}$ by 2 $\frac{1}{4}$ inches, and for common bricks 8 $\frac{1}{4}$ by 4 by 2 $\frac{1}{4}$ inches.

The International Society of Sculptors, Painters and Gravers have elected the following Associates of the Society:—M. Bauer, A. K. Brown, C. H. Shannon, William Strang and William Witsen.

Mr. Percy Fitzgerald, F.S.A., designed and modelled the memorial to Cardinal Manning which has been set up in the church of Corpus Christi, Maiden Lane. It is a large tablet of rouge royal marble, with a profile and other decorations in gilt copper.

The Visit paid on Saturday last by the members of the Architectural Association to the new Gaiety Theatre was a record one in point of numbers, there being close on 200 members present, who were courteously received by Mr. Ernest Rüntz, the architect of the building.

The Birmingham City Council resolved on Tuesday, by fifty votes to fifteen, to take over the tramway system at the expiration of the present leases, the last of which falls in in 1911, and consequently to reject the offer to lease put forward by the British Electric Traction Company.

Mr. W. H. Patchell, member of the Council of the Institution of Electrical Engineers, has been appointed by the Home Secretary a member of the committee to inquire into the use of electricity in mines, in the place of Mr. James Swinburne, resigned.

A Canadian National Exhibition is to be held this summer in Toronto. The Dominion Government have made a grant of 50,000 dollars, and it is expected that the Government of Ontario will also vote a large sum. This promises to be the largest exhibition ever held in Canada, and it is hoped that the visitors from the British Houses of Parliament, in whose honour the Government of Ontario is arranging a reception at the Parliamentary Buildings in Toronto, will, on the day following, pay a special visit to the exhibition. The city of Toronto last year made a large grant of money for the erection of buildings of a permanent character, including a new art gallery, a dairy building, and one for manufactures and liberal arts. Altogether, it is estimated the city will spend a million dollars on the exhibition.

The Trial respecting the ownership of the Irish gold ornaments, purchased a few years ago for the British Museum, will probably begin on June 11. The leading counsel for the Government against the Trustees is likely to be the Solicitor-General, Sir Edward Carson.

The Lord Provost of Edinburgh has been created a baronet. Sir James Steel is a native of Cambusnethan, Lanarkshire, but started business in Wishaw as a builder and became a member of the Police Commission there. Going to Edinburgh thirty-five years ago he engaged largely in building and other contracts.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

IRELAND.—June 18.—The Trustees of the Limerick free library and museum invite designs from architects in independent practice for the proposed Carnegie library and museum to be built in the People's Park, Limerick. Prizes of 75*l.* and 25*l.* respectively will be awarded to the designs placed first and second in the competition. Mr. W. M. Nolan, town clerk, Town Hall, Limerick.

NEW BROMPTON (KENT).—May 30.—Designs and plans are invited in competition for public swimming and slipper baths to be erected in Windsor Road, New Brompton. Three premiums are offered, one of £20 to the author of the design which is considered to be the first in order of merit, one of £10 and one of £5 respectively for the second and third. Mr. F. C. Boucher, clerk, New Brompton, Kent.

POPLAR.—June 23.—Competitive designs are invited for a public library to be erected in Cubitt Town, Poplar, E. A premium of 75*l.* is offered for the design accepted by the Council, which will be deducted from the architect's commission should he be employed as architect in the execution of the work. Mr. Leonard Potts, town clerk, High Street, Poplar.

WALES.—June 2.—A premium of 20*l.* is offered for the best plan and design for a library at Abergavenny, Monmouthshire. Mr. E. H. Restall, librarian.

CONTRACTS OPEN.

ATHERSTONE.—May 19.—For additions and alterations at the Atherstone workhouse. Mr. J. W. Godderidge, architect, 4 Bolebridge Street, Tamworth.

BANBURY.—May 18.—For the erection of receiving wards at the workhouse, Neithrop. Mr. E. Lamley Fisher, clerk, Union Offices, Banbury.

BARROW-IN-FURNESS.—May 22.—For the erection of Wesleyan chapel, Walney Island, Barrow-in-Furness. Mr. John F. Curwen, architect, 26 Highgate, Kendal.

BARROW-IN-FURNESS.—May 25.—For supplying and fixing the whole of the fittings required in the chemical and metallurgical laboratories and class and lecture-rooms, &c., at the new technical school, Abbey Road. Particulars may be obtained from the Town Clerk.

BATLEY.—May 18.—For additions and alterations to nine houses in King Street, Batley, Yorks. Mr. John H. Brearley, architect, Branch Road, Batley.

BIRMINGHAM.—May 18.—For additions to the kitchen and sculleries at the workhouse infirmary, Dudley Road, Birmingham. Mr. W. H. Ward, architect, Paradise Street, Birmingham.

BRADFORD.—May 18.—For the erection of Wibsey Board school; the erection of playsheds, Thackley Board school; alterations to Thornton Board school; alterations to Otley Road Board school; and drainage and ballasting of playgrounds, Horton Bank Top Board school. Mr. Tho. Garbutt, clerk, School Board Office, Manor Road, Bradford.

BRADFORD.—May 19.—For widening Church Bank, Bradford. Mr. J. H. Cox, city surveyor, Town Hall, Bradford.

BRADFORD.—May 22.—For the erection of shop and dwelling-house, with stabling, &c., at Oakenshaw, near Bradford. Mr. Medley Hall, architect, 1 Harrison Road, Halifax.

BRADFORD.—May 23.—For the erection of a shop and house, High Street, Great Horton, Bradford. Mr. Sam Spencer, architect, Old Bank Chambers, Great Horton, Bradford.

BRENTFORD.—May 19.—For the erection of a free library building in Clifden House grounds, Boston Road, Brentford. Mr. Nowell Parr, architect, Clifden House, Boston Road, Brentford.

CANTERBURY.—May 20.—For alterations to premises in the Parade. Mr. Arthur C. Turley, city surveyor, Guildhall Street, Canterbury.

DARLINGTON.—May 21.—For the erection of an infants school for 290 children in Corporation Road. Mr. G. Gordon Hoskins, architect, Court Chambers, Darlington.

DIPTON.—May 18.—For the erection of one self-contained and two tenemented houses at Dipton, Durham. Mr. George Nicholson, contractor, Dipton.

EGREMONT.—For the erection of a large engine-pillar and engine-house at Oregill, Egremont, Cumberland, for the Wyndham Mining Company, Limited, High Mill, Egremont.

EGREMONT (CHESHIRE).—May 20.—For the erection of an engine and boiler-house, together with foundations for engines and boiler, and other work at Seacombe Ferry. Messrs. Wood & Fowler, engineers, 3 Cook Street, Liverpool.

GLASS HOUGHTON.—May 18.—For extensions and alterations to Board school, Glass Houghton, Yorks. Mr. R. M. McDowall, architect, Carlton Street, Castleford.

NORTH OF ENGLAND SCHOOL FURNISHING CO., L^{TD}.

MANUFACTURERS OF COMPLETE FITTINGS FOR

LIBRARIES, TECHNICAL & ART SCHOOLS, SCHOOL DESKS, &c., and CHURCH FURNITURE.

Catalogues and Estimates Free on Application.

Sole Makers of WILKS PATENT "CLIMAX" SLIDING PARTITIONS.

Contractors to H.M. Government, London and Birmingham School Boards, &c.

Addresses: DARLINGTON, NEWCASTLE, SUNDERLAND, MIDDLESBRO, and NORWICH.

HENDON.—May 26.—For the erection of a newspaper repository for the British Museum. Mr. J. B. Westcott, at H.M. Office of Works.

IRELAND.—For the erection of two priests' houses and offices in Bandon. Mr. M. A. Hennessy, architect, 74 South Mall, Cork.

IRELAND.—May 19.—For additions to the church and school buildings, Dunmurry. Messrs. Young & Mackenzie, architects, Scottish Provident Buildings, Belfast.

IRELAND.—May 20.—For the erection of a dwelling-house at Castletownbere. Mr. M. A. Hennessy, architect, 74 South Mall, Cork.

IRELAND.—May 27.—For additions and alterations to school-house, and fitting work and furniture in connection with technical department. Messrs. J. J. Phillips & Son, architects, 61 Royal Avenue, Belfast.

IRELAND.—June 1.—For the erection of fifteen cottages in Nicholas Street, Limerick. Mr. John F. Power, Carr Street, Limerick.

KEIGHLEY.—May 19.—For the erection of ten dwelling-houses, Bradford Road. Messrs. Barber, Hopkinson & Co., architects, Craven Bank Chambers, North Street, Keighley.

KNIGHTSBRIDGE.—May 26.—For the erection of a post office. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, Storey's Gate, S.W.

LANCS.—For extensions to the Crompton Conservative Club. Mr. Charles T. Taylor, architect, 10 Clegg Street, Oldham.

LANCHESTER.—May 23.—For the erection of house and smithy on Ford Lane, Lanchester. Mr. Thomas E. Taylor, architect, Prospect House, Lanchester.

LEEDS.—May 20.—For the erection of stabling off Kirkgate, Leeds. Messrs. Samuel Jackson & Son, architects, Tanfield Chambers, Bradford.

LEEDS.—May 22.—For the erection of a woollen manufactory at Bramley, Leeds. Messrs. John Kirk & Sons, architects, Huddersfield.

LEWISHAM.—May 19.—For the erection of boundary walls, cart-shed, store, &c., on ground at rear of the town hall, Catford. Particulars can be obtained of the Lewisham Borough Council.

LEYLAND.—May 18.—For the erection of new school and alterations to the existing schools at Golden Hill, Leyland,

Lancs. Messrs. Garlick, Sykes & Catterall, architects, 33 Winckley Square, Preston.

LINDAL-IN-FURNESS.—May 18.—For rebuilding the Anchor hotel, Lindal-in-Furness. Messrs. J. W. Grundy & Son, architects, Brogden Street, Ulverston.

LONDON.—May 19.—For erection of Patent Office, Quality Court Block, for the Commissioners of H.M. Works and Public Buildings. Mr. J. B. Westcott, H.M. Office of Works, Storey's Gate, S.W.

LONDON.—May 19.—For the foundations of the new parcel office, Union Street, S.E., for the Commissioners of H.M. Works and Public Buildings. Mr. J. Wager, H.M. Office of Works, Storey's Gate, S.W.

LONDON.—May 19.—For the demolition of the Atlas Works, Woodfield Road, Harrow Road, W. Mr. Fras. J. Smith, architect, Parliament Mansions, Victoria Street, Westminster.

LONDON.—May 22.—For structural and other alterations at the town hall, Marylebone Lane, Oxford Street. Mr. J. Paget Waddington, surveyor, Town Hall, Marylebone Lane.

LONDON.—June 24.—For widening and enlargement of Victoria station, for the London, Brighton and South Coast Railway Company. Mr. J. J. Brewer, secretary, London Bridge Terminus, S.E.

LONDON, N.—May 26.—For the erection of fourteen rows of cottage dwellings for the working classes on the White Hart Lane Estate, Wood Green. Particulars at the Housing Section of the Architect's Department, 19 Charing Cross Road, W.C.

MACCLESFIELD.—June 1.—For the erection of a laundry, chimney-shaft and lavatory accommodation at the workhouse. Messrs. Whittaker & Bradburn, architects, 19 King Edward Street, Macclesfield.

MANCHESTER.—May 22.—For the pulling-down of twenty-two cottages in Tame Street, Ancoats, Manchester. Mr. A. J. Murgatroyd, architect, 23 Strutt Street, Manchester.

NEWCASTLE-UPON-TYNE.—May 18.—For the erection of blocks of dwellings for the labouring classes in Walker Road and Albion Row, Newcastle-upon-Tyne. Messrs. Liddle & Browne, architects, Prudential Buildings, Mosley Street, Newcastle-upon-Tyne.

NORTH SOMERCOTES.—May 20.—For the erection of a Wesleyan chapel and schoolroom, &c., at North Somercotes, Lincs. Mr. W. H. Dinsley, architect, Chorley, Lancashire.

PATENT INDURATED STONE

IN honour of the King's visit to Scotland the premises of the leading business houses, clubs and banks in Edinburgh and Glasgow have been decorated by Messrs. Defries. On the occasion of the visit of the Prince and Princess of Wales, Hull was gaily decorated, the principal part of the work having been executed by Messrs. Defries, of London. At Victoria, where the ceremony of unveiling the late Queen's statue took place, an artistic floral canopy was provided beneath which the Prince and Princess took up their position. Velvet drapery fringed with gold hung in graceful festoons from the edge of the canopy, Prince of Wales's plumes being fixed at intervals in the design. The standard supporting the structure was covered with garlands interspersed with Tudor roses. The Hull Exchange, the leading banks, insurance companies and hotels were also decorated by Messrs. Defries, who have quite recently been appointed decorative illuminators to the Prince of Wales in addition to their appointment to H.M. the King.

THE "CIL-REST" CASEMENT.

WITH all the improvements that from time to time have been introduced in the designs of casement windows there has remained one objection that so far has not been successfully overcome, namely, the difficulty of cleaning them on the outside when so placed that it is necessary it should be done from inside the building. In the "Cil-rest" Reversible Casement, however, to which our attention has been recently drawn, by the adoption of a new principle in its construction this difficulty is not only obviated, but other advantages secured, while not in any way altering the character or appearance of the casement, as will be seen by the following brief description and illustration:—

On the outer face and within the same sight line a third but skeleton frame is hung to the fixed frame, and to this frame at the other side the glazed frame is hung, on the inner edge of which a bolt is attached to fasten the two opening frames together.

To clean the outer face of the glazed frame the casement is opened in the ordinary way; the bolt is then drawn to release it from the hanging side of the skeleton frame, and is carried along the sill, bringing the outer face towards the room. Besides enabling the casement to be reversed for cleaning, this extra frame provides a much-needed support to the outer edge of the glazed frame, and as the inner edge rests upon the sill it is held in a position that prevents any strain on the hinges, and renders sagging or dropping an impossibility. Further, as by its means the casement can be opened against the wind either right hand or left hand, so a considerable economy may be effected. In a three-light window are generally fitted two casements and one fixed light in the centre, the two outer opening from opposite sides of the fixed frames, so that one may be opened against the wind according to the direction from which it comes. By the use of the "Cil-rest"

reversible casement if necessary one casement only need be placed in the centre, as it can be opened in either direction for ventilation, and enables the two fixed lights to be easily cleaned.

A great recommendation for the adoption of these casements is their simplicity, and added to this the ease with which they and the adjoining lights can be cleaned, the absence of sagging and also saving in cost, they should meet with general approval, whilst the great support afforded by the skeleton frame enables them to be made in any width with perfect safety. They are made of any desired section, or can be adapted to existing casements, or the fittings supplied to fit wood casements, and are manufactured by the patentees, Messrs. Williams Bros. & Co., at their works, Kaleyards, Chester, and can be seen at their London showrooms, 81 Endell Street, W.C. These premises have been occupied for many years by Messrs. Pepper & Co., artists in stained glass, which business has now been acquired and is carried on by Messrs. Williams Bros. & Co.

IN the recent open competition in connection with the St. Mellons infectious diseases hospital, the assessor, Mr. P. Gordon Smith, placed the design of Mr. John Robt. Nichols, M.S.A., of Newhall Chambers, Newhall Street, Birmingham, first, and the Council at their meeting last week confirmed the assessor's award, and instructed Mr. Nichols to meet the representatives of the Council and their medical officer of health in London for a conference with the assessor and the Local Government Board.

AN IMPROVED CONTRACTOR'S TRESTLE.

AN undoubted improvement over the old-fashioned wooden trestle has been introduced by Messrs. Bradshaw & Co., of 52 Queen Victoria Street, E.C.

The new trestles, of which we give illustrations, are con-

others by many public bodies, including those of Westminster, York, Woolwich, Barnsley, Nottingham, Rochdale, Middlesbrough, Ramsgate, Godalming, Maidstone, Southend-on-Sea, Hove, Wandsworth, Chelsea and East London Waterworks, and by numerous contractors.

ANGLE IRON CONTRACTOR'S TRESTLE.

structed of $1\frac{1}{2}$ inch by 3-16th-inch angle iron, and while being much stronger, are light, rigid, durable and cheap. They have other advantages, one of the most important being the saving effected in freightage, cartage and storage, owing to their light weight and the small space they occupy when closed.

OPEN.

CLOSED.

One dozen when packed measure only 4 feet by 1 foot by $4\frac{1}{2}$ inches, and 180 trestles weigh less than 30 cwt.

Although only placed on the market during the present year they have already been extensively adopted, amongst

THE DIFFERDANGE BEAMS.

WE have already explained some of the advantages arising from the use of the Differdange beams. They are not confined to bearing capacity, for, as we have pointed out, there is often a saving of depth, which is important in the eyes of an architect. From a purely scientific point of view, the principle adopted in them is remarkably economical. A correspondent informs us of his having the moments of inertia about each axis per pound per foot of ordinary joists calculated. Similar calculations were made for the Differdange beam. The results show to what extent the metal has been distributed in the sections in order to give a high carrying capacity per pound of metal employed. The results of this comparison show that the average carrying capacity of Differdange beams compared with their weight is greater than that of standard joists by $12\frac{1}{2}$ per cent. when used as girders, and still more when used as stanchions. Obviously a still higher ratio of carrying power to weight of metal would be shown if Differdange beams were similarly compared with built-up girders and stanchions.

TRADE NOTES.

THE additions to the St. William's infectious hospital, Rochester, are being warmed and ventilated by means of Shorland's patent Manchester stoves with ornamental tiled sides by Messrs. E. H. Shorland & Brother, of Manchester.

MR. SAM DEARDS'S patent glass roofing has been lately adopted in the new School of Arts, Peterborough, the new drill hall, Chelmsford, the electric-power station and car-sheds at Bexley, Messrs. Homan & Rodgers's new works at Ware, and the electric-power station and car-sheds, Sheerness-on-Sea. Mr. Deards has also extensive contracts for the War Office at Woolwich.

MESSRS. G. WOOLLISCROFT & SON, LTD, Hanley, Staffs, ask us to mention that they have opened an office and showroom at No. 33 Examiner Buildings, Strutt Street, opposite the Royal Exchange, Manchester. Mr. I. Richmond Dixon, of West Didsbury, has been appointed their representative, and will be in attendance at the showroom every Tuesday, or any other time by appointment. A clerk will always be in attendance.

MESSRS. WM. AUG'S GIBSON, LTD, electric, hydraulic and hand-power lift manufacturers, of Temple Bar House, 28 Fleet Street, inform us that among the recent contracts taken by the company are one electric passenger lift, one hydraulic pavement lift, one hand lift, for the Royal London Friendly Society's large new building in Finsbury Square, E.C.; an electric passenger lift with complete push-button device for the Victoria Hospital, Chelsea; an electric passenger lift for Evelina Hospital; an electric passenger lift for Home Hospitals Association, 16 Fitzroy Square; while among orders completed are ten hydraulic passenger lifts and twenty-six service lifts at Coleherne Court, S.W., and one electric passenger lift for Temple Bar House, 28 Fleet Street, E.C.

BUILDING AND BUILDERS.

THE Cleethorpes District Council have adopted plans for new municipal offices. The cost of the buildings will be 5,600*l.*, and the land 893*l.*

FOUNDATION-STONES of a new Congregational church have been laid at Eastbourne. The new building will seat 750 persons, and the estimated cost, including site, is 8,000*l.*

THE memorial-stones of the new Hospital for Women were laid on Tuesday on the site of the building at the corner of Connaught Road and Park Road West, Wolverhampton, by the Hon. Miss Wrottesley and Mrs. J. L. Gibbons.

THE Mayor of Woolwich laid on Wednesday the foundation-stone of new municipal buildings for the borough. The site has cost 15,000*l.*, and the contract price for the buildings is 50,000*l.* A prominent feature will be a clock-tower, 140 feet in height, having four faces, each 10 feet in diameter.

THE Skegness Urban District Council have adopted the report of Messrs. Elliott & Brown, of Nottingham, upon the sewerage system, and have instructed them to prepare working drawings. The scheme embraces bacterial filters at the present sewage farm, new pumping station, and the drainage of the Seacroft estate. The estimated cost is 8,750*l.*

THE foundation-stone of a new Episcopal church for Kelvinside, Glasgow, was laid on Saturday in Hyndland Road. The church, which is to be dedicated to St. Bride, will when completed take the place of the present wooden edifice. It will be of Gothic design, and contain seating accommodation for a congregation of 750. The cost, with enrichments, is estimated at about 25,000*l.*

AT a provisional order inquiry held under the Private Procedure (Scotland) Act, sitting in Glasgow, the Glasgow Corporation granted authority to borrow 1,000,000*l.* extra in connection with the purification of the Clyde, the sum previously granted by Parliament being 1,100,000*l.*, thus exceeding the original estimate by 1,000,000*l.* During the hearing, which occupied the attention of the Commissioners for four days, in which the leading counsel of the Scottish Bar were engaged, the Mersey and similar schemes in the West Riding of Yorkshire were instanced by Sheriff Guthrie for the objectors, but the Commissioners held these to be river pollution as against a purification scheme.

TO meet the increasing demands of Wesleyan Methodism on the Rotton Park side of Birmingham a new edifice has been erected in the City Road. The new building is a school and chapel, with six large rooms running parallel with the main building. The design is Free Gothic, and the building is substantially erected in red brick with stone dressings. It has an open-timbered roof, with a solid wood-block floor. The present building is only a part of the scheme, and it is so arranged that it may be enlarged from time to time. The present portion, which will seat 500 persons, will cost 3,000*l.*

MERRYWEATHER & SONS, 63 LONG ACRE, W.C. Works: Greenwich, S.E., London.

THE foundation-stone of the new church to be erected to the east of St. Swithin's parish, at Lincoln, has been laid. The rapidly-increasing population in that part of the city was a few years ago met by the erection of a mission church, for which Mr. Alfred Shuttleworth contributed the funds. The accommodation having become inadequate, Mr. Shuttleworth offered to build a new church at a cost of 8,000*l.*, and to give 5,000*l.* towards its endowment. The new building is to be designated All Saints Church, and it creates a new ecclesiastical parish, formed by Monk's Liberty parish and part of St. Swithin's parish.

THE new reservoirs and filters in connection with the Crieff water extension scheme from Loch Turret, erected on the Knock Hill, and situated on the north-west side of the town, have been formally opened. The new reservoir is circular in shape, being 100 feet in diameter and 20 feet in depth to top water level, thus holding 981,750 gallons, or between three and four days' supply. The filters, two in number, are each 60 feet by 40 feet by 5 feet 6 inches. The cost of the present water extension scheme, including erection of reservoir, filters and laying of new piping from Loch Turret, &c., is about 12,000*l.*, while the total cost of the works, since the beginning in 1872, has been upwards of 22,000*l.*

At a meeting of the joint committee of the Kirkcaldy Town Council and Harbour Commission appointed to consider the question of harbour extension the sub-committee reported that they had made inquiry as to the trade which might be expected and also the financial aspect. After consideration it was unanimously agreed to recommend to the Town Council and Harbour Commission that 100,000*l.* should be spent on harbour extension, and that they employ Sir A. N. Randell, C.E., to report upon the whole undertaking, and to take into consideration the present situation of the harbour. They also proposed that he should be asked to prepare plans showing the best method of extending the harbour, and if possible to do so in such a manner as it could be added to in detachments, so as to make a large coal harbour at completion if so desired.

THE foundation-stone was laid on the 7th inst. of a new church which is intended to serve the needs of the growing district of Dob Park, Old Basford, Notts. The building is being erected by the Nottingham Spiritual Aid and Church Extension Fund, and the committee in their anxiety to increase the spiritual agencies in the city found their course made easy in this instance by a generous bequest in the will of the late

Mr. G. Waterall, who left 11,000*l.* for the purpose of establishing a church in some part of Nottingham. For the present only the nave and aisles are to be erected, leaving the chancel, choir vestry and organ chamber to be completed at a later period. The architects (Messrs. R. Evans & Son) have adopted the traceried style and the nave will be divided into five bays with traceried windows. The church, which is to be 80 feet long and 60 feet wide, will be built of Bulwell stone faced with Coxbench stone, and will accommodate 500 persons.

THE Church Institute, which has been erected in Church Street, Stoke-on-Trent, at the corner of Booth Old Road, has now been opened. The building is to be known as the Victoria Institute, as a memorial of the late Queen. It has cost altogether about 4,000*l.* Among the subscribers to the building fund was His Majesty the King, who sent a donation of 105*l.* in token of his interest in the district, of which he is lord of the manor, and of his gracious wish to support the movement for a memorial to his august mother. The Institute has been erected by Mr. T. R. Yoxall from the designs of Messrs. Lynam, Beckett & Lynam, and forms a handsome addition to the public buildings of the town. On the Church Street side is a restaurant and a look-up shop, and between them the entrance to the parish-room, gymnasium, &c. In connection with the restaurant, dining-rooms and kitchens are provided. Part of the first floor is occupied by a tea-room and billiard-room. The second floor is entirely taken up by accommodation for the Girls' Friendly Society.

ELECTRIC NOTE.

MR. JAMES WILSON, town clerk of Marylebone, has received the opinion of Mr. Asquith, K.C., M.P., with regard to the powers of the London County Council to lend the Marylebone Borough Council the money needed to complete the purchase of the local property of the Metropolitan Electric Supply Company. The learned counsel suggests a form of letter to the County Council, and pending the sending of this and the reply of the Council, the electric-supply committee of the Borough Council recommend that Mr. Asquith's opinion should not be made publicly known. The omission of certain words from the special Act which authorised the arbitration proceedings accounts for the present hitch. About a million and a half sterling is involved.

THE chapel to the new schools of the Royal Masonic Institution for Boys at Bushey, Herts, will be consecrated by the Bishop of St. Albans on Tuesday, the 19th inst.

MR. ALBERT WARBURTON, A.R.I.B.A., announces that he has removed from 11 Lyme Street Chambers to 2 Bold Street Chambers, Warrington.

THE Urban District Council of Heath Town, having received the sanction of the Local Government Board, have instructed their engineer, Mr. R. E. W. Berrington, M.I.C.E., of Westminster and Wolverhampton, to proceed with the carrying out of the additional sewerage works.

THE estimates for the Dumfries drainage and sewage purification works are fourteen in number, and range from a little over 20,000*l.* to a little over 36,000*l.* The lowest is from Messrs. M'Kay & Son, Broughty Ferry, and there are several only slightly higher.

A NEW infants' school was opened at Clay Cross on the 18th inst. It stands on one acre of ground and provides accommodation for 665 infants. The total cost was 7,700*l.*, and it contains four babies' rooms, eight classrooms, central hall, two cloak-rooms, two teachers' rooms, &c. It is the largest single department in the county except one, which accommodates 670.

THE Rev. Kenelm Vaughan, brother of Cardinal Vaughan, has collected 14,000*l.* in Spain and South America towards the erection and decoration of the Blessed Sacrament chapel in the new Westminster Cathedral. He is now in the city of Mexico, where he hopes to raise another 4,000*l.* to complete the sum required.

THE report of the Aberdeen city architect on the proposed reconstruction of the interior of the municipal buildings states that the whole rearrangements have been designed to have the departments so placed in conjunction with one another that the rapidly increasing volume of work may be carried on expeditiously and efficiently. One of the principal alterations would be the removal of the present staircase, which begins inside the tower doorway, and the substitution of a new marble stairway leading up to the third floor. The town hall would be enlarged about 6 feet, and on the third floor there would be a library, smoking-room and luncheon-room. The alterations are estimated to cost 10,000*l.*

ON Friday last Lord Wenlock opened a new dormitory wing at the York Bluecoat School. For some years the committee have felt the necessity of providing additional accommo-

modation, especially in the dormitories, and having secured the adjoining property it was decided in 1901 to proceed with the scheme. They accordingly instructed their architect, Mr. Brierley, to prepare plans and estimates, and the present building is the outcome. The accommodation provided consists of—on the ground floor, workshop, coal storage, bake-house, bread store; and on the upper floor two large dormitories with a separate stone staircase. With the additional accommodation the cubic air space in the dormitories is increased from 350 cubic feet per boy to 600 cubic feet. The additions are of fireproof construction and the rooms are well lighted and cross-ventilated. The elevation to Aldwark is of a quiet, simple character, and is executed of hand-made bricks, with wooden windows painted white and leaded glazing, and is in harmony with the rest of the school. The extension has also enabled other improvements to be made for the better provision of light and air, chief of which is the enlargement of the courtyard, which has been trebled in area and laid with concrete paving. The total cost has been kept within the estimates, and is about 1,400*l.*

AT the meeting of the St. Pancras Borough Council the following resolution, moved by Alderman D. McGregor was adopted, thus settling in a satisfactory manner an important question:—"That, inasmuch as the London County Council has communicated to this Borough Council its desire to link up its northern and southern systems of tramways by continuing the present tramway from the terminus at the southern end of Hampstead Road along Tottenham Court Road, Charing Cross Road and Northumberland Avenue to the Embankment, and as the County Council appears unwilling to widen the southern end of Hampstead Road without obtaining the Borough Council's consent for a tramway along Tottenham Court Road, and as the continuance of the present congested state of traffic at the southern end of Hampstead Road is not only a constant peril to life and limb, but a disgrace to the Metropolis, the Borough Council is of opinion that the County Council should be informed that the former, with a view to linking up the northern and southern systems of tramways, subject to any street widenings that may be necessary, is prepared to give its statutory consent to the construction of a tramway along Tottenham Court Road, such consent to be contingent upon the County Council obtaining the consent of the City of Westminster Council to continue the same class and description of tramway along Charing Cross Road and Northumberland Avenue to the Embankment."

ELECTRICITY CONTRACT, WORTHING.

At the meeting of the Worthing Town Council on the 5th inst., the electricity committee presented a report which stated that Messrs. Burstall & Monkhouse, writing on April 21, enclosed a copy of a letter received from the Receiver and Manager of the British Power Traction and Lighting Co., intimating that he had decided to close the battery department of their works, and that he was consequently unable to proceed further in respect of the contract with the Corporation. The consulting engineers added that the battery was not yet satisfactory, as it did not give the specified output, and they suggested that the two guarantors to the contract should be called upon to provide such sum of money as might be necessary to put the battery into proper order. The contract price was 984/4s., the sum of 689/4s. having already been paid by the Council on account thereof, and the engineers estimated that to put the battery into proper order will require the sum of 500/4s. The committee resolved that formal notice be given to the contractors under the general conditions annexed to the contract, requiring them to make good all defects in the works comprised within their contract within seven days, and intimating that failing compliance therewith the Council will take possession of the works, plant and materials belonging to them, and take such steps as may be necessary to complete the work by other persons, and that any outlay in excess of the contract price incurred by the Corporation consequent on the default of the contractors as aforesaid, and any completion of the works by other persons will, as provided by the contract, be payable firstly out of the sale of the contractors' plant, secondly out of the contractors' resources, and thirdly out of the resources of the contractors' sureties. The report was adopted.

NEW LIBRARY, WAVERTREE.

THE new branch free library and reading-rooms, Picton Road, Wavertree, were formally opened on Tuesday evening. The institution occupies the site of Davies's nurseries, and will serve as an interesting landmark in so far as it stands on a spot which once upon a time was known as the commencement of Wavertree village, but is now rapidly assuming a city

aspect. Some time ago the City Council bought 5,000 square yards of land hereabouts, and the library and reading-rooms take up about 1,500 square yards. A portion of the remaining site is to be occupied by public baths, now under consideration, and when completed the whole will become a splendid centre for Wavertree inhabitants for physical cleanliness and mental improvement. Externally the building is imposing and artistic. It stands back about 40 feet, and the space between the road and the front elevation will be taken up by refreshing green lawns and charming floral beds. The composition of the building as it fronts Picton Road is an example of modern Renaissance. It is built of red pressed bricks and Cefn stone, whilst the roof is covered with green Westmoreland slates. The building is divided from the road by strong iron railings and handsome gate piers, the main entrance being from the centre of the attractive pile. Particular attention has been paid to the lighting of the rooms both by day and night. By a skilful use of "lantern lights" in the roof a volume of light is emitted which makes the interior of the building quite as light during the day as it is in the adjoining streets or open spaces. This is a commendable feature, and one upon which Mr. T. Sheldermine, the city surveyor, is to be complimented, seeing that he superintended the designing and the carrying-out of the work. Entering the building the visitor finds himself in a magnificent vestibule, on each side of which the various departments we have alluded to are located in a most convenient manner. The staff have not been overlooked, and various rooms, including lavatories, have been constructed for their use in the basement. The principal reading-room has the appearance of a spacious hall, and might be used for lectures if necessary. It is 47 feet by 26 feet 6 inches wide. All the rooms, including the vestibule, are lined with green dado, whilst the vestibule floor is of white marble mosaic, surrounded and divided by strips of black marble. The appearance is handsome. The furniture and the fittings in the different rooms are of fumed oak, whilst the woodwork about the roof and the windows is stained green and beautifully varnished. The whole arrangement in form and colour has been made to please the eye and to have a bright and soothing effect upon those who frequent the premises. The cost of the building and the furnishing amounts to over 8,000/4s. The rooms are heated by hot-water, and everything has been added to the institution necessary to the comfort of those who may use it. At night the interior will be illuminated by powerful electric lights.

THE WIDENING OF PICCADILLY.

THE improvements committee of the London County Council have just issued a report recommending the Council to sanction a scheme for a considerable widening of Piccadilly between Arlington Street and the Green Park. The opportunity for such a widening has presented itself owing to the rebuilding of Walsingham House and the Bath Hotel. The committee have been in negotiation with the company who are the owners of the property, and they have agreed to surrender, upon certain conditions and at a price very much below the market value of the vacant land and without any compensation for trade disturbance, the land necessary to secure a width of 85 feet for this part of the thoroughfare, provided their offer is at once accepted by the Council, so that the rebuilding scheme may not be delayed.

These conditions are as follows:—(1) The owners are to have the right to build over the new footway upon the first-floor level and above up to the height of the present buildings, the new buildings being supported by a colonnade; (2) the line of piers of the colonnade is to be built on a give-and-take line; and (3) the Council are to take the necessary steps to obtain possession of the portions of the premises at present occupied by lessees, the company contributing 2,000*l.* towards the cost of obtaining such possession. As far as the company's interest in the freehold is concerned, they have agreed to accept half value, but a higher price is being paid for the combined leasehold and freehold interests in the particular land of which Lord Walsingham is the freeholder. It will also be necessary to acquire the freehold interest in a strip of land at present forming part of the garden adjoining Walsingham House, so that the widening of the thoroughfare may be continued as far as the Green Park. Upon the basis suggested, the gross cost to the Council of the property needed for the improvement will be about 43,000*l.*, or, deducting the 2,000*l.* to be contributed by the company, 41,000*l.* The cost of the paving works is estimated at 2,000*l.* The Westminster City Council is to be asked to make a contribution of 4,000*l.* towards the cost of the improvement.

Having regard to the recent views expressed in the Council against new financial commitments, the committee state that they would hesitate to advise the Council to incur further expenditure at the present time, but the immediate rebuilding of the premises where the widening will be effected left them no alternative but to submit the scheme to the Council at once. They believe that the method of securing the additional width

by the formation of a colonnade will introduce a very pleasing architectural feature in that part of London.

COST OF ELECTRIC TRAMWAYS.

THE highways committee of the London County Council have issued a statement relating to tramway construction. They say having regard to the altered position of affairs caused by the adoption, for the generating station, of the Greenwich site instead of that at Camberwell, and the provision of a new car-shed, we carefully revised the estimates, and on July 22, 1902, we asked the Council to approve the revised estimates, amounting to 981,497*l.* In doing so we stated fully the reasons for the increase, amounting to 357,997*l.*, over the amount of the original estimates. The revised estimates were approved by the Council on July 29, 1902. It cannot be too clearly stated that both these estimates covered the cost of a great deal more work than was required for the Tooting lines. For instance, both provided for the first section of a large generating station more than sufficient for the requirements of the lines in question, and the provision included for this purpose in the later estimate was considerably greater than that included in the earlier estimate. The Clapham car-shed, too, will provide for other than the Tooting lines.

We have obtained from the responsible officers reports of the cost, as nearly as can be at present ascertained, of the Tooting lines. This includes the cost of rails and roadwork, after making allowance in respect of work done under the same contracts, but not properly chargeable to the Tooting section, the whole cost of the temporary power station at Loughborough Junction, a proportion of the cost of sub-stations and car-sheds, and the necessary cables, &c. On this basis the total cost of the Tooting lines is approximately 440,120*l.*, made up as follows:—

Expenditure for	Total. £	Rate per Mile. £
Rails and roadwork	224,020	13,660
Cars (6·1 to the mile)	72,500	4,420
Power station and cables	74,000	4,510
Sub-stations	20,600	1,255
Car-sheds and workshops	34,000	2,075
Incidentals, including Dr. Kennedy's commission and proportion of salaries of Council's officers	15,000	915
	440,120	26,835

We anticipate that the temporary station will supply current for the working of the tramways which are now in course of construction between Camberwell Green and Vauxhall, and in that case the capital cost chargeable to the Tooting to Westminster sections will be proportionately less. The full cost of the station is, however, included in the above table. In arriving at the above figures as to the power supply, regard has only been had to the cost of the temporary station at Loughborough Junction. We may state that at present it is impossible to judge what will be the effect of substituting for these figures, figures based on the cost of the permanent station at Greenwich, together with the transforming plant which will eventually be required at the sub-stations (as the current to be supplied from the permanent station will be of high tension, while that supplied from the temporary station is of low tension), and the cables to be laid for permanent use when the station is in operation. We therefore ask the Council to accept the figures in so far as they relate to the supply of power as being subject to revision at a later stage. At the same time, we would point out that the tramways are completely equipped in every detail, and that they could be run by power supplied from the temporary station for an indefinite period.

We come now to a consideration of the cost per mile. In evidence given before the Select Committee of the House of Commons in 1900 in support of the London County Tramways (Electrical Power) Bill, the estimate of the cost of reconstruction of approximately 200 miles of single track was stated at 3,000,000 £ , averaging 15,000 £ a mile, in which sum was included provision for cars at the rate of 2 $\frac{1}{2}$ per mile and a corresponding provision for plant; but it was pointed out that no provision was made for car-sheds and workshops. This rate was intended to apply to the whole of London, and it was supposed that a considerable proportion of the lines, especially in suburban districts, would be constructed on the overhead system. In December 1901, in the light of the tenders received for the reconstruction of the Tooting, &c., sections, we were advised that, assuming a service of 2 $\frac{1}{2}$ cars per mile, the average estimated cost per mile of single track for the conduit system was equivalent to 17,800 £ , and that for every additional 2 $\frac{1}{2}$ cars per mile 3,880 £ per mile must be added to cover the cost of additional cars and extra power to work them. On the Tooting lines 6.1 cars per mile have been provided, and the amount on the same basis for this number of cars per mile works out to 23,387 £ per mile. In comparing this figure with the approximate actual cost of the Tooting lines—26,835 £ per

mile, as shown above—allowance must be made for car-sheds at 2,075 £ per mile and for credits by sale of old rails, &c., as the estimate of 17,800 £ a mile was a net figure after bringing these to account. After making these allowances, the difference between the estimated and actual cost is less than 1,000 £ . A large part of this may be attributed to the fact that this is the first line to be reconstructed for electrical traction, and to special expenditure having been incurred in expediting the work by employment of night and Sunday labour. It should be added that there will ultimately be credits of considerable amount in respect of the sale of horses and old materials from the discontinued horse lines, and of the disposal of properties no longer required. These have not been brought into account.

COLINTON HOSPITAL, EDINBURGH.

THEIR Majesties the King and Queen drove through Edinburgh on Wednesday on their way to Colinton Mains for the purpose of formally opening the magnificent suite of buildings which have been erected from the designs and under the supervision of Mr. Robert Morham, the city architect. The site has a gentle southern slope, with an uninterrupted view of the Pentland Hills. The buildings are arranged with special regard to getting as much sunlight as possible in the wards and homes, and are of substantial construction, the stone used being of a light red colour. There are two main entrances, one from Comiston Road on the east and the other from Colinton Road on the west. On the right of the former entrance, reached by a long avenue, is the medical superintendent's house. Further within, and directly facing the principal entrance, are the general offices, and in rear of these the stores, kitchen and dining-room block; beyond these the nurses' and servants' homes. These buildings form a group nearly central in the hospital grounds, the ward pavilions being arranged in double rows to east and west—those on the east being entirely for scarlet fever, while those on the west contain provision for diphtheria, typhoid, erysipelas, measles, chicken-pox, whooping-cough and typhus. Reception and observation wards—the latter for uncertain cases—are placed on either side, near the principal entrance, and isolation wards for complicated or special cases towards the further extremities of the respective groups. At the north-east corner of the grounds are the education block (for students

nurses), the chapel and mortuary, and also a general workshop. Further south are laundry, boiler, disinfectant and incinerator buildings. There is ample space for separate recreation-grounds, &c. The size of the wards is regulated on one hand by the number of patients that can be properly nursed in one ward, with due regard to the cubic space to be allowed for each patient; and on the other with reference to the convenient subdivision of the total number to be provided for in the respective classes of disease, ranging from 329 for scarlet fever to 10 for typhus fever—the former requiring large two-storey pavilions, while one of much less than ordinary size, and of only one storey, is expected to suffice for the latter. A system of covered passages connects all the larger pavilions on the ground floor, and also connects these with the stores, kitchen and dining-rooms, as well as with the nurses and servants' homes. Accommodation has been provided for 150 nurses, and in the servants' homes there are 60 bachelors in four large dormitories, separate rooms for head-nurses, &c. A most elaborate system of drainage, heating and ventilation has been installed, and the experience of hospital treatment in all countries has been brought to bear on this the newest and probably the most up-to-date home for the sick in the world.

FORESHORE PROTECTION.

At the last meeting of the Irish Institution of Civil Engineers Mr. R. G. Allanson Winn read a paper on "The Youghal Foreshore Protection Works." The paper dealt with the recent works made to arrest the inroads of the sea between the Youghal Esplanade and the Rifle Butts. Early in 1900 the work was started, not however before a breach of 500 feet wide had been formed and 600 acres of land flooded. The erection of an embankment was then a necessity, and seventeen case-pynes and an open sluice run were erected. The works were finished in April 1901. The author described the results brought about by the protective works and the exceptional tides of January 15 and 16, which caused a breach in one of the long walls of the main embankment. An illustrated description of the repair works, which were carried on by night and day from January 19 to February 1, followed, and the very important question of the height to which embankments with backing (as distinguished from sea-walls) should be carried

discussed, allusion being made to exceptional circumstances, such as the Galveston tidal wave. Passing from the question of embankments facing the open sea, the lecturer next considered those embankments which have only to resist the waters of estuaries, back-waters, &c., and gave a description of the embankment works carried out in 1815-20 by the then Lord Headley, who reclaimed some 400 acres of the finest alluvial land from the sea. The causes of the failure of this important work about the year 1842 were gone into, and the paper concluded with some remarks on travelling shingle, and was illustrated by means of plans, sections and photographs, as well as large scale diagrams. During the course of the lecture Mr. Winn dealt with deep-sea erosion. There were, he said, two distinct erosions going on, that which was visible between high and low-water marks, and that which was invisible below low-water mark and far down into deep water. They could deal with the former class of erosion and were powerless to arrest the progress of the latter; at least no system had yet been devised which would stop the formation of deep-sea gulches, often running parallel to the shore, and it was to the tidal and storm action in such submerged channels as may be found between the Kish Bank and the Dublin and Wicklow shores, or between the Dogger Bank and the East Coast of England, that they owed much of the erosion now going on below the lowest level they could protect.

THE AUCTIONEERS' INSTITUTE.

THE annual general meeting of the Auctioneers' Institute of the United Kingdom was held at the offices of the Institute, 57 and 58 Chancery Lane, on Friday afternoon. The president (Mr. John Hepper) was in the chair.

The report of the Council for the past year and the statement of accounts showed that 136 new members had been elected, fifteen associates became fellows and eight students became associates. On February 28 there were 1,485 members on the register. The alteration in the articles of association, which came into force on May 29, 1901, had proved advantageous and generally acceptable to members, and increased the usefulness of the Council. The continued prosperity of the Institute was indicated by the increase in its investments, which now reached the sum of 3,441*l.* 12*s.* 3*d.*, as compared with 2,998*l.* 1*s.* 3*d.* for the previous year. There was an in-

crease of 4,240*l.* 12*s.* 4*d.* in the balance carried to revenue, in comparison with 3,569*l.* 9*s.* 1*d.* for the previous year. The sum standing to the credit of the benevolent fund on February 28 was 1,481*l.* 10*s.* 4*d.*, as against 1,363*l.* 7*s.* 3*d.* at the same date in 1902. The Council hoped that members would largely strengthen the fund, so that its usefulness might be extended. For the encouragement of examinees the Council were offering, in addition to medals, special prizes for certain subjects, and it was believed that as these examinations became more known and their advantages were better understood, further prizes would be given by individual members. The hopes which the Council had of being able to congratulate the members on receiving a Royal Charter had not, they regretted to say, been realised. The application was made and was refused, no reason for such refusal being given. No doubt another application would be made at a suitable time. During the year two new provincial branches had been sanctioned and inaugurated—one for Liverpool, North Wales and district, and the other for Birmingham and district. There were now ten provincial branches holding regular meetings, and they all appeared to be thriving and doing very useful work. The Institute was becoming more and more a centre of inquiries upon a great variety of professional subjects, and arrangements were under consideration for increasing the efficiency and usefulness of this valuable branch of work. There was a balance in hand of 736*l.* 8*s.* 4*d.*

The President, in moving the adoption of the report and accounts, referred to the consolidation and advancement which had marked the history of the Institution during the past year. The alteration in the articles of association had, he was glad to say, been a decided improvement. It had made the work of the Council more easy, because in certain directions their action had been rendered more elastic. Additional members were elected in March last, bringing the total up to 1,509; the increase during five years had amounted to 72½ per cent., which he regarded as eminently satisfactory. There had been an alteration in the subscription, and they expected that during the present year it would have the effect of preventing a certain class from joining, and also of increasing the prestige of the Institute; the quality of the members would be greatly improved thereby, though the number of incoming members might diminish slightly. They had 4,240*l.* to their credit, which showed an advance since the last stock-taking of 666*l.* They had 3,441*l.* invested in gilt-edged securities, whereas at the end of 1898 they only had 199*l.* This was a splendid

proof of the interest the work of the Institute had created, and of economical management. The first of the provincial branches—which were very important—was established by Yorkshire in 1892; in 1894 Manchester and district started one, and six other branches followed in the course of a few years. Now there were ten branches scattered up and down the country, with 466 members. He looked upon this as a great stride, and he was very glad to find there was a very healthy spirit among these provincial branches. During the year more candidates had been examined than ever before in the history of the Institution, and the number of candidates in March last showed an increase of 53·44 per cent. on the year 1902. Referring to his past year of office, the President said he hoped that the Institution would prosper more and more in the hands of each succeeding president.

The motion was seconded by Mr. Allen Drew, and the report and accounts were adopted.

The retiring members of the Council were re-elected, with the addition of Mr. A. G. Watney (London). The meeting concluded with votes of thanks to the Council and to the Chairman.

The annual dinner of the Institute was afterwards held at the Hôtel Cecil. The President was in the chair, and the company numbered about 300.

The toast of "The Imperial Parliament" was proposed by Mr. Balfour Browne, and responded to by Lord Allerton; and that of "The County and Municipal Councils of the United Kingdom" was given by Mr. James Green, Lord Monkswell replying.

Mr. Justice Kekewich, in responding to the toast of "The Legal Profession," proposed by Mr. W. M. Battersby, said he not only heard a good deal of auctioneers in his judicial capacity, but he also heard them a good deal, and, without flattery, he might say that he had never dealt with a more pleasant class of witness.

Mr. Boyle, K.C., also responded.

Mr. Gerald Balfour, who met with a hearty reception on rising to propose "The Auctioneers' Institute of the United Kingdom," said that until he had the pleasure of listening to Mr. Justice Kekewich he thought there was nobody present who knew less of all that pertained to the work of auctioneers than himself. But his ignorance in this respect did not carry with it any want of respect—quite the contrary. The auctioneers' profession was an ancient, honourable and necessary profession. It was at least as old as the ancient Romans

and he believed he was right in saying that the original auctioneers were soldiers, and that the original auctions were sales, on the field of battle, of booty captured by the conquerors. But if the profession had a military origin, auctioneers were now men of peace, and had discovered that union meant strength, and that many things could be effected by combination and organization. He took it that was the principle on which the Auctioneers' Institute had been founded. He noted that its objects included not merely the promotion and protection of the interests of its members, but also the work of elevating the status of the entire profession. That was a worthy aim, because everything tending to increase the status and dignity of such a profession was good, not only for the profession, but for the public at large. He also was pleased to observe that one of the tasks of the Institute was the establishment of a benevolent fund, from which donations and advances could be made to necessitous members and to the widows and children of deceased members and others connected with the profession. Everybody must sympathise with such objects. That they had the support of the profession at large was evidenced by the growth of the Institute, the membership of which, he understood, had nearly doubled within the last ten years. Politicians and auctioneers might be said to have this in common—that they were supposed to know a good deal about a great many things. He coupled the toast with the name of their President, with whom he had been for many years intimately acquainted. The President, in replying, dwelt on the flourishing state of the Institution, and urged that auctioneers should, as far as possible, article their clerks to themselves, with a view to their advancement in life and to their entering for examinations. Other toasts followed.

CITY IMPROVEMENTS.

THE report of Mr. D. J. Ross, the engineer to the Public Health Department of the Corporation of London, on the works executed during 1902 describes several improvements by setting back frontages in order to widen streets. The question of forming a new line of thoroughfare from the western end of Fore Street, across Aldersgate Street and Bartholomew Close, West Smithfield, was, it is said, again under consideration, and the London County Council have been approached with a view to obtaining a contribution towards the cost of the proposed thoroughfare. The improvements and finance com-

mittee of the Corporation are now waiting to have a conference upon the subject with the Council; and, in the meantime, fresh plans and estimates have been prepared by the engineer in connection with the subject.

The widening of Leadenhall Street is still under consideration, the London County Council having been approached several times by the Corporation with a view to their agreeing to contribute towards the cost of the improvement and leaving the Corporation a free hand to at once open negotiations whenever a favourable opportunity might occur, thus avoiding a repetition of what took place in the year 1900, when the premises Nos. 57, 58 and 64 were rebuilt before the London County Council had decided as to their mode of procedure with regard to the proposed widening, though intimation of the fact that the premises were about to be pulled down and rebuilt was given them at the first opportunity. In spite of a long correspondence upon the subject, they have declined to receive a deputation from the Corporation, and they will give no assurance as to any contribution.

Negotiations have been entered into for the formation of a new street, leading from Giltspur Street to King Edward Street, across the site of Christ's Hospital. Also with the owners of the surrounding properties for the formation of an opening leading from Bridgewater Square to Fann Street. The surplus land remaining after the improvement at the western end of Cheapside had been completed was put up for sale by public auction, but not sold. It will again be put up by auction, for letting on building lease.

The leasehold portion of the surplus land forming part of the site of No. 9 Newgate Street and No. 1 Warwick Lane, which had been acquired in connection with the widening of the latter thoroughfare, was put up by auction, but not sold. As the arrangements made with the freeholder compelled the Corporation (as leaseholders) to build on the surplus land within a specified time, the necessary drawings and specifications were prepared by the engineer, and a contract has been entered into for the new building which is now in course of erection, and, when completed, will be let or otherwise disposed of.

The premises Nos. 1 to 6 Fore Street (formerly known as "The Four Shoppes") having been acquired for the widening of that thoroughfare—at the request of the inhabitants of the Ward of Cripplegate—negotiations have been completed for the disposal of a certain portion of the surplus land to the authorities of the church of St. Giles's, Cripplegate, so as to

enable the north side of the church to be restored and exposed to view. In connection with the widening of Fenchurch Street, the surplus portion of the premises No. 129 was disposed of to the adjoining owner on a building lease. The freehold and leasehold interests in No. 4 St. Paul's Churchyard, which were acquired in 1901, were, by arrangement, disposed of to the owner of No. 3, adjoining, he agreeing to give up that portion of No. 3 required for the widening of St. Paul's Churchyard, and making a money payment in addition. The surplus land, formerly part of the site of No. 35 Basinghall Street, and that at the corner of Fleet Street and Bride Lane, were sold by public auction.

Some idea of the magnitude of the improvement business carried out by the improvements and finance committee may be gathered from the fact that claims amounting in the aggregate to about 223,172*l.* have been negotiated during the past year. The sum these claims were settled for was about 142,737*l.* Freehold land to the value of 35,750*l.* was disposed of. At the end of the year claims to the extent of 147,668*l.* were under negotiation.

Under the provisions of the Local Government Act, 1899, the boundaries of the City were, in several places, rectified, and the ratings in consequence readjusted. The most noticeable instances were in connection with the boundary abutting on the district of the borough of Stepney, in the Minories; in the borough of Finsbury, where a compensation amounting to 9,940*l.* was paid; and in Holborn, where the Holborn Borough Council paid the sum of 9,362*l.* 5*s.* 8*d.* in respect of the Saffron Hill area.

The regulations made by the Corporation with regard to the dimensions of projecting boards and signs in many cases not having been complied with, it was decided to have all those that did not accord with the regulations removed; 1,548 notices were served with this object, and many of the signs were removed by the parties to whom they belonged; about 200 were removed by inspectors to the City Greenyard, but there still remain a few to be taken down.

ELECTRIC-POWER SCHEME.

A COMMITTEE of the House of Lords, presided over by Lord Glenesk, is considering a Bill to incorporate a company for the supply of electricity and power-gas. The proposed capital is in shares, 1,500,000*l.*, with borrowing powers of half a

million, and the area of operations extends over Cheshire, Flintshire, Denbighshire, and parts of Derbyshire and Staffordshire. The chairman of the company is Mr. T. W. Twyford, managing director of Twyford's, Limited, Newcastle-under-Lyme, and the engineer for the scheme is Mr. John Sturgeon, of Manchester.

It was explained by Mr. Balfour Browne, K.C., that the company proposed to supply electricity and power (or Mond) gas over a very wide area, the generating stations being at Runcorn, Macclesfield, Ruabon and Stone, in Staffordshire. It was hoped that other stations might become necessary in future. Originally no fewer than forty-nine petitions were presented against the Bill, but in many cases the opposition was now either reserved or had been settled. The petitions of the four county councils had been practically settled, and those of six railway companies. Several of the local authorities asked to be left out of the area of supply. On that point he contended that when corporations became traders they became subject to the competition of traders. It was provided by the Bill that the company should not enter into competition with any local authority or company which was established for purely lighting purposes, but at the same time they could not refuse to give a manufacturer electricity. If he chose afterwards to use some for lighting they could not, of course, prevent him. The company could not supply electrical energy in any area which now formed part of the area of supply of any authorised distributors without consent, which, however, was not to be unreasonably withheld, any question that arose on this point being determined by the Board of Trade. There was to be a united competition. If, for instance, Stafford or Hanley was in a position to give traders electricity for power they might refuse to give the company their consent, but any proposal to bind the traders to go to the local authority and take their electricity, whether this was cheaper or dearer than the company's, would, he contended, be a detriment to the trade of the district, and in this respect he asked the committee to give the company the power which had been given to similar companies in Yorkshire and South Staffordshire. Although the proposed capital was large, he should be able to show that the money could be easily raised by the influential syndicate at the back of this Bill. The area of the district proposed to be covered was 2,000 square miles and the population 1½ million. In this area there were ninety-nine local authorities, many of which had powers for the supply of electricity already, but their works were chiefly laid out for lighting purposes.

The Architect.

THE WEEK.

It is difficult for anyone in England to understand thoroughly the relations between employers and employed in the United States. The Labour Commissioner at Washington informed the Mosely delegates that he was about to publish statistics proving a restriction of output. An endeavour on the part of workmen to diminish the normal amount of work on which a contractor had calculated when he prepared his estimates must everywhere have a serious effect in promoting discontent. On the other hand, the English representative of the bricklayers says that through the existence of the joint Board of employers and workmen a friendly spirit prevails in his trade, "and disputes which might otherwise develop into serious ruptures are generally, indeed almost invariably, avoided, which is certainly to the advantage of both sides." The efforts of the American builders at the present time are evidence that, in spite of joint boards and councils, the trade organisations are sufficiently powerful to control the men and to prevent the carrying out of contracts. In New York there are apprehensions that the interference of delegates will cause building operations to stand still. Many builders have therefore decided to take steps in order that they may become "more secure in the conduct of their business, workmen more secure from interference with their opportunity to work, and the public generally more secure from interruptions to business resulting from strikes and lock-outs in the building trades." It is now believed that 100,000 workmen are on strike in New York alone, and in consequence between 200 and 300 buildings are left incomplete. So serious a state of affairs must be perplexing. It should be remembered, however, that by the conditions imposed by employers the labour market is restricted. The American workman, as was shown by the Mosely Commission, is thrown out of work at an early age, and his average life is shorter than that of the English workman. A plasterer's career is over before he reaches his fiftieth year, and among carpenters there is very little employment for men over middle age. As the building workman's life is therefore short, there is some excuse for him when he seeks for relaxation and amusement by means of strikes.

THE Council of the University of the Cape of Good Hope invited architects to send in designs for new buildings. Premiums of 400*l.*, 200*l.* and 100*l.* were offered. Mr. ASTON WEBB, A.R.A., accepted the task of examining the designs, and has reported as follows:—"I have carefully considered each of the sixty-two designs submitted in this competition, amongst which are a large number of very excellent designs. A great variety of treatment is shown both in the architecture and the planning. I am of opinion, taking plan and elevation together and with a due regard to the conditions of the competition, that the design marked No. 35 is the best, and entitled to the first premium. It is an excellent design, well and economically planned, and I place No. 30 second and No. 24 as third." Design No. 35 is the work of Mr. W. HAWKE, London; No. 30 came from Mr. J. EDWIN FORBES, Birmingham; and No. 24 is by Messrs. E. W. WIMPERIS & HUBERT S. EAST, London. The designs will be exhibited in the North Gallery of the Imperial Institute until May 30 between the hours of eleven and five o'clock.

THERE was a time when examples of Greek art were supposed to be indispensable in any English collection which the owner aspired to have considered as valuable. The Arundel marbles form one example of this ambition, the Townley another. At Petworth, Woburn, Wilton and Chatsworth we can see a survival of the class of work which was once prized. So much ancient work was found to be a comparatively modern fabrication, it is no wonder the taste for the antique died out. Pictures are now found to give more pleasure, and they are a better investment. The delightful exhibition at the Burlington Fine Arts Club may be taken as evidence that there are more votaries of Classic art than had been supposed. A

sufficient number of works in marble, bronze and terra-cotta, coins, gems, vases and other treasures have been contributed to require a voluminous catalogue to describe them. This has been mainly prepared by Mrs. ARTHUR STRONG, who deserves credit for the fine judgment shown in organising the exhibition. Assistance has been rendered by other specialists, and the small gallery in Savile Row is enough to suggest the existence of fields in England which the organisers of loan collections and winter exhibitions have not explored. The Petworth collection was obtained by GAVIN HAMILTON, but a large amount of restoration was necessary. The *Aphrodite* from it was long neglected, but it is so remarkable an example, although it may not be the work of PRAXITELES, it ought to have a place in the British Museum. There are other rivals to it. The fragment of the Parthenon frieze recently described at the Institute can also be seen, with much else which will make an invitation to view the collection valued as a favour.

THE theatre known as the Folies-Marigny, near the Avenue Champs-Élysées, is one of the minor class. However, like the larger buildings it is under the surveillance of the Municipal Council. Several works were reported to be necessary, and a committee was constituted to inspect the structure. M. RENÉ PIAULT, one of the members who was an advocate and formerly President of the Council, was appointed to prepare the report. After examining the structure, M. PIAULT with MM. BOUVARD and FORMIGÉ, the architects, with two municipal councillors ascended to the roof. It is partly covered by a domical sky-light. The inspection over, M. PIAULT followed his colleagues, but as he was short-sighted he must have stood on the glass and fell for a depth of 26 feet. He was terribly injured, and in the course of a few hours died without regaining consciousness. He was only thirty-five years of age. A case of this kind should be taken as a warning by amateur inspectors of buildings. As municipal authorities they make rules and regulations relating to construction, and by a natural weakness they conclude that their knowledge about construction is thorough and practical. It is not unusual for such gentlemen to venture into dangerous positions, and the wonder is there are not more fatal accidents among them. The meeting of the Municipal Council was adjourned out of respect to the late councillor, and it was decided that the expenses of the funeral should be borne by the city funds, which is the rule each time a municipal councillor dies in the discharge of his duty.

THE amended design for the new Vauxhall Bridge was discussed at the meeting of the London County Council on Tuesday. The elliptical arch structure had been abandoned, and the bridges committee recommended the adoption of a steel segmental arch structure, but that the pylons should be omitted from the architectural part of the superstructure. The reasons which have induced the committee to decide on the omission of the pylons are on account of the additional cost which they would entail, and also of the amount of space which they would occupy and the consequent interference with traffic. It was also recommended that a vote of 22,690*l.* should be approved, as that sum was required for decorative masonrywork, for panels over the piers and for additions to the engineer's estimate of 170,000*l.*, rendered necessary in consequence of the alterations of design. An amendment was proposed that the new design should be referred back to the bridges committee in order that the pylons, balustrades and piers should receive further consideration. A second amendment was to the effect that the omission of the pylons should be deferred until the committee had further reported. Mr. EMDEN considered that the pylons should be only of a height sufficient to serve as basis for statuary. Mr. JOHN BURNS also suggested that they should only be carried up to the level of the parapet. Upon that foundation they could cheaply erect plaster pylons to the height suggested in order that their effect might be considered before permanent structures were placed there. The amendment was approved, and the bridges committee will therefore decide upon the form which the pylons are to assume. There is a general belief that the construction of the bridge has been too long delayed, especially as it is hopeless to expect unanimity on the subject, even if three or four years were devoted to the preparation of a design.

TYPES OF COSTUMES:—GRACES AND HORÆ

SCULPTURE AT THE ROYAL ACADEMY.

AMONG the arts sculpture is the most likely to suffer through political disturbances or economical depression. The aim of JOHN FLAXMAN in his lectures on sculpture was to prove that outward circumstances alone prevented Englishmen from excelling in the art. It was therefore to be expected that the difficulty of carrying on a war in a remote country, followed as it was by diminished trade and increased taxation, should be suggested by the character of the sculpture in this year's exhibition. All must hope the effect will be only transitory, for there is no doubt the art of sculpture had received a fresh impetus, and the collection in Burlington House during recent years would have astonished FLAXMAN by its merit and convinced him that his anticipations were not exaggerated. Especially there were signs of his desired union between architecture and sculpture.

In *Music and Poetry*, by Mr. PAUL MONTFORD, which is a model for a group on the Cardiff town hall, we observe an indication of the new spirit. In PAN and HOMER we have a return to the ancient world which will always be present to the minds of sculptors, and the spectator can gain an idea of the arts of music and poetry from the two figures which is as expressive as any elaborate allegory. Mr. PEGRAM'S monument, a relief which has attained the marble stage, recalls HENRI REGNAULT'S in Paris. But that is not a defect. CHAPU'S figure of *Youth* in it raises the left arm. Mr. PEGRAM represents the woman stretching upwards the right arm. The figure is admirably modelled. Mr. WHEATLEY'S *Sons of Poseidon*, two swimmers apparently racing, deserves the credit which should be given to invention. FLAXMAN recommended "Paradise Lost" to the Academy students as a treasury of subjects, although up to his time it had been neglected. The Temptation since that day has been a stock subject. Mr. A. G. WALKER in his interpretation does not give the demon the form of a serpent. A more insidious enemy in human shape takes its place. The low relief imposes less difficulty in its comprehension. An excellent group by Mr. BERTRAM MACKENNA, and called *The Truth Seeker*, is likely to be accepted at first sight by all visitors as the familiar ADAM and EVE. The bust of the late Lord RUSSELL OF KILLOWEN, by Mr. J. W. SWYNNERTON, is well adapted to be placed in the town hall of Newry, in order to suggest the greatness of the man who was at one time an attorney in that small town. With the judicial robes, chains and badges it suggests no less omnipotence than we see in some of the busts of LOUIS XIV. But the Celtic "clear the way" manner to which the barrister mainly owed his amazing success was cast aside, "his falser self slipped from him like a robe" when he reached the Bench, and the colossal bust is less expressive of the Lord Chief Justice of England. There is marvellous power shown in a bust of a different kind by Madamé BROMET,

The Harpy Celano, but it would serve for either of her sisters. It is remarkable what an inspiring effect classic themes have for the sculptor. Signor SCOTTO'S *Bacchante* is a surprising example of dexterous manipulation. Mr. GILBERT BAYES has a finely-modelled horse's head in his *Pegasus*, and his *Fountain of the Zodiac Belt* is of unquestionable beauty. Mr. HORACE MONTFORD'S *Hymn to Demeter*, a girl with a lyre, would probably have been still more attractive in marble. It is rare to see a figure of a Chinaman in a collection that is reminiscent of Greek mythology. The figure to be executed in bronze for the Engineers' Institute, Penang, of CHENG KENG LUIE, by Mr. BENJAMIN CRESWICK, of Birmingham, is a realistic representation of figure and costume. Here it may be observed that the difference between Japan and China in respect of art is indicated by the rarity of Chinese visitors to the annual exhibitions of the Academy as compared with the Japanese. The representatives of the older race appear to go through the galleries like Stoics enduring self-inflicted punishment; their rivals seem to take more pleasure in what they see than the majority of Englishmen.

The Lecture Room suffers this year from the absence of dominating works. Busts are in profusion. There are statuettes and examples of *objets d'art*, but for so large a space something more is needed to produce an impressive effect. Mr. GEORGE FRAMPTON of late has displayed so many novelties that he has made visitors expect a continuance of them. He contributes as his principal work a bust of *Chaucer* intended for the Guildhall, in which, of course, the stereotyped portrait had to be faithfully imitated. There is consequently no opportunity for creation. His *Sir Walter Besant* is a bronze memorial to be placed in St. Paul's. The bust is so low as to be suggestive of an example in *repoussé*, but the likeness is faithful. Opinions will differ about the twisted band introduced. The lettering below is so well executed it would have been an advantage if the titles of BESANT'S books were inscribed instead of the band. A work of like character is Mr. PEGRAM'S memorial of *Sir John Stainer*. It also is to be set up in St. Paul's. The use of coloured materials may now be said to be established. Mr. PICKFORD MARRIOTT has produced an *Adoring Angel*, in which mother-of-pearl, precious stones and gesso are combined. Mr. W. REYNOLDS STEPHENS has made his mark by decorative paintings, but this year he sends part of a church screen in metal, mother-of-pearl, marble, &c. The massive upright square gilded bars are in strong contrast with the ornament in the upper part of the composition. The screen is somewhat allied to the "new art" but is without its extravagance. Various metals are also employed to produce *Love's Crown* by the same artist. There are three busts of the KING, viz. by Mr. DRURY, Mr. MERRETT and Mr. LANIER. Mr. THORNYCROFT has a bronze statuette, *The Sandal*, a small model of another statue of the late Mr. GLADSTONE, and another illus-

trative of Education. By Mr. ARMSTEAD, who has been exhibiting for over fifty years, and may, therefore, be considered the NESTOR among British sculptors, is a figure of *Remorse*—a woman wringing her hands, which in height comes between a life-size statue and a statuette. It suggests tragedy, and might be Lady MACBETH asking, "Will these hands ne'er be clean?" Mr. A. J. LESLIE'S *The Birth of Aphrodite* departs from the usual arrangement, for the goddess is seen seated on a rock as if wondering at the ocean around her instead of rising from the water. Mr. VON HERKÖMER in his *Child of the Sea*—"a phantasy in copper and enamel"—shows one of the original works of the year, for in the shell and figures colour is liberally and skilfully used, and it might be considered as a painting in the solid, or a combination of painters', sculptors' and metal-workers' crafts.

Devotional feeling is expressed with a delicacy and subtlety that are not always found in modern Italian art in Signor CANONICO'S *Communicants*, a group of the busts of two girls at the altar-rail. By the *Roadside*, a work of M. LÉON SOLON, is characteristic of his style, which retains many of the qualities of the finest French pottery. *The Triumphs of Art and Science* is part of a frieze by Mr. WILLIAM MIDGLEY, and has the rhythmical qualities desirable in a work of the class. Another vigorous work is *Sledge-hammerers*, which is also a portion of a frieze by Miss RUBY LEVICK.

The busts are very numerous. Among them are *Sir John Williams* and *Prince Christian Victor*, by Mr. GOSCOMBE JOHN; *Sir William Abney*, by Mr. LANTERI; *My Mother*, by Mr. A. GILBERT; the *Right Hon. W. Court Gully*, by Mr. V. BONANNI; *Luke Fildes*, by Mr. HERBERT HAMPTON; *Monsignor Nugent*, by ANIZA MCGEEHAN; *H. H. Armstead*, by Mr. W. ROBERT COLTON; the late *Sir William MacCormac*, by ALFRED DRURY; the *Dean of St. Albans*, by BASIL GOTTO. It may also be noted that this year the vestibule is adorned with some portrait-busts of deceased Academicians who were painters or sculptors. They are out of place. There would be no objection to them in the winter exhibitions. But in a display of the works of living artists their appearance is disturbing. Probably it is only an experiment in order to ascertain the effect of using the vestibule for busts, and by that means diminishing the monotony caused by the long shelves in the Lecture Room. The old busts vary in quality; the most interesting is one of THOMAS STOTHARD.

METZ CATHEDRAL.

It is generally believed that in Mediæval times architectural sculptors were accustomed to employ for their figures on ecclesiastical buildings portraits of dignitaries of the Church or other distinguished individuals. Italian painters are also known to have introduced their patrons and friends as scriptural personages in pictures. There is an abundance of precedents for making the figure of the prophet DANIEL, which is one of those adorning the new porch of the cathedral of Metz, assume the lineaments of the German EMPEROR. Many other German potentates were employed in the past to give character to other Gothic figures. The Mediæval sculptors were allowed exceptional privileges at a time when men were severely punished for a slight irreverence. They were permitted to gibe at the ecclesiastical system, and a great number of misereres that have survived to the present time reveal the extent of the license. A more severe code of criticism now prevails, and it is adverse to the perpetuation of portraits unless under exceptional circumstances, and we suppose they existed at Metz, or Herr TORNOW, the architect of the new work, would not have selected an imperial model for one of the prophets.

A War Memorial, designed by Mr. Alfred Gilbert, R.A., is to be erected in front of the entrance to the Victoria Park, Leicester. The height of the column will be about 25 feet, and it is proposed to engrave the names of the Leicestershire officers and men round the base of the column. It will be surmounted by a figure of Victory,

THE PRINCIPLES OF ARCHITECTURAL DESIGN.

By PERCY L. MARKS.

CHAPTER XI. (continued).

A.

SYMBOLS AND THEIR SIGNIFICANCE (see fig. 75)

Saints:—

Andrew (leaning on saltire cross)	Scotland (Patron Saint).
Anthony (holding Tau cross with bell at end, and accompanied by a pig)	Butchers' sign.
Apollonia (female holding a tooth and palm branch)	Dentists' sign.
Blaise (iron combs)	Hairdressers, woolcombers.
Catherine (wheel)	Patron Saint of girls;
Crispian and Crispin (two shoemakers at work)	Shoemakers.
Cuthbert	Smiths.
Denis (holding his mitred head in his hands)	France (Patron Saint).
Dunstan	Goldsmiths.
George (cavalier tramp—ling dragon).	Piety, England's Patron Saint (illustrated at m).
Giles (old man with arrow in his knee and a hind by his side)	Cripples' Patron Saint.
Hubert (hunter kneeling to a crucifix, borne by a stag)	Huntsmen.
Ives (judge or doctor of laws, with widows and children)	Lawyers' Patron Saint.
James of Compostella (the Greater), with pilgrim's staff, and cloak covered with scallop shells	Spain's Patron-Saint.
James the Less, with fuller's club	Fullers.
John the Baptist (holding lamb, with nimbus round its head)	Baptist chapels and colleges.
John the Evangelist (represented by an eagle)	Lectern (illustrated at j).
Joseph (aged man with budding staff)	Carpenters.
Jude (with club or staff, and a carpenter's square)	Carpenters.
Lawrence (with gridiron, illustrated at g)	Curriers.
Loy (with crozier and hammer)	Smiths.
Luke (a bull, or the saint seated at a desk with a bull's head beneath)	Painters, doctors.
Martin (giving alms to a beggar, illustrated at k)	Charity.
Nicholas (as a bishop holding three golden balls or purses, or with three children)	Boys and scholars, sailors, Russia.
Olaf (carrying a loaf, and a halbert or sword)	Bakers.
Pancreas (treading on a Saracen, and with symbols of martyrdom)	Children.
Patrick	Ireland (Patron Saint).
Paul (with sword and open book)	Preachers, tent-makers.
Peter (cock, triple cross, keys, illustrated at a)	Fishermen and fishmongers.
Sebastian (bound to a tree and pierced with arrows)	Archers, pinmakers.
Simon (with saw and fish)	Fishmongers.

Stephen (with stone and book)	Hungary (Patron Saint).	Authority	Mace, truncheon.
Thomas the Apostle (with builder's square)	Architects (Patron Saint).	Bakers	Owl, Saint carrying a loaf.
Salamander	Fire.	Baptist chapels, &c.	Pale green, Saint carrying a nimbused lamb.
Screw, Archimedean	Eternity.	Baronets	Blood-red hand.
Scroll (open) read by lamp-light	Study.	Barristers	Lion sejant.
Scythe	Time.	Battle	Red flag.
Seal (animal)	Canada.	Bishop	Curved crook.
Serpent casting its slough	Resurrection.	Blacksmiths	Anvil, forge, Vulcan.
Serpent discharging its virus into chalice held by a maiden	Health (illustrated at <i>u</i>).	Boys' schools, &c.	Bishop accompanied by three children.
Serpent holding its tail in its mouth	Eternity.	Bravery	Horse, leopard.
Serpent (winged) rising from a chalice	St. John the Baptist.	Brewers	Tun, barrel.
Shamrock (illustrated at <i>w</i>)	Ireland.	Butchers	St. Anthony's Cross; Saint holding a Tau cross with a bell at the end, and accompanied by a pig.
Sheaf of corn	Plenty.	Callicpe	Stylus and wax tablets.
Ship (illustrated at <i>z</i>)	Navigation.	Canada	Seal (animal).
Silver (tone)	Purity.	Carpenters	Saint holding a club (or staff), and a carpenter's square.
Skull and crossbones	Mortality.	Charity	Flaming heart; pelican; red; woman suckling children; St. Martin giving alms to a beggar (illustrated at <i>k</i>).
Sphinx	Mystery.	Chemists	Red lamp, phoenix.
Spider's web	Prison.	Children's institutions	Saint treading on a Saracen.
Stag (in Christian art)	Christ.	Christ	Cross, fish, lamb, pelican, stag.
Stag bearing crucifix, &c.	St. Hubert (<i>q.v.</i>), Shooting-boxes.	Comedy	Mask, Thaleia the Muse.
Sticks, Bundle of	Strength in union.	Concord	Myrtle, pomegranate.
Stylus and wax tablets	Calliope the Muse.	Confession	Saffron colour.
Sundial	Time.	Consolation	Swallow.
Sunflower	Devotion.	Conviviality	Bacchus.
Swallow	Consolation.	Counsel	Lion sejant.
Sword	Military buildings.	Courage	Horse, leopard.
Sword and open book (in Christian art)	St. Paul, preachers, tent-makers.	Courtship	Cupid.
Tablets (see Stylus)		Cripples	Saint with arrow in his knee, and a hind by his side.
Terpsichore the Muse	Dancing.	Cunning	Fox.
Thaleia the Muse	Comedy.	Curriers	Gridiron.
Thistle (illustrated at <i>w</i>)	Scotland.	Cycle-depôt	Winged wheel.
Toad	Inspiration.	Dairies	Yoke, cow.
Tongs, Smith's	St. Dunstan (<i>q.v.</i>), goldsmiths.	Dancing	Terpsichore the Muse.
Torch, Bridal (see Hymen)		Deity, The	Hand issuing from clouds.
Torch flaming (illustrated at <i>z</i>)	Knowledge.	Denmark	Raven.
Trumpet	Newspaper offices.	Dentists	Female saint holding a tooth and palm branch.
Truncheon	Authority.	Devotion	Sunflower.
Tun	Brewers.	Diana (for Shooting-boxes)	Female with bow and arrows.
Unicorn (as supporter on Royal Arms)	Scotland (illustrated at <i>d</i>).	Doctor	Red lamp.
Venus	Love.	Earth, The	Cow; globe (illustrated at <i>e</i> and <i>l</i>).
Violet (colour)	Mourning.	Egypt	Crocodile.
Violet (flower)	Innocence.	Electric cable	Man with winged heels (Mercury); globe (<i>l</i>).
Vulcan (at his forge)	Blacksmiths.	Electricity	Electric bolt grasped in the hand.
Wheel, Female saint with	Girls' schools, St. Catherine.	Empire	Banyan tree, eagle.
Wheel, Winged	Cycle depôts, &c.	Empire, Dual	Double-headed eagle.
White	Purity.	Endurance	Camel.
Willow branch	Mourning.	England	Britannia (<i>y</i>), St. George's Cross* (<i>v</i>), St. George trampling on dragon (<i>m</i>), John Bull, Rose (<i>w</i>), Lion passant regardant (<i>d</i> and <i>w</i>).*
Woman with bow and arrows	Diana, Shooting-boxes.	Equinox	Balances.
Woman suckling children	Charity.	Eternity	Circle, globe, ivy, Archimedean screw, serpent holding its tail in its mouth.
Yew	Mourning.	Faith	Green.
Yoke	Dairies.	Fire	Salamander.

B.

SUBJECTS AND THEIR SYMBOLS (see fig. 75).

Africa	Camel.
Air	Chameleon.
Ambulance	St. George's Cross.
America, North (United States)	Flag (Stars and Stripes).
Apothecaries	Pestle and mortar.
Archbishop	Floriated crook; Mitre (illustrated at <i>f</i>).
Archers	Saint bound to a tree, and pierced with arrows.
Architects	Saint carrying a builder's rule or square.
Asia	Elephant.
Auctioneers	Hammer.
Australia	Kangaroo.
Austria	Double-headed eagle.

Fire insurance (illustrated at <i>r</i>)	Phoenix.
Fishermen and fishmongers	Cock, key or two keys.
Folly	Cap and bells.
Fortitude	Eagle.
France	Fleur-de-lys (illustrated at <i>z</i>), lily, Saint holding his mitred head in his hand.
Fruiters	Cornucopia.
Fullers	Saint holding a fuller's club.
Furriers	Bear.
Girls' schools, &c.	Female saint holding a wheel.
Goldsmiths	Saint with a harp.

* Drawn according to heraldic blazonry.

Grocers	Grasshopper.
Guardianship	Policeman, serpent.
Hairdressers	Pole with gilt knob at end, Saint with combs.
Health	Hygeia holding a salver, into which a serpent drops its virus (illustrated at <i>u</i>).
Holy Spirit, The	Dove.
Homœopathy	Hahnemann.
Hope	Anchor; blue.
Huntsmen	Diana hunting, Saint kneeling to a crucifix borne by a stag.
Hygiene	(see Health.)
Hymen	Man holding bridal torch and veil.
Ignorance	Ass carrying blindfolded person.
Immortality	Azure blue; green.
Incorruptibility	Peacock; rose.
Industry	Beehive.
Innocence	Violet (the flower).
Inspiration	Toad.
Ireland	St. Patrick's Cross* (<i>v</i>), harp (<i>d</i> and <i>w</i>), shamrock (<i>w</i>).
Isle of Man.	Three radiating legs.
Justice	Balances carried by blindfolded female holding a sword; purple.
Kennels	Dogs.
Kent	White horse.
Knowledge	Flaming torch (illustrated at $\frac{z}{c}$).
Lawyers	Judge; Doctor of Laws.
Leinster	Harp.
Liberty	Cat, blue cap with white border (England), red cap (France), cap on a pole ($\frac{z}{a}$).
Life, Tree of	Palm tree.
Locksmiths	Key, padlock.
Love	Venus.
Luck (good)	Horseshoe.
Marriage	(see Hymen.)
Martyrdom	Palm branch; rose colour.
Mary (Mother of Jesus)	Heart pierced with arrows; marigold.
Masonic Societies	Compasses, cube, equilateral triangles crossed.
Mercury	Man with winged heels.
Messengers	Mercury (as last).
Meteorology	Figures representing the winds (as on the Clepsydra at Athens).
Military	Cannon, gun, halberd, helmet, sword.
Mortality	Skull and crossed bones, broken column.
Mourning	Black, violet, cypress, yew, willow branch, laurel, oak, half-masted flag.
Munster	Three crowns.
Music	Apollo, lyre.
Mystery	Sphinx.
Navigation	Figurehead; ship (illustrated at $\frac{h}{c}$).
Newspapers	Cuttlefish; trumpet; globe (illustrated at <i>e</i>).
Painters	Palette and brushes, St. Luke.
Pawnbrokers	Three golden balls (illustrated at $\frac{z}{b}$).
Peace	White flag, olive branch.
Pinmakers	Saint pierced with arrows (see St. Sebastian).
Plenty	Cornucopia, quails, sheaf of corn.
Poetry (heroic)	Calliope the Muse.
Poetry (historical)	Clio the Muse.
Preachers	Saint with sword and open book (see St. Paul).
Printers	Cuttlefish.
Prisons	Handcuffs, spider's web.
Prosperity	Olive tree.
Providence	Hen and chickens, raven.
Purity	Silver (tone), white.
Regeneration	Lotus flower or plant, phoenix.
Resurrection	Box plant, holly, serpent casting its slough, green colour, phoenix (<i>r</i>).
Royalty	Purple.

Russia	Bear.
Sacrifice	Pelican.
Sanctity	Nimbus.
Schools	Owl (illustrated at <i>t</i>); beehive, &c.
Scotland	Lion rampant (<i>d</i> and <i>w</i>), St. Andrew's Cross* (<i>v</i>), Saint leaning on a saltire cross; thistle (<i>w</i>); unicorn (<i>d</i>).
Sea, The	Dolphin (<i>s</i>), Neptune with trident.
Security	Noah's ark (<i>c</i>), bulldog, portcullis.
Shoemakers	Two saints working at the trade; a boot-last.
Shooting-boxes	Diana, Saint kneeling to a crucifix borne by a stag.
Smiths	Hammer, Saint with crozier and hammer.
Sorrow	Heart pierced with arrows.
Sovereignty	Crown and sceptre (illustrated at <i>w</i>).
Spain	Pomegranate, Saint with pilgrim's staff and in cloak covered with scallop shells.
Speed	Horse.
Stables	Horse.
Stock Exchange, The	Bear, bull.
Strength	Hercules; bundle of sticks ("Strength in union").
Study	Open book, lamp, open scroll read by lamplight.
Tailors	Ram suspended round the middle.
Tentmakers	Saint with sword and open book.
Time	Hour-glass, scythe, sun-dial, old man with scythe.
Travel	Globe.
Trinity, The	Equilateral triangle.
Turkey	Crescent moon and star.
Ulster	Blood-red and erect hand.
Union	Myrtle; pomegranate; bundle of sticks ("Strength").
Valour	Lion saliant.
Victory	Laurel wreath, palm branch, parsley wreath.
Vigilance	Bulldog, cock.
Vintners	Barrel (<i>n</i>).
Wales	Dragon, goat, leek.
Wales, Prince of	Three ostrich plumes (badge).
Watchfulness	(see Vigilance.)
Weather, the	(see Meteorology.)
Wisdom	Owl (illustrated at <i>t</i>).
Woolcombers	Iron combs.
Youth	Hebe holding a cup. (To be continued.)

PRESERVATION OF HISTORICAL BUILDINGS.

ON Tuesday last the First Lord of the Treasury was asked by Mr. YOXALL whether he would consider the appointment of a Select Committee of the House of Commons to inquire into the desirability of establishing in the United Kingdom a system of national protection and conservation of buildings of historical or biographical interest, such as exists in France under the Loi du 30 Mars, 1887, whereby a Government grant of 1,427,000 frs. is available for the purpose this year. The reply of Mr. BALFOUR was:—"I should be very sorry to express any opinion on this question, or even go the length of saying that it is ripe for discussion before a committee of the House. I have looked at the French law, and I find that it entirely turns upon the discretion of a Minister who is competent, or understood to be competent, to deal with questions of this kind. I am not sure that I should like to add to the labours of the central Government in this country such addition to their responsibility as the copying of the French law would entail." We do not venture to say that the First Lord was in error. So little attention is given to antiquity or historic buildings in Parliament, it is unlikely he considered the French laws about historic monuments until it became necessary to give an official answer to the member for Nottingham. What was done by the French Chamber in 1887 was merely to develop and to impart more definiteness to arrangements which had been adopted

* Drawn according to heraldic blazonry.

* Drawn according to heraldic blazonry.

for about fifty-five years. It may, then, be an advantage for other men as well as legislators and officials to describe the efforts of various Governments in France to preserve architectural works having more or less relation to the history of that country.

The subject should be interesting to Englishmen, for although it may not be generally known in France, the preservation movement owed its origin to English influence. The love of architecture which is inherent in Frenchmen as in all the Latin races is exemplified mainly by the encouragement of living representatives of the art, rather than by vaunting the superiority of their predecessors. The past may have sentimental associations occasionally for Frenchmen, but the Revolution of 1799 was enough to show how easily all that is antique could be cast aside. In the excitement of that stirring epoch a spirit of vandalism was allowed to appear, and to it many a fine building succumbed. But fortunately the current of events turned the attention of Frenchmen from antiquity for a period. It is a remarkable fact that DUCAREL, who was the first Frenchman to write about the antiquities of Normandy, was only the agent of our Society of Antiquaries, and his book was brought out at their expense. There was a large collection of treatises produced in London on French Gothic before a single volume on the subject appeared in France. D'AGINCOURT's great work, which was completed in 1816, relates to the whole of Europe rather than to his own country. It was not until 1824 that essays by a few enthusiastic architects in Normandy were printed for the use of the public. At the time there was an official fear of an investigation of the past. In 1822 the course on the history of Europe at the Sorbonne by M. GUIZOT was suppressed. But the same year saw the revelation of a power that was destined to give charm to the past, for it witnessed the dawn of VICTOR HUGO as a poet. The glamour which WALTER SCOTT exercised over England and Germany was to some slight extent operative in France. The work of THIERRY on the conquest of England by the Normans was avowedly an effort to adopt SCOTT's system, and to make history picturesque and vivid as well as truthful. Then came the revolution of 1830 when LOUIS PHILIPPE was elected king. The queen was of a religious nature, and courtiers began to take an interest in the old churches of the country.

Another factor was the rise of romanticism. It might be described as an attempt to bring back the Middle Ages. It mattered little to the zealots whether it was the era of St. LOUIS and the Crusades, or the more remote Merovingian or the Carolingian time which was revived, so long as every trace of classicism could be held in subjection. So general was the new infatuation that in 1831 the French Chambers agreed to allow 80,000 francs towards the reparation of ancient buildings in urgent cases, and in order to encourage local administrations to tax themselves for the conservation of monuments in their districts. The distribution of the money was confided to the Department of Fine Arts, which was then one of many sections of officialdom belonging to the Minister of the Interior. Mr. BALFOUR's advisers, we imagine, must have informed him of the arrangement, and made him believe that since 1831 the restoration of old buildings was a task imposed on successive Ministers of State. Anyone acquainted with official life in France would at once realise the true meaning of what was done, for it may be laid down as a general rule that the creation of paid and honorary appointments has much to do with all French reforms.

The disposal of the 80,000 francs led to the engagement of inspectors, who acted under an Inspector-General. LUDOVIC VITET was the first to hold the latter office. He was a painstaking archæologist; but although he attained a seat in the Academy, he never could be said to have received the applause he merited. After a year or two he was supplanted by PROSPER MÉRIMÉE, the author of "Carmen" and several delightful tales, but who had a genius for statesmanship. In 1836 he procured an increase of the vote to 120,000 francs, and then to 200,000 francs. By 1837 he had persuaded the Minister of the necessity of an independent Commission to deal with historic monuments. The Director of Civil Buildings was appointed president; FÉLIX DUBAN, the architect, was one of the members, and PROSPER MÉRIMÉE became secretary, as well as inspector-

general, and was therefore the soul of the new authority. The first aim of the Commission was the preparation of a sort of Domesday Book. The historic monuments were registered and classified. Their condition was investigated, not very thoroughly, but sufficiently to allow of the despatch of circulars to prefects calling attention to the reparations which were necessary for the buildings in their districts. No less important was the order that no prefect was to sanction any work on one of the tabulated buildings until it had received the sanction of the new Commission. A central authority in Paris is sure to give rise to the voluntary creation of subordinate organisations in the provinces. A large number of departmental societies were founded to co-operate with the Commission. They were willing to confirm the wisdom of the instructions received from the Commission by their own conclusions. The general enthusiasm was not without its effect on the Chambers, and in the course of seven years the vote had grown from 80,000 to 400,000 francs. There was a proportionate increase of officials. Special inspectors were appointed for each department of France. In order that relics of various classes might not be dispersed, the Musée Cluny was founded for their reception. In spite of the numerous changes in government, the grants from the Legislature became more liberal. People may have been amazed when it was stated by Mr. YOXALL that a sum of 1,427,000 francs was devoted this year to historic monuments; but as far back as 1859 the vote was 1,100,000 francs, and that amount was regularly assigned for several years. It is needless to say that the votes had of necessity to be supplemented by much larger sums raised in the different districts where works were executed.

When the Commission was formed it was inevitable that, with masters of composition like VITET and MÉRIMÉE at the head of affairs, they would carry out the business of the Commission by means of documents. It is a weakness in all countries to associate the production of State papers with successful government. If style alone was the test, a selection from the archives of the French Historic Monuments Commission deserves to be considered as forming the most perfect example of official literature in existence. But there were politicians in France who believed circularising had been carried to excess. The initiative in schemes of restoration was imagined to be a privilege of the Commission, and local energy was sometimes subdued. The law of March 1887, to which Mr. YOXALL alluded on Monday, was introduced by M. ANTONIN PROUST, then Minister of Fine Arts, and was to give more of a compulsory character to the regulations, or, in other words, to make the preservation of monuments a public duty.

The first Commission consisted of about eight members; there are now thirty. Among them are several architects, a sculptor, a painter, an archæologist, directors of civil buildings, museums and cults, besides prefects and officials possessing special knowledge of all bearings of restoration. There has also grown up, as subordinate or auxiliary to the Commission, a department of diocesan architects, and in that way local knowledge of the most exact kind is obtainable. There are many other officials, and any proposed scheme of operating on a building has in consequence to be subjected to a manifold scrutiny. The Minister of Fine Arts is simply the chairman for the time being of a permanent body having thirty members, and although he may be influential, his power is minimised owing to the number of high officials who may be said to take a personal interest in the subject, while his can only be temporary, for it depends on his term of office. It was therefore inexact on Mr. BALFOUR's part to speak as if the whole work of restoration in France depended on a Minister's investigation of archæological problems. As we have said, the Minister's office, as relates to historic monuments, is mainly honorary. He approves of arrangements, but they are initiated and conducted to their completion by a Commission that in its constitution exemplifies the power of French organisation.

Mr. BALFOUR's alarm about such an addition to the duties of an English Minister as responsibility for restoration was justified. Whenever any project of the kind is proposed in this country it becomes a subject of controversy which is often acrimonious. There is no accounting for

GLASGOW TECHNICAL COLLEGE.

taste, it is said, and differences between men about the treatment of an old building are more frequent than in those arising in connection with other cases where taste is involved. What politician would care to accept office if he knew he was to be subjected to badgering about the erection of a public library in Stratford-on-Avon, the restoration of Exeter Cathedral, the search for the Ark of the Covenant at Tara, or the numerous controversial proposals raised every year? It is rarely, however, a question relating to restoration is discussed in the French Chamber. The Minister of Public Instruction and Fine Arts is no doubt responsible in all cases, and any subject may serve for an attack on Government in an emergency, but the extent of his power is known, and it is recognised that every proposal for restoration has been investigated by specialists from different points of view, and whatever is undertaken is the best settlement which fallible men can devise.

If restoration were included in the work of one of the English ministries and had to be controlled by ordinary officials there would not be much gained by the public in any sense. But a Commission corresponding as far as English peculiarities would admit with the Commission of Historic Monuments is likely to be as serviceable in England as the French institution has proved to be in France. Although renovation was too often carried to excess, we should judge results by French ideas of propriety. There would be little difficulty in making arrangements to enable a body of experts in England to investigate projects of restoration, and their conclusions could be made to hold a like relation to ministerial decisions that the awards of arbitrators related to the judgments of the High Courts. The members of the French Historic Commission discharge their duties mainly without fees, for the money expended is devoted to the execution of works and superintendence.

GLASGOW TECHNICAL COLLEGE.

THE new buildings, of which the memorial-stone was laid on the 14th inst. by the King, occupy a spacious site in George Street, and their cost, with the price of the ground, but exclusive of the equipment, is estimated at 210,000*l.*, towards which subscriptions have been received to the amount of about 180,000*l.* They will cover an area of nearly two acres, and will be the largest of the kind in Great Britain. The new buildings, which have been designed by Mr. David Barclay,

F.R.I.B.A., will consist of five wings, two being parallel to George Street, the other three at right angles to them and parallel to Montrose Street on the east. The style of architecture is a free treatment of Italian Renaissance. The main frontage to George Street has a centre block of three bays, slightly projecting, in which are three spacious arched doorways, each 16 feet wide and 20 feet high. The first-floor storey is 20 feet in height, and in the centre block and wings this storey is treated with solidity and breadth, forming a base to a columnar façade of columns in pairs 22 feet in height carrying an entablature, broken around pillars and surmounted by an attic storey of square disengaged pillars, upon which is the finishing pediment. The flanking wings are treated as quasi-towers, finished with a balustrade and corner turrets. The intermediate bays are divided by projecting buttress piers to give, with stability, great width of window openings. In the fenestration two storeys of windows are framed under semi-circled arches springing from imposts, the lower tier divided by circular pillar mullions carrying panelled transoms at the division of the floors. The same style and character is maintained in the elevation to Montrose Street. The main front to George Street is 346 feet long, over 100 feet in height, and contains five floors and a semi-basement. The following table shows the amount of space allotted to each of the seventeen departments comprised in the college:—

Department.	Area in sq. ft.
Mathematics	5,500
Natural philosophy	10,400
Chemistry	16,500
Technical chemistry	7,500
Mechanics	10,000
Machine design	10,000
Prime movers	15,100
Metallurgy	4,800
Electrical engineering	15,900
Practical engineering	4,000
Mining and geology	3,400
Architecture and building construction	7,700
Biology	3,200
Industrial arts	4,000
Workshops	7,900
Bakery school	2,100
Administration, library, general classrooms, &c.	37,000

The prime movers laboratory, the dynamo laboratory and the practical engineering laboratory will be placed at the bottom of the interior courts and will be lighted entirely from the roof. The chemical laboratory will occupy practically the whole of the top floor, and will contain several large laboratories and other rooms set apart for special purposes. Each of the departments will be confined to its own floor, with the result that the internal arrangements generally will be admirably adapted to promote efficiency and economy of working.

NOTES AND COMMENTS.

WHEN the London Building Act was first passed through Parliament buildings in flats were little known. They were, so to speak, an exception to established usage, and legislators were to be excused if they neglected them. As flats became more general many questions relating to them had to be brought before the magistrates. It might be supposed that in the Act of 1894 provision would be made for dealing with all difficulties; but it is evident that the amended Building Act is incomplete as regards flats. The case *GOODCHILD v. MATHEWS*, which came before the High Court on appeal last Saturday, exemplifies one of the problems of the Act. The respondent proposed to erect six blocks of flats in West Hill, St. Pancras. Mr. J. GOODCHILD, the district surveyor, served notice on him objecting that they were not in accordance with section 77, which states:—"Buildings shall not be united except where they are wholly in one occupation or are constructed or adapted to be so." The walls between the blocks were as thick as party walls, but were not carried up through the roof. Each block had its own staircase and entrance. There was, however, a passage under the roof which was continuous through the blocks. The district surveyor held that each was a separate building to be united by a corridor. The builder, on the contrary, maintained the blocks of separate dwellings constituted a single building. The magistrate came to the conclusion that section 77 referred to the union of buildings which originally had been separate structures, and did not apply in a case like that before him where the parts were intended to form one structure. The Lord Chief Justice said he would have arrived at the same conclusions as the magistrate. The "uniting" was not to be considered as accomplished by means of a covered way between two structures, for according to sub-sections 2 and 3, "Buildings shall not be united if when so united and considered as one building only they would not be in conformity with this Act. An opening shall not be made in any party wall or in two external walls dividing buildings, which if taken together would extend to more than 250,000 cubic feet." Mr. GOODCHILD's appeal was accordingly dismissed. Their lordships' decision is not convincing, and as leave for a further appeal was granted it is to be hoped the arguments will be heard at greater length in another Court.

THERE was only one bidding at the sale of Clifford's Inn by Messrs. FAREBROTHER, ELLIS, EGERTON, BREACH, GALSWORTHY & Co, under an order of the Court of Chancery. Although there were apprehensions of its transformation, the rental of the chambers and offices amounted to 2,550*l.* a year. Considering the capability of the estate, the auctioneer was justified in announcing it was worth 150,000*l.* Mr. W. WILLETT, the builder, offered 100,000*l.*, and for that sum acquired an estate that deserves to be considered as historic. Six centuries ago EDWARD II. made a gift of the property to ROBERT CLIFFORD, but there was an earlier possessor. This is evident from the patent which is dated 1310, viz.:—"The king granted to ROBERT CLIFFORD that messuage, with the appurtenances, next the church of St. Dunstan in the West, in the suburbs of London, which messuage was sometime MALCULINE DE HERLEY, and came to the hands of EDWARD I. by reason of certain debts which the said MALCULINE was bound at the time of his death to our sayde father, from the time that he was escator on this side Trent, which house JOHN, Earle of RICHMOUNT, did holde of our pleasure, and is now in our possession." The messuage was let to apprentices of the law by the widow of ROBERT CLIFFORD. Afterwards it fell into the king's hands, and at a subsequent time became once more the possession of the CLIFFORD family. When the property is appropriated to a different purpose we hope some means will be taken to continue the association of the name of CLIFFORD with it. The historical records and buildings committee of the London County Council have expressed deep regret that the historic buildings comprising the Inn, and especially the hall, should be about to be demolished. They were not, however, prepared, owing to the great cost involved, to recommend the purchase of the property by the Council. For the

purposes of record instructions were given for photographs of the buildings to be taken and drawings made of objects of interest in connection with the Inn. The oak panelling in one of the rooms was expressly excluded from the sale by auction, the vendors reserving to themselves the right to sell and remove it.

THE name of Abydos at first recalls the Greek legend of HERO and LEANDER, or Lord BYRON's poem. But Abydos in Egypt is of older date than the legend of the swimmer. In magnificence it used to rank next to Thebes, and was reputed to be the burial-place of OSIRIS. "There are many places," says PLUTARCH, "where his corpse is said to have been deposited, but Abydos and Memphis are mentioned in particular as having the true body, and for this reason the rich and powerful of the Egyptians are desirous of being buried in the former of these cities, in order to lie, as it were, in the same grave as OSIRIS himself." During the past winter Professor FLINDERS PETRIE has been at work at Abydos. In a paper which he read last week he described his operations. Owing to the condition of the Nile he had been able to get down to a lower level than had previously been the case, and from the excavations carried on had succeeded in making a plan of the temple, based on the foundations. It was interesting to find as the work went on that they were dealing, not with a single temple, but with a succession of temples, built one over another. There was stonework of about the eleventh dynasty, chiefly in the form of doorways, and as these were found inserted in brickwork, it appeared to be safe to conclude that the older temples were mainly of brick, with stone doorways. There were also remains of a brick wall surrounding a temple which seemed to be of the twelfth dynasty. Apparently, about every five hundred years the existing temple was razed and a new one built. The most remarkable point was that these temples differed in their orientation, which was sometimes east and west, and sometimes north and south. He was also able to identify the great hall of OSIRIS.

ILLUSTRATIONS.

HOUSE, WESTMINSTER ESTATE, BOURNEMOUTH.

THIS house is covered with red tiles, the walls finished with white stucco; the window frames painted green, the glazing with lead lights. The principal feature in the planning is the hall sitting-room. The architect is Mr. MILLS.

BLEAK HOUSE, BROADSTAIRS.

BLEAK HOUSE, Broadstairs, Kent, once the residence of the late CHARLES DICKENS, that incomparable master of English fiction, has been slightly altered and an addition made to same for Mr. THOMAS BARRY, as shown by the illustration. The portico, basements and other windows, and the old wooden oriel window to DICKENS's study overlooking the sea, have been removed owing to their rotten state, and a brick and stone oriel window substituted in the latter case, but practically the whole of the interior, with the old staircase, remains as of old. The new brickwork has been made to match the old work, and the whole of the stonework has been executed in patent Victoria stone by the Victoria Stone Co. The hot-water work has been done by Messrs. KEITH & BLACKMAN, LTD., and the electric-light installation, bells, &c., by the Alliance Electrical Co., Ltd. The builders are Messrs. GANN & CO., of Whitstable, and Mr. WILLIAM A. BURR, M.S.A., of 65 Chancery Lane, W.C., is the architect.

THE SOCIETY OF ARCHITECTS.

THE nineteenth annual dinner of the Society of Architects was held in the Grand Hall of the Princes' Restaurant, Piccadilly, W., on Friday, May 15, the chair being occupied by the president, Mr. Silvanus Trevail, J.P., F.R.I.B.A., who was supported by a very large and representative gathering, including the Very Rev. Canon Vere, Rev. A. Mercer, M.A., Rev. H. Mills, Right Hon. Lord St. Levan, Right Hon. Viscount Clifden, Right Hon. Sir Arthur D. Hayter, Bart., M.P., Sir Edwin Durning-Lawrence, Bart., M.P., Sir Walter B. Foster, M.P., Right Hon. T. F. Halsey, M.A., M.P., Hon. W. Massey-Mainwaring, M.P., H. E. Duke, K.C., M.P., Cumming Macdonald, M.P., Edward Hain, M.P., F. Layland Barratt, M.P., D. J. Morgan, M.P., General Festing, C.B., F.R.S., General Hamley, C.B., Alderman Sir William Treloar (ex-Sheriff of London), Alderman Sir H. E. Knight (past Lord Mayor of London), Sir Robert Harvey, Sir C. Boxall, K.C.B., Sir W. H. Bailey, Hon. Geo. T. Lincoln (Consul-General U.S.A., Belgium), Sir C. J. Owens (general manager, London and South-Western Railway), Sir Henry Trueman Wood (secretary, Society of Arts), His Honour Judge Rentoul, K.C., LL.D., Right Hon. Lord Mayor of Liverpool (W. Watson Rutherford), Colonel C. Prideaux-Brune, Major Tremayne, Major F. B. MacCrae, Captain T. V. Kearn, U.S.A., Captain V. Millett, the Deputy Chairman of London County Council (R. A. Robinson), R. K. Causton, K.C., R. B. Blennerhassett, K.C., the Mayors of St. Pancras, Stoke Newington, Islington, Poplar, Deptford, Holborn, Wandsworth, Stepney, Hammersmith, Shoreditch, Hampstead, Hackney, Bermondsey, Camberwell, Paddington, Rochester, Southampton, Reading, Brighton and Greenwich, the Master of the Painters' Company (W. Dunn), the Master of the Carpenters' Company (Walter Smith), the President London Master Builders' Association (Ernest J. Brown), the President Surveyors' Institution (Arthur Vernon), the President Institute of Builders (William F. King), the Presidents of the Liverpool, Cardiff and Aberdeen Architectural Societies, the ex-High Sheriff of Berkshire (W. Walters Bond), Vice-Chairman Cornwall County Council (W. Cole Pendarves), the Architect London County Council (W. E. Riley, F.R.I.B.A.), the Clerk of the London County Council (G. L. Gomme), E. O. Sachs (Chairman British Fire Prevention Committee), Dr. Henry D. Martin, Dr. Venning Burgess, Alderman J. Glazier, Messrs. G. Gard Pye and Walter W. Thomas (vice-presidents), Ellis Marsland (hon. secretary), H. G. Quartermain (hon. treasurer), Edgar Farman (solicitor), T. R.

Richards, E. W. Cooper, R. G. Bare, H. Passmore Edwards, Thos. B. Bowring, George Tangye, J.P., C. Selby Lowndes, E. O. Preston, J. H. Oxley, H. H. Bartlett, Rashleigh Phipps, F. Hutchins, Alfred Cummor, W. Beck, A. A. Johnson, H. James, J. Lanyon, A. H. Campbell, A.M. Inst.C.E. (borough surveyor, East Ham), J. W. Jerram, A. A. Hudson, J. Miller Carr, Franklin R. Kendall (general manager P. and O. Steamship Company), J. W. Woodall, M.A., W. Vicary, J.P., C.C., J. Brotherton, S. Roberts, T. V. Forrest, A. Conder, F.R.I.B.A., R. Waldram, George Cory (secretary London Cornish Association), L. Schlenheim, C. Ingram Hayden, F. Phillips, J. R. Manning, C. Haslett, A. W. Wells, G. E. Bond, C. E. Skinner, E. R. Viney, C. H. Leavey, W. D. Driver, R. D. Batchelor, J. R. Leatherby, C. Day (borough surveyor, Chatham), Walter C. Williams, C. McArthur Butler (secretary), W. L. Cantrill, E. T. Ruthven Murray, D. Legat Fulton, E. Pye, C. Palmer, P. Condy, H. Warren, F. E. Warren, E. W. Dring, C. H. Child, O. Marsland, C. H. Mead, M. Zimmerman, C. Zimmerman, E. C. Beaumont, E. J. Gee, A. H. Quartermain, M. V. Cassall, C. Mason, A. A. H. Scott, E. G. Hanson, G. M. French, S. C. Hanson, P. Fraser, C. E. Jackson, G. Sharples, J. F. Stovell, A. Souttar, S. Herbert, A. Emslie, E. G. Sadgrove, E. C. Wotton, M. C. Meaby, A. A. Webbe, A. F. Goddard, H. Prosser, J. C. Jackson, C. D. Collins, G. Allen, A. E. Scanes, E. J. Naldrett, W. H. Linton, Tom Brown, R. Banks-Martin, A. Bethell, J. H. Richardson, T. G. Hart, W. H. Pertwee, W. Taylor, J. Lennard, J. P., A. H. Pethick, E. G. Kibblewhite, J. Littlejohn, C. Menhenwick, C.C., H. B. Comber, W. Windham, R. H. Spalding, A.R.I.B.A., H. Dennis, J.P., C.A., F. Parkyn, W. H. K. Wright, F.R.G.S., A. Carkeek, C.C., Vivian Thomas, A. Y. Mayell, H. W. Matthews, J. B. Paynter, Frank Dodd, J. Brewer (Great Western Railway, Swindon), Oscar Berend, C. S. Covington, A. K. Carlyon, J.P., C.C., Fred Hare, A. E. Collins, A.M. Inst.C.E. (city engineer, Norwich), F. G. Mansfield, D. E. Costigan (secretary London Master Builders' Association), W. Lees McClure, J.P., Edmund Carlyon, Edward H. Balydon, C. H. Heathcote, F.R.I.B.A., William Woodward, A.R.I.B.A., F. B. Hollis, A. J. Cornelius and Owen Owen.

The two first loyal toasts, "His Majesty the King," "Her Majesty Queen Alexandra, Their Royal Highnesses the Prince and Princess of Wales and the other members of the Royal Family," were passed with musical honours.

The Mayor of Paddington proposed "The Houses of Parliament." He regretted the fact that the fine arts in

England did not receive the same fostering care given to them by Governments in France and Germany. The fault was not so much with the legislature, because it was unreasonable to expect that the parties of government would do more for art than the average Englishman, who seemed rather ashamed of magnificent display. The average Englishman divided everything into two classes, the practical and the unpractical, and much that appertained to art was considered unpractical.

The Right Hon. the Lord St. Levan in a clever speech responded for the House of Lords. Sir Walter Foster, M.P., replied for the House of Commons.

"The Imperial Forces" was the fourth toast, proposed by Alderman Sir Wm. Treloar. General Festing, C.B., F.R.S., responded. He remarked that seventeen years ago such a toast as this would have referred only to the Army and Navy, but so many were the changes of recent years that the toast was incomplete unless titled the Imperial forces. This showed an absolute solidarity between the colonies and the Motherland.

Sir A. D. Hayter, Bart., M.P., proposed "The Society of Architects and Architecture." The toast would commend itself to all. He questioned whether there was any man with an intelligent eye who did not feel when passing through the towns and provinces of England that he owed an extraordinary debt of gratitude to the community of architects. London itself bore testimony to the ability of its architects, and the many new thoroughfares would afford them a still further opportunity for the legitimate use of their art. The Society of Architects was a business society, and he rejoiced to think that they had introduced a Bill into Parliament for the registration of architects. He trusted the Bill would receive the sanction of the legislature, and make the British architects a great profession. It was happily first intended to create a great central council in London with two sister councils in Edinburgh and Dublin. An examining board would be constituted, and no man who did not possess the diploma and certificate should be able to call himself an architect. In conclusion, he hoped that the numbers of the profession would be limited to those who could call themselves members of the registered profession, and those who had charge of the Bill in Parliament should do all in their power to assist the profession towards that end.

The President, in the course of his response to the toast, said:—At no period in our history as a people, a nation, or an empire was the work of the architect more important than it is to-day. Never before were there so many and so varied a collection of architectural problems to be solved, nor of such an exacting character. This applies no less to buildings of the commercial class than to those of the domestic, the ecclesiastic or the municipal, with all its subdivisions of hospitals, asylums, educational or other classifications that might be multiplied indefinitely. As one of Her Majesty's Lunacy Commissioners once observed to me, asylum planning and construction is a progressive science, and what may satisfy us to-day may not do so to-morrow, when we have the advantage of adopting an improved method. It will be seen that the scope of an architect's duties is a very wide one. It requires in the properly qualified practitioner a man of good education, a travelled man, a man of keen observation, a man skilled in the science as well as in the art of his profession, with a knowledge of the latest appliances and the latest developments of all those specialties which go to make a successful building, and at the same time a keen discrimination so as to weed out and to avoid in his client's interest the bad. In short, it requires a highly trained man with many years' experience before he can undertake the responsibilities of a principal. This means time and it means money. And what we say is that when a man possesses all this to the satisfaction of an examining body appointed by the State, he should be by the State registered as a qualified practitioner, just as much as is to-day the physician, the surgeon, the barrister, the surgeon-dentist, or the chemist. We don't say that a man not possessing the requisite qualifications and not registered may not design and superintend the erection of buildings, but what we do say is that the State shall, in its own interest, tell the general body politic who is so qualified, and then if they employ an unqualified man it will be their own fault, just as much as if they went to a quack doctor and got killed as the consequence. Now, with all the developments of sanitary science, for example, is it to be expected that the nearest auctioneer or estate agent or his clerk around the corner, who has to do all the cataloguing and ticketing of an auction sale one day, can design a mansion or a villa the next, and see to it that the drainage, its ventilation, traps and connections are all right, or tell you what is the exact entasis to give to a Doric, an Ionic, or a Corinthian column, and to say where the Greek standards may vary from the Roman in such orders? The thing is absurd, and what we say is that the man doing such work should, in the interest of the general public, be trained and skilled and afterwards duly registered by the State. This would protect the public, who are not always as discriminating upon such matters as they ought to be. To

this end the more active spirits among us have promoted an Architects' Registration Bill which is now before Parliament that will, I hope, commend itself to all the gentlemen I see around me, and eventually become the law of this land as much as it is already the law of almost every important state on the continents of Europe and America, and in our colonies. This is the principal subject that I wished to refer to to-night, being, in our opinion, the one of the day so far as the architects of this country are concerned. I recognise that this is not the place nor the occasion to go into a long dissertation upon either the art or the science of architecture. I have been preaching brevity to others, and so must practise it myself, but as we have so many municipal chieftains here I may perhaps be allowed to take this opportunity of congratulating them upon the great street and other improvements that are taking place all over the country. As a past municipal chieftain myself I well understand the difficulties attendant upon any advance in this direction, and often from those who will be most benefited by them in the long run. What we, as architects, say is, continue in this course, but now and then call to your aid the skilled trained mind to advise you as to how the improvement may be best made, and the space properly and artistically utilised afterwards. Often the very best opportunities are thrown away for want of this, and spaces and sites that might have been things of beauty and joys for ever given up to the advertising fiend, who does not, as a rule, care how many abominations he creates so that his pockets may be filled by the illicit puffing of some worthless nostrum. These huge letters on buildings destroy all sense of dignity, taste and proportion. These plasterings of public conveyances, so that the last thing that one can discover is the point of their destination, is an abomination and a scandal that England should be ashamed of, and which does not exist in the same degree in other civilised states. Soon to design a commercial building in a leading thoroughfare the chief problem will be, not a dignified sense of proportion, style and architectural balance with columns, entablature, cornices, mouldings, &c., properly adjusted and proportioned, but how much flat wall surface can be provided for these advertising monstrosities. Another reason has been mentioned for the bad architecture in England as compared with that of other countries in buildings of the ordinary class. Here we are tied down by the short lease system of ninety-nine years, or even less. There no one dreams of building excepting upon the actual freehold, or, like they have in Scotland, the perpetual feu. This, of course, means good design and good building, because the person who builds is secured in his holding. But under the short leasehold system the leaseholder, of course, builds so far as he possibly can only to last his lease out, and the effect is apparent all around us, and especially to those who compare buildings here with what they have seen abroad.

Mr. J. Woolfall, president of the Liverpool Architectural Society, also responded to the toast.

"The London and other Local Authorities" was proposed by Mr. H. E. Duke, K.C., M.P. There were three responders. Alderman Sir H. E. Knight (past Lord Mayor of London), the deputy-chairman of the London County Council (Mr. R. A. Robinson), and the Mayor of Rochester.

Mr. R. A. Robinson, in his reply, said the County Council would be very badly off without the help of London architects. As many knew, the London County Council had its own establishment of architects, with no less than 25 members of the profession and 150 students. The County Council had many opportunities of offering to architects exercises for their skill. At the present time the body was in need of a county hall. They desired a piece of land, which must be freehold, in extent about 3½ or 4 acres, not far from Charing Cross and not very far from the Houses of Parliament but yet not too near. The county hall when built should be able to accommodate about 1,500 officers, with good space for departmental work and from 137 to 200 members. The building would have to conform entirely with the London Building Act. Its architectural design would be submitted for approval to members of the County Council and the Society of Architects.

"Our Guests" was proposed by Mr. G. Gard Pye, vice-president of the Society. The Lord Mayor of Liverpool and Mr. W. C. Pendarves, J.P., responded.

"The Arts and Crafts allied to Architecture" was proposed by the Hon. W. Massey-Mainwaring. Mr. W. F. King, president Institute of Builders, responded.

After singing "Auld Lang Syne" the company dispersed.

The American Art Association, a benevolent society, held an amateur theatrical and musical performance in Paris on Saturday evening. Two pieces were played, "An American Dentist in Paris" and "A Matinée at the Julia Rosse Academy." In the latter the principal character was Careless-Dowrong (Carolus Duran). Among the audience were the British and American ambassadors and the Minister of Public Instruction.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Mr. Aston Webb, A.R.A., president, in the chair. Sir MARTIN CONWAY read a paper on

The Beginnings of the Egyptian Style of Architecture.

The Egyptian style appears to have arisen about the time of the fourth dynasty, and to have rapidly developed during the fifth. Its elements existed earlier, but not till the fourth dynasty were they definitely compounded into an architectural style applicable to buildings in stone. Until recently it was commonly believed that the early dynastic Egyptians employed wood for small and costly edifices. In fact, however, no such Egyptian wooden architecture ever existed. Pictures and models which survive do look like representations of wooden structures—indeed, some of the slender columns depicted have more the appearance of metal than wood. It must be remembered that unpractised architectural draughtsmen, though for their day able artists, invariably represented columns with exaggerated slenderness. Numerous examples exist in the wall-paintings of Roman Italy; as a special illustration the lecturer showed a photograph of Giotto's painting of the façade of the Temple of Minerva at Assisi. The columns that represent tent-poles and the octagonal, or sixteen-sided, columns of the hieroglyphs were originally of wood. The rest were of reed-bundles plastered over with mud. Both kinds had been copied into stone at the date of the pictures referred to, and those pictures may actually depict stone buildings, little though they suggest that material.

The earlier Egyptian stone buildings had no architectural features whatever. It was mere building, not architecture. The chapel excavated by Professor Petrie was the simplest kind of stone building conceivable. The neighbouring mastabas were similarly destitute of architectural quality; their false doors were inscribed with beautiful hieroglyphs, but there was no attempt to arrange them architecturally.

Down to the middle of the fourth dynasty, then, the craft of building in stone had been carried to a high degree of perfection, but it had developed no architectural art. Building whose forms and features were determined by the desire to give pleasure to the eye was only carried out in the old materials of mud and reeds, with which the Egyptians had been familiar from the earliest prehistoric days.

The lecturer described the characteristic features of a stone building in the developed Egyptian style. The walls have an external batter, are surrounded or edged by the torus moulding and are crowned by the Egyptian gorge. The supports are either piers—square, octagonal, or sixteen or more sided—or clustered columns made in imitation of bundles of papyrus stems or reeds, with a flat circular stone for base and with a capital made in imitation of a group of flowers, buds or palm-fronds. There are porticoes and halls of columns and there are dark chambers and passages. Only the piers, the porticoes and the halls of columns can have descended in direct sequence from the early stone buildings, and it is not to be supposed that such elements were lacking in contemporary or even prehistoric mud buildings. It may therefore be safely declared that all the features and principles of Egyptian architecture were invented by the mud builders, and were afterwards directly translated into stone. The outward batter of the walls of stone buildings had no meaning in stone; it was borrowed from mud-brick. The Egyptian gorge copied the old fringe of palm-frond tips with which mud walls once habitually terminated. The torus moulding was a translation of the bundle of reeds that protected the tender angle of termination of a mud wall.

Discussing the question as to when this translation took place and in what kind of building, the lecturer said that the well-known sarcophagus of Khufu-anekh at Cairo throws a welcome light upon this problem. It represents a palace, apparently built of crude brick, with wooden fittings. The vertical grooving along the top of the lower part was, doubtless, intended to represent the gorge. If at that time the gorge had actually begun to be imitated in stone as a cornice to stone buildings, the mason who carved this sarcophagus would have known better than to represent it by flat grooving. The fact that he flattened it seems to prove that, though at the time the gorge was in common use as top member of a crude brick building, it had not yet taken its place in stone building. The sarcophagus of Menkaura, as compared with that of Khufu-anekh, shows a development. Like the latter, it imitates a building, usually said to be of wood, but really of mud and reeds, or mud-brick perhaps, with wood fittings. This building is surmounted by a fully developed gorge cornice, whilst each façade is surrounded by a torus moulding. Here, then, is the Egyptian style completely formed. It must have sprung into existence between the days of Khufu and Menkaura.

The fifth dynasty has left us several actual examples of stone architecture containing decorative features, such as a mastaba at Sakkara, where the architrave of a portico is decorated with a stone gorge rather tentatively employed.

The fifth dynasty tomb of Ptah-Shepses at Abusir, excavated in 1893, when fragments of lotiform capitals and columns were brought to light, yielded results of the highest importance for the present inquiry.*

The tomb was approached by a great court, which was surrounded by a colonnade of twenty square piers. At the end of the great court was a porch of two columns, whereof only fragments remained. In a lateral chamber, which contained the statues of the deceased, were fragments of the two columns that had supported the roof. The base and lower portion of the shaft of one were in place, and enough fragments of a capital were found to enable a complete restoration to be made. Column and capital in each case were hewn out of a single block of limestone. The circular base is simply bevelled off at a slope of about 45 degs. Its diameter was large in proportion to that of the shaft. Such large bases were required when they were used instead of a foundation to spread the pressure of a shaft over an area of ground large enough to support it. This column and capital are, beyond question, the finest that have come down to us from ancient Egypt, as far as workmanship and carving are concerned. The proportions of the capital are excellent. The abacus is a thin rectangular tablet. In the Middle Empire it was made thicker. It is only by comparing these Abusir fragments with later examples of the Lotiform order, such as the Middle Empire rose granite column in the British Museum, that its surpassing merit becomes obvious. The conclusion may be justified that the Memphite architecture of the fifth dynasty was highly meritorious, and may have been the finest ever produced in ancient Egypt, or even in the world before the great days of Greece. The date of the Abusir Column is about 3,600 B.C.

The pyramid field of Abusir is being systematically explored by the German Oriental Society. They have already laid almost entirely bare the pyramid temple of the fifth dynasty king, Ra-en-user, which is earlier in date than Ptah-Shepses's tomb. In Ra-en-user's temple the gorge cornice and the colonnade of clustered columns were fully developed. The courts were floored with basalt. In the great court was a red sandstone cistern to catch the rainwater. A drain led this out to another red sandstone cistern. The base of the walls was also of basalt (in places of granite), which explains the black-painted dado so frequently found in tomb chambers of the Old Empire. The walls above the basalt foot were all covered with fine plaques of white limestones, delicately carved and painted, whereof only fragments remain. The side posts of the magazine doors were of red sandstone. The only fragment of sculpture found was a noble head of a colossal granite lion. There were also remains of an alabaster altar embellished with reliefs of the various nomes.

Throughout the period when true stone architecture was arising in Egypt, pyramid building steadily lost its charm for the kings. Khafra's pyramid was smaller than Khufu's, Menkaura's than Khafra's; their successors were yet smaller. The reason evidently was because, as time advanced, less of the mass of human energy under the command of the king was devoted to pyramid building, and more to building of some other sort.

The lecturer next considered the character of the divine temples of the Old Empire. Fragmentary remains prove that Khufu and Khafra built temples of granite. The shrine was the chief feature, and its fossilised likeness is preserved as the Holy of Holies of almost every later temple. All of them possess one marked characteristic. Entering through the great pylon, and proceeding inwards from court to court and from chamber to chamber, there is a steady diminution in height the further you advance. The reason for this is plain. The normal temple plan resulted from a series of accretions. An Ancient Empire shrine received additions, mostly in front, in the Middle Empire, and successive further additions in the New Empire. Often the old parts were ruinous and had to be rebuilt, but, according to the general Egyptian way of doing things, the habit was to reconstruct the old parts on the old scale, and as far as possible in the old style, and to add the new parts in the new style. The Middle Empire built on a larger scale than the Ancient Empire, the eighteenth dynasty on a larger scale than the Middle Empire, and the nineteenth larger than the eighteenth. Thus a big temple, resulting from the accretions of various building periods, naturally grew in scale from shrine to pylon, and this feature was adopted into the style of temple design, so that even a wholly new temple was built in that fashion. From these considerations we may safely conclude that the Ancient Empire temples were small in scale. The best of them, the important royal temples, were probably built of the hard and precious rocks, such as granite, diorite, porphyry and alabaster. We have every reason to conclude that all the later types of column and capital were fixed at this time. The lotiform, palmiform and campaniform or papyrus orders are all represented in the painted reliefs of the Ancient Empire.

* Sir Martin Conway eulogised M. G. Foucart for his labours in connection with this important find, and passed high encomiums upon his *Histoire de l'ordre lotiforme*.

Describing the fifth dynasty divine temple revealed by the recent German excavation, the lecturer said that it was built near the Abusir pyramid field by the King Ra-en-user in honour of the sun-god Ra. Instead of a shrine its chief feature was an obelisk raised on a massive base covered with great blocks of granite at the foot, and with fine white limestone above. The outer walls were built of big blocks of hard, yellow limestone. The inner walls were badly built, but covered with plaques of finest limestone carved with delicate reliefs above a dado painted black. At important points the base of the decorated walls was of granite. The ceilings were painted with yellow stars on a blue ground. The relief carvings were admirable, in the style of the best reliefs in the almost contemporary tomb of Ptah-hotep.

The lecturer referred to the evolution brought about in temple building by changes in religious ceremonial, and by the gradual ousting of the laity from the temple services, and the rise of the priestly caste. Finally he considered the character of the sculptured decoration applied to Old Empire temples, and the system of its distribution. No Egyptian sculpture in the round ever surpassed that of the fifth dynasty. The mural decorative sculpture of the Old Empire was correspondingly excellent as far as it went, but it suffered from a great defect that sculpture in the round escaped. It was governed by faulty Egyptian perspective. A figure in the round could be absolutely copied from nature, but a figure in low relief could only be truthfully represented by the aid of conventions not yet invented. Quality of surface is the great test of bas-relief. The best fifth dynasty work in this kind is sometimes good, though seldom to any high degree. The best result is attained when the artist treats vegetable forms, especially thick growths of lotus and other luxuriously growing plants. It is evident that he relied strongly upon colour for decorative effect. Where the colours have survived an excellent effect is obtained. The Egyptians attained to perhaps the most perfect comprehension of how to design and carry out a decorative scheme in one logical style ever attained by any people. Every form they employed, whether in their architecture or their sculpture, their paintings, their writing, their decoration of every object, large or small, employed for whatever purpose, was the consistent outcome of a single artistic ideal. All parts therefore harmonised together.

Egypt has impressed the prestige of its mighty name as a country of great buildings and noble art upon the imagination of succeeding generations. We are only now beginning to realise that the reputation of Egypt as an ancient artistic nation, so far from being exaggerated, does not attain the level it deserves.

Mr. R. PHENÉ SPIERS proposed a vote of thanks for the paper. Professor BERESFORD PITE seconded the motion, which was supported by Mr. E. W. HUDSON and Mr. H. STANNUS.

THE CHURCH BUILDING SOCIETY.

ON Tuesday the Archbishop of Canterbury presided at the annual general court of the Incorporated Church Building Society. The Rev W. B. L. Hopkins, the secretary, read the annual report, which showed that during the year twenty-seven grants had been made towards building additional churches, four towards rebuilding churches, forty-one towards enlarging or improving church accommodation, and eleven towards mission and school churches or hamlet chapels. The additional sittings in the seventy-two churches would number 16,808, of which 15,268 would be free. The estimated cost of the works proposed was 219,405*l.*, of which 136,729*l.* would be devoted to the twenty-seven new churches. The Society's grants, including 365*l.* towards mission buildings, had amounted to 5,360*l.* The year's income had been 5,000*l.*, against 8,960*l.* in the previous year, when large legacies and special donations had been received. Since its formation the Society had granted 897,416*l.*, calling forth further contributions of 15,501,289*l.* from the public for building 2,392 new, and improving 6,280 old, churches and chapels. In this way more than 2,000,000 seats had been obtained, three-fourths of which were free. The funds now held in trust by the Society for the repair of churches were 382 in number and 104,568*l.* in amount.

The Archbishop of Canterbury said that for eighty-five years the Society had been doing a work of incomparable value to the Church of England. The way above all others by which this central fund benefited the Church was the eliciting of local effort. Then the indirect influence of the Society on the character of church buildings was enormous. People came grumbling to their bishops because the Society would not pass particular plans; but that was one of the most wholesome signs of the Society's usefulness. There were churches built sixty years ago which were now tumbling down, while a mile away a church 600 or 700 years old stood as firm as the rock on which it was founded. A very large number of churchwardens and others forgot the great additional cost of building nowadays

and the consequent risk of failure to replace a church adequately in case of accident. As to mission buildings, he was distressed to see how absurdly inadequate the subscriptions were for this object. People often said it was not bricks and mortar but men that the Church wanted. It was an easy taunt, but everyone surely knew the direct and indirect influence of a church building which was not merely good, but worthy in appearance and character of its high purpose.

LIVERPOOL CATHEDRAL DESIGNS.

A MEETING of the Liverpool Cathedral executive committee was held at the Church House on Friday last. Sir William B. Forwood presided, and there were also present the Bishop of Liverpool, the Hon. A. Stanley, M.P., the Ven. Archdeacon Madden, Canons Penrhyn, Spooner, Stewart and Willink, the Rev. C. Harris, Mr. W. Bartlett, Mr. A. Crosthwaite, Mr. R. Dart, Mr. A. Earle, Mr. R. Gladstone, Mr. R. A. Hampson, Mr. H. Douglas Horsfall, Mr. F. M. Radcliffe, Mr. John White, Mr. H. S. Woodcock, Mr. G. Bradbury and Mr. J. Alderson Smith. After a very careful consideration of the plans which had been sent in by the five architects, Messrs. Austin & Paley (Lancaster), Mr. C. A. Nicholson, Mr. Gilbert Scott, Mr. Malcolm Stark and Mr. W. J. Tapper (all of London), the committee decided that they could not accept any of them. In drawing up the conditions of the competition the committee made a strong point of securing ample accommodation within sight of the preacher for a large congregation in the proposed cathedral. The design (No. 1) approved by the advisory architects does not appear to the committee capable of fulfilling this condition. The following is the advisory architects' report:

"Gentlemen,—We have carefully inspected the five sets of designs submitted in competition for the proposed cathedral at Liverpool.

"It is with much pleasure that we bear our testimony to the great care and pains that the competitors have bestowed on their work and the admirable response they have made to the invitation of the committee.

"The drawings, as drawings, are most excellent, and show skill in the working out of many difficult problems.

"Almost without exception we see the hand of the master himself and not merely draughtsman's work. This makes the designs doubly valuable.

"Out of the five competitors, four of them had sent in designs for the cathedral in the first and unlimited competition. We note, with great interest, that the new drawings embody much general design and character as previously delineated by each competitor. This clearly shows that from the commencement all the four had decided views, and that the second competition proved no temptation to any to deviate materially from their original conception. This seems to us good evidence that from the commencement they had offered of their best.

"You may be sure that we, your assessors, feel the great responsibility of our judgment and the importance of this very rare occasion.

"What we had to find was not the best or the most beautiful drawings, but the best idea and the finest conception.

"Many of the drawings are attractive. But we had to look much further than that. We had to look at the real effect of the building rising to its final completion, at the dimensions and proportions of the different parts, such as the piers and arches of the great nave. We had to look at the practical and feasible aspect of the designs. We had to look for a sufficiently original conception. We had to look for a fine and a noble proportion, combined with an evident knowledge of detail. Lastly, we had to look for that power, combined with beauty, that makes a great and noble building.

"In the set of drawings marked 'No. 1' we find these qualities pre-eminently shown. We cannot but give it the first place.

"We should recommend that the quasi-east end should be drawn with the towers shown, and that a window of fine size and proportion should be shown for the gabled end, one suitable to receive the offered gift of stained glass, a gift that will greatly add to the beauty of the interior.

"We are, Gentlemen, faithfully yours,

"R. NORMAN SHAW, R.A.

"G. F. BODLEY, R.A."

The architect who sent in "No. 1" design is Mr. Gilbert Scott. Until to-morrow, the 23rd inst., all the designs will be on view to the general public at the Walker Art Gallery, Liverpool.

M. Foulard, who was one of the lieutenants of Baron Haussmann in the transformation of Paris, has died at Passy. Among the undertakings with which he was connected were the Avenue Dumesnil and the Boulevard Malesherbes.

COOPER'S HILL COLLEGE.

THE question of the expediency of maintaining the Engineering College at Cooper's Hill as a Government institution for the supply of officers to the Public Works Department in India has been raised, not now for the first time, in consequence of the large expenditure which will have to be incurred if the college is to be thoroughly equipped in all respects according to modern standards. The Secretary of State for India has therefore appointed a small committee to inquire and report to him on this subject. It will be composed as follows:—Sir Charles Crosthwaite, late Lieutenant-Governor of the North-Western Provinces and member of the Council of India, chairman; Sir James Mackay, G.C.M.C., Sir William Arrol, M.P., Sir Arthur Rücker, principal of the University of London, and Sir Thomas Higham, K.C.I.E., late of the Indian Public Works Department, with Mr. J. E. Ferard, of the India Office, as secretary. It is intended that the committee shall begin to sit at once, and shall report as soon as may be possible.

PREHISTORIC DWELLINGS IN SCOTLAND.

AT the last meeting of the Society of Antiquaries of Scotland for the present session, Mr. Ludovic Mann, Glasgow, reported the discovery near Stranraer of a series of prehistoric pile-structures of a curious if not unique type. Their sites are on the crest of a plateau about 50 feet above sea-level, in a wooded area apparently never disturbed by agriculture. Before excavation they appeared as shallow, oval and scarcely noticeable depressions, which on being explored were found to be the tops of pits silted up with vegetable mould. In the sitting, and chiefly in the lower deposits, there occurred many implements of greywacke, sandstone, quartz and quartzite, such as rubbing or smoothing stones, pounders, anvil and hammer stones. Many flints were also found, ranging from unwrought nodules to cores of various grades, one of the finished implements being a massive scraper with a finely worked edge of $4\frac{1}{2}$ inches. At a depth of about 7 feet vestiges of what seemed a flooring of wooden logs were detected, on which were found fire-fractured stones, traces of hearths, wood charcoal and fragments of a coarse hand-made rude pottery, with peculiar ornamentation. Below this level were remains of upright pointed piles of birch and oak, several dozens of which occurred in spaces of about 8 feet by 4. Mr. Mann offered the conjecture that these peculiar remains had been the sites of half or wholly subterranean huts, but the evidence was yet too scanty for well-established conclusions. The implements and other objects found and specimens of the piles were exhibited, and the paper was illustrated by large diagrams of the constructions.

Mr. M. M. Charleson, Stromness, gave an account of the excavation of a chambered mound near Breckness on the property of Mr. W. G. T. Watt, of Skail. The excavation was continued for two seasons, and resulted in the exposure of a construction consisting of two separate chambers, closely resembling each other in their quadrilateral shape, with a recess off the north side, the walls slightly concave in outline and converging upwards in the usual beehive form, each chamber opening by a lintelled passage into a long passage to the south, which led into a larger enclosure of a rounded form with a row of slabs on edge in the middle. The one chamber was roughly about 9 feet square, and the walls remained about 5 feet high at the highest point, the entrance passage being 4 feet long by 18 inches in width and the same in height. The other chamber was slightly smaller, and the passage slightly wider, but scarcely so much in height. Nothing was found except some pieces of very rude pottery and a rude implement of claystone of a type peculiar to the northern islands. The structure was of a different type from those with passage and chamber, having small chambers off the sides, which have usually been considered sepulchral. In this case also there were no human remains found, but only bones of the domestic animals, and the recess on the east side of the large chamber, which went down to a level of more than two feet and a half under the floor might have been a well. All the circumstances pointed to the probability that the chambers were occupied as dwelling-places, notwithstanding the exceptionally low and narrow entrances.

Mr. John Fleming, Glasgow, described three stone forts in Kintyre. That at Stron Namba is a large structure, with three parallel walls from 5 to 9 feet thick, enclosing an oblong space of a promontory on two sides, the other two being defended by the cliffs. One on the west side of the Mull, known as Innian Dunan, is similarly situated but more ruined, and a third on the point of Rhu Mharaiche is a great fort much ruined, with circular foundations of smaller size in close proximity. Photographs of the several forts were shown.

Mr. Harry F. Young, Cairnbar, New Deer, described a group of small burial-cairns on the farm of Hindstones, parish of Tyrie, which to the number of fifteen were removed in the

process of bringing a piece of waste land under cultivation. Like most other instances of such groups of small cairns there was nothing found in any of them, but in breaking up another piece of moorland close by a very interesting hoard of broken flint nodules and partially worked flakes was found. The flints were exhibited.

WALWORTH.

AN article on the "Etymology of Walworth," by Mr. W. F. Potter, architect, appears in the seventeenth volume of the "Surrey Archaeological Collections" recently published. The following extract will suggest the ingenious solution:—The question whether South London was ever in-walled will, I am afraid, always remain an archaeological conundrum; yet it is hard to believe that the Romans would have left it unprotected. If they had done so, I think it would have been the only town which they constructed that was never surrounded by a wall.

Ptolemy, the geographer, speaks of London as a city of the Kentish people, and that it was situated south of the Thames. If a South London wall ever existed it must have been completely destroyed by the Saxons and Danes, who came here after the Romans left. Assuming there was such a wall, we find that in 1695 a head of Janus in marble was dug up near St. Thomas à Watering in the Old Kent Road; this must have fallen from the entrance gateway in the said wall. East of this wall stood the village of Hatcham, which probably took its name as being the hamlet by the said gateway or hatch.

Carrying our supposition a little further, and assuming the wall ran along somewhere near the New Kent Road, and continuing along the London Road and Westminster Bridge Road, it would end at the old Stangate, or the old Stonegate. If this conjecture be correct it would have given South London a much larger area than in-walled London north of the river, and this would probably account for Ptolemy describing London as being situated south of the Thames. South of this wall which I have sketched out stands the ancient village of Walworth, spelt Walewrth, Wallwrth, Wallewurd, or Walewurd in the Surrey "Pedes Finium." May we not conjecture this to mean the village by the wall, as Walbrook means the brook by the wall?

ST. MARY'S ABBEY, YORK.

WE cannot congratulate the Yorkshire Philosophical Society, says the *Yorkshire Herald*, upon their method of dealing with the work undertaken by them at St. Mary's Abbey. The foundations of the old Saxon abbey of the eleventh century and those of the abbey of the thirteenth century have been exposed in such a manner as to disclose the beauty of the original designs. They now present a very forlorn appearance. Sir Joseph Sykes Rymer compared them at a recent meeting of the Society to "someone's back yard." There is not much poetry in a back yard, and the element of romance is absent. Antiquaries who are interested in the work of restoration should pay a visit at once to these ruins, where they will receive a useful object lesson in the art of "How not to do it." The labour of the excavators has been utterly spoiled by the unsightly covering of flagstones and common brick that disfigures and desecrates the splendid examples of Mediæval architecture beneath. We are informed that the object of the Council is to protect the foundations from the ravages of wind and rain. Is there no presentable material that when applied to this purpose is of equal value to brick and flagstone? In some large towns it is customary to level the stones in churchyards that are no longer required for purposes of interment, and the spaces thus treated have a most melancholy and forbidding appearance. Why St. Mary's Abbey, of all places in the world, should be treated in this way we are unable to conceive. A few weeks ago, when we visited the scene of this twentieth-century triumph, one portion of the ruins resembled the foundations of a number of fifth-rate cottages. The Yorkshire Philosophical Society are not wont to carry out their operations in such a manner, and at this the eleventh hour we urge them to stay their hand. The ruins are of great historic interest, and we have nothing but commendation for the enterprise of the Society in laying the foundations bare for the inspection of visitors. We have heard but one opinion expressed concerning the appearance of the ruins, and that is far from complimentary to the judgment of those who are responsible for the undertaking. There is a strong feeling in the city against the completion of the work in the form originally contemplated, and this was doubtless known to the Council when they passed a resolution to the effect that nothing further should be done with regard to covering the foundations until they had been provided with the opportunity for further discussion. We hope they will take immediate steps to reverse their unfortunate decision to cover the ruins disclosed by the spade of the excavator with a top dressing of flagstones or common brick. In the past the members of the Yorkshire

Philosophical Society have done most excellent service. They have recently materially assisted in the preservation of the College Street Gateway and the Moats, which were threatened by the York City Council. What would they have said if the hideous top dressing, for which we have nothing but condemnation, had been applied by the Lord Mayor, aldermen and councillors for the city of York? We invite the members of the Society to pay a visit of inspection to St. Mary's Abbey, and while there to pass a solemn vote of censure upon themselves. If they do not see their way to do this they may convince themselves that it is their duty to order the immediate removal of the offending stone and brick to the rubbish-heap.

THE HAMILTON BRUCE PICTURES.

THE advantage of foresight and courage were exemplified at the sale of the Hamilton Bruce Collection on Saturday. The late owner purchased examples of the modern Dutch school at a time when such works were little appreciated in this country. The difference between the prices he paid and those which represent the modern value of the pictures is shown in the following article by a correspondent of the *Glasgow Herald*:—

The late Mr. R. T. Hamilton Bruce, of George Square, Edinburgh, who died four years ago in his house at Dornoch, which stands almost on the golf links, was a familiar figure in the city life of Glasgow. Twice or thrice a week he visited the commercial capital of Scotland in connection with the flour-importing business of Messrs. Hamilton Bruce & Wilson, in which he was a partner onward from 1872. Some time ago his library was dispersed at Dowell's Rooms, Edinburgh, and on Saturday there came under the hammer at Christie's most of the important pictures and drawings in the bringing together of which he showed so much taste and judgment. For the preceding four or five days the collection had been on view in King Street, where it was examined by practically every connoisseur with special leanings towards the modern Dutch and Barbizon schools. The seventy-seven "lots" were not sufficient to occupy the whole afternoon, and for this reason a miscellaneous assemblage of seventy-four works from various sources was added. In itself this was no disadvantage, but the issue was that instead of the Hamilton Bruce works being hung separately they were mingled with a number of others, many of which struck discordant notes. The company in the big sale-room was large and representative, and, needless to say, every prominent dealer was present in person or by deputy.

Mr. Hamilton Bruce acquired practically the whole of his pictures and drawings in Glasgow, in the main between about 1878 and 1895. Business over, it was his custom to call regularly at the Renfield Street gallery of Mr. Craibe-Angus, and that his purchases were justified from a commercial point of view—to say nothing of the harvest of pleasure reaped by the collector himself, by his friends, and by a large section of the public—will be clear from what follows. I must acknowledge my indebtedness to Mr. J. Craibe-Angus for giving me details of the actual prices paid by Mr. Hamilton Bruce for many of the works which came under the hammer, details which add materially to the interest attaching to the sale. I have to thank him, too, for some other particulars embodied in my notice. Initially, it is to be recalled that as "a member of the committee" Mr. Hamilton Bruce lent generously to the splendid exhibition of works by modern Dutch and Barbizon masters arranged in Edinburgh seventeen years ago. Chief among the pictures which, naturally to the disappointment of those eager to buy, are retained, I may mention Corot's fine "Evening in Normandy" and his perhaps unsurpassed "Le Lac," this last a smaller, but it is said no less good, version of the work in Mr. Alexander Young's collection; "The Squirrels" and the "Girl with the Goats," from the hand of Matthew Maris; a shore scene of high quality by Daubigny, and a large and important church interior by Bosboom. Each of these masters, save Daubigny, is represented in the seventy-seven works sold. The prices placed within brackets immediately after the sums, in guineas, realised at auction are those paid by Mr. Hamilton Bruce for the respective pictures and drawings.

The highest price in the sale, 2,500 guineas, was paid for the fine view of Amsterdam, its river and shipping, beneath a cloudy grey sky with a single break of blue, from the brush of James Maris. The canvas measures 36 inches by 43 inches, and on its appearance there was approval in the form of clapping. The opening bid was of 1,000 guineas, and with Messrs. Tooth as their final opponents Messrs. Obach were the buyers at 2,500 guineas, a sale-room record, if I mistake not, for this artist. Mr. Hamilton Bruce paid 300*l.* for this picture. From the same brush in oils were "Loading a Barge at the Mouth of a River," 33½ inches by 42 inches, belonging to about the same rather late period, started at 500 guineas, 1,500 guineas (the cost was 350*l.*); an earlier and particularly fine "Canal Through the Dunes," the sky less heavy than in the previous examples, on canvas 18½ inches by

24 inches, started at 300 guineas, 850 guineas (cost 175*l.*); "The Sisters," 24 inches by 20½ inches, the bitumen unfortunately running somewhat, 780 guineas (cost 250*l.*); "A Village on a Canal," with windmill and figures, 16½ inches by 24 inches, a deep-toned canvas probably of the late seventies, which once belonged to Mr. James Macgavin, of Glasgow, who left a work by Linnell to the Fine Art Gallery, 730 guineas (cost 120*l.*); "Cottages on the Dunes," a grey-day effect, 16 inches by 19 inches, 620 guineas (cost 120*l.*); "A Boy Playing the Flageolet," 14 inches by 9 inches, exhibited at Edinburgh in 1886, 300 guineas (cost 60*l.*); "The Drawbridge," 12 inches by 9 inches, 420 guineas (cost 90*l.*); "The Beggar," 8 inches by 6 inches, 10 guineas; a study of a red cabbage and onions, 7 inches by 8½ inches, 42 guineas.

The finest of the six works in oil by Matthew Maris was "He is Coming," 17½ inches by 12½ inches, painted in 1874, and exhibited in Edinburgh. It shows a golden-haired girl in brocaded dress at her spinning-wheel, a blue-robed youth coming towards her through the background door. This picture was not only rejected at the Royal Academy, but, for fear it might mislead students, perhaps, at the Glasgow Institute of Fine Arts. In about the mid-eighties it was bought for 300*l.* It elicited an opening bid of 500 guineas, and there was what is known as a "firm" offer at 1,800 guineas. I understand, however, that the high reserve of perhaps 2,000 guineas or more was not reached, and the little work was knocked down at 1,900 guineas. The lovely "Enchanted Castle," a dream in bold grey, 8 inches by 13 inches, begun at 100 guineas, brought 720 guineas (cost 550*l.*); a version of the "Montmartre," 9½ inches by 13½ inches, the bitumen in this again running, 620 guineas (cost 40*l.*); "The Bride," a dim work on panel, 20 inches by 13½ inches, 360 guineas (cost 150*l.*); the study of a girl's head in the same dim manner, 19 inches by 15 inches, 320 guineas (cost 150*l.*); and the head of a dark peasant boy in blue blouse, 19 inches by 14½ inches, 55 guineas. By Corot were the following in oils:—"Through the Wood," an evening effect, 15 inches by 18 inches, 560 guineas (cost 240*l.*); "The Ruined Castle," 15½ inches by 20½ inches, seen at Edinburgh in 1886, started at 300 guineas, 1,100 guineas (cost 320*l.*); "The Harbour," on panel 10½ inches by 15½ inches, 410 guineas (cost 380*l.*); and "The Bathers," a nocturne, 10½ inches by 14 inches, 220 guineas. Mr. Hamilton Bruce some years ago gave an open commission for the purchase in Dowell's Rooms, Edinburgh, of a sketch by Constable for his famous "Jumping Horse," 10½ inches by 25 inches. He acquired it for 30*l.* It was started at 100 guineas, and bought for 190 guineas. By Fantin were "A Nymph" reclining under a tree, 8 inches by 15 inches, 130 guineas (cost 30*l.*); a study of fruit on a dish, 6½ inches by 11½ inches, 24 guineas (cost 10*l.*); another nymph, in red drapery, 8 inches by 6 inches, 70 guineas (cost 15*l.*); "On Mount Olympus," a rich-toned study of four figures, 9 inches by 8½ inches, 75 guineas (cost 15*l.*). By Monticelli were "The River Bank," a glowing pictorialisation, 15 inches by 23 inches, exhibited at Newcastle in 1887, begun at 40 guineas, 490 guineas (cost 40*l.*); a group of figures on a mountain side, in unusually pale tones, 9½ inches by 18 inches, 210 guineas—the gentleman who bought this panel some years ago for 2*l.* was present to see it resold; a "Fête Champêtre," on panel 13½ inches by 17 inches, 65 guineas (cost 50*l.*); a springtime landscape, 16½ inches by 23 inches, 30 guineas; a study of oxen, 17½ inches by 27 inches, 11 guineas; and a "Twilight," 13 inches by 22 inches, on which Matthew Maris had worked, 200 guineas. A second picture, parts of which had been repainted by Matthew Maris, is Bellange's big "Diana," 77 inches by 40 inches. The Maris head is surely worth the 48 guineas paid for the canvas. Diaz's lovely "Forest Glade, Fontainebleau," a sunset effect, 17½ inches by 11 inches, seen in Edinburgh, begun at 50 guineas, made 370 guineas—it fetched 220 guineas at auction in 1883, and cost the collector 300*l.* Israel's vigorously painted "Head of a Peasant," ill-shaven, in fur cap, fetched 300 guineas, against a cost of 150*l.* Four technically excellent works by L. Mettling realised 143 guineas, against about the same cost; four landscapes by Emil Michel, "father" of the Barbizon masters, 119 guineas; three little pictures by Mr. Peppercorn, 59 guineas; Troyon's "Donkey with Panniers," 8 inches by 10 inches, 42 guineas.

Chief among the twenty-two water-colour and other drawings were those by James Maris. A masterly "River Scene," with barge, hay-cart and figures, 16 inches by 19½ inches, made 450 guineas (cost 120*l.*); "The Quay at Rotterdam," 11 inches by 18 inches, 410 guineas (cost 45*l.*); a village scene, with bridge over a canal, 10 inches by 17½ inches, 340 guineas (cost 40*l.*); "The Downs," an effect of storm, 12 inches by 16½ inches, 310 guineas (cost 60*l.*); "Buildings on the Banks of a River," 1877, 11½ inches by 6½ inches, 210 guineas; and a view of a water-mill, with figures and goats, 9 inches by 5½ inches, 46 guineas. Two black and white studies of figures by Matthew Maris, respectively 21½ inches by 30 inches and 19 inches by 26 inches, brought 210 guineas, against a cost of 60*l.* Anton Mauve's

"Ox in a Stall," 17 inches by 27 inches, similar to the oil in Judge Day's collection, made 290 guineas (cost 50*l.*). A fine church interior, with two figures, by Bosboom, 15½ inches by 11½ inches, fetched 200 guineas; a street in a Dutch town, 15½ inches by 9½ inches, 105 guineas (cost 15*l.*); two other church interiors, about 16 inches by 12 inches, 178 guineas (cost 50*l.*); and "The Cow House," 9 inches by 13½ inches, 55 guineas (cost 15*l.*). Bidding was very slow—indeed, it took about two hours and a quarter to sell the seventy-seven lots. These show a total of no less than 20,804*l.* 19*s.*

TESSERÆ.

Old Churches in Ireland.

IN most parts of Western Christendom, whether Protestant or Catholic, and most conspicuously in England and France, we commonly find in each village an ancient church, built several, sometimes many, centuries back, and which, allowing for a few exceptional years of war or revolution in either country, has been during all that time uninterruptedly used for divine worship. Where we do not find such an ancient church we commonly find a modern one, which has replaced the ancient church, as that ancient church in most cases replaced one still more ancient. The new church in such a case is simply the old one in another form, standing on the same site and carrying on the same tradition. In England, and even in France, to see an ancient village church—we are of course speaking neither of town churches nor of monasteries—left as a disused and forsaken ruin, is an exceptional sight, to be explained by some exceptional local cause. We see that the convulsions of either country, the Reformation, the great Civil War, the Huguenot wars, even the great French Revolution, have been mere passing storms, by which the buildings have suffered much less than we might have looked for. But the state of things which in England or France is exceptional is in Ireland the rule. We will not dogmatically say that there is no such thing in Ireland as an ancient village church remaining in use, but such a case is rare. It is certain that we may go a long journey through various parts of Ireland without once seeing, what we expect to see everywhere in England, the ancient parish church of the village still used for divine service as it was centuries back. The difference is one of those differences which at once force themselves on the traveller. It makes a difference in the look of the country. As a general rule—a rule perhaps not without exceptions, but a rule to which the exceptions must certainly be very rare—the ancient village churches of Ireland are always in ruins. In the towns, an ancient church, cathedral or parochial, not uncommonly survives, and is used for Protestant worship. But even in these cases the proportion of modern churches to ancient strikes an Englishman as large. In the villages it is unknown, or next to unknown, that the ancient parish church, built ages back, should be used for the divine worship of either religion. The church lies in ruins, that fact proclaims itself; it would require local knowledge in each case to say which churches have been ruined in war, and which have simply dropped to pieces because one set of people could not use them, while another set of people who could have used them were not allowed to do so. The churches used for both religions are modern buildings—buildings, for the most part, of no architectural value at all. The only exceptions seem to be when, as now and then happens, the dismantled church of a monastery has been restored and again applied to ecclesiastical uses. Otherwise, in an Irish village there is commonly a modern Roman Catholic church, often also a modern Protestant church, the latter very often standing near the ancient ruin, but most certainly in no way proclaiming itself as its natural successor.

The Picturesque in Art.

Gilpin defines picturesque objects to be those which please from some quality capable of being illustrated in painting, or such objects as are proper for painting. Price attempts to show that the picturesque has a character no less separate and distinct than either the sublime or the beautiful, and quite as much independent of the art of painting. The characteristics of the beautiful are smoothness and gradual variation; those of the picturesque directly the reverse—roughness and sudden variation. A temple of Grecian architecture in its smooth state is beautiful; in its ruin is picturesque. Symmetry, which in works of art accords with the beautiful, is in the same degree adverse to the picturesque. Many old buildings, such as hovels, cottages, mills, ragged insides of old barns and stables, whenever they have any peculiar effect of light, form, tint or shadow, are eminently picturesque, though they have not a pretension to be called either grand or beautiful. Smooth water is beautiful, rough water picturesque. The smooth young ash, the fresh tender beech are beautiful; the rugged old oak

and the knotty wych-elm picturesque. In animals the same distinction prevails. The ass is more picturesque than the horse. Of horses the wild forester, with his rough coat, his mane and tail ragged and uneven, or the worn-out cart horse, with his staring bones, are the most picturesque. The picturesque abhors sleekness, plumpness, smoothness and convexity in animals. Among our own species, beggars, gipsies and all such rough, tattered figures as are merely picturesque bear a close analogy in all the qualities that make them so to old hovels and mills, to the wild forest horse and other objects of the same kind. "If we ascend," adds Price, "to the highest order of created beings, as painted by the grandest of our poets, they in their state of glory and happiness raise no ideas but those of beauty and sublimity. The picturesque (as in earthly objects) only shows itself when they are in a state of ruin; when shadows have obscured their original brightness, and that uniform, though angelic, expression of pure love and joy has been destroyed by a variety of warring passions."

Portrait Statues and Buildings.

If we assume that the proper field for sculpture is in association with architecture we shall find that one or two matters that have always been difficulties—lions, so to speak, in the path of the sculptor—solve themselves naturally. One of these is the question of portrait statues. Statues of public men, whose only reason for existence lies in the likeness they bear to their originals, and therefore to be regarded from that point of view first, and not from the purely artistic one, cannot, when placed in the open, as they generally are, be fairly judged. Other considerations step in. The observer is first attracted or repelled by the outline and general appearance of the work, before he can come near enough to appreciate the likeness. Again, in order to give importance to the statue, it must be made so much larger than life that conventionalities have to be resorted to to meet this difficulty; so that the resemblance to the individual whose memory is to be perpetuated is often largely impaired by these artistic considerations. Now it is almost impossible to render interesting or attractive a portrait statue in modern dress when placed in an open space—out of doors and with no near surroundings. But place the same statue by a building—either on a pedestal, in character with the architecture, or in a niche—and the monument will be then in place, and the straight up-and-down clothes will be a matter of less importance; they will challenge the eye less, and the statue, at any rate, will not be condemned because of them. For instance, the more modern figures carved on the podium of the Albert Memorial in Kensington Gardens, such as Goethe and Turner, are as interesting as their more sumptuously or artistically clad neighbours, and as they are by the same artist's hand it is fair to infer that modern dress will lend itself to treatment, but the figure must have a home. Another example is the statue of Lord Herbert of Lea at the War Office, an excellent statue, but the excellence of which is greatly enhanced by the position in which it is placed. There are very few of our London statues that stand the test of an isolated position, and our difficulty in portraitwork is increased because as a nation we are quiet and restrained in our bearing, and make use of fewer gesticulations than our livelier neighbours, for instance, across the Channel, so that it is exceedingly rare that a sculptor can put action to a portrait figure to give it freedom and variety of line, that is, if he wishes to be true to his original.

Gavel or Gable Pennies.

The judicial duel seems to have been introduced into Leicester subsequently to the Conquest. Instead of the decision of the twenty-four burgesses in the town mote, the litigants, armed with staves, bareheaded and barelegged, fought out the matter till one yielded or was killed. An inquisition taken in the reign of Henry III. tells how this custom was abolished in the time of Earl Robert of Mellent. It happened that two kinsmen—namely, Nicholas the son of Acon, and Geoffrey the son of Nicholas—waged a duel about a certain piece of land, concerning which a dispute had arisen between them, and they fought from the first to the ninth hour and longer, each conquering by turns, one of them fleeing from the other until he came to a certain little pit; and as he stood above the pit and was about to fall therein his kinsman said to him, "Take care of the pit—turn back lest thou shouldst fall into it." And as he stood over the pit so much clamour and tumult was made by the bystanders and those who were sitting around that the earl heard their clamour as far off as the castle, and he inquired of some of them how it was there was such a clamour; and answer was made to him that two kinsmen were fighting about a certain piece of land, and that one had fled until he reached a certain little pit, and that as he stood over the pit and was about to fall into it the other warned him. The burgesses being moved by piety then made a covenant with the earl that they should give him threepence yearly for each house in the High Street that had a gable, on condition

that he should grant to them that the twenty-four jurors who were in Leicester from ancient times should from that time forward discuss and decide all pleas they might have among themselves; and this was conceded to them by the earl, and in such a manner were the pennies, called gavel-pennies, first levied.

A Twelfth-Century French Castle.

When peace was made with Count Manasses, Arnold, the Lord of Ardres, built himself, on the mound reared by his father, a stately palace of wood, the work of a carpenter (*artifex vel carpentarius*), of skill well-nigh like to that of Dædalus, Lewis by name. The house was of three stages. It had granaries below, cellars, chambers full of all household goods. On the second stage was the great chamber of the lord and lady, and other chambers for their various attendants. Here, too, was the kitchen, joining this storey of the house, but itself built in two stages, so that we may suppose that the lower stage was on the ground floor. Here pigs, geese, capons and other fowls were kept and fattened. In the upper stage dwelt the cooks, who, when the time came, dressed them with the utmost skill. In the highest stage of all were rooms for the sons and daughters of the lord, as well as for the guards of the palace. Adjoining the house was a "logium" for pleasant talk, whence, we are told, its name derived from "logos." Attached also to the house and the "logium" was a chapel, whose goodly ceiling and paintings rivalled Solomon's temple. We need hardly say that every detail of this description of a lordly wooden house of the twelfth century is worthy of the heed of all students of Domestic architecture. And now the Lord of Ardres, having, like Solomon, built him a house, went over to England on a visit to the king—seemingly Henry I.—his superior lord for his possessions in our island.

Statutory Registration of Qualified Architects.

SIR,—Mr. Silvanus Trevail's letter in your last issue is a manly, straightforward statement of his views of the above vexed question. The worthy body of gentlemen who control the affairs of the R.I.B.A. seem to lack the energy to tackle the question. The Institute is better than it was, and seems to be awakening from its venerable repose, but new and more vigorous blood is required before it can be said that it really and properly represents the profession of architecture. Let us have a few more Trevails, not to attack the Institute, but to strengthen and invigorate it.

Apologising for trespassing on your space, I am, &c.,
R.I.B.A.

GENERAL.

The King of Italy has conferred the Order of the Crown of Italy on Mr. Alfred East, A.R.A. His Majesty the King has been graciously pleased to give his private consent to Mr. East's acceptance of the honour.

The forty-third annual dinner of King's College, London, will be held at the Holborn Restaurant on Monday June 22 with the Right Hon. and Right Rev. the Lord Bishop of Exeter in the chair.

The late Mr. Richard Philip Day, architect, 18 Bloomsbury Square, W.C., has left property valued at 8,521*l.* 11*s.* 1*d.*

A Parliamentary Paper has been issued giving an "approximate estimate of expenditure under the Military Works Acts of 1897, 1899 and 1901." The return shows that the sums provided in the schedules to the respective Acts is 15,810,500*l.*, of which 5,331,536*l.* has been expended up to March 31, 1902. The estimated expenditure for 1902-3 was 1,700,000*l.* and for 1903-4 3,450,000*l.*, the latter including 550,000*l.* for defence works, 2,450,000*l.* for barracks and completion of large camps, and 350,000*l.* for ranges and accommodation for manœuvring and mobilisation.

Lord Iveagh has signified his intention to make a donation amounting to nearly 40,000*l.* to Trinity College, Dublin, in connection with the building and equipment of scientific laboratories.

The Institute of Builders will hold a meeting on June 10 at the house of the Society of Arts, when Dr. Hubert Higgins will deliver a lecture entitled "The Seasoning and Preservation of Wood," which will be illustrated by means of lantern slides.

The Mayor of Woolwich laid the foundation-stone last week of new municipal buildings for the borough of Woolwich. The site cost 15,000*l.*, and has an area of 9,000 square yards. The contract price was 50,000*l.*, the builders being Messrs. J. E. Johnson & Son, of Leicester. The buildings will consist of a basement and three floors, with a dome and a clock-tower

rising to a height of 140 feet, and have been designed by Mr. A. Brumwell Thomas, Westminster.

The Hackney Borough Council have agreed to contribute 10,000*l.* towards the cost of purchasing Springfield Estate, overlooking the river Lea at Upper Clapton, provided the London County Council will purchase the ground and maintain it as a public park.

Mr. T. G. Jackson, R.A., submitted last week to the Old Radleian war memorial committee his design for a monument in bronze and alabaster, to be surmounted by an allegorical figure of Faith in bronze. Subject to alterations in detail and to the substitution of a figure of St. George, the design was accepted. The selection of a sculptor was left to Mr. Jackson.

Mr. Hamo Thornycroft, R.A., has been commissioned by a committee of the University of Cambridge and the Royal Society to undertake a bronze medallion portrait, in high relief, of Sir George Gabriel Stokes, which will be placed in Westminster Abbey.

The London, Brighton and South Coast Railway Bill, by which the company seeks powers for the completion of the enlargement of Victoria Station and for widening the line, has been approved by a select committee of the House of Lords.

A Casket has been found by one of the masons engaged in the new works at the Paris Bourse which contains an inscription relating to the laying of the foundation-stone of the building in 1808. The architect of the familiar Classic edifice was Brongniart. It was not opened until 1826.

The Ruins of Abergwili Palace, the former residence of the Bishop of St. Davids, have been inspected by Mr. Coombes, architect to the Ecclesiastical Commissioners, and the rebuilding of the palace on the old site is to be proceeded with immediately.

An Inquiry has been held at Southampton with respect to the application of the Borough Council to borrow 12,500*l.* to provide housing accommodation in a slum area north of Simnel Street. Mr. C. J. Hair is the architect of the proposed buildings.

Documents have been discovered which testify that the New Inn hotel, Gloucester, was erected by the monks for the use of pilgrims in the fourteenth century.

The Parish Church of All Saints, Hereford, was recently reopened after restoration. The principal portion of the work, the restoration of the south aisle, has been carried out under the direction of Mr. Oldrid Scott. There were two roofs, the south aisle one of very ancient character and well worth preserving, and the other a lean-to, the former being hidden from view by a ceiling of lath-and-plaster. The lean-to has now been removed and a substantial oak roof exposed.

The London County Council have decided that plane trees only are to be used for the widened Strand, plane trees and acacias alternately in Aldwych, and plane and ailanthus trees alternately in Kingsway.

Professor W. M. Ramsay delivered a lecture on the 14th inst. before the British Academy on "The Importance of a Systematic Exploration of Asia Minor (in conjunction with the recently formed societies for the same purpose in Austria and in Germany)."

The International Society of Sculptors, Painters and Gravers have elected as Associates Messrs. M. Bauer, A. K. Brown, C. H. Shannon, William Strang and William Witsen.

The Annual Report of the Chief Registrar of Friendly Societies gives the number of members of the unincorporated societies in England for 1901 as 54,219, or 834 for each society stating the number of its members. The total receipts during the financial year were 17,565,181*l.*, or 270,234*l.* for each society stating the amount of its receipts, being more than thirty times the average of the incorporated societies; but this is accounted for by the exceptional case of a society in London (the Birkbeck), the receipts of which are returned as 16,134,126*l.*

The Agent-General for the Cape of Good Hope has arranged for a free exhibition in the North Gallery of the Imperial Institute from May 18 to May 30, between the hours of 11 and 5 o'clock, of the competitive designs of the new buildings for the Cape of Good Hope University.

The Supper of the Architectural Association at the Great Central Hotel on Friday last was as successful as the promoters could desire. There was an excellent selection of music, and the conjuring was the more remarkable as performed by an amateur. There were present about one hundred and fifty members and friends.

The New Bridge at Kew was opened by the King on Wednesday. It was designed by Sir John Wolfe Barry and Mr. C. A. Brereton. The contractors were Messrs. Easton Gibb & Son. There are three arches of masonry, the central one having a span of 133 feet.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BRIDLINGTON.—June 19.—Schemes are invited for providing the village of Flamborough (1,000 inhabitants) with an efficient supply of water. Mr. John B. Simpson, clerk, Rural District Council, Bridlington.

CROYDON.—June 9.—Competitive designs and estimates are invited for a children's home and two relief stations to be erected in Croydon. A premium of £15 15s is offered for the best design for the children's home and £10 10s for the second best, and a premium of £10 10s is offered for the best designs for the two relief stations. Mr. Harry List, clerk, Union Offices, Mayday Road, Thornton Heath.

IRELAND.—June 18.—The Trustees of the Limerick free library and museum invite designs from architects in independent practice for the proposed Carnegie library and museum to be built in the People's Park, Limerick. Prizes of 75l. and 25l. respectively will be awarded to the designs placed first and second in the competition. Mr. W. M. Nolan, town clerk, Town Hall, Limerick.

NEW BROMPTON (KENT).—May 30.—Designs and plans are invited in competition for public swimming and slipper baths to be erected in Windsor Road, New Brompton. Three

premiums are offered, one of £20 to the author of the design which is considered to be the first in order of merit, one of £10 and one of £5 respectively for the second and third. Mr. F. C. Boucher, clerk, New Brompton, Kent.

POPLAR.—June 23.—Competitive designs are invited for a public library to be erected in Cubitt Town, Poplar, E. A premium of 75l. is offered for the design accepted by the Council, which will be deducted from the architect's commission should he be employed as architect in the execution of the work. Mr. Leonard Potts, town clerk, High Street, Poplar.

SCOTLAND.—June 13.—Competitive plans are invited for the formation and laying-out of ground for new cemetery at Wellhall, extending to about 9½ acres. Mr. A. L. Smith, 25 Duke Street, Hamilton.

WALES.—June 2.—A premium of 20l. is offered for the best plan and design for a library at Abergavenny, Monmouthshire. Mr. E. H. Restall, librarian.

CONTRACTS OPEN.

ASPATRIA.—May 26.—For rebuilding business premises in the main street, Aspatia, Cumberland. Mr. J. S. Moffat, architect, 53 Church Street, Whitehaven.

BARROW-IN-FURNESS.—May 25.—For supplying and fixing the whole of the fittings required in the chemical and metallurgical laboratories and class and lecture-rooms, &c., at the new technical school, Abbey Road. Particulars may be obtained from the Town Clerk.

BATH.—May 30.—For extensions to the electric-light generating station in Dorchester Street, and the construction of a river wall abutting on the site known as Kingston Wharf in connection therewith. Mr. F. H. Moger, clerk, 3 Wood Street, Bath.

BRADFORD.—May 27.—For the erection of a warehouse in Canal Road, Bradford. Messrs. Samuel Jackson & Son, architects, Tanfield Chambers, Bradford.

BRADFORD.—May 27.—For alterations to premises, 21 and 23 Darley Street. Mr. F. E. P. Edwards, city architect, Whitaker Buildings, Brewery Street, Bradford.

BRIGHTON.—May 26.—For alterations and improvements to the artists' rooms, lavatories, &c., connected with the Dome, Royal Pavilion, Brighton. Mr. Francis J. Tillstone, town clerk, Town Hall, Brighton.

BRISTOL.—May 28.—For erection of sanitary conveniences at Colston Avenue, Lawrence Hill and Welsh Back. City Engineer's Office, 63 Queen Square, Bristol.

CANTERBURY.—May 27.—For the alterations and additions to the head teacher's house at the Board schools, St. John's Place, Northgate, Canterbury. Mr. W. J. Jennings, architect, 4 St. Margaret's Street, Canterbury.

CHANDLER'S FORD.—May 30.—For the erection of a church at Chandler's Ford, Hants, from the designs of Mr. G. Bodley, R.A. Messrs. H. T. Northcroft, Son & Nicholson, 9 Regent Street, London.

CLEETHORPES.—June 3.—For the erection of Council offices, Cleethorpes, near Grimsby. Mr. Herbert C. Scaping, architect, Court Chambers, Grimsby.

COPMANTHORPE.—June 3.—For the erection of station buildings, warehouses and weigh offices at Copmanthorpe, Bolton Percy and Ulleskelf, for the North-Eastern Railway Co. Mr. William Bell, the company's architect, York.

CROSTON.—May 28.—For the erection of a new U.M.F.C. school at Croston, Lancs. Mr. W. H. Dinsley, architect, 12 Cleveland Street, Chorley.

DODWORTH.—For the erection of a Wesleyan church, Dodworth, Yorks. Mr. Geo. Moxon, architect, Central Chambers, 26 Church Street, Barnsley.

VENTILATE and WARM ON THE STURTEVANT SYSTEM.

IT
EXACTLY MEETS THE RECOMMENDATIONS OF THE GOVERNMENTAL COMMITTEE APPOINTED
TO REPORT ON THIS SUBJECT. Send for New Booklet, "A 29."
STURTEVANT ENGINEERING CO. LTD. 147 QUEEN VICTORIA STREET, LONDON.
PARIS. BERLIN. STOCKHOLM. AMSTERDAM.

DUBLIN.—June 8.—For the erection of two platelayers' cottages near Beauparc and three platelayers' cottages at Killester, near Ralleny, for the Great Northern Railway Company (Ireland). Mr. T. Morrison, secretary, Amiens Street Terminus, Dublin.

DUDLEY.—May 29.—For alterations at the workhouse. Mr. Arthur Marshall, architect, Nottingham.

DURHAM.—May 30.—For additions to Wesleyan Methodist church, Witton Gilbert. Mr. H. T. Gradon, architect, 22 Market Place, Durham.

ECCLES.—May 25.—For the erection of the additional building at the electricity station, Cawdor Street, Patricroft. Mr. N. H. Hacking, architect, 50 Blackfriars Street, Manchester.

EGREMONT.—For the erection of a large engine-house at Oregill, Egremont, Cumberland. Plans can be seen at the Wyndham Mining Company's Office, High Mill, Egremont.

FARSLEY.—May 25.—For the erection of ten terrace houses in New Street, Farsley, Yorks. Messrs. George Verity & Sons, builders, Lowtown, Pudsey.

FAYGATE.—For the erection of small house near Faygate, Surrey. Mr. K. D. S. Robinson, 7 Carteret Street, Westminster.

FINCHLEY.—June 2.—For the erection of a sorting office at Church End for the Commissioners of H.M. Works and Public Buildings. Mr. J. Wager, H.M. Office of Works, Storey's Gate, S.W.

HALIFAX.—June 3.—For the erection of four shops, paper warehouse, stable, &c., Horton Street, Halifax. Messrs. Walsh & Nicholas, architects, Museum Chambers, Halifax.

HANWELL.—June 2.—For the erection of a sorting office. Mr. J. Wager, H.M. Office of Works.

HENDON.—May 26.—For the erection of a newspaper repository for the British Museum. Mr. J. B. Westcott, at H.M. Office of Works.

HORNSEY.—June 8.—For the erection of workmen's dwellings (140 houses) in Hawthorn and Beechwood Roads. Mr. E. J. Lovegrove, engineer to the Urban District Council, 99 Southwood Lane, Highgate, N.

HYDE.—May 27.—For the erection of the Queen Victoria memorial tower, Holy Trinity parish church, Gee Cross. Messrs. James Hunt & Son, architects, 4 Warren Street, Stockport.

IRELAND.—For the erection of shop and stores in Main Street, Bangor. Messrs. Jas. T. Brice & Son, auctioneers, Bangor.

TRADE NOTES.

MESSRS WM. AUG'S GIBSON, LTD., of Temple Bar House, 28 Fleet Street, have received an order for three lifts, electrically driven, for the *Standard* offices, Shoe Lane.

THE new police-station, Amlwch, has recently been fitted with the well-known "small tube" hot-water heating apparatus by Messrs. John King, Ltd, engineers, Liverpool, who employed their economical coil-heater.

MARBLE Arrolithic paving is being supplied and laid at East Riding lunatic asylum, Beverley; Corn Exchange, Chelmsford; conservatory, Howbery Park, Wallingford; and Moon's Hill, Farnham, by Messrs. Arrolithic, Ltd., 18 Berners Street, W.

MESSRS. JOHN SMITH & SONS, Midland Clock Works, Derby, have just received an order for a large clock for the new town hall at Vryburg, Cape Colony. It will be supplied with all the latest improvements, and is expected to go to great accuracy.

THE fireproof construction of the Columbian Fireproofing Company, Limited, 37 King William Street, E.C., has been adopted for the new lampblack works at Greenwich for Messrs. Binney & Smith Company, including the providing and erecting constructional steelwork, fireproof roofs, casing the steel girders and glass finish to roofs. The architect is Mr. J. Thorman, of Borough Hill, Royal Hill, Greenwich.

THE North-Eastern Railway Company have erected several large buildings recently on the main line from Leeds to York, Selby and Hull, at Neville Hill, on the outskirts of Leeds, and Messrs. Wm. Potts & Sons, clock manufacturers, Guildford Street, Leeds, have erected a large illuminated turret clock in one of them, showing the time upon three large external dials, which are lighted by electricity, under instructions received from Mr. Wm. Bell, the company's architect.

THE Safety Lift and Elevator Company, Albert Works, Rolt Street, Deptford, S.E., electric, hydraulic, belt-driven and hand-power lift manufacturers, inform us that among recent contracts taken by them are:—Bedford Hotel, Southampton Row, electric passenger and service lifts; King's Mansions, West End Lane, Hampstead, four electric passenger-lifts, eight service-lifts; Ivorna Court, High Street, Kensington, three electric passenger-lifts, one hydraulic passenger-lift, eight hydraulic service-lifts; Mr. Graves, Sheffield, electric passenger-lift; Spa Boarding House, Scarborough, electric passenger-lift.

Hyams, Ltd., Leeds, electric passenger-lift; Mr. E. Rubie, 28 City Road, hydraulic passenger-lift; Messrs. Crossley, Ltd., Post Office Buildings, Newgate Street, E.C., hydraulic passenger-lift and hydraulic goods-lift; Dieudonné Hotel, Ryder Street, W., four hydraulic service and luggage-lifts.

VARIETIES.

THE Victoria Wesleyan church, Pendlebury, which has been erected at a cost of 3,600*l.*, was opened on Saturday.

MR. SAMUEL PRYCE PARRY, M.A., has been appointed town clerk of Oswestry at an inclusive salary of 350*l.* per annum.

MR. WM. SPINK, of Nawton, near Helmsley, has been appointed surveyor to the Pickering (Yorks) Urban District Council. The salary attached to the post is 75*l.* per annum.

CONSIDERABLE regret was expressed in Cheltenham at the announcement of the death at Sandgate on Thursday of the town clerk, Mr. Edward T. Brydges.

THE Leith Parish Council have considered the plans for the new poorhouse, with the report of the assessor, Mr. R. D. Sandilands, architect, Glasgow, and have awarded the first premium of 100*l.* to the design of Messrs. Scott & Campbell, architects, Edinburgh; and the second to the design of Mr. W. C. Laidlaw, architect, Edinburgh.

THE Colville memorial church, Cleland, N.B., was opened for public worship on the 16th inst. Built upon a site given by the late Mr. John Colville, M.P., the church has been dedicated to his memory. Seated for 460, with a hall for 130, and having a spire, back gallery, vestry, kitchen, cloak-room, heating chamber and gashouse, it has cost altogether about 2,150*l.*

MR. CARNEGIE has promised Mr. Fritz, the ironmaster, and Mr. Kafer, president of the Engineers' Club, a sum of one million dollars, or more if necessary, for a central Institute in New York, where professional and social bodies representing the engineering profession in all branches—civil, mechanical, electrical and mining—can be brought under one roof.

A NEW mission hall, which provides accommodation for 300 people, was opened in connection with the Holland Street Sunday and Ragged School, Ancoats, Manchester, on Saturday afternoon. The mission has been carrying on its excellent work in that densely populated neighbourhood for a period of forty-four years, and the new extensions, which comprise the mission hall already alluded to and an infant school will add materially to the efficiency of the institution.

MR. J. DAVIS, chairman of the baths and washhouses committee of the Whitehaven Town Council, opened on the 15th inst. the new public baths in Duke Street, which have been built as an extension of those built in 1884 at a total cost of 5,850*l.* The accommodation which has been provided includes the Lascare Grove bath, Turkish, rain and spray baths, hot and cold, and twenty washing stalls. The price paid by the Corporation for the old baths was 3,000*l.* The extensions have cost 2,850*l.*, making a total of 5,850*l.*

THE Vestry of St. Giles's, Cripplegate, have offered to acquire from the City Corporation a strip of land in front of the church of St. Giles's, Cripplegate, for 1,770*l.*, in order that no shops or buildings may in future be erected in front of the church. The Ecclesiastical Commissioners have already bought another strip for the purpose of preventing the church from being again obscured from view from Fore Street. If the offer is accepted by the Corporation, an appeal will be made for funds to restore the north side of the church, and the total cost of the work is estimated at about 6,000*l.*

ALL SAINTS CHURCH, Hereford, has been reopened after undergoing considerable restoration, which has been carried out at a cost of nearly 3,000*l.* The principal portion of the work has been the restoration of the south aisle and lady chapel. The roof of the former has been put into a thorough state of repair, an old lean-to roof demolished, and by the removal of a lath-and-plaster ceiling a fine old panelled roof, with ancient carved spandrels and bosses, revealed. The lady chapel has undergone thorough restoration and has been entirely refitted and beautified. The organ has been improved and the electric light introduced throughout the building, while a good deal of outside work has also received attention.

A PUBLIC meeting of the parishioners of St. Aidan's Church, Harrington, was held recently to consider the report of Mr. Milburn, architect, of Sunderland, in respect to the damage done to the church by subsidence, and also the dangerous state of the belfry. The vicar of the parish, the

Rev. W. E. C. Frith, M.A.) presided over a good attendance. He presented the architect's report, which showed that the building was in a somewhat serious condition, and the architect recommended the work, including the removal of the present belfry from the extreme west end more to the centre of the roof, the total cost of the work being estimated at 300*l*. The report was adopted, a committee appointed to have the work carried out, and to make a house-to-house collection in the parish to raise the money, also to approach the Lambton Collieries Company for a donation. The building was only erected in 1886 at a cost of 3,500*l*.

CHEAP tickets available for eight days will be issued to Brussels May 27 to 30 inclusive and June 1 *via* Harwich and Antwerp. Passengers leaving London in the evening reach Brussels next morning after a comfortable night's rest on board the steamer. For visiting The Hague, Amsterdam, Utrecht and other parts of Holland, the Rhine, North and South Germany and Bale for Switzerland special facilities are offered *via* the Great Eastern Railway Company's Royal British Mail Harwich-Hook of Holland route, through carriages being run to Amsterdam and Berlin, Cologne and Bale. Restaurant cars are run on the North and South German express trains. The General Steam Navigation Company's fast passenger steamers will leave Harwich on May 27 and 30 for Hamburg, returning May 31 and June 3. The United Steamship Company of Copenhagen steamers will run between Harwich and Esbjerg, on the west coast of Denmark, as usual.

BUILDING AND BUILDERS.

THE Folkestone Town Council has decided on the erection of an up-to-date dust destructor.

The authorities are about to spend over 50,000*l*. in extending the present school buildings at Hythe, and are purchasing new lands for future use.

MEMORIAL-STONES of a new Wesleyan Sunday-school have been laid near the Wesleyan chapel in the Newtown portion of New Mills, Lancs. The building will cost about 1,800*l*.

ON Saturday memorial-stones of a new Wesleyan chapel at Longwood, near Huddersfield, were laid. The chapel and site are estimated to cost 7,600*l*. The new building will be in the Gothic style of architecture, and will seat 700 persons.

THE tender for the erection of Inglehurst, Beckenham, Kent, submitted by Messrs. H. Copeland & Son, contractors, Beckenham, has been accepted, the amount of contract being 1,726*l*. 1*s*. 6*d*. The architects are Messrs. G. & R. P. Baines, 5 Clement's Inn, Strand, London, W.C.

NINETEEN tenders have been received by the Crewe Town Council for the erection of new municipal buildings for the borough. The highest was over 17,000*l* and the lowest under 15,000*l*. A committee of the whole Council have accepted the tender of Messrs. Robert Neill & Son, of Strangeways, Manchester, to erect the buildings for 14,752*l*.

EIGHTY-NINE sets of designs for the Fenton Public Library competition were submitted by architects, and the assessor, Mr. Ernest George, F.R.I.B.A., has awarded the premiums as follows:—First (60*l*), Messrs Short & Penty, of 11 Anley Road, West Kensington Park, London; second (30*l*), Mr. J. Stephenson Stout, of Whitehaven. The cost of the building was limited to 4,250*l*.

THE Walsall Bricklayers' Society, who have been on strike for five weeks for an increase of a halfpenny per hour, have decided to relinquish their demand and return to work to-morrow at the old rate of 8*½**d*. Over 300 men have been out, and the only point gained has been a concession as to winter conditions—work to start at 7.30, with an hour for breakfast, instead of 8 o'clock and no breakfast time.

THE Liverpool Corporation have, it appears, abandoned for the present the scheme for building a public hall at a cost, including site, of some 100,000*l*. The reasons for dropping the proposal are that the Liverpool Wesleyan Mission is about to erect in Renshaw Street a Charles Garrett Memorial Hall, which will hold about 2,500 people, and be available for public meetings, while simultaneously a still larger building to hold 4,000 people is about to be erected near the Necropolis.

THE present buildings devoted to police and county court proceedings at Altrincham are no longer calculated to meet the requirements of the rapidly increasing district. For some time past the standing joint committee of the Cheshire County Council have had the matter under consideration, and permission has now been received from the Local Government Board for additions and alterations which will practically amount to rebuilding. Additional rooms will be provided for the accommodation of the Mayor, and a second court-room will be added. Underneath this will be a drill and parade-room for the police.

6-11 Imperial Buildings, Ludgate Circus.

THE scheme for the restoration of St. Leonard's Church, Walton-le-Dale, near Preston, at a cost of between 8,000*l.* and 9,000*l.*, has now been definitely settled. The plans have been prepared by Mr. Seddon, of London, and the character of the building will not be materially altered, though many improvements will be effected. One of these will be the extension of the church 6 feet at the chancel end, while the gallery will be abolished and the organ chamber removed close to the chancel. The character of the tower will not be interfered with. The scheme has received the approval of Mr. Richard Calvert, who a short time ago gave the sum of 4,000*l.* towards this object, while a further donation of 1,000*l.* was received from Mr. Frank Calvert. Altogether a sum of about 7,000*l.* has been promised in aid of the scheme.

A MEETING of Kirkcaldy Harbour Commission was held last week to consider the report by the joint committee of representatives from the Harbour Commission and Town Council, appointed to consider the question of improved harbour accommodation at Kirkcaldy. The committee reported that after making investigations as to the trade which might be expected they considered they would be justified in spending 100,000*l.* on a commercial harbour, and they proposed that Sir A. M. Rendel, C.E., should be asked to report on the question of a harbour on the line suggested, with a view to extension for export of coal if found necessary. The Commission unanimously adopted the committee's report, and instructed the clerk to engage the engineer, the expense to be borne by the Commission.

At a meeting of the Clydebank and Renfrew Joint Hospital Board general satisfaction was expressed that the Town Council of Renfrew had now seen their way to approve of the extension of the hospital and the plans prepared therefor. The architect (Mr. Paterson) was instructed to proceed with the working plans and other details to be submitted to the Local Government Board, and also to prepare the necessary specifications; and the clerk was instructed to have the agreement with Mr. Speirs for the additional grounds carried out as a purchase if possible. The proposed scheme is to give accommodation for thirty-four new beds, making a total, with existing beds, of sixty-four. The buildings consist of new scarlet fever pavilion, with acute wards connected to existing scarlet fever pavilion by an open covered way, and to which new duty rooms have also been added; isolation block and extension and alteration of present administrative and laundry blocks, and new

stables to be placed at south boundary wall. The pavilion in appearance will be similar to those existing, with slight alterations on plan. The extensions are estimated to cost over 12,000*l.*

THE Aberdeen Harbour Commissioners met recently. The engineer, Mr. R. Gordon Nicol, C.E., submitted a scheme for the widening of Pocra Quay, and providing deep-water berths in front, the estimated cost being 9,820*l.* The board adopted the scheme, and instructed tenders to be accepted for the work. Owing to the unavoidable absence of a number of the members, it was resolved to defer consideration of the recommendation of the lands and fishings committee to purchase for 30,000*l.* 4½ acres of ground at Balnagask, on the south side of the Dee. It was reported that the revenue of the harbour from dock rates for the six months ending March was 26,584*l.*, an increase of 40*l.* over the corresponding period of the previous year. An increase of 785*l.* 10*s.* on the salmon fishings, so far as the season has gone, was reported. There will also be an increase from rents and feu duties. It was resolved to purchase for 1,160*l.* a steam-tug to move about herring-boats in the harbour during the season.

At a special meeting of Currie (N.B.) School Board the design sent in by Mr. William Baillie, architect, 223 Hope Street, Glasgow, was adopted. The school is to occupy a prominent site at the west end of the village, on the high ground at the junction of the Lanark and Curriehill Roads. The plans show a pleasing architectural design of square-dressed rubble masonry, with dressings of red Dumfriesshire sandstone, and roofed with green slates and tile ridge. The school provides accommodation for 206 pupils. The entrances are situated near the centre of the main front, facing the Lanark Road, and give access to wide corridors leading directly into a central hall, which is spacious and well lighted from the roof. Four classrooms and the boys and girls' cloak-rooms are grouped around the three sides of the hall, and each opens directly off it. Two teachers' rooms, &c., form the remaining side of the hall and look towards the back. The school will be heated throughout by means of hot-water pipes and radiators on the low-pressure system. Shelters and suitable lavatory accommodation are provided. The estimated cost of the whole buildings amounts to 2,676*l.*

At a meeting of Dundee Harbour Board Mr. J. Thompson, jun., the engineer, reported that designs, specifications and bills of quantities had now been prepared for the reconstruc-

tion of the cattle wharf, a scheme which was to cost 23,000*l*. The jetty had been designed to carry a uniformly distributed load of 2 cwt. per square foot on the quay and 3½ cwt. per square foot in the sheds, and also to carry a train composed of one engine of 30 tons weight and trucks of 18 tons each, and also a 5-ton locomotive crane weighing 30 tons. Mr. A. B. Gilroy, convener of the works committee, said it was estimated that the work would occupy fifteen months to complete, and they proposed as soon as possible to advertise for tenders. The work would be completed for the 1904-5 jute season. Mr. William High objected to the proposal to spend 8,500*l*. on a new shed, an emergency shed so far as he could see, which would be occupied only about a month in the year. The present accommodation, in his opinion, was ample. Lord Provost Barrie said the cattle sheds were not sheds for the storage of jute or any other article of commerce. They were never designed for that, being only a makeshift. The ground had sunk considerably and the Board recognised that the whole thing must be reconstructed. They might as well have a horse without a cart as a wharf without a shed. Mr High replied that the whole trouble was with the jute merchant, and Mr. J. C. Buist pointed out that the 8,500*l*. was not entirely to be expended upon a shed, but included also the cost of dredging. Mr. High's dissent was recorded.

ELECTRI NOTES.

THE Bermondsey Borough Council have decided on an extensive scheme for the enlargement and extension of the electric-lighting system. The cost of the work is estimated at nearly 52,000*l*.

THE accounts of the Bath municipal electric-lighting undertaking for the year ending March are the most satisfactory yet presented. The private lighting revenue has increased by 2,336*l*., and although a reduction in the price per lamp for public lighting reduced the income by 774*l*., the net increase is 1,500*l*. The expenditure includes 871*l*. for renewal of machinery and hire of plant—a special charge which will not occur again—and this makes the gross profit 5,800*l*., about 100*l*. less than last year. This is enough to pay 5,424*l*. for interest and sinking funds on the loans, which have now reached 110,000*l*., and to leave a net profit of 376*l*. The

previous year's working having produced a profit of 857*l*., there is available for disposal 1,233*l*., which if applied to the relief of the rates would be equal to a penny in the pound.

THE total expenditure by Bolton Corporation on electricity for the year ended March 31, 1903, is 12,884*l*., an increase of over 400*l*., but the balance carried to profit and loss account has gone up from 17,319*l*. to 20,807*l*., and a sum of 4,500*l*. has been devoted to the relief of the rates. The income is 33,691*l*., of which 15,670*l*. comes from private lighting and 14,281*l*. from tramway traction. During the year no less a sum than 27,224*l*. on capital account was spent on new works. This brings the expenditure up to date to 207,482*l*., and 30,430*l*. has been written off in depreciation and 25,120*l*. of the capital account has been paid off. At the end of March 1902 Bolton had the record for the lowest cost of generating electricity in the United Kingdom with 959*d*. Subsequently Liverpool, Bootle and Bradford passed this figure, but this year Bolton again comes out at the top with 813*d*. They propose to offer the electricity current at 4*d*., less 10 per cent. on the flat rate.

BRITISH URALITE COMPANY, LTD.

THE third ordinary general meeting was held on Tuesday at the Cannon Street Hotel, Mr. William E. Hubbard presiding. The chairman, in moving the adoption of the report, said that although the company had been in existence for a considerable time, it was not until the beginning of the last six months that they were really in a position to do any business. The progress made during the past twelve months had started the company as a going concern, but a great deal more needed to be done before it could be considered in a satisfactory state. Business development had been very rapid—more so than they could have expected or even hoped in such a case as this, where they were introducing an unknown material into use in England. They had been successful in instituting several very valuable agencies abroad—in Africa, in the East and in various parts of the world; they had made more than one alliance with firms of excellent standing in England, and had agents working in various parts of the kingdom. Experimental orders received some months ago had since resulted in orders of much greater magnitude. Throughout the year the company increased their volume of business in an increasing ratio. In

the last six weeks they had sold 100,000 feet more than in the previous six months, and he hoped that in the present quarter their sales would amount to 1,000,000 feet. As to foreign patents, nothing definite had yet been done, but they were not without hope that in more than one direction they might be able before long to bring some business about. The London County Council had now recognised it as an efficient fire-resisting material; and what was still more valuable was that quite recently the company had succeeded in persuading the fire insurance companies to take the same view. The motion was seconded by Mr. A. G. Salamon and carried.

THE INTERNATIONAL EXHIBITION AT ATHENS.

It is officially announced that the International Exhibition at Athens will be opened on June 3, the name-day of the Crown Prince of Greece, and will last six months. The estimated cost of the Exhibition is 20,000*l.*; the entrance fee will be 1 drachma (6*d.*) and 3 drachmas on special days. The superficial area is 72,000 square metres. The British exhibits, as at present arranged, will occupy 500 square metres, and the German 400 square metres. The Governments of France, Austria and Spain are assisting semi-officially. The largest exhibition section after that of Greece itself will be the Turkish section, those of Austria and France coming next. The British exhibits will consist mainly of engines, ship-models and guns; the German are described as very varied, while the American section is insignificant. The national section will contain exhibits of all kinds, including locally manufactured machinery. The originator of this, the first international exhibition to be held in Greece, is the director-general of the committee, Mr. James Deanworth, an Englishman, who began to elaborate the idea in 1901. Although the scheme encountered much local opposition at the outset, it was enthusiastically supported by the Greek element in Turkey, Roumania, Egypt and other foreign parts. Some opposition was also experienced at the hands of German firms trading in the Near East, in view of the early announcement of French participation, as it was considered that the Exhibition would enable France to regain much of the trade she has been steadily losing in the Levant during the last ten years. Subsequently, however, the German houses came forward actively, and in point of variety and value the German exhibits as now arranged should prove an attractive feature of the foreign sections.

NORTHAMPTON SEWERAGE WORKS.

A LOCAL GOVERNMENT BOARD inquiry was held at the town hall, Northampton, on the 15th inst., relative to the application of the Northampton Town Council for sanction to borrow 3,500*l.* for works of sewerage and surface-water drainage, including the construction of works in the parish of Weston Favel. The inspector was Mr. H. Percy Boulnois, M.Inst.C.E. No objection was raised to the proposal, and very little interest was manifested in the inquiry. Besides the Inspector, there were present Alderman Hickson, Councillor A. J. Chown, Councillor J. Brown, Mr. Herbert Hankinson (town clerk), Mr. A. Fidler (borough engineer), Mr. W. J. Hull (borough accountant), Mr. T. A. Dickson (agent to the Wantage estate), and Mr. W. Tomalin (clerk to the Northampton Rural District Council). The town clerk explained that the area of the borough was 3,451 acres, the population in 1901 was 87,021, and the assessable value of the general district rate was 338,089*l.*, the product of a penny rate being 1,320*l.* The loans now outstanding were 143,572*l.* 1*s.* 8*d.* under the Public Health Acts, and there was also sanctioned and not exercised, or only partially so, 47,260*l.* Within a few months most of those amounts might be exercised. The total debt, therefore, was 190,832*l.* He would like to say with regard to one of the greatest items in the amount that 18,800*l.* was a sum sanctioned to enable the Council to buy property for street improvement. When they had effected the alterations there would be some property to sell, which would leave only something like 5,000*l.* or 6,000*l.* The present application was to enable the Council to supply pipes and surface-water drains, which were required for a portion of the north-easterly part of the borough. The part to be drained was all within the town area, but the Council went just outside its area for the purpose of joining with an existing sewer. At the present time the drainage of that particular district was discharged into a small cesspool, which was built simply as a temporary means for collection in the district, which was only partially developed. It had to be admitted that the method had proved itself insufficient for some length of time past, and had become very objectionable. It was, therefore, necessary to carry out the works for which the loan was asked. Mr. Fidler having given evidence, a few questions were asked by Mr. Dickson, and some observations made by Mr. Tomalin. The inquiry then closed, and the Inspector afterwards proceeded to view the site.

THE BUILDING BY-LAWS REFORM ASSOCIATION.

THIS Association, which was recently formed to secure that official control of private buildings shall not extend beyond the demands of public health and safety, met again at the offices, 45 Parliament Street, Sir William Chance, Bart., in the chair. There was a good attendance, and on the motion of the Hon. Percy Wyndham, the Duke of Westminster was unanimously elected president of the Association. A proposal was made for the appointment of a special committee to consider and report on the amendments required to secure the removal from existing by laws of those provisions which unreasonably encroach on individual liberty. A long discussion followed, in which Mr. W. M. Acworth, Mr. Lacy Ridge, Mr. A. H. Clough, Mr. Mark H. Judge, Mr. W. Henman (Birmingham), Mr. T. M. Shallcross (Liverpool), Mr. Thackeray Turner, Mr. E. D. Till and Mr. R. A. Read, hon. sec., took part. The special committee was appointed, and letters asking for advice for the amendment of by-laws at Guildford, Bucklow and Bradfield were referred to it.

THE INTERNATIONAL FIRE PREVENTION CONGRESS.

THE arrangements for the impending International Fire Prevention Congress, convened by the British fire prevention committee, which will be opened by the Lord Mayor on July 7, include the presentation of a number of very important papers by foreign authorities conversant with special sections of the subject, and among such papers as have already been accepted for consideration and discussion at this Conference are the following:—By G. Edward Atkinson, president Boston Manufacturers' Mutual Insurance Company, U.S.A., "The Prevention of Loss by Fire in the United States of America;" by Privy Councillor J. Stübben, late president Amalgamated Societies of German Architects and Engineers, late city surveyor of Cologne, "Urban Fire Protection as influenced by Street Planning and Building Regulations;" by chief officer Westphalen, Hamburg city fire brigade, "The Latest Experience in Warehouse Construction at Hamburg and Bremen;" by Professor Woolson, Columbia University, New York, "Fire Retarding Wood;" chief officer Meier, city fire brigade, Amsterdam, "The Necessary Development of Fire Alarm

Systems;" by Professor Medem, University of Greifswald, "Spontaneous Combustion;" by A. Dittman, chief officer, Bremen fire brigade, "The Influence of the Fire Service on Fire Prevention;" by A. Goldoni, chief officer, fire brigade, Milan, "Fire Survey and Fire Watches in Theatres;" by Gorham Dana, Inspector 'Underwriters' Bureau, New England, Boston, U.S.A., "The Care of Private Fire Appliances;" by Chas. Hexamer, president, National Fire Protection Association, U.S.A., "The Principles of Fire Insurance in America;" by W. H. Stratton, chairman of executive, National Fire Protection Association, U.S.A., "Fire Hazards in America from an Insurance Point of View;" by W. H. Merrill, jun., the Underwriters' Laboratories, Chicago, "The Testing Principles adopted at the National Fire Prevention Laboratory of Chicago;" by Crown Surveyor Jaffé, Berlin, "The Testing Principles adopted at the Royal Technical Research Laboratory, Charlottenburg, and at other Fire Tests in Germany;" by Chief Officer Welsch, City Fire Brigade, Ghent, "The Necessity of Systematising Testing Operations as Based on Belgian Experience." Regarding the programme of the Congress and the arrangements made for visitors to the Metropolis, all applications should be addressed to the hon. general secretary, Mr. Ellis Marsland, 1 Waterloo Place, S.W.

CITY AND GUILDS OF LONDON INSTITUTE.

THE annual report of the Council of the City and Guilds of London Institute, after expressing regret at the death of Sir Frederick Abel, the chairman of the executive committee, states that Sir John Wolfe Barry has been appointed to that position, and that Mr. S. Steuart Gladstone has accepted the office of treasurer, made vacant by the resignation of Mr. Beckwith, both gentlemen being representatives of the Fishmongers' Company in the Institute. The Council proceed to review the circumstances in which the Institute was founded and compare them with those now existing, because the present appears to be a convenient time in which to consider them. They claim that in establishing the Institute—it was incorporated in 1880—the City and Livery Companies of London took the first substantial step towards the provision and organisation of technical education. During the earlier years of its existence the Institute did much to direct public opinion to the necessity of a liberal

provision being made for the technical education of all grades of men employed in the industries of the country, and thus prepare the way for State-aid and municipal action. The report refers to the later work of the Institute and to the assistance it has rendered to county and borough councils at the request of those bodies; and the belief is expressed that in the provision made for systematic courses of instruction of a high character at the Central Technical College and at the Technical College, Finsbury, the Institute has done most valuable work of a special and distinctive kind, which is not covered by that of any other public or private institution in London. The Council say that the necessity for that work is in no way lessened by recent legislation, and that there will still be much valuable work of a special and distinctive character, such as that carried on by the Institute, which must, at least for the present and some time to come, if not permanently, depend to a large extent on private and voluntary effort. The great work done under the Technical Education Board of the London County Council during the past ten years has, the report adds, added to the necessity of the Institute's developing its present work, as, with the greater efficiency of secondary and continuation schools and the number of scholarships now available, an increasing number of qualified candidates seek to enter upon higher courses of study under the Institute. The Council indicate briefly the directions in which the Institute's work is developing. In this connection they mention the Central Technical College, the Department of Technology, and the Technical College, Finsbury, an effort to extend which is being made, and they earnestly trust that their endeavour to allow this work free scope for its national growth and development will receive the approval and support of the Corporation and Livery Companies of the City of London.

BAPTIST CHURCH, CAMBRIDGE.

THE foundation-stone laying of St. Andrew's church took place on May 6. The church is being remodelled, and to a large extent rebuilt with an entirely new frontage and interior fittings, making use as far as possible of the foundations and side walls of the present building. The seating accommodation of the new structure will be, on the ground floor 580 adults, and in galleries 326 adults. The materials for the front will be whole white flint facings to walls, and stone dressings and

tracery to windows, &c. The joinery internally will be of wax-polished wood. The cost will be about 8,000/, exclusive of furniture. The exterior will present a bold appearance from St. Andrew's Street, having a square tower rising to a height of 60 feet to the parapet, with a spirelet rising to a height of 90 feet. This tower will have a three light tracery window in the belfry stage on all sides, and a bold doorway at its base leading to one of the staircases up to the gallery.

The architects are Messrs G. & R. P. Baines, 5 Clement's Inn.

NORTHALLERTON NEW COUNTY HALL.

MR. WALTER H. BRIERLEY, architect to the North Riding County Council, has supplied to the county hall committee of the North Riding County Council a description of the new county hall which is to be erected in a field in front of the cricket ground, Northallerton. To provide for further extensions Mr. Brierley is of opinion that the best way of arranging the building upon the site is to place the principal front towards its approach and to the main road, but to set it back from the boundary line about 200 feet, in order to provide a forecourt, and to allow of wings being projected at each side when required for future extensions. The arrangement of the building is straightforward and direct, the different departments are separate and yet easy of communication, and can be readily enlarged at any time without inconvenience. The entrance hall, staircases and corridors will be wide and well lighted, and there will be ample through ventilation in every part of the building. The front of the building, facing the approach and main road, will be about 200 feet long, and will consist of a central block with projecting wings. The central block will contain:—The principal entrance, the grand vaulted entrance hall with stone columns, writing and waiting-rooms, porter's office and telephone-room, and the grand staircase (of polished limestone) leading to the upper floors. The north and south wings will provide ample accommodation for the department of the clerk to the Council, and for that of the secretary of education or the county surveyor. Entrances are arranged at each end of the corridor and service staircases to the upper floor. Separate and disconnected lavatory blocks are provided for each department, as well as strong-room accommodation. The council chamber will be a fine and noble apartment, and has been most care-

fully arranged to meet the requirements and convenience of the members. It is square in shape and ample in size, and the seats are arranged in lines radiating from the chair. The materials proposed to be used are common local brick for the general walling, and bright red Leicestershire brick for the facings, with Whitby or Farndale stone for the dressings, and green Westmoreland slates for the roofs. Internally the whole of the floors are to be of fireproof construction, finished with maple or oak blocks for the rooms, and marble for the entrance hall and corridors. The walls are all to be finished in Parian cement. The windows double-hung sashes glazed with best plate glass. All inside joinery is to be of selected yellow pine, except round the entrance hall, where Spanish mahogany is to be used, and the council chamber doors are to be covered with leather to prevent noise. The estimated cost is about 25,000*l*.

UNITED FREE CHURCH ASSEMBLY HALL, EDINBURGH.

THE fine old building on the Mound having become altogether inadequate to the greatly-increased demands upon its space, it became necessary to take steps for the enlargement of the hall, and the preparation of plans was entrusted to Mr. Dick Peddie, architect, under whose care the work has been admirably carried out. The hall before reconstruction gave accommodation for a total of 1,336; the altered building will seat comfortably 1,861, or an increase of 525. In order to get this additional room it was found necessary to absorb the buildings which formerly existed to the east of the hall proper. With an increased area the previous height of the building was inadequate, and as it was desired, as far as possible, to preserve the features of the old hall, it was finally decided to leave the roof as it was, but to lower the floor 5 feet, adding to the height of the roof supports to meet the altered conditions. Formerly the area measured 62 feet by 53 feet; now it extends to 93 feet by 67 feet. For the purposes of debate the hall has been surrounded on all four sides by division lobbies, to which there are numerous doors of access, and from which, of course, the public are excluded. The division lobby to the north is immediately in connection with the north corridor, which forms the access to the galleries set apart for the use of the public, and the division lobbies are also in communication with the Lawnmarket by staircases at the south-east and south-west corners.

Off the division lobbies there is ample cloak-room and lavatory accommodation. Two new rooms have been set apart for the Moderator of Assembly—a reception-room and a private room, which are entered from the north corridor—and there is a special ladies' room, which can be reached both directly from the north corridor and from the ladies' gallery. The staircases at the south-east and south-west corners rise from the Lawnmarket level to the upper floor, which is placed over the south gallery, where there is a smoking-room for members of the House, as well as a museum. Although situated some 20 feet below the Lawnmarket level, the division lobbies are well lighted from four angle courts, and an ample supply of air to the hall is secured by fans in each of these courts, which drive in air from the upper level. The main hall is provided with a large electrical fan, by means of which the air is in turn withdrawn. The heating is by hot-water pipes, placed below the floor. The lighting has been greatly improved, and it is expected that the acoustic properties of the hall will be as good as ever. It is believed that the total cost of the alterations will be considerably over 20,000*l*.

NEW CHURCH FOR LINACRE, LANCS.

THE foundation-stone of the daughter church of St. Andrew, Linacre, in the parish of Litherland, was laid on Saturday last. The aim of the architects in the designing of this church has been to provide a building in which the congregation will have an uninterrupted view of the clergy at all stages of public worship. Internally the church will consist of a nave 89 feet long by 37 feet wide, containing seating accommodation for 522 persons, which, with the side aisles, gives a total width of 48 feet. The chancel is 34 feet long by 26 feet wide, containing accommodation for 26 men and boys. The choir and clergy vestries are placed on the north side of the chancel, with entrance porch and lavatory. The organ chamber and south entrance porch occupy the south side of the chancel. Facing Stanley Road is the west front, with an entrance porch on either side. The narthex, including the side porches, is 48 feet long. The nave is divided from the side aisles by six arches, which die on to triangular piers. All the internal arches and nave piers are in Storeton stone, the walls being finished in tinted plasterwork. The floors of aisles, nave, narthex and baptistery are laid with wood blocks, the floors

Excelsior and Rawdon Potteries,

under seating being in red deal boards. The two porches on either side of the west entrance are paved with red tiles. Hopton Wood stone is used for the chancel floor, laid in 12-inch diagonal squares. The pulpit and low screen, between chancel and nave, are also in Hopton Wood stone, the former being effectively treated in a simple manner. Fumigated oak will be used for the choir stalls, holy table and rail. A handsome hammer-beam timber roof will span the nave, with a cornice under it ornamented by moulded brackets. The roof will be barrel vaulted, lined with narrow boarding, laid longitudinally. Over the chancel is a hexagonal roof, with moulded ribs, lined with narrow boarding. The church will be seated with chairs. A font is placed at the end of the north aisle in an octagonal baptistery, and will be executed in white stone. Externally the church will be faced with red bricks, the windows and other dressings being in terra-cotta. Over the west front is placed a traceried window, 22 feet high, of imposing design, the lower part being divided into seven lights by moulded mullions. The traceried windows will all be filled in with leaded glass. The treatment adopted by the architects is a fine style of Perpendicular architecture of the fifteenth century. The ventilation and heating of the church will be on the most approved system, the heating being by hot water on the low-pressure system, with ventilating radiators placed in the recesses of the windows. The heating will be carried out by Messrs Cooper, of London Road. The church has been designed and is being carried out under the supervision of the architects, Messrs. Willink & Thicknesse, of Castle Street. The contractors for the whole works are Messrs. Morrison & Sons, of Wavertree.

WOOD PAVEMENT.

STATEMENTS having been published about the quality of the blocks for wood pavement to be used in Brighton, Mr. F. J. C. May, the borough engineer and surveyor, has presented the following report to the works committee:—

May 14, 1903.

To the Works Committee.—Gentlemen,—After reading in the public Press the report of the proceedings of the Town Council at the meeting on Thursday, the 7th inst., when it appears that unwarrantable and unjust insinuations and innuendoes, if not more direct charges, were made against me and my mode of supervision of the wood paving now being laid

in London Road, I feel compelled to lay before you the following information relating to the management of the work, and to ask you to absolve me from all blame and to refute all charges against me or insinuations that I have been in any degree negligent of my duties in the interests of your committee. Mr. Day, a qualified civil engineer and of experience in similar works, was, with your approval, appointed by me clerk of the works, and is always on the work to see that the conditions of the specification and contract in all respects are duly observed by the contractor. Mr. Paterson, of London, an expert in wood-paving blocks, was, at your request and direction, appointed inspector of paving blocks, and one of our own reliable workmen, T. Ashdown, was also, with your approval, appointed to assist him.

The sole duty of these two last-mentioned men is to examine the paving blocks when brought on to the concrete foundation, and to reject all unsound or badly sized blocks. The work is done in sections. Every block brought on to the work is inspected by them, and no blocks not passed by them as satisfactory are allowed to be laid. Moreover, each section of the work is inspected throughout its progress, and again after its completion, before it is passed as satisfactory. The final inspection is always made by Mr. Day, and generally by myself or Mr. Grant, the highways inspector, as well, before the first coating of tar is applied, in order to insure good work. It is, of course, possible for anyone passing by to see unsound or otherwise defective blocks being picked out during the paving operations, but I deny that any are left in after the final inspection. I append hereto copies of all the correspondence that has passed between me and the contractor since the commencement of the work, which is strong evidence that the interests of the Corporation have received the greatest consideration from me, and that no point has been neglected by me. The new blocks supplied by the contractor have generally been satisfactory.

On April 22 it was reported to me that the contractor was sorting the stack of blocks in Hollingdean Yard, which were partly rejected and partly left over from the last paving contract, and had brought about two cart-loads of the best of them to his London Road depot for use on the works. When I received this information I immediately wrote to the contractor, forbidding him to remove any more of these blocks from Hollingdean Yard. I also sent a note to the yard foreman at Hollingdean, instructing him not to allow any more of such blocks to leave the yard. The contractor complained very

strongly of my action, as he stated that there was a very large percentage of sound blocks in the stack, and that he had given instructions for the men to be very careful and strict in the sorting, so that only good blocks should be sent on to the works. I said, however that might be, I should not take upon myself the responsibility of allowing such blocks to be used, and that I should report the matter to the works committee. I did so at your meeting on the 24th ult., and submitted some samples which I picked quite casually out of the stack. After discussing the subject, your committee gave permission for the sound and otherwise suitable blocks to be used, subject to careful supervision in the sorting before leaving the yard. This was done, but no amount of such supervision is equal to that when each block is handled and laid singly on the road under the eye of an expert inspector.

In consequence of a report made to me, and of my subsequent inspection of the work in conjunction with your chairman, I took upon myself the responsibility, on the morning of the 7th inst, to prohibit the use of any more of the blocks from Hollingdean Yard, and later in the day I gave the contractor notice to remove all rejected blocks, including the stock at Hollingdean Yard, out of Brighton forthwith, and they are being removed as fast as trucks can be obtained from the railway company. Only about 12,000 blocks altogether have been brought from Hollingdean Yard, and if they had all been used they would have covered an area of only 250 square yards. I find, however, that only about half of these blocks were used, and the remainder have been sent back to Hollingdean Yard, and are being taken out of Brighton with the others.

The introduction of unsatisfactory blocks from Hollingdean Yard has given us all, and especially our inspectors, a great deal of trouble and annoyance, but I claim that the inspection has been so severe and complete that, before the blocks have been allowed to be covered with tar and sand, the paving has been as perfect as it is possible to make it. It is with regret I feel compelled to say that interference with the work and the workmen, such as has been practised in relation to this work by individual members of the Council, otherwise than through my department, is not only subversive of all discipline, but disorganises the arrangements for supervision of the work and greatly prejudices my authority over the contractor. On behalf also of all those associated with me in supervising the work, as well as for myself, I deny absolutely that there is any justification for the unfair accusations and insinuations made at the last meeting of the Town Council, and I ask that you will take such steps

as you consider necessary to vindicate my honour in as public a manner as the insinuations have been made.—I am, gentlemen, your obedient servant,
(Signed)

FRANCIS J. C. MAY,
Borough Engineer and Surveyor.

The works committee have resolved that the statements which have been made respecting the execution of the contract are in most cases contrary to fact, and those for which there is any foundation are greatly exaggerated, and that the statements referred to, so far as they charge the committee or the borough surveyor with neglect of duty or improper conduct are wholly unjustifiable.

NEW SURVEYING INSTRUMENTS.

THE recent conference of the Surveyors' Institution of Great Britain and Ireland, held in the Royal Dublin Society's Theatre, afforded occasion for bringing into public notice some very novel and valuable instruments, the invention of Sir Howard Grubb, by which engineers and surveyors are provided with means of obtaining more rapid results than have hitherto been possible in fieldwork. Sir Howard Grubb gave a demonstration of the working of these new hand-surveying instruments which have recently been patented by him.

They are designed upon the same principle as his patent gun sight, and are not intended to supersede the standard surveying instruments such as the theodolite, dumpy level, &c., but it is expected that they will fill a gap at present existing between the very coarse and unreliable hand instruments now in use and more elaborate and costly standard instruments. For rapid work, not necessarily of extreme accuracy, such as military surveys, and for filling in details of surveys, the main features of which have been laid down by the more elaborate instruments, these simple pocket tools are expected to prove of great value. Among the instruments exhibited were:—A prismatic compass, a clinometer, a hand-level and gradiometer, and a graphometer, which could be used either as a plane table of a very superior type or as a plane table combined with a subtense instrument, by which the distances of each point of the survey could be plotted out at the same time as their directions; and as Sir Howard Grubb explained, by means of this instrument fields or plots of a moderate size could be surveyed and plotted in little more than the time which the staff-bearer could walk round the boundary.

The Architect.

THE WEEK.

THERE will be satisfaction among architects at the resolution of the general committee of the Liverpool Cathedral on Tuesday. When it was announced that the committee had refused to abide by the award of the assessors, and declined to accept the design by Mr. G. GILBERT SCOTT, which was declared to possess the power combined with beauty that makes a great and noble building, we imagined the conclusion was premature, and made no comments on it. For so important a body to disregard the recommendations of Mr. NORMAN SHAW and Mr. BODLEY was to set an example to the promoters of other competitions which would cause grievous trouble among architects. After a long and careful discussion on Tuesday it was resolved, on the motion of Mr. R. A. HAMPSON, seconded by Mr. ARTHUR STANLEY, M.P., that Mr. G. F. BODLEY, R.A., and Mr. GILBERT SCOTT be approached with a view to their appointment as joint architects of the proposed Liverpool Cathedral, and that the design marked No. 1 be selected, subject to the above arrangement, and to such alterations and modifications as may be advised by the architects and approved by the committee, also subject to the signing of an approved agreement. With the hereditary gifts which Mr. GILBERT SCOTT possesses, combined with the genius and vast experience of Mr. BODLEY, there is a possibility that a cathedral will arise which will be worthy of its purpose and confer distinction on the city containing it. It is not the first time an assessor has become the architect. The arrangement is rarely to be recommended, for it is fraught with danger to competitors, but we are willing to believe that in the Liverpool case Mr. BODLEY was inspired with a desire to aid a young architect, and to rescue the executive committee from an embarrassing position.

MR. GILBERT SCOTT's description of his design is as follows:—The general effect aimed at in the design has been dignified severity and largeness of scale. A great feature of the Mediæval cathedrals is length; that of Renaissance and Byzantine is mass rather than length. The effect of mass obtained with Gothic forms has been my chief object, for which reason cross transepts have been introduced to break the length of the exterior. The interior of these transepts being well lighted, and the intervening barrel vaults fairly dark, would give a curious effect of light and shade to the interior of the cathedral. The interior, for a good effect, should be either long or else very short, when it has a peculiar character of its own. To prevent the unhappy mean a continuous arcade and triforium has been introduced throughout the whole length of the interior, in order to give perspective and counteract the breaking up of the vault. The nave and choir are wide (50 feet), the aisles narrow, being intended solely as a means of access to the seats, &c. Cloisters are introduced at the main entrance facing Duke Street, and enable persons alighting from carriages to reach the building under cover should it be necessary.

ALTHOUGH so much interest surrounds the project for erecting the KING's sanatorium near Midhurst, the procedure required for ordinary cases must be followed, as no exception can be made between it and any common building. The question of drainage remains in an uncertain state. The Midhurst Rural Council propose to borrow 20,000*l.* to carry out a scheme of sewage disposal. That is a large sum for such a district to expend, and very great opposition has arisen. The Earl of EGMONT, who has offered a site at Pittsham, is of opinion that the expense will prove too heavy a burden for himself and other ratepayers. In so rural a district expedition about sanitary affairs is unknown, and under ordinary circumstances many deliberations would have to take place before a conclusion was arrived at. But it is considered desirable that the KING's sanatorium should be open for occupation within two years. Until it is known whether the Midhurst sewers can be utilised, or whether an independent drainage scheme for the sanatorium will be necessary, the erection of the buildings must be delayed.

The latter or special scheme would undoubtedly be difficult, for it would be impossible to avoid interference with the watershed of the sanatorium or the local supply. The decision, of course, rests with the Local Government Board. The people of the district believe they have no right to be taxed on account of the sanatorium, and the majority desire that the advisory committee should carry out an independent drainage scheme.

It is incomprehensible why the London County Council will persist in upholding the Works Department. One gross error succeeds another with appalling regularity, and there must be something inherent in the system which makes reformation impossible. Yet for some mysterious reason the Council have not the courage to accept the inevitable, and to put an end to the Works Department, which is casting discredit on the whole system of municipal government. The latest instance which was brought before the weekly meeting on Tuesday was the Horton Asylum. The architect of the Council estimated the cost of the work at 291,110*l.* A tender was received to carry out the work for 296,000*l.*, or, allowing for certain extras, which were afterthoughts, 314,000*l.* The manager of the Works Department estimated that the superstructure, including the extras, could be accomplished for 302,000*l.*, and thus save the Council 12,000*l.* The actual cost has been 330,500*l.* The excess is supposed to arise from the following causes:—(1) Error of judgment on the part of the late manager of works in undertaking the work and insufficiency of accepted estimate; (2) refusal of local authority to allow temporary railway for carriage of material; (3) rise in prices of materials and in wages, and (4) scarcity of labour. It is needless to say some of the members found much which was consoling in the revelation. Sir J. McDUGALL, who has developed into a humourist, considered that when all was said and done they had an extremely good asylum, which was rather more costly than it should have been. Mr. TORRANCE, chairman of the works committee, held out the illusory prospect which has served on so many former occasions, saying that under the present régime and the present constitution of the committee, he was sanguine that in future reports that came before the Council they would be able to show uniformly satisfactory results. The Council are easily persuaded in all cases relating to excessive expenditure, and it is needless to say the report was approved.

How long does the right of ownership extend over an object after it has been surreptitiously removed elsewhere? Is there a limit to the time when a person who has acquired a treasure which should not have been sold can claim to be its legitimate possessor? The two questions may be said to be the foundation of an action which has for a long time occupied the French Courts. The story extends over a vast period. The abbey of Cluny is renowned in the history of Mediæval architecture, for it was a school of art and gave rise to a special class of churches. As there were about six hundred minor abbeys in subjection to it in France alone, many opportunities arose for realising the Cluniac style. During the French Revolution the abbey was destroyed. Some of its treasures were seized by the French Government, and among the rest several manuscripts. A catalogue was prepared by a librarian named BAUZON. He was not perhaps a learned man. One manuscript, on the back of which was written *Opera Gregorij*, he attributed to BOETHIUS, the author of the "Consolations of Philosophy," who was executed on a suspicion of treason by THEODORIC, the king of the Ostro-Goths. A manuscript by BOETHIUS was discovered in a collection belonging to M. LECLERC, a bookseller. This was claimed by the authorities of the Bibliothèque Nationale. It was admitted that the library had a right to obtain any work which formerly was found on the shelves. But the problem was, could M. LECLERC's manuscript be accepted as that which BAUZON had catalogued as derived from Cluny? Experts maintained that his description suited the manuscript, but the judges considered the words were no less applicable to others. Finally, it was decided that the work in question could not have come from the abbey, and that it was not at any time in the Bibliothèque Nationale. The manuscript will therefore be allowed to be retained by M. LECLERC, and the State will have to bear the costs of the action.

TYPES OF COSTUME :—ANCIENT BRITISH AND NORTHERN EUROPE.

THE CENTENARY OF EMERSON.

THE celebrations of the centenary of the birth of RALPH WALDO EMERSON, which have taken place in America and England, are evidence of his popularity as a writer, or, shall we say, as a teacher. The resolve to found a hall for the department of philosophy in Harvard University, where he was taught, indicates the aspect under which his countrymen wish to consider him. For a great many people, EMERSON'S writings are accepted as an embodiment of modern metaphysics and ethics. Would-be "thinkers" find in the pages an incentive to reflection which, if generally rather vague, is not unpleasing. In consequence, many copies of his essays are printed. It is, however, remarkable that in treatises on philosophy his views are rarely referred to. Whether that arises from the difficulty of classifying him in any known school of thought or from his being an unattached or unofficial professor we need not discuss. All things must change, and systems of philosophy which are supposed to be based on foundations as steadfast as those of the universe are generally superseded before they are fully expressed. EMERSON also suffers either through the perversity of his nature or his indifference to system. What he says of GOETHE is more applicable to himself:—"He is fragmentary, a writer of occasional poems and of an encyclopædia of sentences." Not one of his essays or discourses is complete according to a rhetorician's views, and the creation of a volume was evidently a task beyond his powers. A man who was always thinking, or, to be more exact, who was maintaining himself in a condition to receive inspiration, could hardly fail to give utterance to remarks which will long be of interest, if it were only for their manifest sincerity. As art was one of the subjects which frequently arose in his thoughts, it may be interesting to glance at some of his sayings respecting it.

EMERSON belonged to one of those Puritan families in New England that are considered to be, in the Northern States at least, the true aristocracy of the country. So many of his ancestors were clergymen, it was natural that from an early age he should be set apart to fill the office of spiritual teacher. In course of time he became a minister and preached for about seven years. Holding such a position and living amidst Puritanic surroundings, there would be no reason for wonder if he grew a still more determined enemy of art in all forms than THOMAS CARLYLE. In Boston there were few chances of seeing a picture or a statue; but somehow the very rarity of them compelled EMERSON to exercise his imagination and to create visions of works of art. He tells us how in his youth, when he heard of the wonders of Italian painting, he fancied "the great pictures would be great strangers; some surprising combination of colour and form; a foreign wonder, barbaric pearl and gold, like the spontoons and standards of the militia, which play such pranks in the eyes and imaginations of schoolboys." When afterwards he arrived in Rome and Naples he was agreeably disappointed. For when he saw the works of art they seemed to be familiar friends that said to him:—"Thou foolish child! hast thou come out hither, over four

thousand miles of salt water, to find that which was perfect to thee there at home?" It is no wonder, therefore, that although the knowledge of picture-dealers might have its value, he considered they were not to be trusted whenever genius touched the heart. As he found his own consciousness was better than any connoisseurship, he imagined that susceptibility to the impressions of nature was the principal qualification to turn a man into an artist. One anecdote will suggest the direction in which EMERSON'S thoughts were moving and the extent of his faith in mysterious auguries:—

I knew in my younger days [he says] the sculptor who made the statue of the youth which stands in the public garden. He was, as I remember, unable to tell directly what made him happy or unhappy, but by wonderful indirections he could tell. He rose one day, according to his habit, before the dawn, and saw the morning break, grand as the eternity out of which it came, and for many days after he strove to express this tranquillity, and lo! his chisel had fashioned out of marble the form of a beautiful youth, Phosphorus, whose aspect is such that it is said all persons who look on it become silent.

Somehow the young Puritan preacher had become acquainted with his countryman, WASHINGTON ALESTON, A.R.A., and must have sympathised with him in his domestic afflictions. The painter was also a writer, and we can imagine how he explained much about his art to EMERSON. When, after his breach with the Church, EMERSON came to Europe for change of scene, one of his first visits was to another countryman, HORATIO GREENOUGH, the sculptor, who lived in Florence. He was a votary of the Greeks, believed the sculptors worked in schools or fraternities, under the inspiration of a master, and evidently had a great deal to do with the guidance of EMERSON'S tendency towards Greek art. GREENOUGH expressed his own theory of architecture as follows:—"A scientific arrangement of spaces and forms to functions and to site; an emphasis of features proportioned to their gradated importance in function; colour and ornament to be decided and arranged and varied by strictly organic laws, having a distinct reason for each decision; the entire and immediate banishment of all make-shift and make-believe." These words were potent with EMERSON whenever he attempted to criticise or explain the labours of architects.

We observe the effect of the words in the declaration that Salisbury Cathedral is the culmination of English Gothic, because the buttresses are fully unmasked and honestly detached from the sides of the building. But the inability to realise the use of obstacles like screens and organs was also a deduction from the principle; for, according to EMERSON, the eye hungers for length of line, yet is rarely gratified. For that reason he himself preferred the ample dimensions of Winchester. The adaptation to function and site was confirmed for EMERSON when he read in MÖLLER that "the building which was fitted accurately to meet its end would turn out beautiful, though beauty had not been intended."

EMERSON must have been able to talk about pictures and statues soon after his landing in Italy, for in his diary

he records how LANDOR cared only for Greek sculpture, preferred JOHN of Boulogne to MICHEL ANGELO; PERUGINO, and the early masters to the late. He evidently displayed his knowledge to COLERIDGE, as he relates a story told him by the poet of a picture-dealer who thought a work by ALLSTON was by one of the old masters until he touched it with his fingers, when he declared it was not ten years old. On his return to Boston we may suppose there was some surprise about EMERSON's new power as a critic. He continued to preach, but it was not as a minister of any Church, for he stood on the platform instead of in a pulpit. He had seen enough varieties of examples of art to make him feel that no one kind should be preferred. There were not any great masters to be seen in a Boston gallery to compel his allegiance to the productions of any age or clime. He had sacrificed position and broken affectionate ties in order that his thoughts might have their way. The liberty he enjoyed himself he recommended to others. We can notice in one of those early discourses how he advised painters to prefer American scenery as subjects, and the expression of the belief that they were not to undervalue ordinary life, for the difficulties amidst which people imagined they were living were only advantages in disguise.

In his discourses EMERSON may have adapted himself to his audiences, but in 1834 he appeared as an author in a small book entitled "Nature." His adoption of that subject could be well understood by those who heard him speak. In fact, throughout his life EMERSON might be regarded as an expounder of nature. As an interpreter he did not profess to be a follower of BACON. Indeed, the Baconian system, which as explained by MACAULAY found its development in reducing the intellect to a saucepan, was to EMERSON nothing more than the debasement of philosophy to sordid uses. Nature is treated with so much indifference by those who pierce isthmuses, level mountains and fill up lakes, it seems to be no more than a *corpus vile*, to be employed in more useful forms and made the occasion of daring experiments. But to the eye of the artist and the poet all those operations may seem to be only so many acts of sacrilege. We have recorded how one of EMERSON's friends created a statue in endeavouring to express the tranquillity of the morning. In English poetry there is much which shows a belief in the creative influence which lovely scenes can exert upon a sensitive mind. For example, DENHAM, in addressing the Thames, desires that his verse should have the character of the river:—

O, could I flow like thee, and make thy stream
My great example, as it is my theme!
Tho' deep, yet clear; tho' gentle, yet not dull;
Strong without rage, without o'erflowing full.

But of all English poets there was not one who could be considered to have greater claims to be acknowledged the high-priest of nature than WILLIAM WORDSWORTH. In his early days he also prayed that the Thames might bestow its quiet soul on all poets, and throughout his life nature, especially as displayed in solitary places, was his principal theme. WORDSWORTH was one of the four men that EMERSON thought it worth while to cross the Atlantic in order to see. He went on a pilgrimage on two occasions to WORDSWORTH. Although he could not realise why there should be so much of the cliff and bare mountain in the man—for he was disappointed when he found there was a wide difference between the poet and himself—yet EMERSON acknowledged that WORDSWORTH "alone in his time treated the human mind well, and with an absolute trust. His adherence to his poetic creed rested on real inspirations. The Ode on Immortality is the high-water mark which the intellect has reached in this age. New means were employed, and new realms added to the empire of the muse by his courage." The English poet wished to proclaim:—

How exquisitely the individual mind
(And the progressive powers perhaps no less
Of the whole species) to the external world
Is fitted,—and how exquisitely, too—
Theme this but little heard of among men—
The external world is fitted to the mind.

EMERSON looked on himself as having a similar mission. We can trace this in what he says about art. Nature, according to him, signified essences unchanged by man. Art was a mixture of will with the same things, but as, after all, the operations consisted only of a little chipping, baking, patching and watching, they made little alteration in the world as it stood. EMERSON's own delight in natural scenery is constantly expressed. In all seasons he found a cordial in the air. Walking through snow puddles gave him a perfect exhilaration. In the woods he thought there was no disgrace or calamity which nature was unable to repair, and there he believed inspiration for architecture arose. Almost all ornament was, he remarked, no more than the imitation of natural forms, and man was therefore a copyist rather than a creator. To an individual who was thus disposed to find the origin of everything in some natural forms, it was inevitable that his fancy should discern the origin of Gothic in the alleys of the forest. The stained-glass windows were also supposed to have been suggested by the colours of the western sky as seen through the branches of trees. The whole of the ornament was derived either from the leaves of trees or the vegetation in the forest. But it was not architecture alone which was indebted to nature. EMERSON was reminded of a mountain-top by the head of an old Indian he met, and the wrinkles of the forehead recalled the rocky strata. The sculpture of the Parthenon he fancied might have a similar origin. He relates with satisfaction how he was informed by a painter that nobody could draw a tree without becoming a tree to some extent, or a child without becoming a child. On the other hand, from the closeness of the relationship, he believed a work of art to be an abstract or epitome of the world which cast a light upon the mystery of humanity, and in one place he cries out:—"What a joyful sense of freedom we have when VITRUVIUS announces the old opinion of artists, that no architect can build a house well who does not know something of anatomy." In other words, animate as well as inanimate nature was a treasury of prototypes adapted for universal application.

We should remember that EMERSON was a true American, and his writings were more immediately addressed to his countrymen. It was a new world he was living in, and he was perfectly contented with it. In the course of his life he only made three voyages to Europe. He never sought to be a disciple of an earlier philosopher, and although he esteemed scholarship, he did not attach the same value to it as Englishmen or Germans. The present was to him of more importance than the past, and he cared little for men who wished to live in the days of chivalry or when historic events were being transacted. A man could show his courage in Boston, he thought, in the nineteenth century as well as in imperial Rome. He rebuked those who built their houses after foreign or ancient models, or who formed their opinions according to a remote standard. An artist should, he said, seek his model in his own mind, and there was no need to recur to forms which were Doric or Ionic. If the American architect would study with hope and love the precise thing to be done by him, considering the climate, the soil, the length of the day, the wants of the people, the habit and form of the government, he would create a house in which all these would be fitted and taste and sentiment satisfied also. Were EMERSON still living—he died in 1882—his philosophy would be sorely tried. He would find that Americans not only continued to build their mansions after foreign models, but the ambition of the wealthiest among them was to convert their rooms into private museums, in which the remains of foreign art of all ages were exhibited as if they were spoils torn from an enemy. He might argue it was only a stage in a beneficent process, for before many years were expired the heterogeneous objects would be deposited in public museums, where they would be classified and explained for the public benefit.

EMERSON was an optimist, and much of what appear to be conclusions in his writings are only aspirations. He knew the world could not cease rotating, and he assumed that everything on its surface was compelled to move. Beautiful as he believed nature to be, he imagined it was possible for a painter to produce finer landscapes than any which existed. WORDSWORTH would say such a thought

was rank heresy. The artist himself EMERSON looked on as no more than a landscape from which immense quantities of mere matter had been eliminated. On that principle the artist should labour to give suggestions of immensity by means of the fewest strokes. Who can tell whether EMERSON did not believe his own encyclopædia of sentences were examples of what was desired, forming a *multum in parvo* of literature and the essence of philosophy? LOWELL, in describing him, said with friendly banter:—

'Tis refreshing to old-fashioned people like me,
To meet such a primitive pagan as he,
In whose mind all creation is duly respected,
As parts of himself—just a little projected;
And who's willing to worship the stars and the sun,
A convert to—nothing but Emerson.

EMERSON could take a transcendental view of the fine arts because he was without the power to express pictorially the joy of the humblest tyro in art. We have never seen it stated that he attempted a drawing, and we suppose not one of the farmers around Concord would have ventured to ask his advice about the simplest kind of structure. In that respect he differed from GOETHE, who made experiments in the arts in order to realise the difficulty of production, and who owned that from occasional visits to a building under construction he acquired a degree of knowledge concerning architecture which was not to be obtained through the reading of books. EMERSON proposed too high a standard to his countrymen, and for that reason it cannot be said that his influence on art was of much account.

THE FOULIS ACADEMY.*

GLASGOW now contains so many painters of ability it is entitled to claim the rare privilege of possessing a distinct school. It has also a municipal art gallery on a large scale, which is well provided with pictures. A visitor to the western capital can hardly fail to realise from the number of shops in which pictures are sold and other evidence that art is now a real power in the city. The history of the past should not, however, be forgotten, and a statue of ROBERT FOULIS, if not of his brother ANDREW also, who were the pioneers of the school, should be set up either in the art gallery or in some prominent part of the city. ROBERT FOULIS was the first man to comprehend the capabilities of the Glasgow people for art. He was no mere theorist, but a practical Scotsman, and in order to establish his convictions he founded an academy of art. At the time it was a daring experiment and it should be considered successful, but as the whole cost of upholding it had to be borne by ROBERT FOULIS and his brother, the academy in course of time went beyond their resources, and finally it brought about the ruin of their fortune and hastened the death of the more prominent brother. A more remarkable instance of enthusiasm is not to be met with in the history of English art, although it has received very little attention from the public.

ROBERT FOULIS was born in 1707. In his early life he served as a barber. He was an intelligent man, and we may imagine that he resembled the Florentine NELLO who is introduced in "Romola," and who looked on his shop as the haunt of the muses and a meeting place for scholars. Among the tonsor's clients or customers were some of the university professors. FRANCIS HUTCHESON, the professor of moral philosophy and an able metaphysician, took great interest in FOULIS, and advised him to turn his cleverness to better account by setting up as a bookseller and printer. HUTCHESON, who was a refined gentleman, and in æsthetics far in advance of his age, was likely to have pointed out to his *protégé* the difference as regards form between the type of some of the famed Italian printers and that used in Great Britain. From the beginning of his career the books which came from the press of FOULIS were remarkable for their beauty, and on that account they are still prized by collectors. As a bookseller he was fortunate in obtaining some fine editions of the classics, and he endeavoured to rival them in appearance and accuracy. His edition of "Demetrius Phalereus,"

which appeared in 1743, was so excellent as to warrant his appointment as printer to the university. His business extended so much, he was obliged to take his brother ANDREW into partnership. His "Horace" has gained renown, for proofs of the sheets were allowed to be attached to the gate of the college and a reward was offered to anyone who could discover an error in one of the lines. During thirty years nearly all the Greek and Latin classics were printed by the brothers in various sizes, and their merit won fame not only for the firm, but also for the city of Glasgow. The rebellion in Scotland and the subsequent troubles were without any effect on their printing-presses. Another innovation of the firm was the production of the plays of SHAKESPEARE one at a time.

There was an opportunity presented for increasing the attractiveness of books by engravings. In the middle of the eighteenth century it could not be said that any city in Great Britain, with the exception of London, offered facilities for work of that kind. ROBERT FOULIS went abroad in order to reconnoitre, and, if possible, to discover artists who would act as his assistants. He was able to find a designer, an engraver and a printer who would carry out the first experiments. But his observations in Paris enabled him to realise the great service which art could perform for many industries, although in Scotland that fact was not recognised. During his sojourn in France he saw the benefits which had been derived from the Academy of Fine Arts, which in reality owed its origin to COLBERT, who prized commerce above glory. In England an institution of the sort was almost unknown. There existed an academy in St. Martin's Lane, London, but it had more the character of a modern sketching club than a place where a systematic education could be received. Nor was there an opening for such an institution as FOULIS contemplated, if some of the elder artists were to be believed. There was a prejudice at the time against native artists, and a student of art had therefore to contemplate the possibility of illustrating prodigies at fairs and adorning heroic signboards as a means of earning a living. It was a courageous act for ROBERT FOULIS to set up an academy for engraving, painting, modelling and drawing before the Duke of RICHMOND had opened his gallery of casts in Whitehall, and about sixteen years before the Royal Academy of Arts was founded by GEORGE III.

There was a great difference between the Glasgow venture and the London Academy. For the latter there was no difficulty in obtaining teachers, and even JOHNSON and OLIVER GOLDSMITH were willing to forget their Bohemianism and to accept professorships without a salary. Instead of "the royal munificence" of which REYNOLDS boasted at the opening meeting, in Glasgow there was only the capital of a couple of printers, though, at a later time, three merchants expressed willingness to give aid. But from first to last all expenses may be said to have been borne by ROBERT and ANDREW FOULIS. There were no fees to be derived from students, for those who cared to follow art could not only study but live free of expense at the Glasgow academy. Models of many kinds were provided. The founders were also willing to send promising students abroad, their expenses being charged to the institution. But it was a by no means easy task to procure instructors. The examples placed before the students, although they were excellent, required interpreters. The brothers also discovered that the outlay was exceeding the amount they had calculated. In order to secure aid they anticipated the plan of modern art unions. They invited people who cared for art to become subscribers, and it was guaranteed that paintings, models, prints or drawings were to be received which would at least be an equivalent in value to the amount of the subscriptions. Edinburgh about that time began to take an interest in art, and an exhibition of the prizes which were to be distributed was held there as an inducement for obtaining an increase of funds. The brothers must have accumulated a vast amount of property in works of art, for it is related they were able to adorn the court of the University with paintings on the occasion of the Coronation of GEORGE III. In spite of all their efforts they were not able to attract a sufficient number of subscribers. It was accordingly contemplated to dispose of the entire collection. It was said to be in a reputable degree of perfection,

* See Illustration.

for evidently the public imagined works of art in an academy were not likely to be in better condition than books in a school. The academy came to an end in 1770. At the time when ROBERT and ANDREW were in a state of despair after their disappointment about the success of their academy, we obtain a glimpse of them by means of JAMES BOSWELL. In 1773 Dr. JOHNSON and himself were in Glasgow, and met the brothers. The interview is thus related :—

"Professors REID and ANDERSON and the two Messieurs FOULIS, the ELZEVIERS of Glasgow, dined and drank tea with us at our inn, after which the Professors went away; and I, having a letter to write, left my fellow-traveller with Messieurs FOULIS. Though good and ingenious men, they had that unsettled, speculative mode of conversation which is offensive to a man regularly taught at an English school and university. I found that, instead of listening to the dictates of the sage, they had teased him with questions and doubtful disputations. He came in a flutter to me and desired I might come back again, for he could not bear these men. 'O ho, sir!' said I, 'you are flying to me for refuge.' He never, in any situation, was at a loss for a ready repartee. He answered with quick vivacity, 'It is of two evils choosing the least.' I was delighted with this flash bursting from the cloud which hung upon his mind, closed my letter directly, and joined the company."

We suppose neither JOHNSON nor BOSWELL could be aware of the trouble through which the brothers had passed, and from which, at the time, they had not emerged. The fortune they had gained by printing classical works was nearly at an end. ANDREW FOULIS died in 1775, leaving his brother to struggle with the difficulties of the firm. ROBERT FOULIS sent the collection of works of art to London. To increase the importance of the paintings a catalogue of them in three volumes was prepared. CHRISTIE, the auctioneer, whose rooms were then in Pall Mall, considered the time to be unfavourable for a sale, but the owner was desperate. The result unfortunately proved the correctness of CHRISTIE'S view. It is said that after payment of expenses not more than fifteen shillings were forthcoming for the unfortunate owner. He returned a broken-hearted man, and before reaching Glasgow he suddenly expired in Edinburgh—a sad ending for a life which for so long was devoted to the public good, and which should always be recalled with pity.

The illustration we publish is a reproduction of an engraving which was executed in the Academy, and is therefore almost the only memorial of it which exists. The painting copied was long accepted as the most beautiful cabinet work of CORREGGIO, and was sometimes called *The Egeria*, and sometimes the *Reading Magdalen*. It is in the Dresden Gallery, but a replica belonged to Lord VARD, and there were others which were also believed to

be originals. Signor MORELLI subjected the painting to a close scrutiny, and, contrary to the opinion of all the old connoisseurs, has concluded that the intense blue of the robe, which was supposed to be the most characteristic part, was never executed by CORREGGIO, and that all the details are unlike those in his genuine works. The Italian master never made use of copper, and on a plate of that metal the painting is executed. Signor MORELLI believes the small picture to be a Flemish work, and the artist ADRIAN VAN DER WERFF, although he concedes that it may be a copy of an Italian of the Bolognese school. However adverse may be the new theory to the belief of generations, the delightful little picture in the Dresden collection continues to receive as much admiration as before.

THE PRINCIPLES OF ARCHITECTURAL DESIGN.

By PERCY L. MARKS.

CHAPTER XII.

MISCELLANEOUS REMARKS.

IN this chapter it is proposed to refer to various matters that need mention, without admitting of anything more than very brief treatment.

The influence that *materials* should exercise on design must always be taken into account; and though a few remarks have been made on this elsewhere as affecting economy, they did not cover the whole ground.

In the first place, it must be remembered that, everything else being equal, it is well to use for a building local materials in preference to others. Where the local possibilities are inferior in quality, that is, where they are insufficiently good for the required class of work, materials should be brought in from outside districts; but even then it is advisable not to go further afield than is necessary, in the search for what is suitable. Exotics may be interesting, but they seldom inspire such affection as the home-grown products, and this is of general application. In this connection Cardiff Infirmary (fig. 76) may be illustrated, though to do adequate justice, it should be represented in all its charm of colour and variety.

The design should be adapted to the materials, and not the materials to the design; treatment that is suitable for brickwork, with its more numerous vertical and horizontal lines, does not necessarily answer so well for the broader effects obtained in stone and terra-cotta. Again, the treatment that is suitable for stone, with the numerous possibilities for varied carving, is different from that for terra-cotta (all whose blocks have to be turned out of moulds); for the limits imposed by the usual desire to avoid

FIG. 76.

extravagance, demand that variety of treatment shall be kept somewhat restricted. Of course, the design is also affected by the kind of stone used—in a granite district it will be naturally much bolder and more rugged in nature than in a freestone district, and much broader effects will be obtained in the neighbourhood of Bath (where the quarries yield large blocks of limestone) than in Kent with its ragstone.

This being the case, the designs should be dealt with so as to keep in accord with these local conditions.

The chess-board effect that may be noticed on many façades is to be condemned, and its absence may be insured by avoiding "spottiness" in treatment, both as regards materials and decorative ornament. To mass materials is effective; thus, a stone-fronted central block may be flanked by brick-faced walls, or a stone-fronted ground storey may have brick facings superimposed.

Not only in that respect is massing desirable, but also as regards colour-effects, but the massing must be done with judgment; pigment decoration is not under consideration here, but only the broad colour-effects on materials. It is only recently that the writer had occasion to call attention in conversation to the crude juxtaposition of tones and colours in some new houses. There were three samples within a stone's throw, serving to exemplify satisfactory and unsatisfactory effects; each of the three had red brick ground storeys, red-tiled roof, and rough-cast upper storey between; it was in the last that difference of treatment was apparent, for in one case the plaster was of a dazzling white, in another ochre, in the third cement tone, and it was this only that looked well, the ochre looking dismal, and the white glaring.

And yet coloured or whitened rough-cast looks excellent when suitably distributed, as the numerous Elizabethan half-timbered houses attest. Where a large unbroken mass of subdued or dull green or grey tones will look effective, whites, ochres and reds prove overwhelming. Blue is so palpably unmanageable in large display as scarcely to call for comment; it can be used in effective combination internally, and more especially where the lighting is somewhat subdued.

Vitrified material has a beneficial influence on colours, whether for external or internal effects. A greater play of reflected and refracted light is obtained, imparting variety of tones and shades. The incidental advantage of being able to keep the façade clean and bright by the mere use of water is incalculably valuable in fog and smoke-laden atmospheres.

In close connection with the subject of colour-effects is the treatment of ornament on the façades of terrace-houses. It is one of those errors of judgment that carry their own condemnation whenever one design is shared between two adjoining houses, for the difference of tones (and often tints) between a freshly-painted façade and its neighbour is

FIG. 77.—PARTI-COLOUR EFFECT.

only bearable if the two designs are quite independent. It is a distinctly displeasing sight to note, say, a column or pediment with a straight line of demarcation between clean and dirty, or between one colour and another; the latter is especially noticeable on shop fronts, giving an effect such as is shown in fig. 77. It may be that of two adjoining

owners, one may like a stucco façade, and the other may prefer plain brick, and thus a feature shared in common may be parti-treated in ludicrous fashion. Gables, pediments, columns and pilasters, panels and coursed projections, should never therefore be shared between adjoining houses, but this treatment is frequently to be met with in early nineteenth-century work. Instances certainly occur where the original landlord keeps the terrace-property in his own hands, and has a covenant inserted in the various leases that all the houses shall be painted externally at the same time, and in colours or tones to his approval; this is naturally a provision only possible in first-class property, and secures uniformity of treatment.

(To be continued.)

THE SOCIETY OF ARCHITECTS.

THE seventh ordinary general meeting was held at St. James's Hall, Piccadilly, W., on May 21, at 8 P.M.; the president, Mr. Silvanus Trevail, J.P., F.R.I.B.A., in the chair.

The following were elected by ballot:—*Members*—Mr. F. G. Fraser, 19 Old Hall Street, Liverpool; Mr. S. H. Healing, 79 London Road, Gloucester; Mr. A. G. Howard, Public Works Department, Cape Town; Mr. E. P. Laycock, 26 Arundel Square, W. Holloway, N.; Mr. John Love, Victoria Road, Fleet, R.S.O.; Mr. C. R. Mitchell, 11 New Court, Lincoln's Inn, W.C.; Mr. A. W. Nye, 34 Duke Street, Brighton; Mr. Frederic Quay, Public Works Department, Cape Town; Mr. P. B. Tubbs, 68 Aldersgate Street, E.C.; Mr. F. W. Wills, St. Peter's Churchyard, Derby. *Student*—Mr. R. J. Smith, Eastlea, Weston-super-Mare.

After the transaction of the formal business the President gave an interesting account of his impressions of architectural rambles on the Continent, illustrating his remarks by means of a large number of specially prepared lantern slides, including views of the principal buildings in Boulogne, Brussels, Paris, Cologne, Versailles, St. Ouen, Lucerne, Munich, Stuttgart, Buda-Pesth, Constantinople, Rome, Vienna, Prague, Venice, Strasburg, Potsdam, Turin, Genoa, Florence, Nice, besides views of Washington and a number of the principal buildings in London.

Upwards of 100 slides were shown, and upon each of them Mr. Trevail had something practical to say. He compared the Gare du Nord at Paris with the stations of the English railway companies, very much to the latter's disadvantage, following it up by showing how artistically the Parisians spanned their rivers and the use they made of their waterway as contrasted with the neglect of our magnificent waterway for passenger traffic. He contrasted the French Salons with Burlington House, and the Law Courts of Brussels with those in the Strand. Mr. Trevail laid great emphasis upon the laying out of the continental streets, which permitted of their buildings being properly seen, whereas here they were confined and shut in on all sides. After seeing St. Peter's at Rome he came back direct to St. Paul's with the object of comparing the two in his own mind, and while the latter was the more imposing outside, the interior was very disappointing after St. Peter's.

Upwards of seventy took part on the 23rd inst. in the field day at Rochester, among the party being the president, Mr. Silvanus Trevail, Mr. G. Gard Pye, vice-president, Mr. Ellis Marsland, hon. sec., Mr. C. McArthur Butler, secretary, and a number of ladies. The South-Eastern and Chatham Railway had attached two saloons to their train leaving Victoria at 9.30 A.M., and these were well filled. A special stop was made at Rochester, and here the party were met by Mr. Geo. Bond, who had been concerned in the local arrangements, and a start was made at once for Eastgate House where Mr. George Payne, F.S.A., took charge of the party and most kindly acted as leader throughout the day.

Well pleased with what they had seen at Eastgate House, the Cathedral was next visited, and its chief points having been seen, an adjournment was made to the Bull hotel, where luncheon was ready. Here the party was favoured by the presence of the Right Worshipful the Mayor of Rochester, Alderman W. J. McLellan, the Mayor of Chatham, and others, who gave the members a very hearty welcome to the ancient city.

At the conclusion of the luncheon, the President having fittingly expressed to the Mayor their appreciation of his courtesy, and a short toast list being disposed of, the party proceeded to Restoration House, where, by permission of the owner, Mr. Stephen Aveling, the ancient mansion was inspected. From thence the party went on to the Castle, which was thoroughly explored, and by that time tea was awaiting the visitors at the Corn Exchange, the hospitality of the Mayor being thoroughly appreciated.

At half-past five brakes were in readiness to convey the members to Cobham, which was reached via Gad's Hill Place, the residence of the late Charles Dickens, after a most pleasant drive through the Kentish lanes. The church of St. Mary Magdalene was first visited and its old brasses greatly admired. The college adjoining, now converted into twenty almshouses, was taken next, and after a short rest at the Leather Bottle of Pickwickian fame, the journey was resumed to Sole Street and the homeward journey commenced, Victoria being reached at 9.30 P.M., with everyone thoroughly satisfied at the result of the field day.

THE ROMAN WALL.

AT the present rate of archaeological activity the remains of the wall of Antonine in Dumbartonshire and Stirlingshire should ere long, says the *Glasgow Herald*, be as thoroughly investigated as those of the wall of Hadrian in Northumberland. One of the most recent excavations of the former has been at Hillfoot, in the parish of New Kilpatrick, where, on a patch of moorland to the east of the Milngavie railway, the course of the rampart and ditch is very strikingly visible on the crest of the slope. The vestiges there, indeed, are outwardly the most interesting part of the wall between the commanding stations of Castlehill on the west, which looks north to the Kilpatrick Hills, and the foot of Balmulie on the east, which guarded the passage of the Kelvin. Thence to the Firth of Forth the ancient work pursues the line which, after seventeen centuries, has been followed by the Forth and Clyde Canal and the North British Railway between Glasgow and Edinburgh, so wondrous is the continuity of history. There was, of course, no need for further proofs either of the keen eyes of the Romans for good positions of fortification, or of the solidity of the works which they there undertook; yet not without interest does one learn that the remains on the slope at Hillfoot disclose "sixteen layers of turfing with a stone base 15 feet wide." Well may we wonder if, seventeen centuries hence, the plains and hills of India will show such lasting memorials of the days of Clive and Nicholson. For the rest, these excavations, and notably, the recent important discovery at Inchtuthill, seem to indicate that the Roman hold upon southern Scotland was firmer and further extended than former theories had led us to suppose. It would seem probable that the most of the Roman remains found north of Antonine's wall belong to a later period than his reign, and are to be considered as results of the expedition of Severus at the beginning of the third century, which in all likelihood was not so cursory a raid as it has sometimes been represented.

ALTARS IN ENGLISH CHURCHES.

THE half-yearly meeting of the Church Crafts League was held in Clifford's Inn Hall, Fleet Street, on Monday last. Mr. F. C. Lees delivered a lecture on "Altars: their Arrangement and Ornaments." He described what English altars had been in the past, what they ought to be like at the present day, and said it was scarcely possible to consider the English tradition alone without reference to the early ages or to continental practice; for the English tradition on the subject was really the English adaptation, suited to English circumstances, of the general tradition of Western Europe at the time when European architecture attained its best and fullest development. Like everything else about a church, the altar was, first of all, a piece of ecclesiastical furniture provided for a religious purpose, the form and arrangement of which were subject to ecclesiastical proscription and regulation. It became a matter of artistic and architectural consideration only in the second place. At the same time there was a certain amount of give and take on both sides. The architectural arrangement gave way to the ecclesiastical essentials, but in things that were not essential some few of the adjuncts had to be adapted to the character of the building. Until the artificiality of recent times the whole arrangement of the church and its altar was largely a matter of common sense expressed both in the church's ceremonial requirements and in the architectural features of the building. The great mistake which was nowadays made with altars was that they were too small. It was sought to give dignity to the altar by raising it on many steps, by surmounting it with shelves filled with large candles, pots of flowers, and other large and conspicuous ornaments. Over and above all was built a huge erection called a reredos; all was done regardless of the prescriptions of the ornaments rubric, the principles of Gothic architecture, of common sense, or of the English tradition. At the conclusion of the lecture the Dean of Westminster thanked the lecturer, who, he said, had justified the fact that they had two altars in Westminster Abbey which were still without a cross, and they also had various other features of dignity to which he had alluded. Every Sunday they put out all the plate they could on the altar, and he hoped they would continue to do so. That was an old custom which had never been given up, and which was not

limited to times of coronation. They also had two altars which had not gradines. It was curious how the customs changed, and if people only stood still long enough they would find themselves again in the height of the fashion.

BIRMINGHAM MUNICIPAL SCHOOL OF ART.

THE museum and school of art committee on Monday held a special meeting in order to appoint a successor to Mr. Edward R. Taylor, who retires on June 30 from the head-mastership of the Municipal School of Art under the terms of the Corporation superannuation scheme. Alderman the Right Hon. William Kenrick presided. The committee unanimously appointed Mr. R. Catterson-Smith, who has since 1901 been head-master of the Vittoria Street school for jewellers and silversmiths.

Mr. Catterson-Smith was born in Dublin. His father, a well-known portrait-painter, was President of the Royal Hibernian Academy. Originally a successful student and assistant teacher at the Dublin School of Art, Mr. Catterson-Smith at the age of twenty entered the studio of John Henry Foley, R.A., the sculptor, and remained with him until his death. Then he became well known as an exhibitor, especially of landscape, but also of portraiture, at the Royal Academy, and as a draughtsman in black and white. His work illustrated his fondness for nature. In 1893 he was engaged by William Morris to assist him and Sir Edward Burne-Jones in the production of drawings for the Kelmscott Press. Mr. Catterson-Smith executed most of the "Chaucer" drawings, and designed and executed three of the borders for the "Earthly Paradise." Of his work in this direction William Morris spoke in terms of unstinted praise. His set of "Chaucer" drawings was in 1901 sold in London for 800/. In 1892 Mr. Catterson-Smith began to work in metal. He is a member of the Art Workers' Guild and of the Arts and Crafts Exhibition Society. Visitors to the Arts and Crafts Exhibitions held at the New Gallery will recall especially his beautiful silver repoussé, executed from the designs of Burne-Jones, which exhibits the highest skill in workmanship. He has also done much metalwork from his own designs, both on his own account and for leading gold and silversmiths and jewellers. In addition, Mr. Catterson-Smith was for some time associated as a teacher with Mr. George J. Frampton, R.A., and Mr. W. R. Lethaby, then co-directors of the London County Council Central School of Arts and Crafts, and worked with Dr. William Garnett, the secretary of the Technical Education Board of the London County Council. On his arrival in Birmingham he was described as an "enthusiastic teacher," and Dr. Garnett said that he would be found "a most agreeable colleague and inspiring principal," descriptions amply fulfilled, as all know who have come into touch with Mr. Catterson-Smith in his work at the Vittoria Street school. Whilst in London Mr. Catterson-Smith also served under the London County Council as the inspector of art schools and art classes held at secondary schools—about forty in all. Recently he has executed for Lady Burne-Jones a set of drawings—"The Beginning of the World"—from designs of her husband's, and acted as examiner of the works submitted to the London County Council for their annual competition for art scholarships. He also holds testimonials from the late Sir Edward Burne-Jones, Bart., A.R.A., Mr. Philip Webb, the architect, and Mr. Walter Crane, A.R.W.S., member of the Council of the Royal College of Art, South Kensington, and examiner under the Government Board of Education.

The First Meeting of the Architectural and Archaeological Society of Durham and Northumberland for the year 1903 will be held on Thursday, June 4, at Haltwhistle, Beltingham and Willimoteswick. Members will assemble at Haydon Bridge station at 11.13 on arrival of train leaving Durham 9.47, Newcastle 10.25. They will drive to Beltingham Church, which is the only church in Northumberland which is entirely of the Perpendicular style of architecture. It was built in the fifteenth century, and is an oblong square. It is situated in an ancient burial-ground which contains three venerable yew trees. A short walk from here will bring members to Willimoteswick Castle, the chief seat of the ancient family of Ridley. Several remains of the stronghold, including the capacious fireplace, still exist. Crossing the river by foot-bridge at Bardon Mill, the conveyances will be resumed, and the drive continued to Haltwhistle, when the church, built about 1240, will be examined. It contains an effigy of the Blenkinsopp family, and many other objects of interest. Castle Hill, an oval-shaped mound, will also be visited. If time permit the drive will be continued to Bellister Castle, a border peel tower, some remains of which still exist; and Featherstone Castle, a handsome castellated mansion containing an old peel tower vaulted underneath.

NOTES AND COMMENTS.

A SIDELIGHT was cast on the manner of producing bricks which is now adopted in some places by means of the evidence in a case which was heard during the past and present week before Mr. Justice RIDLEY. The Sussex Brick Company, Ltd., have works at Warnham, which is close to Horsham. As the works are alongside the railway line, travellers have noticed how comparatively few men were to be seen upon the ground. Generally it is the practice for a company to depend on its staff for the execution of all kinds of work. But as much reliance is now placed on machinery, we can understand the existence of a belief that labour is only secondary and can be easily imported. When there was no machinery there were roving brickmakers. Whatever was the reason, the Sussex Brick Company, Ltd., in July 1901 issued an advertisement inviting tenders for making 10,000,000 bricks per year for three years, the plant, machinery, &c., to be found by the company. Mr. TOMLINSON, of Forest Gate, sent in a tender which was accepted. He had received a specification stating that the company's machinery was new, in good order, and capable of producing from 40,000 to 50,000 bricks per day. On that statement he relied. He alleged that almost from the first day upon which he started work he complained of the defective character of the plant and machinery, by reason of which he was unable to fulfil his contract in regard to the number of bricks turned out annually, and was put to extra cost and subjected to loss on the reduced output. Mr. TOMLINSON accordingly brought an action in which he claimed 1,273*l.* 3*s.* 6*d.* for loss of profit on the contract, 1,055*l.* extra cost, together with certain sums representing value of stores, &c. The case for the company was that they had made no representations as to the capacity of the machinery, &c., and they said alternatively that any statement that may have been made did not constitute a representation, and did not affect the plaintiff in entering into the contract. They further said that the plaintiff had had an opportunity with other experts in the trade of inspecting the works prior to undertaking the contract. It was also said the complaints had been abandoned by a letter of February 27, 1902, and the company counter-claimed for 2,481*l.* for loss by reason of the plaintiff having broken his contract and stopped the works. On behalf of the plaintiff it was stated that he entered into the contract in the belief that the company would purchase five new machines and erect three new kilns. The jury, in answer to questions put to them by the judge, came to the following conclusions:—(1) That new machinery was supplied, but it was not in perfect order; (2) that the statements by the defendants' representative were recklessly made; and (3) that there had not been accord and satisfaction. Mr. Justice RIDLEY entered judgment for the plaintiff, referring the items of detail in the account to the official referee.

THE colonnade or arcade cannot be said to have had fair play in England. There is nothing in London which is comparable to the Rue de Rivoli in Paris. The openings in the latter have to be rather narrow, but as the work was constructed in masonry there had to be limitations. By the use of steel it would now be comparatively easy to make a passage of the same kind which would be far brighter and have other advantages. Considered simply as an experiment it is satisfactory that the London County Council on Tuesday adopted the report of the improvements committee, in which it was recommended that the owners of Walsingham House and the Bath Hotel, which are on the south side of Piccadilly, should be allowed to build over the new footway, the building being supported by a colonnade. For that privilege the company are willing to surrender the land required for widening the street at a price much below the market value, and without making any claim on account of trade disturbance. The increased width will be about 15 feet. A large building will therefore be considered as projecting over the footway, and that is a departure from the usual custom in London. But no danger is likely to arise from the innovation, and we may assume if the experiment is successful that a similar arrangement will be adopted in other parts of London.

At the Assembly of the Church of Scotland the trustees appointed by the late Duke of ARGYLL to have charge of the ruins of Iona, comprising the cathedral, chapel of St. Oran, and nunnery, presented their report. It was desired by the Duke that the ancient cathedral should be restored so far as to enable public worship to be held there. The work carried out has already cost 2,750*l.*, of which about 500*l.* remains unpaid. An agreement was entered into with the Dowager-Duchess giving the right to erect a monument of the late Duke in the south transept, her Grace undertaking the restoration of that part of the building. There was a time when the restoration would have been generously supported, but it is evident that many people in Scotland do not approve of the proposed works, which would transform the character of the ruins. The aid which was anticipated has not arrived. A resolution was adopted by the Assembly recommending the work to the liberality of the Church.

IN the number of "A Beautiful World" for May there is a tribute to Mr. A. WATERHOUSE, R.A., who presided over the S.C.A.P.A. in its beginning and directed its course. The following resolution was adopted at a special meeting:—"That this meeting of members of the National Society for Checking the Abuses of Public Advertising learns with deep sorrow that Mr. WATERHOUSE has been compelled by illness to retire from the office of president, and expresses its grateful sense of the services he rendered both in the formation of the Society and in the conduct of its proceedings. While thanking him for the sacrifice of time and thought and strength which his devotion to the cause entailed, they will always as individuals cherish the recollection of the kindness and cheerful courtesy which brightened the transaction of even routine business. They desire to assure him of their sympathy and affectionate goodwill." Mr. WATERHOUSE's successor as chairman is Dr. LONGSTAFF. As a result of their exertions, the committee claim that they "have done much to make people feel that it is well worth while to use their opportunities as purchasers of commodities to make it known that they object to using the goods of makers who resort to objectionable methods of pushing their wares. Also we have impressed on travellers the duty of telling all who in any degree profit by the tourist traffic that the picturesqueness of their district is a sound commercial asset, and that those who destroy it are destroying wealth."

THE struggle for existence among American architects would appear to give rise to modes of acting which are not suggestive of that solidarity which is supposed to be an essential quality in a great republic. The malpractices have gone so far, the New Jersey Chapter of the American Institute have been obliged to appoint a committee to investigate them. It is becoming common to prepare sketch plans for buildings as a speculation, and, in fact, an individual has only to allow the rumour to go forth of his intention to build a house or business premises and he will have a competition got up for him without any trouble on his part, and without incurring the least responsibility to the designers. It is doubtful whether much advantage can arise from an inquiry instituted by rival architects. The American code of ethics is elastic, and in a case where a chapter expelled a firm for not strictly complying with the regulations of the Institute, the Courts decided the chapter were going beyond their powers.

REGISTRATION OF ARCHITECTS.

SOME letters have appeared in the *Times* on the subject of registration *apropos* of the speeches delivered at the annual dinner of the Society of Architects. The following extracts will suggest their character. Professor Beresford Pite says:—The registration of architects will not effect any public benefit. Any one, honestly ignorant or incompetent, or dishonestly jerrybuilding, will still be able to endanger human life and will only be prevented by such an Act from calling himself an architect; the resources of æsthetic and scientific nomenclature are still open to him, and "artist and sanitary engineer" will be as ensnaring to the public as the then illegal term "architect." That completer and fuller education in building art will be beneficial to the public needs no proof, and if it is capable of enforcement as a corollary to the Education Act it will be welcomed by all architects, and should be imposed upon all who build, but whether Englishmen will ever consent to have their liberty of action in building castles of liberty curtailed by Act of Parliament is another matter. But no registration of architects alone will improve the building art of the country. Architecture, however, appeals to qualities of intellect and has imaginative range and purpose that demand its treatment as among the greatest of the liberal arts. To fetter its exercise by Act of Parliament will be as foolish as the action of the "Masters" of Florence in opposing Brunelleschi's appointment to build the Duomo dome because he was not registered by them, and a Registration Bill such as proposed by the Society of Architects would have prevented an Oxford don named Christopher Wren from building St. Paul's; while registering all the incompetent quacks whose claim to be considered architects is best judged by their works.

Mr. Jackson, R.A., says:—An attempt is, it seems, being made to revive the scheme for registering or "hall-marking" architects. One might have thought that its ghost had been laid in 1891, when, as Mr. Beresford Pite reminds your readers, a protest against it was made by an important body of artists, with the result that no more has been heard of it till within the last few days. The protest was signed by seventy artists. Such names as Anderson, Bodley, Butterfield, Champneys, G. Gilbert Scott, Sedding, Norman Shaw, Stevenson and Philip Webb among the architects, and Alma-Tadema, Armstead, Brock, Madox Brown, Burne-Jones, Ford, Herkomer, William Morris, Richmond, Rivière and Thornycroft among the rest, will suffice to show that the opposition was widespread, and not confined to one school. The reasons for our protest remain unchanged. Now, as then, architecture would suffer as a fine art if fettered by the chains of a close profession. Now, as then, we should hold that those artistic qualifications which differentiate the architect from the builder cannot be tested by examination; that a diploma of architecture would have no value, that it would separate architecture still more from the sister arts to which we should try to draw it nearer; and that—in the words of our protest—"no legislation can protect the public from bad design, nor could legislation help to prevent bad construction unless builders and all others who erect buildings were required to pass the test of examination as well as architects, inasmuch as architects are not employed in the majority of cases." If, then, the promoters of registration have the public interest really at heart, and not merely the increase of the architects' social respectability, with which, as I well remember, the movement began, let them enlarge their scheme to include all who build and from whose incapacity the public might possibly suffer. I think this is a fair challenge, and await their reply with interest.

Mr. W. Howard Seth-Smith writes:—Professor Pite speaks with great assurance for the Royal Institute of British Architects, but I have good reason for believing that a larger proportion of my fellow members share my views on this subject than his. That some of the most talented architects within and without the Institute object to the closing of the profession against ignorance and incompetence is not a very convincing argument in face of the fact that it was the opposition of the leaders in the great registered callings which deprived the nation for so many years of the benefits of highly-trained professions.

Every true architect holds with Professor Pite that architecture is one of the greatest of the liberal arts, and that it "appeals to qualities of intellect and has imaginative range." It is none the less impossible, either in training or in practice, to divorce the science of construction from architectural design. We hold that compulsory training in both, so far from stifling the imaginative faculties or fettering the exercise of this art, would give it a great impulse. The far more imaginative and emotional art of music has under an organised system of education and examination become a national art. It is, moreover, interesting to know that musicians are also seeking registration.

The following facts should surely modify the vehemence of the opposition to the principle of registration:—

1. The fourth International Congress of Architects, held at

Brussels in 1897, by a unanimous vote agreed to the following resolution:—

"That the architectural societies should unite and conduct an energetic campaign to obtain from their Governments the institution of the diploma."

2. The Fifth International Congress of Architects, held in Paris in 1900, passed a resolution, which was unanimously adopted, to the effect:—

"That Governments should take steps to protect and secure respect for the title of architect by reserving it for the future, and without retrospective action, for architects provided with a certificate of capability, or by forbidding its use by others; and, further, should place such certificate within the reach of all by the spreading of special architectural education and training."

3. The States of Iowa, Illinois and California have passed such a law, and other of the American States are seriously considering the question. The province of Quebec has adopted a similar policy.

4. Germany and Hungary oblige all public architectural officials (State or municipal) to have a Government diploma. In France the method of appointing Government officials approaches that of making a diploma necessary. In Italy, Spain and Russia our profession is a closed one.

Professor Pite urges that the protection of the public would be more effectively secured by examining builders. This may follow, but let us train our own ranks before legislating for others. His assertion that a closed profession would have prevented Wren from building St. Paul's is astonishing. Wren's earlier work betrays the fact that he had no early training in his art; is it fair to assume that genius which could triumph over such a disadvantage would have failed to pass an ordinary test of competency? Nor is the statement that "all incompetent quacks would be registered" any truer, for such an Act, in coming into force, would oblige claimants for the title of "architect" to make an affidavit as to established practice. This would, to begin with, exclude a vast number of charlatans, and, from that time, all entering the profession would be trained men.

Mr. Walter Emden says:—Having now for nearly twenty years actively worked for and supported the movement for a compulsory examination of architects, and hence their registration, may I ask space to answer the statements of Mr. Beresford Pite in your to-day's edition? I am afraid at the outset I must say the statements in his letter are very inconsistent. In the fourth paragraph he says, "Completer and fuller education in building art will be beneficial to the public" (the only statement in his letter with which I agree, and which in my opinion gives his whole case away); while in the third paragraph he says that "the registration of architects" (which means only their compulsory examination) "will not effect any public benefit." This, I think, shows how hollow the protest of Mr. Pite is against registration; but to deal with his statements separately shows this still more.

In paragraph 2 of his letter he says the movement has neither the countenance nor sympathy of the Royal Institute of British Architects, or of the leaders of the profession of architecture in or out of that body. These are statements which will not bear looking into, because the Royal Institute of British Architects has passed resolutions in favour of the principle, and I think I am speaking well within the facts when I say that the questions of difference with the Royal Institute of British Architects are rather as to details and whether the time has yet come to press the matter on the attention of Parliament, and also that many of the leaders of the profession have spoken in favour of registration.

The great bulk of the profession, as a matter of fact, belongs to other societies, or to none, and some years back they had an opportunity of speaking in answer to a circular sent as to whether they were in favour of registration or not, and the answer given was overwhelmingly in favour of the principle, and many among those who answered were men of most undoubted position from all parts of the kingdom. So much for this statement of Mr. Pite's.

Then he says anyone, honest or dishonest, will still be able to practise, simply calling himself by another name. Is it reasonable to suppose anyone would employ to do architects' work some one whom they knew had not the necessary knowledge? This argument, to be correct, ought to apply equally to the employment of doctors, surgeons, dentists and other such like professions which were at one time unregistered, and were, for the great benefit of the public, brought under Acts of Parliament and compulsory examination. There may be a few who go to unqualified men, but, apart from the law dealing with such unqualified persons, the number of such cases is practically a negligible quantity.

With regard to Mr. Pite's statement as to registration curtailing the liberty of the subject, and that art, intellect and imaginative power which are so necessary to the architect would be discouraged or prevented by an Act of Parliament making examination compulsory, I would ask, How would art

or construction or sanitation suffer by examination? The answer is so obvious that Mr. Pite's contention will not hold water for an instant.

Does a painter paint less well because he knows how to mix his paints or the nature of the colours he uses, or does a sculptor carve with less ability or artistic merit because he knows anatomy or the nature of the materials he uses? Or would even the architect design a less artistic building because he knew construction, from which the original art of architecture grew?

Can any one fairly say, with the lives often enough and the purses always of the public in their hands, that the public will not be benefited by all architects being compulsorily examined before being allowed to practise?

The last paragraph in Mr. Pite's letter shows how little dependence there is to be placed on his arguments. He says we should have lost Sir Christopher Wren to the profession, but Wren would not have been deterred, nor would he have been less capable, had there been compulsory examination in his day; if so, indeed, he would neither have been a don of Oxford nor the architect of St. Paul's Cathedral.

In conclusion let me say that in almost if not every country in Europe the architect has to pass a compulsory examination. Is it contended that the European architects are less artistic or less capable than their English brethren? I think not, but rather that the designs and buildings of the Continent are the best. How then can it be contended, either from the artist's point of view or from the point of view of construction or sanitation, that compulsory examination would deteriorate our architects?

Mr. Reginald Blomfield says:—The Council of the Royal Institute of British Architects, the official representative body of the profession, is against registration, and has taken steps to oppose the Registration Bill now before Parliament, and the leading architects of the day, whether members of the Institute or not, are opposed to the scheme as making confusion worse confounded. It is surely quite previous to talk of registration before some reasonable standard of average ability exists. The best efforts of all who care about architecture would be more wisely directed to the formation of some such standard by means of an improved and organised architectural training, rather than to the manufacture of a fallacious and misleading professional label.

CITY SURVEYOR'S DEPARTMENT, MANCHESTER.

A CHARGE was brought against Mr. Edward Birks before Mr. Brierley, the stipendiary magistrate in the Manchester City Police Court, for having published a libel on the city surveyor, Mr. T. de Courcy Meade. Mr. Hockin appeared for the prosecution, and Mr. M'Keever for defendant.

It was said by Mr. Hockin, according to the *Manchester Guardian*, that when Mr. Meade was appointed in 1894 he found the defendant, who had been engaged a few months before, occupying the position of assistant measuring surveyor in the department. The position occupied by the defendant was a responsible one, for upon his measurements depended whether the contractors for work done for the Corporation were properly paid or not. On January 25, 1901, the Corporation were erecting twenty-two cottages at Miles Platting. Mr. Birks sent in his certificate, which showed that the contractors were entitled to 67*l.* 9*s.* 4*d.* Mr. Meade reported the matter to his committee, and the result was that Mr. Jackson, a quantity surveyor who was appointed to measure the work, found that instead of 67*l.* 9*s.* 4*d.* being due the amount was 1*l.* 19*s.* 9*d.* less. The next case had reference to some alterations at the Mayfield Baths. In this case there was a different set of contractors. Mr. Birks certified that 205*l.* 10*s.* 8*d.* was due. The accuracy of that certificate was questioned, and Mr. Gregory, a quantity surveyor, not in the service of the Corporation at all, was instructed to measure. Mr. Gregory certified that the contractors had been overpaid to the extent of 128*l.*

Mr. M'Keever: I question that. The gentleman did not measure. He did not find the contractors had been overpaid 128*l.*, and in point of fact the city surveyor and the contractors tossed up and split the difference, and 102*l.* 10*s.* was paid instead of 205*l.* by agreement with the contractors.

Mr. Hockin: In another case the same procedure took place. The contract in this instance had reference to Monsall Hospital. An independent surveyor estimated that the contractors had been overpaid 526*l.* 7*s.* 8*d.*, and the Corporation had to succumb to the extent of half the contractors' claim because Mr. Birks had certified that the amount claimed was due. Dishonesty was not suggested. These matters having been investigated by the committee, Mr. Birks ceased to be in the service of the Manchester Corporation. From that date the libel began. On April 25 Mr. Meade received a printed paper containing the libel now under consideration. It was dated 27 Lyme Street, Stockport, April 2, 1903, and was

headed "Manchester Corporation Building Scandal. Disgrace and dismissal of Edward Birks, late measuring assistant City Surveyor's Department." The document was addressed to "the Right Hon. the Lord Mayor of Manchester and the members of the City Council." A clerk in the City Surveyor's Department opened the letter in the course of his duties, the envelope being open and stamped with a halfpenny stamp. A copy of the libel was sent to each member of the City Council and to some, if not all, the officials of the Corporation. One was likewise sent to Mrs. Meade. Mrs. Meade was away from home at the time, and a domestic servant opened the letter, in accordance with her mistress's instructions, to see if it was worth forwarding. For a time Mr. Meade, acting on advice, thought he would treat the libel with contempt, as certain members of the Council, who were also attacked in the document, did, but now he felt that, as a servant of the Corporation, he was bound not only in his own interest, but for the credit and honour of the Corporation, to take action. Mr. Hockin then read the statement containing the alleged libel. It was a long document, containing three or four thousand words. The document began as follows:—

"I am indeed sorry to have to trouble the members of the Manchester City Council again on this matter, but force of circumstances and the serious consequences it has brought upon myself and family make it my bounden duty to do my utmost to try and vindicate myself at whatever cost by putting the true facts before every member of the City Council. In addressing the Council for the second time, I desire to emphatically state I am prompted by no feelings of animus towards the city surveyor, my great anxiety being to clear my name from the foul stain upon it; at the same time to try and compel the city surveyor, if possible, to speak the truth. You will doubtless remember that on January 8, 1902, I was publicly charged in the council chamber, by Alderman Rushworth, seconded by Councillor T. T. Shann, and supported by Councillor W. B. Pritchard, with having certified for 1,000*l.* in excess of work executed on nine contracts. Councillor Pritchard quoted figures. Those figures could only have been supplied to him by the city surveyor. In one instance I am charged with having measured and certified for some 330*l.* in excess of work executed at Harrison Street lodging house. Now I solemnly tell you I have never seen Harrison Street lodging house in my life, never measured one foot of work done there or certified for one penny. The work did not belong to my department. Yet Councillor Pritchard remarked I ought to be severely punished, and most certainly I have for doing that of which I know nothing whatever about. I propose first to give a brief history of these nine contracts, consisting of six at Monsall Hospital, one at Mayfield Baths, one at Miles Platting cottages, and one at Jackson's Row joiner's shop." Then followed a detailed statement with regard to these contracts and the matters in question. In regard to Monsall Hospital, the defendant gave an account of an interview he had with the city surveyor and Councillor Pritchard. He denied that he took the responsibility of making the certificates final; he gave them without prejudice and so marked them, because he had not had sufficient time to deal with the matter. When asked by the city surveyor why he had not signed them he replied, "Because they are unsatisfactory, having been done in such a hurried manner, and each contract is very fully endorsed 'without prejudice.'" The document proceeded:—"The committee, unfortunately relying upon what had been said and the chairman's (Councillor Pritchard's) silence, gave the authority craved for, and the next I hear the accounts are sent to an outside surveyor, who takes considerably over eight months to do what I had done in two, and cannot find a single inch wrong in measurement, although assisted by some dozen labourers from the Paving Department excavating holes. The prices I omit, accepting no responsibility, not having gone into them. It was a deliberate trap laid for me by the city surveyor, and I refused to fall into it. Alderman Walton Smith, chairman of the sanitary committee, took such an interest in this matter that he sent to the contractors to get at the truth. He got the truth in plain honest language, and knows full well that instead of my having certified 525*l.* in excess on these contracts, the contractors have received from the outside surveyor a few pounds more than they would have got from myself had I been allowed to complete the accounts, and the sanitary committee, with the outside surveyor's fees (some 170*l.*) plus the paying committee's account for the labourers, have paid some 200*l.* more than they need have done through the conduct of the city surveyor, who ought to be surcharged with this 200*l.* utterly wasted. But why, sir, does Alderman Walton Smith, knowing these facts, remain silent, and where does Councillor Pritchard's over-certified 525*l.* come in? The baths committee have also paid hundreds of pounds in arbitration and surveyor's fees utterly wasted, and the amount ought also to be surcharged to the city surveyor, occasioned by his unscrupulous scheming to injure myself and deprive me of my position. It was part of the city surveyor's duties, for which he is paid a handsome salary, if he

suspected anything wrong to go into it and find out the alleged errors himself, and not put the committee to the expense of outside assistance. His great effort was to evade responsibility. "For the evasion of responsibility is the refuge of the incompetent." In regard to the Jackson Row contract the defendant stated that the city surveyor demanded from him the pencil draft of his measurement, and he never issued a certificate. The two certificates he did sign were for the alterations to the Mayfield Baths and the erection of the Miles Platting cottages. The duplicates would be found in the contractor's certificate book, and defendant asserted that these bills and certificates were correct, no matter what outside surveyors might say to the contrary. "To any fair-minded man," continued Mr. Birks, "if differences had arisen between these gentlemen and myself a referee or umpire would have been appointed to decide; but the word referee finds no place in the city surveyor's dictionary. He must be referee, to manipulate and mutilate, to suit his own purpose, and keep me entirely in the dark, which was done." He defied the city surveyor to place his finger on a single item in the bills that left his hands and say it was wrong. The document went on to deal with what the defendant had done for fifteen months "to get out the truth," and proceeded:—"Of all the gentlemen who have been driven from the service of the Manchester Corporation by the deception of the city surveyor, I appear to be the most bitterly attacked. My hard-earned character, which ought to be considered sacred—a very sacred treasure—until proved otherwise, is torn to pieces by this man, who when challenged shelters himself beneath the ample skirts of Alderman Rushworth and Councillors T. Thornhill Shann, J.P., and William Bridgett Pritchard, J.P., and they in turn hug close the stone wall of privilege. The only reason I can give for this bitter attack is that I always tried to do my duty to my employers." Further, it was said, "Thousands upon thousands of pounds of the ratepayers' money have been wasted in this department during the past nine years through sheer ignorance. Thousands of pounds have also been wasted by work being sent outside that could and ought to have been done in the office, solely to bring discredit upon the official in whose department it belonged. For years a plausible tongue, assisted by a polished manner and courteous bearing, has misled and deceived the committees. The city surveyor is the servant of the Council. You hold the power to call upon him to prove his accusations against myself, withdraw in as public a manner as they were made, or resign his position." Concluding, the document ran:—"Gentlemen, it is finished. I have sorely taxed your patience, but kindly remember it took, with the devil's assistance, over eight years to concoct and carry out this despicable and cruel policy, solely with the intent of depriving well-tried, faithful and experienced officials of their positions, no matter what the far-reaching consequences might be. My life has been miserable—at least, of late—but I will not cast away the gift of God while he affords me the means of defending it. I deny this charge. I maintain my innocence, and I declare the falsehood of the accusation. Gentlemen, my honour is in your hands. I most earnestly and respectfully plead and appeal to you for fair play without prejudice and justice without fear."

Evidence was then given of the publication and circulation of the libel.

The defendant pleaded Not guilty, adding, "I reserve my defence, and will justify all that I have said."

Mr. McKeever said the defendant was on January 8, 1902, charged publicly in the council chamber by Alderman Rushworth with having certified upon nine contracts for 1,000% over the amount certified by other surveyors called in to check the amount. That statement was corroborated by Councillor Pritchard, and subsequently Councillor Shann said he was quite satisfied the committee had taken the right course, and that Mr. Birks's measurements were wrong. Those statements could have only been made on the statements of the city surveyor. It was not for him to go into the truth or otherwise of the libel, but he would only say that members of the Corporation who had made the statements implicating the defendant in serious matters, if they had any regard for their reputations, would say what the source of their information was. If they had looked at the documents on the office files they would have seen that so far from Mr. Birks having certified as stated, or his measurements being wrong, nothing of the sort had happened. Mr. Birks was labouring under a grievous sense of wrong. He had appealed from time to time to the committee to be allowed to make a statement in his defence. Sir Bosdin Leech appeared to have protested and resigned his position as a member of the committee, and Sir John Harwood and Mr. Brocklehurst said it was not fair to discharge a man without giving him an opportunity of saying what he had to say in his defence. They were overridden, however, and Mr. Birks was not allowed to say a word. If the defendant had been carrying on any collusion with contractors and accepting bribes, he ought to have been prosecuted, and the Corporation

was invited to prosecute by the defendant. Instead of that, however, the Corporation called upon him to resign, and after he had refused to do so they gave him three months' notice to quit, and took other steps which took away from him any right of action for wrongful dismissal. Labouring under this sense of wrong, he wrote to the members of the committee, some of whom endeavoured to assist him, and others who treated his accusations with silence. Acting under that sense, too, he wrote to the city surveyor and various members of the Corporation. Looking at the documents carefully counsel did not think anyone could say Mr. Birks should have been proceeded against criminally. If proceeded against at all it should have been by a civil action. Again counsel complained that the charge was brought under the fifth section of Lord Campbell's Act, which prohibited him from offering any justification at this stage. The object, he submitted, was to close the mouth of the defendant. In support of his contention that the Court should not lend itself to actions of this kind Mr. McKeever cited the dictum of the late Lord Chief Justice Coleridge, who in 1888 at the Berkshire Assizes counselled a grand jury to ignore a bill in a case where criminal proceedings had been taken when a civil action should have been brought. In his Lordship's opinion criminal actions were not warranted unless the libel affected the Crown, or persons in a judicial position, or was so frequently repeated as to be likely to cause a breach of the peace.

Mr. Hockin said the libel had been going on since January 1902, and sending a copy to Mrs. Meade was, he submitted, likely to cause a breach of the peace.

Mr. Brierley said he thought the case was one in which he must commit, but he did not see how any jury, civil or criminal, could try the case if all those contracts had to be gone into.

Mr. Hockin: We shall see at the proper time.

The defendant was allowed his liberty on entering into his own recognisances to appear at the Assizes.

Already preparations are in progress for the trial. For the prosecution Mr. Shee, K.C., and Mr. Overend Evans are, it is said, retained. The defence is hoping to secure the services of Mr. Lawson Walton, K.C., M.P., or Mr. Marshall Hall, K.C., M.P. It is further stated that a fund has been started on Mr. Birks's behalf.

RESTORATION AT IONA.

IN a letter to the *Scotsman* Professor Baldwin Brown writes:—

Is it too late for the authorities of the Church of Scotland to reconsider this profitless and risky project for the restoration of Iona? It is admitted that there is no scheme according to which the restored buildings can be made of any practical service, and this fact deprives the project of the one plea that might be urged in its favour. When there is a distinct religious purpose which a ruined ecclesiastical building might serve and a purpose that cannot be so suitably served in other ways, then there come in considerations of great moment in favour of restoration. Only the fanatical anti-restorer would resist such works as those at Dunblane, Paisley or Hexham. In the case of Iona, on the other hand, there is no such practical purpose in view, and, indeed, the project was apparently due to certain private desires and apprehensions which do not seem to have much in them, and with which the public have little concern. Hence all the arguments which have been urged for the last fifty years against needless tinkering of our ruined Mediaeval buildings hold here their full validity. Of course, the ruined buildings of Iona, like all other monuments of the kind, should be carefully watched, and should be preserved according to means now well understood, on which the trustees could obtain expert advice from independent sources. One stands aghast, however, at some of the phrases in the report of the trustees, who are apparently prepared with light hearts to embark on one of those extensive campaigns of restoration against which the experience of the last half-century furnishes us with so many warnings. Some of the following phrases ring of the bad old times:—"The walls urgently required to be pointed outside and repaired inside, and the plan had to be laid as much in the style of the original as possible. After this, much remained to be done, and the trustees, with the view of carrying out a faithful restoration, in order to preserve the buildings and hand them down to posterity in as nearly as possible their original form, were about to obtain from their architects a comprehensive scheme, the details of which they hoped soon to make public." Common sense, as well as art, protest against all the money being spent in the transformation of the town we knew and loved, and the substitution of something "in as nearly as possible the original form." The old buildings of Iona are of considerable intrinsic beauty, and of still greater romantic interest and charm. Like all the works of man they are perishing, but very slowly, and they cannot be entirely

saved. A great value still remains to them, and there is a serious risk that this may be destroyed by the proposed "faithful restoration."

The question is not with the past, or one would doubt the ingenuousness of the statement that the trustees "had done what was universally acknowledged to be by those capable of judgment well done," for as a matter of fact the recent work has been rather sharply criticised. What we are concerned with now is the future, and I would appeal to the good sense of the trustees and of the public against any further prosecution of this unfortunate scheme. The Scottish Ecclesiological Society would be doing better service by safeguarding the unique treasure of the Iona of ten years ago, than by indulging in any extensive dreams of a forceful restoration of half the Mediæval ruins of Scotland.

ENCOURAGEMENT OF ART IN SOUTH AFRICA.

A SOCIETY for the Encouragement of Art in South Africa has been formed. The object of the Society is to provide a comprehensive art education, including crafts, in South Africa for South Africans by the foundation of an academy of arts. It is evident from the letter in the *Times* of April 23, by Mr. E. B. Sargent (Director of Education for the Transvaal and Orange River Colonies), that the time has now come for the initiation of a movement in this direction. The evident necessity of an organisation devoted to the study of art cannot be overestimated. The development of native talent, undoubtedly latent in the Boer, an offspring of a nation which has ever been foremost in art, having produced some of the greatest painters in the world, is certain to be an important element in the elimination of racial feeling and the subsequent fusion of the two peoples.

The Society is under the presidentship of Sir William B. Richmond, K.C.B., R.A., and has the support of the following distinguished persons:—Sir Edward Poynter, president, Royal Academy of Arts; G. F. Watts, Esq., R.A.; Josef Israels; Sir John Stirling-Maxwell, Bart., M.P., trustee, National Gallery; Lieutenant-General Sir John French, K.C.B., K.C.M.G., and others.

In furtherance of this object it is proposed to found a school of art at Johannesburg, Transvaal.

The system of education will be carried out, as far as possible, on lines analogous to the course of instruction provided in the schools of the Royal Academy of Arts and the Royal College of Art, London, and will endeavour to uphold and maintain the splendid traditions of the masters as handed down in those schools, thus developing its work on the basis of all true and serious art.

The Society is organising an exhibition of pictures by British and Dutch masters to be held in Johannesburg. Leading artists of both nationalities have promised to lend works.

It is hoped that the Society will meet with the active support and encouragement of private owners of works of art, and of all those who are interested in the progress of education and culture in our South African Colonies.

The following letters have been received by Mr. E. L. Van Someren:—

Royal Academy of Arts, London, W.:

February 15, 1903.

I have pleasure in recommending Mr. Edmund Van Someren as a competent teacher. He is desirous of setting up a school of art in South Africa, and such an institution appears to me very desirable in a country where, as yet, there can be little opportunity for those whose instincts lead them in the direction of art to gain proper instruction.

Mr. Van Someren, besides winning prizes in the Royal Academy schools, gained the Landseer Scholarship of 50*l.* a year, enabling him to continue his studies for two years in the schools under the best instruction to be found in England; he is therefore fully competent to give instruction in drawing and painting, and I hope that his school will be well attended, and be the beginning of a widespread movement towards the study of the higher forms of art in the colonies.

EDWARD J. POYNTER, President of the Royal Academy of Arts, London.

Limnerslease, Guildford: January 27, 1903.

Dear Sir,—I like the idea of your scheme very much. There must be a fine opportunity of starting an original school of art, which may also have the merit of helping to bring together the late opponents in the war. I believe greatly in music and art as factors in co-operation and good-fellowship. I should be glad to aid, but do not see how I can; my age and my health exclude me from taking an active part in any under-

taking, so I can only send you my interest in your projected work and good wishes for its success.—Very sincerely yours,

G. F. WATTS.

Beavor Lodge, Hammersmith: May 3, 1903.

Dear Sir,—I have read the epitome of your scheme which has regard to the establishment of an art scheme, or schools, in South Africa.

In common with all other forms of education, an art training, as well as exhibitions of good pictures, must help to cement good-fellowship; the cause of the pursuit of beauty is always elevating, and more than that, because it tends to promote peace—peace which has as its basis the common ground of love for all that is enlightening and intelligent. I think that the idea of an exhibition of Dutch pictures is admirably peace-making. What we ought to show the Boers is, in my thinking, this, that a large section of the English people has the higher education much at heart, and that if the type of Colonials is not the highest, England, or that section of it to which I have alluded, is desirous for its elevation by the refining influence of both art and letters.—I am, dear Sir, yours faithfully,

W. B. RICHMOND.

ROMAN KILNS.

A PARTY consisting chiefly of members of the Lancashire and Cheshire Antiquarian Society recently visited Stockton Heath, near Warrington, to examine two potters' kilns recently uncovered near to the site of the Romano-British civitas. The kilns have been explored at the expense of the museum committee of the Warrington Corporation and under the superintendence of Mr. Thomas May, who has in recent years discovered fortifications, iron and glass furnaces, and the remains of a jeweller's shop in the same locality. The potters' kilns in question are of undoubted Roman origin, a silver coin of the Emperor Antoninus Pius, in fine condition, having been found by Mr. May on the floor in front of the firehole of one of the kilns at 4½ feet from the present surface, and the pottery being all of the soft unglazed ware extensively made in Britain during the Roman occupation. Two years ago a furnace forming portion of another of these kilns was found at the same spot. Those now uncovered very much resemble an old-fashioned washhouse boiler in shape, without the iron boiler or fire-bars. There is a fire-hole in front and a false bottom, supported by a central pillar, on which the pots were arranged for baking, and around the sides of the false bottom a series of holes for conveying the heat from the fire into the chamber all round the sides of the vessels. The kiln was loaded by a circular opening on the summit, which was then covered with loose flakes of clay-like rough tiles. The base of the kilns was on a layer of natural clay at about 5 feet to 8 feet down, which was probably the raw material used for making the vessels of common soft red and grey smoke-tinted ware in the shape of mortaria, ollæ, urnæ, pateræ and patellæ, of which a great quantity of fragments were found all round and inside the kilns. Some of the vessels were noticed to be of fine thin paste and graceful contour, ornamented with "engine turning" and "rough cast" round the lower portion of the bulge. The kilns are built up entirely of massive clay, and the most perfect of the two is 3½ feet high, the other being broken down to nearly the level of the false bottom. They were met with at 2 feet below the grass, and have now been covered in to prevent damage by unlawful intrusion into a private garden.

TESSERÆ.

Mediæval and Modern Restorations.

W usually read of the ruinous and dangerous condition of the old church, of its recent destruction by fire or the like, and on the other hand Professor Willis has taught us, in the cases of Canterbury choir and Winchester nave, how much of at least the substantial masonry of the former building was often preserved through the most extensive reconstructions. But we must remember, as it has been acutely observed, that massive stone walls do not burn, and when we see the state in which contemporary structures have come down to us safe and sound, we cannot help being tempted to interpret such phrases as "ruinous" and "dangerous" with very considerable latitude. The building to which they are applied probably often stood in need of a thorough repair and no more; we may feel quite sure that a modern bishop or chapter would be satisfied, on every ground, with simple repair and restoration, without any rebuilding or even remodelling. So, also, chroniclers desirous to magnify the fame of their patrons doubtless exaggerated their works, and often described as complete rebuildings alterations which left a considerable portion of the former building standing. How strictly we are to interpret the "notoriam et evidentem ruinam" of the former nave of Canterbury, its complete demolition forbids us

from ascertaining; but from the extensive portions of the Norman nave of Winchester still existing, we may feel tolerably certain that, had any of ourselves been in the position of Wykeham, we should have been contented with a substantial repair instead of that complete remodelling which gave birth to his glorious work. The Perpendicular recasting of the choir of Gloucester can have been little more than a whim; the mass of the Romanesque walls is hardly touched; there is only a Perpendicular network awkwardly thrown over them. Even when rebuilding was absolutely necessary, as when at Ely "the steeple in a night fell down upon the quier, making a most horrible and fearful noise," with our feelings we should rather have followed in the new structure as nearly as might be the type of its predecessor, whereas Alan de Walsingham "built it in such order as now we see it, a pece of worke both for cost and workmanship singular." Had the siege of Lichfield taken place in the troubles of the fifteenth instead of the seventeenth century, the destruction of the great spire would probably have been seized upon as the occasion of its re-edification in some entirely different form. Perhaps the truest way of putting it would be that our ancestors did not often make any extensive changes simply for the sake of the supposed improvement in the effect, but that they eagerly grasped the opportunity afforded by comparatively slight dilapidations to reconstruct portions of much greater extent than any necessity required.

Da Vinci and Raphael.

The various operations in the province of art of the two main motive forces of the Renaissance—the impulse towards the scientific study of nature and the impulse to reinstate the Classic spirit—may be best illustrated by special reference to Leonardo da Vinci, Raphael and Michel Angelo. Of the scientific impulse we see the fullest expansion in that miracle of many-sidedness, Leonardo. A never-sated hunger for knowledge in every form, a desire, ever burning, to lift up the veil from every secret of creation, possessed and marked him through life. The hidden mechanism of the bodies of men and of animals, the structure of plants, the ways of rushing waters and of wandering winds, and every riddle in the book of nature were objects of his ardent curiosity and unwearied study. How far beyond the horizon of his day his prescient spirit carried him along the fields of science in which art is not involved has been told elsewhere. But we cannot in this strange man separate the scientific investigator from the artist. In his moody and fitful spirit, unrestingly straining forward in the quest of some intangible, new perfection, it was the same haunting sense of mysteries unsolved that led him, now towards scientific prophecy and now to the creation of a type of human beauty more subtle and complex than any the world had seen before. The influence of the revival of classicism, both in its spirit and as a form of æsthetic expression, is seen at its meridian in Raphael. To him the knowledge of such masterpieces of ancient sculpture as were brought again to the light in his day came when his precocious gifts were already about to reach maturity, and their example found a fruitful soil in his singularly well-poised genius, fitted as it was with a stately sense of beauty and chastened by a mind of rare refinement. Whatever was best in the Classic spirit was absorbed and eagerly assimilated by him, and imparted to the work of his best day that rhythm, that gentle gravity and that noble plenitude of form which are its stamp, and proclaim him the brother of Mozart and Sophocles.

Influence of Byzantine Painting.

The art of modern Europe at the beginning was a direct offshoot from Greek art, as modified by the influences of the "lower" or Byzantine empire—influences, we may note by the way, to which Western civilisation was infinitely more indebted in every direction than Western pride has commonly allowed. Without entering upon the question of antique art, we may safely aver that, owing to the peculiar direction of the Byzantine mind, painting had been gradually elevated and narrowed to the expression of religious facts or feelings, whilst sculpture disappeared almost entirely under the prevalence of the "iconoclastic" sentiment. The technical methods, however, of painting, and the general idea of treating a subject, were still those which had been handed down by tradition from the days of free Hellas. Art, thus conceived and practised, held by but a slender thread to its proper and natural sphere. As the means of conveying a certain class of pleasure by the representation of all pictorially representable things, it had almost no existence. We call it art, yet it was only another mode in which theology reproduced itself. Under these conditions painting migrated to Italy towards the beginning of the twelfth century—that great European revolutionary epoch in which the main principles of the Renaissance were really, though often unconsciously, developed. Immediately, therefore, a remarkable change began to pass over the art which had made its way from the East. There, we repeat, it had not only restricted its functions to performing the part of a handmaid and interpreter of theology, but in so doing all effort on

the part of the artist, with all wish to distinguish himself individually, had well-nigh vanished. The whole design of every subject, down to its smallest details, had been long elaborated, and could not be deserted without danger of heterodoxy. One painter was, consequently, as good as another for the task required from art; and this peculiar stationary position has, as is well known, been prolonged in the East and in Russia (the barbarian caricaturist of Byzantium) to the present day. In the West, art at once felt the stirring atmosphere of what we may roughly characterise as Teutonic free thought. It was vivified; but the vitality infused carried with it the seeds of its own decay; the decadence of the sixteenth century was implicitly contained in the dawn of the thirteenth. At first, however, this decay was invisible and unthought of. Painting, now reinforced by sculpture, retained its original impulse. Its office was, not to represent all things that are representable, not to give pleasure by such representation, but to aid religion and morality; to inspire the meditations of the cloister; to re-echo the lessons of the preacher; to colour this life with images of another. For a certain time in Italy, for a certain time in Swabia and the valley of the Rhine (the word Germany would imply far too large an area), these ends were carried out with a completeness and a variety which the Byzantine parent of the European schools never reached. So far as we know, the "religious idea" was at no time, not even in early Hellas, expressed with the energetic naïveté of Giotto, the exquisite intensity of Angelico, the spiritual insight of Buonarrotti. But these splendid names, marking the progress of individual genius in the art, mark also the signs of the inevitable decline of art under its original impulse. Painting cannot at once be the handmaid of theology and the expression of the idiosyncrasies of the painter. When what is thought of is the progress of a school, the style of an individual artist, there will soon be an end of religious interpretation, of devotional incitement. The Virgin of St. Sixtus may invite and receive the worship of the connoisseur; but the long gaze of ecstasy, the sigh of passion, are reserved for the dingy Madonna, huddled in brocade and garlanded with tinsel.

Catania, in Sicily.

The main interest of Catania is not antiquarian; it is before all things the city of lava, the city at the foot of Ætna. The one object which, in a cursory view of the modern-looking town, carries us back to any of the great times of Sicilian history is the fragment of the Norman or Saracenic minster, the three black apses of Count Roger. Catania has no Hellenic temples like Syracuse, no Mediæval palaces like Palermo. The Greek city has vanished; so has the Saracen city; so has the Norman city, all but that one ecclesiastical fragment and that castle of Frederick II. which does not show itself as we pass through the chief streets of the modern town. The lava has covered a considerable part of the once habitable city; it has choked up the haven where Magôn displayed the trophies of Phœnician victory, and into which Pyrrhos sailed in triumph, greeted with rejoicings and golden crowns as the deliverer of Greek and Italian alike from the Phœnician yoke. Small indeed is now the haven of Catania, but except where the lava has ruled otherwise, the extent of the city has not very greatly changed in Roman, Mediæval and modern times. Grass grows in some of the streets, but there are no visibly forsaken ancient quarters, as at Rome and Syracuse, nor has the modern town so greatly outstripped the ancient boundaries as in many other cities. We may fairly say, as we walk through modern Catania, that Roman Catina is still there below the ground. And, indeed, a little search will show that a good deal of Roman Catina is left above ground also. The city is positively rich in remains of that one age, her Roman colonial age. Only there is no one object to stand out and give a character to everything, like the theatres of Tauromenion and of Orange. And yet, in one way of looking at it, Catania is rich, above almost all other cities, in this particular article of theatres. Arles has its theatre and amphitheatre far outshining their Catanian rivals, but Catania has further, what Arles cannot boast, its lesser theatre, its Odeion, hard by the greater. Now it is in the theatres that we are to seek, if anywhere, for remains of the Greek city. And as we stand in the Catanian theatre we would, of course, gladly believe that these are the very seats on which the hearers of Alkibiadês sat. But it is unlikely that any building can have stood through the eruption of B.C. 123, and nothing is more certain than that all the architectural features of the building are of Roman work. Still, there is no reasonable ground for doubting that the site and extent of the present building date from Hellenic times. Professor Holm rules in favour of the antiquity of the lava-wrought watercourse at the bottom of the seats. We may say the same of the Odeion beside the theatre. It stands a precious fragment, though in its present state a little hard to examine, and by it lies a vast fragment of itself, a mighty mass of Roman masonry blown up by a private possessor whose tale Professor Holm has not failed to put on record.

The Düsseldorf School of Painting.

There is scarcely a painter of note, hardly a phase—whether Christian and spiritual, or realistic and naturalistic—in the history of modern German art which has not been more or less intimately connected with Düsseldorf. The great Cornelius—termed by some the Goethe of the art of painting—was born at Düsseldorf, and to Cornelius, a man conspicuous from his youth up for large comprehensive intellect, the Academy of Düsseldorf owed its resuscitation, and art in general that signal revival of which Munich, Berlin and other chief cities give signs in our times. This giant, the Michel Angelo of Germany, gathered around him a compact band of scholars, ardent as himself for the revival of fresco-painting. The new school received timely encouragement from King Ludwig in a commission to decorate the then recently erected Glyptothek in Munich. The cartoons for this arduous work were prepared during the winter months in Düsseldorf, and then when summer came masters and pupils went to the Bavarian capital to carry out the frescoes. In like manner at Coblenz, Bonn and the Castle of Heltorf, "monumental art" got a fair start; thus the Italian method of fresco-painting learnt by Cornelius, Schadow, Veit and Overbeck in Rome, having been transplanted to Düsseldorf, took root throughout Germany. Yet it was not without difficulty that the young school of Düsseldorf struggled into life and paid its way. The fame of the Academy became so great that pupils flocked in from all parts, but success brought with it perplexity. Genius became in excess of the demand, the market was overstocked. The secret had been discovered whereby high art could be manufactured wholesale, and yet for the commodity when produced no purchasers were forthcoming. Fortunately King Ludwig was ready for the rescue. Moreover, the emergency called into existence the famed "Kunstverein für die Rheinlande und Westphalen," an art-union localised within the Academy, with the express purpose of subsidising works which proved in advance of public taste. It is interesting to know that this Kunstverein on its twenty-first anniversary was able to announce that, in addition to 900 great and small pictures distributed by lottery, it had been the means of securing to churches both Protestant and Romish, to museums and public buildings, twenty-seven altar-pieces and eleven large oil-pictures. Among the works thus fostered are the famous frescoes from the history of Charlemagne in Aix-la-Chapelle; also may be mentioned a masterpiece by Overbeck now in Cologne Cathedral; likewise Professor Keller's engraving—the largest in line ever executed—of Raphael's *Disputa*. Düsseldorf, indeed, has long been a chief centre for the publication of religious prints engraved from pictures by the best known painters in the Düsseldorf "Christian school." Such are among the means taken to educate the people of Germany up to the standard of high art. In fact Düsseldorf does as much for religious art in a twelvemonth as London in a century.

Building Easements in Roman Law.

A summary remedy provided by the edict against a person who was making an opus novum was known as operis novi nuntiatio. An opus novum consisted in either adding something in the way of building or taking away something so as to alter the appearance of a thing. The object of the nuntiatio was either the maintenance of a right, or to prevent damage or to protect the public interest. The owner of the property which was threatened with damage by the opus novum or he who had an easement in such property had the jus nuntiandi. Nuntiatio consisted in protesting against and forbidding the progress of the opus novum on the spot where the work was proceeding and in the presence of the owner or of some person who was there present on his account. The nuntiatio did not require any application to or interference on the part of the prætor. It was a rule of law that the nuntiatio must take place before the work was completed; after it was completed the operis novi nuntiatio had no effect, and redress could only be obtained by the interdict quod vi aut clam. If the opus novum consisted in building on the complainant's ground or inserting or causing anything to project into his premises, it was better to apply at once to the prætor or to prevent it per manum; that is, as it is explained, "jactu lapilli," which was a symbol of the use of force for self-protection. The edict declared that after a nuntiatio nothing should be done until the nuntiatio was declared illegal or a security was given. If the person to whom the notice was given persevered, even if he had a right to do what he was doing, yet as he was acting against the prætor's edict he might be compelled to undo what he had done. By the nuntiatio the parties were brought within the jurisdiction of the prætor. In cases where there was danger from the interruption of the work, or the person who was making the opus novum denied the right of the nuntians, he was allowed to go on upon giving a cautio or security for demolition or restoration in case the law was against him. When the cautio was given or the nuntians waived it the party was entitled to an interdictum prohibitorium for his protection in prosecuting the work. The effect of the nuntiatio ceased when the cautio was

given, when the nuntians died, when he alienated the property in respect of which he claimed the jus nuntiandi, or when the prætor permitted the work to go on.

Registration and the Institute Election.

SIR,—I had little idea when, at the request of others, I took up this question, that it would lead to so much correspondence, and, in two or three instances, so much resentment. But this I shall in a measure disregard. I am dealing with a public question, affecting not only the vital interests of our profession, but also those of the public at large. I contend that we have a right to know the views of every candidate for a representative position before we cast our vote, and from that I shall not swerve. I hold out no threats; I don't say who I shall vote for. I claim my right to exercise the ballot that is given to us under the constitution of the R.I.B.A., after I have ascertained the attitude assumed by each candidate for my suffrage. I will do my best to place other members in the same position in regard to facts before they give their votes, but without indicating any preferences, as my desire is that all may cast their ballot as they please, after a proper disclosure of the facts. This circular might not possibly have been issued but for the letters of Messrs. Grüning and Carøe. After that I had no choice, and so beg now to give the correspondence up to date.

In consequence of the volume of inquiry I have had as to how other candidates for the Council would act on the registration question, I issued my circular letter of the 19th, and to this I have received the replies which are given below.—Yours faithfully,

SILVANUS TREVAIL.

Palace Chambers, Westminster, S.W.:
May 25, 1903.

(Copy of circular letter sent to each nominee for the Council.)

R.I.B.A. ELECTIONS.

Palace Chambers, Westminster, S.W.: May 19, 1903.

Dear Sir,—I observe by the list issued by the Secretary that you have been nominated for the Council.

Before filling up and returning my voting paper I shall be glad if you will kindly inform me whether you are in favour of the statutory registration of duly qualified architects or not?

I enclose a stamped addressed envelope for reply.—Yours faithfully,

(Signed) SILVANUS TREVAIL.

6 Montagu Place, Baker Street, London, W.:
May 20, 1903.

Dear Sir,—In reply to yours of yesterday's date, I write to say that I am in favour of the statutory registration of duly qualified architects if the measure is undertaken by the Institute.—Yours faithfully,
ARTHUR C. BLOMFIELD.

To Silvanus Trevail, Esq., F.R.I.B.A.

3 Verulam Buildings, Gray's Inn, London, W.C.:
May 20, 1903.

Dear Sir,—In reply to your inquiry of yesterday's date. My attitude with regard to statutory registration would depend entirely upon the details of any proposal which might be brought forward, and especially as to what is intended by the words "duly qualified."

In any case I can see no objection to the principle of registration, though I conceive the difficulties of framing a satisfactory scheme to be very great. I am disposed to think that the time has come for the Institute to make a definite pronouncement on the subject.—Yours truly,

JOHN W. SIMPSON.

Silvanus Trevail, Esq., F.R.I.B.A.,
Palace Chambers, Westminster, S.W.

11 Gray's Inn Square, W.C. (and Bancroft, Hitchin):
May 20, 1903.

Dear Sir,—In reply to your letter of yesterday's date, I am of opinion that no one should be allowed to practise as an architect without a Government diploma.—Yours faithfully,

S. B. RUSSELL.

Silvanus Trevail, Esq.

4 Adam Street, Adelphi, London: May 20, 1903.

Dear Sir,—In answer to your letter, I have in the past been more or less opposed to a measure for the statutory registration of architects, largely because I have been of opinion that such a measure would not be of real use.

However, my friend Mr. Cross and others with whom I am working for a common policy are very much in favour of registration, and I have therefore undertaken to sink my objections (such as they are) and work with them in this particular too.—Yours faithfully, HERBERT W. WILLS.
Silvanus Trevail, Esq.

i Vernon Place, Bloomsbury Square, London, W.C.:

May 20, 1903.

Dear Sir,—I do not think you would consider that I was in sympathy with your views on registration.—Yours faithfully,
S. Trevail, Esq. F. W. LANCHESTER.

18 Maddox Street, W.: May 20, 1903.

In reply to Mr. Trevail's inquiry, Mr. Ernest George begs to say that he is decidedly opposed to the scheme of statutory registration.

44 Parliament Street, Nottingham: May 20, 1903.

Dear Sir,—In answer to your letter of the 19th inst., I desire to inform you that I am strongly in favour of the statutory registration of qualified architects.—Yours faithfully,
A. W. BREWILL.

To Silvanus Trevail, Esq.,
Palace Chambers, Westminster, S.W.

6 Princess Street, Manchester: May 20, 1903.

Dear Sir,—Replying to your favour of May 19, I think you know I am not only in favour of statutory registration but also competition reform.—Yours very truly, CHAS. HEATHCOTE.
Silvanus Trevail, Esq.

58 Conduit Street, Regent Street, W.: May 20, 1903.

Dear Sir,—I am heartily in favour of the statutory registration of architects.—Yours faithfully, ALFRED W. S. CROSS.
Silvanus Trevail, F.R.I.B.A.

11 Dowgate Hill, Cannon Street, London, E.C.:

May 20, 1903.

Dear Mr. Trevail,—In reply to your letter, you will remember that we discussed the question of statutory registration the other night, and until I see the Bill proposed to be introduced it is impossible for me to express an opinion beyond this, that if every person who now * dubs "Architect" after his name is to be placed on the register, as was the case with dentists before they got their charter, I could not support it.—Yours faithfully, J. DOUGLASS MATHEWS.

Silvanus Trevail, Esq.,
Palace Chambers, Westminster, S.W.

3 Scroope Terrace, Cambridge: May 21, 1903.

Dear Sir,—I am afraid that we are not agreed on registration question.

I cannot vote for you, so pray do not vote for me.—Yours truly, W. M. FAWCETT.
S. Trevail, Esq., F.R.I.B.A.

180 New Bond Street, London, W.: May 21, 1903.

Dear Sir,—Replying to your note of the 19th inst., my mind is perfectly open on the subject you mention.—I am, yours very truly, WM. FLOCKHART.

Silvanus Trevail, Esq., F.R.I.B.A.

29 New Bridge Street, Ludgate Circus, London, E.C.:

May 21, 1903.

Dear Sir,—In answer to your inquiry of 19th instant, I am decidedly in favour of the statutory registration of duly qualified architects.—Yours faithfully, F. R. FARROW.
Silvanus Trevail, Esq.

7 Dawson Street, Dublin: May 21, 1903.

Dear Sir,—Referring to your circular of the 19th, I am in favour of the statutory registration of duly qualified architects as a general principle. The want of a clear definition of what an architect is is greatly felt in Ireland, especially in relation to appointments by local councils under the control of the Local Government Board. I have already expressed my views on this matter in response to a previous circular, and reserve my right to keep an open mind on the question until the provisions are more clearly defined.—I am, yours faithfully,
G. C. ASHLIN, F.R.I.B.A., R.H.A.

Silvanus Trevail, Esq., F.R.I.B.A.

* This is strictly provided against by the Bill now before Parliament.—S.T.

20 New Cavendish Street, Portland Place, W.:

May 21, 1903.

Dear Sir,—During eleven consecutive sessions of the R.I.B.A. I have occupied a seat on the Council, and I have done so in an entirely independent attitude. If therefore I decline to give you a definite answer to the question which you have every right to ask, it is neither out of discourtesy to yourself nor from lack of interest in any matter that concerns the welfare of our Institute and our profession. My feeling on such questions is that our elections not being Parliamentary elections on party lines, there is happily no reason for candidates to pledge themselves unalterably to the views of any body of constituents. In other words, I have preferred to feel, when elected, that I was at liberty both to use my own judgment and to listen to the reasonable arguments of those with whom I may not hitherto have agreed.

But that you may not consider me altogether incapable of an opinion in the present matter, I may inform you that I have no sympathy with any Registration Bill hitherto drafted and no personal wish to be a registered architect.—I am, dear Sir, yours faithfully, PAUL WATERHOUSE.

To Silvanus Trevail, Esq.

St. John Street, Newcastle-on-Tyne (and Bishop

Auckland): May 21, 1903.

Dear Sir,—Thanks for your letter of the 19th inst. I am in favour of the statutory registration of duly qualified architects, but think it should be carried through by the Institute. If elected on the Council I shall be pleased to support you in your efforts to bring this about. The matter has not been officially brought before the Northern Architectural Association Council, but from conversations I have had with several of the members of that body, I find they share my views.—Believe me, yours faithfully, J. W. TAYLOR.

Silvanus Trevail, Esq., F.R.I.B.A.

25 Gresham House, Old Broad Street, E.C.:

May 21, 1903.

Sir,—I have duly received yours of the 19th inst., from which I understand that I shall not have the benefit of your support at the coming election unless I at once state whether or not I am in favour of the statutory registration of duly qualified architects.

Under no circumstances should I commit myself to any such statement without the fullest and most careful consideration, and I feel bound to observe also that in no case would I associate myself with any party canvassing for election (in itself, as I think, a most undesirable proceeding) whose methods were similar to those adopted by you, and which I consider to be detrimental to the character of any member of an honourable profession.

I hold myself at liberty to make any use I may think fit of this correspondence.—I am, your obedient servant,
Silvanus Trevail, Esq. EDW. A. GRÜNING.

(Copy.)

STATUTORY REGISTRATION OF QUALIFIED ARCHITECTS.

Palace Chambers, S.W.: May 22, 1903.

Sir,—I beg to acknowledge the receipt of your favour of the 21st inst.

There is nothing in my letter of the 19th inst. indicating that I should withhold my vote from any honourable, straightforward opponent, and you will perhaps, on reflection, pardon me if I take the liberty to say that you are not quite justified in making the inference you do in the first paragraph of your letter. It is not always wise to jump hastily at conclusions.

I submit, sir, in all humility, that you have no right to charge me with "canvassing." To state definitely and decisively one's views upon a question which the majority of the profession believe to be of vital consequence, not only to themselves but to the public at large, and to say to each member of the Institute, if you agree with my views on this question, then vote for me, but if you do not, then vote against me—is one thing; but to "canvass," in the objectionable sense of the term, is quite another.

Unless there be a declaration of views on both sides how can any council call itself representative? And which is the more derogatory to an honourable profession—for a would-be representative to give his views openly and frankly before an election and take his chances upon them for what they are worth, or to withhold his views until the election is over, and then to act in direct opposition to what he knows to be the wishes of the majority of his constituents?

To be fair in this correspondence you will, of course, give me a straightforward reply to this question.

I thank you for the expression of your opinion as to what is detrimental, and what is not, to the character of members of an honourable profession. You are entitled to your views upon this subject, as I am entitled to mine, and it will be for

the majority of the members of the Institute to say which view they prefer and support. My only regret is that the voting papers will have been mostly returned before your views can have been known.

Like yourself, I not only hold myself at liberty "to make any use I may think fit of this correspondence," but I shall take steps at once to publish it, not in ill temper or bad feeling, but in what I believe to be the best interests of the profession and the Institute.—I am, Sir, your obedient servant,

SILVANUS TREVAIL.

To Edward A. Grüning, Esq., F.S.I., F.R.I.B.A., &c.,
25 Gresham House, E.C.

8A Whitehall Place, London, S.W.: May 20, 1903.

Sir,—It seems to me that your proceedings in reference to your candidature for election upon the R.I.B.A. Council are not such as to entitle you to any reply to your letter of May 19, 1903.

To me they appear to be wholly derogatory to membership of an honourable profession, and I reserve to myself the right to make such use as I may think fit of your letter and my reply.—I am, yours truly,

W. D. CARÖE.

S. Trevail, Esq.

(Copy.)

STATUTORY REGISTRATION.

Palace Chambers, Westminster, S.W.: May 22, 1903.

Sir,—I am much surprised at the discourteous tone of your letter. I shall be glad if you will kindly explain wherein "my proceedings have been wholly derogatory to membership of an honourable profession," or to withdraw such an offensive allusion. I contend most respectfully that I or any other member of the R.I.B.A. have a perfect right if we please to bring to the front any question that we either rightfully or mistakenly believe to be of vital consequence to the profession, and to take all legitimate and fair means of doing so. How is the general body of the membership of the Institute to know who they wish to vote for unless the views of those nominated for the Council are expressed, and how can the latter claim to be representative without this? The question of registration is not a personal matter to show temper and spite upon, but one vitally affecting the interests of the general public, as well as those of the profession to which we belong. If you allow your name to appear as one of my would-be representatives on the Council I maintain that I have the right to ask you what your views are upon an all-important question before I entrust you with my franchise. I desire your reply to this, and, like you, claim the right of making what use of the correspondence that I think proper.—I am, sir, your obedient servant,

SILVANUS TREVAIL.

To Wm. D. Caröe, Esq., M.A., F.S.A., F.R.I.B.A., &c.,
8A Whitehall Place, S.W.

243 St. Vincent Street, Glasgow: May 22, 1903.

Dear Sir,—Yours received on my return this morning. I am in favour of architects being duly qualified and registered, and wish I could see and devise some way in which it could be done.—Yours truly,

HORATIO K. BROMHEAD.

Silvanus Trevail, Esq., F.R.I.B.A.

Leicester: May 23, 1903.

Dear Sir,—I have a perfectly open mind on the question of the registration of architects, but honestly I am not yet convinced.—Yours truly,

ARTHUR WAKERLEY.

Silvanus Trevail, Esq., F.R.I.B.A.,

Palace Chambers, Westminster, S.W.

46 Lincoln's Inn Fields, London, W.C.:
May 22, 1903.

Dear Sir,—As I read the paper on the "Statutory Education of Architects" which originated the recent movement, assisted in drafting the present Bill, and have never lost a fitting opportunity of advocating my views on this subject, both at the R.I.B.A. and the Architectural Association, as well as in public, you will need no further evidence of my attachment to the idea.—Yours faithfully,

W. H. SETH-SMITH.

Silvanus Trevail, Esq., F.R.I.B.A.

6 Millstone Lane, Leicester: May 23, 1903.

Dear Sir,—I am in favour of registration, but I consider that the R.I.B.A. is the only body who ought to promote a Bill upon such a matter.—Yours faithfully,

Silvanus Trevail, Esq.

S. PERKINS PICK.

35 Park Street, Bristol: May 23, 1903.

Dear Sir,—In reply to your inquiry, may I say that the statutory registration of architects, qualified on examination, appears to me to be desirable, and I should probably give any vote

I might have in its favour should the question be entertained by the Institute.—Yours very truly,
Joseph Wood.

Silvanus Trevail, Esq., F.R.I.B.A.

Charles Street Chambers, Cardiff: May 23, 1903.

Dear Sir,—In reply to your letter of the 19th inst., I beg to say that I am in favour of the statutory registration of all duly qualified architects.—Yours faithfully,
DAVID MORGAN.

Silvanus Trevail, Esq., Westminster.

The other gentlemen nominated have made no reply.—S.T.

GENERAL.

A Memorial Statue of Charles Sellier, the Lorraine painter, was unveiled last week at Nancy. The sculptor was M. Finot.

The London County Council have decided that the elevations of the new buildings in the Strand, Aldwych and Kingsway must be "such as the Council shall approve as worthy of the position."

A Hostel is proposed to be established in Paris for the benefit of Russian students of art. The chief feature will be a large atelier to be used as a studio, a meeting-place and an exhibition gallery.

The First Commissioner of Works has stated that when the sanitary works now in progress at the Palace of Holyrood are completed it will be a suitable residence for the Sovereign on any future visit to Edinburgh.

A Circular has been issued by the Irish branch of the Surveyors' Institution drawing attention to the extremely critical position in which the Irish land agents will be placed when the Irish Land Bill now before Parliament comes into operation. It is pointed out that one result of the measure will be the extinction of the land agents' profession and their consequent financial loss, which in many cases will amount to ruin, and this through no fault of their own; indeed, the more actively they assist the working of the Act the sooner their extinction will occur.

M. Paul Soyer, a French painter, died last week. He was a native of Paris and studied under Cogniet. He devoted himself to scenes from the life of rustics and labourers. One of his principal works was *The Ironworkers' Strike*, which was suggested by a poem by M. Coppée.

The Late Professor Roger Smith has left property which has been valued at 6,741*l*.

Mr. John Wheeler, builder, of Wantage, who was often employed by the Ecclesiastical Commissioners, has died in his eightieth year. He restored about sixty churches.

The Phoenix Park, Dublin, is not called after the fabulous bird, for the name is derived from an Irish phrase expressive of clear water. When the Earl of Chesterfield was the Lord-Lieutenant in the eighteenth century he set up a column surmounted by a gilded figure of the phoenix. As it is supposed to be an obstruction an effort is being made to have the column removed.

Mr. F. W. Ruckstuhl, the New York sculptor, is engaged upon the model for a colossal "National Peace Monument." Two and a half million dollars have been privately subscribed for the monument, which will be erected on the bank of the Hudson river. Its main feature will be an Ionic column 600 feet high, resting upon a two-storey building, which in its turn stands upon a platform 300 feet square. On the top of the column a glass globe, 40 feet in diameter, will serve the purpose of a lighthouse.

The Estate of the late Mr. A. Marcet, of Greenhithe, has been proved at 87,338*l*. 16*s*.

An Innovation will be introduced at the ceremony of laying the foundation-stone of the Carnegie Library, Hartlepool. The Patent Victoria Stone Company, Ltd., are supplying their material for the building. The foundation-stone will also be a specimen of Patent Victoria Stone, and there is no doubt it will be found in good condition should a search be necessary at a remote time.

A Site has now been fixed upon for another Glasgow public library for Bridgeton and Calton districts. The architectural assessor is Mr. Horatio K. Bromhead, F.R.I.B.A., the president of the Glasgow Institute of Architects. At his suggestion the Corporation have added premiums of 50*l*., 30*l*. and 25*l*. for the best designs in the competition. This will be the sixth district library in Glasgow with Mr. Bromhead as architectural assessor.

The Northern Architectural Association will hold a meeting on Wednesday next, June 3, when the Conssett Iron Company's works will be visited.

A Series of water-colour drawings of the inundated temples of Philæ and of other parts of Egypt, by Fredk. F. Ogilvie, will be exhibited at the Modern Gallery, 175 Bond Street, during June. The private view takes place on Saturday, June 6.

Architect and Contract Reporter.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BRIDLINGTON.—June 19.—Schemes are invited for providing the village of Flamborough (1,000 inhabitants) with an efficient supply of water. Mr. John B. Simpson, clerk, Rural District Council, Bridlington.

CROYDON.—June 9.—Competitive designs and estimates are invited for a children's home and two relief stations to be erected in Croydon. A premium of £15 15s is offered for the best design for the children's home and £10 10s for the second best, and a premium of £10 10s is offered for the best designs for the two relief stations. Mr. Harry List, clerk, Union Offices, Mayday Road, Thornton Heath.

IRELAND.—June 18.—The Trustees of the Limerick free library and museum invite designs from architects in independent practice for the proposed Carnegie library and museum to be built in the People's Park, Limerick. Prizes of 75% and 25% respectively will be awarded to the designs placed first and second in the competition. Mr. W. M. Nolan, town clerk, Town Hall, Limerick.

POPLAR.—June 23.—Competitive designs are invited for a public library to be erected in Cubitt Town, Poplar, E. A premium of 75% is offered for the design accepted by the

Council, which will be deducted from the architect's commission should he be employed as architect in the execution of the work. Mr. Leonard Potts, town clerk, High Street, Poplar.

SCOTLAND.—June 13.—Competitive plans are invited for the formation and laying-out of ground for new cemetery at Wellhall, extending to about 9½ acres. Mr. A. L. Smith, 25 Duke Street, Hamilton.

TAUNTON.—July 20.—Competitive designs are invited for a library building to be erected in Corporation Street, at a cost not exceeding 5,000*l.* inclusive. Premiums of 30*l.*, 20*l.* and 10*l.* will be awarded for designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. George H. Kite, town clerk, Municipal Buildings, Taunton.

WALES.—June 2.—A premium of 20*l.* is offered for the best plan and design for a library at Abergavenny, Monmouthshire. Mr. E. H. Restall, librarian.

VARIETIES.

ON the 23rd inst. the public baths erected by the Swinton and Pendlebury Urban District Council, at a cost of 5,880*l.*, were formally opened.

A NEW and commodious hospital, which has for nearly two years been in course of erection for the Duchess of Bedford at Woburn, and is intended for the accommodation and treatment of patients resident within the radius of the Duke's extensive estates in the Woburn district, was formally opened on Monday by the Duchess, who was accompanied by the Duke.

THE new church of St. Thomas, which has been erected in the populous district of Earl Kirkby, in the parish of Kirkby-in-Ashfield, Notts, in the diocese of Southwell, was consecrated on Saturday. The cost of erection is nearly 6,000*l.* The church, which will accommodate 380 persons, is of brick with stone dressings, and the style of architecture is English Gothic of the early fifteenth century.

SINCE the proposal to erect a new workhouse at Evesham was defeated the expenditure upon various buildings at the old workhouse has reached a total not far short of the estimate for the new building. At Monday's meeting of the Board of Guardians there was a rather lively discussion as to a proposal to spend 230*l.* upon a corridor connecting the new and old infirmaries. The Rev. E. B. Shekell suggested that there was a lack of foresight, or these "extras" would not be continually cropping up, and he asked where the expenditure was going to stop. The Chairman said the corridor would save the services of a nurse, and the building was sanctioned.

ON Saturday, May 23, about fifteen members of the Manchester Society of Architects, under the leadership of Mr. G. W. Lord, made a sketching visit to Mobberley Church, Cheshire. The rector, Rev. H. L. Mallory, kindly explained various points of interest. By the kindness of Mr. Ernest Leycester, Mobberley Old Hall was also visited and several sketches made of it. On Tuesday evening about sixty members visited the new Midland Hotel, Manchester, by kind permission of the architect, Mr. C. Trubshaw. The visitors were shown round by Mr. Elwell and Mr. Lund, who explained the general design of the building and the elaborate warming and ventilating arrangements.

TUESDAY was the last date for receiving applications for the office of town clerk of Dundee, rendered vacant by the death of Sir Thomas Thornton. The applications came from various parts of the country, and included in the names are

Mr. James W. Davidson, depute town clerk of Aberdeen; Mr. Andrew Grierson, depute town clerk of Edinburgh; Mr. James F. Johnstone, depute town clerk of Paisley; Mr. J. Burn Fergusson, Hamilton, clerk and treasurer to the Middle Ward of Lanarkshire; Mr. W. F. Mackintosh, town chamberlain of Arbroath; Mr. Archibald Smith, town clerk of Kirriemuir; Mr. James Burns, town clerk of Motherwell; and Mr. John W. Thain, W.S., Edinburgh. Amongst the Dundee solicitors mentioned in connection with the vacancy are Messrs. James Thomson, Hubert Carlton, John L. Stevenson, Thomas Littlejohn, James Allison, W. F. Hill, W. H. Blyth Martin, William Nixon, James Urquhart, G. B. Carmichael and David Gowans. The committee who have charge of the matter were to finally consider the applications to-day.

THE popular passenger-steamers *Royal Sovereign* and *Koh-i-Noor* will commence their sailings from London Bridge (Old Swan Pier) to Southend, Margate and Ramsgate to-morrow, the 30th inst., at same times of sailing as last year, viz. *Koh-i-Noor* at 8.50 A.M. for Southend and Margate and back, and *Royal Sovereign* at 9.20 A.M. for Margate and Ramsgate and back; the fares will be the same as in previous seasons. The New Palace Steamers Company announces that during the past winter months the steamers have been thoroughly overhauled and all the Board of Trade requirements have been complied with and improvements made, so that the public may rest assured that everything possible has been arranged for their comfort. The company also announce that they are prepared to offer specially reduced fares for parties of twelve and over, and party organisers will do well to write to the company at their offices at 50 King William Street, E.C., for particulars of their trips before deciding on their excursion. The catering on board the steamers will be on the same liberal scale as hitherto, and worked entirely by the company.

BUILDING AND BUILDERS.

FOR the new Congregational church which is about to be built at Hither Green, London, Messrs. Church & Son, of 12 South Place, Finsbury, London, E.C., have been appointed architects.

THE foundation-stone of the new Roman Catholic church of the Holy Ghost and St. Stephen, at Shepherd's Bush, has been laid. The church, which will be built in the Romanesque style, will be completed in six months time and provide accommodation for a congregation of 700.

VOLUME LXVIII OF THE ARCHITECT.
Handsomely bound in Cloth, Gilt Lettered, price 12s. 6d.

MEMORIAL-STONES of a new Wesleyan Sunday-school at inley were recently laid. Two years ago the Midland Railway Company took the old school for their extensions. The new building will be much nearer the railway station, in a central situation.

THE Seisdon Rural District Council at their last meeting unanimously approved the scheme of sewerage and sewage disposal for the parishes of Penn, Penn Fields and Bradmore which has been prepared by their engineer, Mr. R. E. W. Harrington, M.I.C.E., of Westminster and Wolverhampton. The estimated cost of the scheme is 14,000*l.*, and the Council have applied to the Local Government Board for sanction to borrow that amount.

THE new denomination, the Free Church of the Welsh, on the 23rd inst. opened their second permanent place of worship at Merton Road, Bootle. Hitherto the congregation have worshipped in the Masonic Hall, Bootle, and their communicants number 270. The large hall of the new structure will accommodate 600 persons, and there are attached to it classrooms, kitchen, vestry, lavatories, cloak-room and a school-room with seating capacity for 250 people.

A LONG discussion took place at a meeting of the governors of the Gordon's College, Aberdeen, over an application by the gallery committee for a piece of land within the precincts of the college grounds for the construction of a sculpture hall, towards which 7,000*l.* had been offered by the trustees of the late Mr. John Clark, advocate. The finance committee reported that it was highly expedient for the governors, before entering with any of the ground, gratuitously or otherwise, to consider their own probable requirements in the near future, and recommended that a remit be made to a committee to consider the subject from that point of view. Treasurer Wilkie opposed that the ground be granted as requested by the gallery committee, and this was agreed to by eight to four votes.

THE foundation-stones were laid on the 21st inst. in connection with the new Wesleyan Sunday-schools at Halebank, which are being erected on land adjoining the chapel, which has been secured from Lord Derby. Provision is being made for one large room to accommodate 200 scholars, and three classrooms, obtained by the conversion of the present school, which will be connected by a corridor to the new building, with necessary cloakroom and other accommodation. The building will be erected by Mr. Edwin Wood, contractor, of Widnes, from designs by Mr. John K. Newburn.

THE opening service of South Cliff Congregational church, Lowestoft, was held on Thursday, May 14. The church consists of nave and double transepts, the latter as at present erected, only projecting a few feet; these, however, can at any time, when extension is found necessary, be extended or increased in depth so as to provide considerably larger accommodation (about 180 extra). The facings are of red brick, and the dressings of white Costessey work. The roofs are of open timber construction of the hammer-beam type. The seating is of oak, wax polished. A bold square tower with angular pilasters, and terminating with a lead-covered spirelet and weather vane of quaint design, forms a prominent feature of the design. The contract was let to Mr. John Ashby, Woodbury, Lowestoft, and amounts to 1,698*l.* The accommodation of the building is about 430 adults. The architects are Messrs. G. & R. P. Baines, 5 Clement's Inn, Strand, London, W.C.

THE movement on foot for the erection of a permanent church in the Maney district of Sutton Coldfield to replace the present iron structure has advanced a stage. At a recent meeting Mr. G. H. Lloyd pointed out that to accommodate 400 persons would involve an outlay, including the site which had been purchased, of 6,000*l.*, while a building to accommodate 600 would cost 8,000*l.* It was decided to instruct Messrs. Cossins, Peacock & Bewlay, of Birmingham, to prepare plans of a church to provide sittings for 600 people, the plans to be prepared in such a manner that if found necessary part only of the church capable of holding 400 might be built. The funds already in hand amount to 2,300*l.*

TRADE NOTES.

THE well-known business of Messrs. Mellows & Co., of Sheffield and London, roof-glazing manufacturers and plumbing contractors, has been converted into a limited company, bearing the name of Mellows & Co., Limited, with a capital of 50,000*l.*, divided into 50,000 shares of 1*l.* each, of which 25,000 are 5 per cent. cumulative preference shares and 25,000 are ordinary shares. The registered office is at Corporation Street, Sheffield; London offices, 28 Victoria Street, Westminster, S.W.

THE Teale Fireplace Co., 28 Berners Street, Oxford Street, London, W., have been honoured with an appointment under Royal Warrant as fireplace manufacturers to H. M. the King.

THE Westminster Iron Roof and House Building Company, of 1 Tothill Street, Westminster, have just completed

their contract with Messrs. Charles & Albert Kiralfy for erecting at the Nottingham exhibition six steel and iron buildings, comprising the two minor halls, Japanese refreshment-house, English restaurant, theatre and variety hall.

THE National Provident Institution for Mutual Life Assurance, whose offices are at 48 Gracechurch Street, have just issued their valuation returns as taken on November 20, 1902, at which date the amount of funds stood at 5,878,924*l.* 5*s.* 10*d.*, an increase in the quinquennial period from November 1897 of no less than 645,506*l.* 9*s.* 7*d.*, a result on which the directorate may be congratulated, especially as progress on a commensurate scale has been made in all directions.

OWING to the continued and increasing demand for the Simplex steel conduit system, and with the object of furthering the mutual interests of their customers and themselves, the Simplex Steel Conduit Co., Ltd., have considered it desirable to open premises of their own in Glasgow, and they now have a branch office and stores at 165A West George Street, Glasgow, under the management of Mr. D. G. Brooks, and have there a large stock of all grades of conduits and fittings ready for immediate delivery.

THE Columbian Fireproofing Company, Ltd., 37 King William Street, E.C., have secured the contract for the whole of the steel construction and erection and fireproof floors for the new premises for Messrs. Laurie & McConnell, Ltd., general providers, of Fitzroy Street, Cambridge, whose premises were destroyed by fire some time ago. This will be the first entirely steel frame building of the warehouse class erected in England, and the architect is Mr. R. Frank Atkinson, of 8 Sackville Street, Piccadilly, who has designed the new buildings in Oxford Street for Messrs. Waring, Ltd.

NEW CATALOGUES.

MESSRS. SAMUEL ELLIOTT & SONS, LTD., of Caversham, Reading, have sent us a copy of their new and voluminous catalogue illustrated by upwards of 1,500 sketches of the wood mouldings which are the specialty of the firm. To emphasise the artistic value of these mouldings, photographic views are given of a sumptuous banqueting-hall designed by Mr. R. Norman Shaw, R.A., in the elaborate wainscoting of which they are freely introduced. Mr. Samuel Elliott, Sen., was the founder of the high-class moulding and joinery business at

Newbury, and he and his three sons have fitted up and equipped the Reading Works with all the latest machinery for an up-to-date moulding and joinery mill.

MESSRS. STANLEY BROS., LTD., of Nuneaton, have just issued a new catalogue of their well-known roofing tiles which, as most of our readers are aware, are made in red and red mottled, both kinds being of the same material and make; but the latter are subjected to a greater heat and prolonged process in firing, the result being a darker and more modified tone of colour which architects generally prefer. These can be supplied in lighter or darker shades. The demand for these goods has latterly increased to such an extent as to necessitate the doubling by Messrs. Stanley Bros. of the plant for their manufacture.

THE General Iron Foundry Company, Ltd., 43 Upper Thames Street, have sent us two sectional catalogues, the first section being devoted to the illustrated description of their Moline's patent wrought-steel windows, which, as they say, have been used for forty years at home and abroad in all classes of buildings. They are light but incomparable for strength, and the chilled bosses obviate the disadvantages of the mitred joints, where only a small portion of each bar is retained. In the Moline's patent windows the joints are unbreakable under ordinary circumstances, and the full strength of the sash-bars is retained. The other section, also illustrated, treats of different varieties of wrought-iron casements, &c.

OTHER catalogues are to hand from Messrs. James Allen, senr., & Son, Elmbank, Glasgow, of architectural, ornamental and sanitary iron castings; Messrs. Alfred Dodman & Co., Ltd., King's Lynn, engines; and Ratner Safe Co., Moorgate Street, safes, strong rooms, iron doors, &c., &c.

THE PALMDAY ROLLING PARALLEL RULER.

MESSRS. B. J. HALL & CO., of 39 Victoria Street, S.W., are introducing a new rolling parallel ruler, which will, no doubt, be found of great service to draughtsmen and others. As the illustration shows, this ruler is fitted with a graduated cylinder, which revolves with the rollers; a small pawl falling into each notch clearly indicates by a slightly arrested motion the distance traversed. The pawl can be moved so as to give any division down to 1/32nd of an inch, or can be placed out of action altogether. This arrangement is invaluable for drawing equidistant lines, it insures even cross-hatching and affords an easy means of producing accurately squared paper.

DUBLIN HARBOUR WORK.

ON Saturday the members of the Engineering and Scientific Association of Ireland were invited to view the chief points of interest in connection with the Port of Dublin.

The members, numbering over sixty, were conducted by their hospitable host to the portion of the wall now in progress of reconstruction, opposite the Great Southern and Western Railway terminus. Here they had an opportunity of viewing the coffer-dams and excavations, some of which have been carried down to depths of 28 to 32 feet under low-water mark till firm foundation was reached, also the powerful dynamos and other machinery used for pumping and other operations connected with the works. Having embarked on the *Majestic* and the *Erin* launch, the visitors were conducted to the Alexandra basin, now in course of construction, and which promises to be at some future date one of the most capacious docks for shipping in the world.

It was pointed out that the whole of the machinery and appliances used in this great work were designed by Mr. Bindon B. Stoney, the late chief engineer of the Port and Docks Board, and a model of his powerful shears used for lifting concrete blocks weighing 350 tons was exhibited and explained on the deck of the steamer.

The foundation of the blocks was first excavated by a steam dredger to within two feet of the finished level, and the remainder of the excavation was taken out by men working in a large diving-bell 20 feet square and 6½ feet high. Access was obtained to this chamber by a wrought-iron shaft and air lock. One of the most important features of this mode of construction is the absence of coffer-dams, staging and pumping, and it has proved exceptionally economical, the quay walls having been built for about 40¢ per lineal foot, inclusive of the cost of all special plant. The next object of interest was the tank-steamer employed for dredging purposes by a new system

of suction tubes. The sand on the bar outside the mouth of the harbour must be kept constantly dredged in order to enable vessels of heavy tonnage to enter the Liffey. The sand is sucked up, together with a portion of sea-water, and conveyed by this tank-steamer to the jetty inside the Alexandra Basin; here it is discharged by means of extremely ingenious pumps at great velocity over the surrounding slob-lands through a pipe, and the sand and water is spread so that the sand deposits and the water flows off back to sea, thus forming a foundation upon which soil may be deposited and subsequently solid ground obtained for the erection of buildings.

On leaving the basin the steamer conveyed the party to the Eastern Breakwater, which will ultimately form a portion of the entrance to the dock. Here the fog-bells were sounded, and the party proceeded on to the entrance of the harbour, where they inspected the Poolbeg and North Bull lighthouses.

ST. BRIDE'S EPISCOPAL CHURCH, KELVINSIDE.

It is about ten years since the little wooden church, in which the congregation of St. Bride's are still worshipping, was brought from Douglas Castle and erected on a site in Beaconsfield Road. It accommodates about 150 sitters, but on special occasions, such as was the case a few Sundays ago, many more have found places. The new church will have chairs for 750, and will consist of nave, aisles and chancel. The entire length of the building will be 130 feet by 70 feet wide, and the height from floor to apex of roof 56 feet, while the spire will rise to fully 100 feet. The chancel is 36 feet long by 29 feet, and is divided from the nave by a beautifully designed rood-screen of carved oak; while a similar screen marks off the chancel from a side chapel on the south side, under which an arched mortuary chapel has been placed. The nave is 102 feet long by 26 feet wide, while the aisles on each side are 14 feet wide. The aisles are separated from the nave by arcades of five

THE PASTEUR FILTER

arches, supported on beautifully moulded and clustered columns, the arches rising to a height of 27 feet. The building is entirely of red stone, outside and in, plasterwork being debarred. The architect of the building is Mr. G. F. Bodley, R.A.

In the case of the new St. Bride's, no estimates or contracts have been entered into; but a stipulation for the very best work has been made. The cost will probably be close on 40,000*l*. The builders are Messrs Stephens, Bastow & Co., London and Bristol; and Mr. Arthur Barber is clerk of works. The memorial-stone was laid by Mr. R. T. N. Spier, of Culdees, convener of the Home Mission Board of the Representative Church Council.

LIMITS OF HIGH BUILDING.

It is satisfactory for the rest of the world that New York should proceed as fast as it can to the logical extreme in high building. What the rest of the world wants to know is, What will it come to? What is the limit, and what are going to be the consequences of building up to the limit?

The limit in height is practically in sight, says Mr. W. A. Langton in the *Canadian Architect*. Passenger elevators, which were the generating factor in these buildings, are also fixing their limitations. Accessibility to the street level is what is required for an office; and, when buildings are so high that time is wasted in going and coming in the elevator, the offices in the highest floors will not rent sufficiently well. The device of express elevators gets over the difficulty to some extent, but in the first place there is a limit to the percentage of floor space that can be given up to the elevator shafts if the building is to pay, and in the second place there is a speed limit in elevators. What is known as a "nausea limit" is recognised; anything above this rate of speed is found to be uncomfortable—at least for landsmen. For men this rate is said to be 720 feet a minute; for women not more than 600 feet, and the descent must be much less rapid than this. Anything faster than 400 feet a minute going down is distressing; so that about 600 feet per minute up and 400 feet per minute down is the maximum for an express elevator. The floor to floor elevator is still further reduced in speed to enable the operator to make a prompt stop. If with higher speed he bobs up and down at every floor—a consequence partly of human weakness and partly of the elasticity of steel rope—

there is no ultimate gain in speed and considerable waste of power. Limiting calculations are often upset by new inventions; but where the human body is the measure there is a standard which may be relied on not to change. It is difficult to conceive of more rapid motion up or down for human beings than the present nauseau limit, or of more abrupt stops at this rate of speed without great discomfort to the occupants of the car; and we may therefore accept as a scientific datum the present opinion of engineers in New York that the limit of business buildings due to the limited speed of elevators is between twenty-five and thirty storeys.

This may be the limit of height, but how to fix the limit of continuity? A skyscraper at intervals is a gain in every way; it gives well-lighted, airy and quiet offices, and it makes the street picturesque. A row of skyscrapers converts the street into a box canyon of unwholesome gloom; but it is not to be compared to the gloom and unwholesomeness within the buildings themselves. This condition of affairs is rapidly approaching in New York. There is what almost amounts to a skyscraper war going on. The early tall buildings in which, with more confidence than judgment, the party walls were filled with windows, are now in an awkward position. Skyscrapers are rising beside skyscrapers and blocking up whole walls of windows. Rooms which, when the buildings were erected, had the winter sun and the summer breeze, are now sealed up in darkness for ever, and the sanitary consequences are beginning to cause alarm. In the lower rooms, in a street of continuous skyscrapers, there is no light anyway, and if darkness is to invade the upper storeys too the unwholesomeness of the overcrowding in these expensive offices is going to be as bad as that in the poor tenements which so much effort has been made to stop. At a recent meeting of the Municipal Art Society a prominent speaker said:—

"I read in my newspaper to-day of the benevolent project to build a great hospital for consumptives, the victims of tuberculosis, where they may have air and sunlight. And in the same paper I read of plans for a thirty-storey building. What are we trying to do? What do we mean by putting up these horrible structures, to the lower floors of which no light can ever penetrate? . . . We build hospitals for the poor consumptive, and then we turn around and erect skyscraping structures where consumption may breed, so that we shall not lack for patients."

It is not merely the darkness, but the crowding of the streets and buildings which is a menace to health and safety.

his same speaker calculates that "when Broadway is lined with these structures there won't be room for the tenants, unless they are packed horizontally 30 feet thick." It is not hard to believe that this calculation, if checked, will be found to be not far from the truth. It was calculated at the beginning of the year that the buildings of nine storeys or more in the lower part of Manhattan Island, below Leonard Street—that is to say, only in the tall building district proper—have added the floor area above their fifth storeys, 180 acres of area, to the island. The estimated cost of these buildings was 3,000,000 dols. There is said to be 10,000,000 dols. worth of buildings of the same sort in process of erection now, so that, as area may be presumed to compare consistently with price, when these are completed, which will not be long at the rate these buildings go up now, there will be added to this small district 240 acres of standing room above the streets; but there will be only the same old streets to walk in, and these more than ever filled with vehicles from other parts. The Broad Exchange building has a floor area of 12½ acres and a normal population of 4,000 persons. Apply this rate of population to the sixty acres or so of floor area (above the fifth storey) which are now being constructed, and it will appear that this portion of New York is about to receive an increase in daily population of at least 20,000 souls. If they only were souls, if "in going from place to place" they need not "pass through the intermediate space," it would be all right; but 20,000 hustling bodies in streets where one has already, in going to keep an appointment, to allow time for hindered progress—it is nearing the limit.

The cure is exhibited in a trio of buildings on Broadway—a two-storey bank between two skyscrapers. This is, at any rate, the solution of the light and air problem. It would also solve the problem in design. The two storeys of the bank run with the two storeys which constitute the base of the tall building; the bank's cornice with the top member of this base; their columns and arcades are fairly comparable. Here is dignity without monotony, picturesqueness without extravagance, height without gloom; every gain without any loss except loss of space, and loss of space is gain in this case.

What other cities have to learn from New York is to put the limit out of the question by taking precautions in time. The limit is not practical. It is not worth while to shut numbers of people in darkness for the sake of getting them all together, only to find that it would be better if there were not quite so many together. The limit of elevators and the limit

of traffic and transit in the streets seem to point to the same moderation in close building which is indicated by the requirements of planning for light. It is no extreme to advocate the attainment of this moderation by municipal regulation requiring that every tall building shall be isolated above such height as usually forms the base storeys of a skyscraper. This allows for such an arrangement as is suggested by the bank on Broadway between two such buildings. It would make a satisfactory street effect if the cornice at this height were continuous and the sky-line above broken at intervals, more or less regular, by buildings more or less tall.

A way to bring this about would be to require every high builder to isolate his upper storeys by the purchase of land sufficient for the purpose. This would not be tyrannical legislation. If any criticism is to be made of it, it might be called grandmotherly legislation, for it is looking after the interests of the high builder himself to compel him to guard the value of his building in this way. It is not, however, entirely grandmotherly, for the interests of the public are also guarded in matters for which it is certainly within the province of the City Fathers to care, viz. light and air and reasonable density of population. There is also plenty of precedent in cities which owe part of their success to regulations of this kind for requiring that the low part of the building shall have, for æsthetic considerations, a cornice line of a fixed height.

GAS FROM CHALK.

A REPRESENTATIVE of the *Sussex Daily News* recently called at the office of the Natural Gas Fields of England, Ltd., at Heathfield Station, to make inquiries concerning the progress of the discovery which has been the subject of so much comment for the last year or two. Most Sussex people are acquainted with the discovery of the gas at Heathfield. Although some workmen really had the gas alight in 1895 while sinking a deep artesian bore tube in the stable yard of the Heathfield Hotel, nothing was done until the following year, when a similar discovery was made on the railway. Mr. Charles Dawson, F.G.S., F.S.A., of Uckfield—who is now geologist to the large company owning the undertaking—went to Heathfield, and practically discovered natural gas in the district. It is well known, too, that for a long time Heathfield Station has been lighted by it, and that the engine which pumps the water for use of the locomotives passing through the

Upper Saint Martin's Lane, LONDON, W.C.

station is also driven by natural gas. Many houses and business premises in Heathfield are also lighted by it, and the users speak in terms of unqualified praise with regard to the gas. At Mayfield Station a deep boring has been made without apparent success, and it is considered that the gas-bearing strata was full of water when the boring was made, and as it was cased to keep the water back, that it has been passed. Hopes are still entertained of finding gas there. The company have made some twelve boreholes in the Heathfield district, and have been successful in finding gas on each occasion. This work has gone on now for some eighteen months, and the yield of gas has continued the same during the whole of the time. The advice of the highest authority has been sought, and there is a consensus of opinion that there is a very large quantity to be found throughout the district. The gas has its origin in the Timmeridge clay, which is stated to smell strongly of petroleum, or mineral oil, throughout its vast area. In point of quality the natural gas of England has an advantage over that of America. The latter, burnt in the ordinary fish-tail burner, is practically devoid of illuminating power, while the English gas, burnt in the same way without previous enrichment of any kind, gives a candle-power of about 14.

That the discovery is one of national importance everybody will admit. Given further success at the borings and a continuance of supply the possibilities are multitudinous. Not only might various towns all over the South of England be supplied with the gas, but power-generating stations could be established on such a scale that the manufacturing industries would be revolutionised. It is said that more than one American millionaire owes a great deal to natural gas. Mr. Carnegie in 1885 said:—"In our steel rail mills we have not used a pound of coal for nearly a year, and in our iron mills for the same period the change is a startling one." Where we formerly had ninety firemen at work in one boiler-house and were using 400 tons of coal a day, a visitor now walks along the long rows of boilers and sees but one man in attendance. The cost of the coal is not only saved, but the great cost of firing and handling it, while the repairs to boilers and grate-bars is much less." Preparations are being made at Heathfield for establishing factories; there is a rumour that negotiations are pending for electric power to be supplied from Heathfield to the London, Brighton and South Coast Railway to run trains by electricity from Tunbridge Wells to Eastbourne. Gas has been found at Mayfield, and efforts will shortly be made to find it at Crowborough, Groombridge and other places in the

district. The only question in the mind of the public has been, "How long is it going to last?" That, of course, is an important question—at least, it has been—and, as has been said before, the highest advice as to the probable length of supply has been obtained. It is, however, no longer a question of importance, and the *Sussex Daily News* has been furnished with details of an invention which will doubtless be the subject of conversation throughout the scientific world before the week is over. Natural gas may last for years, or, on the other hand, the supply may cease, but with the new gas there can, it is stated, be no question of failure of supply.

The new invention, our representative was informed, is to be called "The Pearson Gas," after the managing director of the Natural Gas Fields of England, Ltd., whose discovery it is, and it may be said at once that it has been tested by Professor C. Vernon Boys and Professor W. J. Atkinson Butterfield, both of whom have pronounced it an unqualified success. It is claimed that while it will be from 25 to 30 per cent. better than ordinary gas for heating purposes it can be produced at so small a cost that it could be sold at the rate of 2d. per thousand feet, while the price of lime will be reduced from approximately 12s. 6d. per ton to about 5s. 6d. The process by which it is claimed this revolution will be achieved will be by obtaining gas from chalk, and in all probability Lewes and the South Downs will soon hear a good deal more about the matter. To every hundred tons of chalk will be mixed about ten tons of coke or coke breeze, and from this it is claimed 10,500,000 cubic feet of gas will be obtained. After the gas leaves the limekilns it will pass through a series of converters and regenerators, which will be blown up to a great heat, and all the power for this purpose will be generated by the waste heat from the various processes. The calorific value of the "Pearson" gas is 52½ heat units per cubic foot, which shows a great advantage over other gases—Siemens's being 30 heat units, the Dowson gas 37 and the Mond 47. The chemical analysis, too, is greatly in its favour, giving the following figures:—CO 44, hydrogen 20, CO₂ 6, nitrogen 30. It is highly probable now that, instead of supplying gas to Eastbourne and other places from the natural gas supply at Heathfield, a plant will be laid down for the manufacture of the "Pearson" gas. To a county like Sussex, abounding in chalk, the discovery of this method of manufacturing gas holds forth untold possibilities, while it should also mean a considerable reduction in the price of almost every article in the making of which either heat or power is used.

THE WEEK.

THE calamity at Eton on Monday morning, when two boys lost their lives through the fire in one of the houses of "Baldwin's End," reveals that on such occasions few buildings can be considered as secure. Special arrangements for escape are rarely demanded by building owners, and if they were more general they might help to create uneasiness among nervous people. At the inquest on the victims no cause was assigned for the outbreak of fire. The electric light was used throughout, and although there was gas also there was no danger from its coming in contact with anything inflammable. One of the boys who lived in the house said smoking was not allowed, and he never knew of any interference with the lights or playing with fire. It was also proved that the fire was not caused by electricity. Although the house was old and there was lath and plaster within, yet the fire lasted four hours in spite of all the efforts of the firemen. Three of the windows were barred, and it was owing to the failure to break one of the uprights with a crowbar that one of the victims suffered. The jury, while admitting there was no evidence to show how the fire originated, recommended electrical communication with the engine-house for every boarding-house in the college, and that printed lists be placed prominently in every house. They also advised the removal of bars from all windows at once. The bars were introduced for safety, and their removal may lead to accidents. What is more desirable at Eton, as in schools and institutions where there are many inmates, is special drilling. The headmaster, Dr. WARRE, must have had a presentiment of the tragedy, for in January last he wrote to all the house masters, saying:—"It is the duty of every house master to see that in cases of fire there are ample appliances for dealing with it in its initial stage, and, secondly, sufficient ways and means of escape for all the inmates of the house. It is advisable also that the boys in every house should have fire drill once or twice in a schooltime, and that each and all should be taught what to do in case of emergency."

THE médaille d'honneur at the salon of the Artistes Français in the section of architecture has been awarded to M. RAYMOND CHAUSSEMICHE. First class medals have been won by M. NODET and M. MUNIER. Second-class medals by MM. LAPEYRÈRE, FORTIER, ROUSTAN and HÉBRARD. Third-class medals by MM. RIPIN, DAVI, DELAPORTE, CRET, BRUNEL & POTTIER and HERLOSSON. In the section of painting the successful artist is M. GABRIEL FERRIER. Although there were several candidates, the contest lay between him and M. HENRI MARTIN, who is one of the representatives of sober Impressionism. In the first voting, when 430 votes were given, M. MARTIN obtained 142 and M. FERRIER 113. In the second, out of 452 M. FERRIER obtained 216 and M. MARTIN 184. In the third, out of 407 M. FERRIER obtained 243 and M. MARTIN 148. M. FERRIER is a native of Nîmes, and studied under M. PILS and M. HEBERT. He won the Prix de Rome in 1872. One of his principal works is a ceiling painting having for subject *The Glorification of the Arts*, which was executed in the French Embassy at Berlin. M. FERRIER is well known to many English painters through his connection with the Académie Julian. In the section of sculpture M. HANNAUX has gained the medal. In the second voting M. HANNAUX obtained 103 and M. SOULIS 30. M. HANNAUX is a native of Metz and studied with MM. DUMONT, THOMAS and BONNASSICUS. He has not been fortunate heretofore in obtaining rewards, and he was not distinguished in the Ecole des Beaux-Arts.

At the last meeting of the Anthropological Association of Berlin a paper was read by Dr. STÖNNER on the Temple of Nakhon Wat. Probably it is no more than a preliminary exercise for a large volume on the subject. It is doubtful whether in the East there is a more remarkable temple. FERGUSON devotes several pages to it. It is almost an exact square and measures an English mile each way. The walled enclosure of the temple is 1,080 yards

by 1,100 yards, and is surrounded by a moat 230 yards wide. The outer enclosure has an area of 370,000 square feet. This is, however, exceeded by the Temple of Karnac, which has 430,000. The sculpture, it is calculated, represents from 18,000 to 20,000 figures, mostly battle scenes. The relief is so low as to be taken at first sight for incised work. "The Gothic architects," says FERGUSON, "attempted to incorporate their sculpture with the architecture in the same manner as the Indian architects. The Greeks, on the contrary, kept them distinct; they provided a plain wall outside the cella of the temple for their paintings and sculpture, and protected it by screens of columns precisely as the Cambodians did, and it is difficult to say which was the best principle." Dr. STÖNNER found that a large part of the sculpture was in good condition, but nothing was done for the conservation of those wonderful works. Vegetation is allowed to appear everywhere unchecked. Some of the doors were so large that an elephant with its howdah could easily pass through. Although many kings have taken a share in the building, it was never completed. Dr. STÖNNER was able to show a vast number of photographs of the sculpture and other portions of this marvellous building, and he expressed surprise that so little was known of the structure by Europeans.

THE census return of the number of houses in England and Wales shows a steady increase during the century which ended on April 1, 1901. On that date there were 6,260,852 inhabited houses and 448,932 described as uninhabited. But among the latter were 189,137 which were utilised for business or other purposes during the day, but were without inmates on the census night. There were also 61,909 houses building. The increase of inhabited houses in the ten years between 1891 and 1901 was 14.87 per cent. The houses in course of erection indicated a larger increase, for in 1891 there were 38,387 against 61,909 in 1901. The latter number was larger than in any of the decennial periods, the nearest approach to it being 46,414 in 1881. The inhabited houses in 1801 numbered 1,575,923. The increase during the century has therefore been nearly four-fold. The families or separate occupiers of houses in 1801 numbered 1,896,723, consisting of 8,892,536 persons. In 1901 there was an increase of families to 7,036,868, and of persons to 32,527,843. The ratio between occupiers and houses was nearly similar in the first and last period, but there were slightly fewer persons in each house in 1901, or, in other words, there was in general less crowding.

THE statue of DEMOSTHENES in the Baccio Nuovo has long been considered as one of the noblest examples of ancient portraiture. RICHARD COBDEN was more captivated by it than by any of the great works in the Vatican. Instinctively, he said, everyone who was the advocate in a great cause must believe in the fidelity of the likeness. The figure, it will be remembered, holds a partly unrolled scroll in both hands, and the strained arms are in keeping with the pose and with the determined look on the face. The whole force of the orator's soul appears to be concentrated in the expression he uttered at the moment. For a long time doubts have arisen about the correctness of the attitude. Why should he hold a scroll? His speeches were no doubt most carefully prepared, but DEMOSTHENES was never likely to read from a manuscript in public. There would, however, be no extravagance in supposing he was reading from a record or commenting on an indictment of one of his enemies. There was a statue in Athens which had clasped hands, for the story is told of a robber placing some money he had stolen within them. It was supposed by some archæologists that the scroll was an addition, and the hands were originally differently placed. Dr. PAUL HERTWIG has, however, brought evidence in support of the existing arrangement. Last year remains of a statue were found in a Roman garden, which appeared to be a copy of the *Demosthenes*. The hands were tolerably well preserved. A cast was obtained of the statue in the Braccio Nuovo, and there was little difficulty in adapting the hands to the arms. In one there was a very slight difference, which rather confirmed the conclusion. There is sure to be discussion on the subject, but at present there is less doubt about the introduction of a scroll in the orator's hands.

TYPES OF COSTUME :—ANGLO SAXON.

FIREPROOF CONSTRUCTION AT EARL'S COURT.

DURING more than fifty years there has been a struggle in the great exhibitions between business and recreation. In Hyde Park, in 1851, there was little scope for the latter, but the dawdlers of society were supposed to have their wonder excited in some degree, and to be gratified, as far as they were able, by such an amazing amount of industry. As time went on recreation gained the upper hand, and the last Paris Exhibition, which was believed to be the climax, derived any success it attained through the arrangements made for diverting the mind from arts and industries. The Earl's Court Exhibitions have been so long associated with amusement, it is difficult for the public in general to believe they can have any other purpose. There has always to be a modicum of reality, and the cleverness of the management is shown by making it serve as a nucleus around which spectacular displays of a gorgeous kind can be arranged. But it must be owned it is a disadvantage for those to whom the nucleus is everything to find themselves and their productions relegated to the positions of mere atoms, which are likely to be overlooked amidst an immense mass having diverse elements. Many people object to such a sacrifice of themselves. That we believe to be the principal cause why the exhibition of means for fire prevention and fire extinguishing at Earl's Court has not the comprehensiveness that is desirable with a subject of such vast importance.

The exhibitors can feel justifiable pride in knowing that if they were absent the *raison d'être* of the exhibition would not be apparent. We do not suppose if a different class of objects were suddenly introduced into the "Queen's Palace" and "Imperial Court" there would be any diminution of sightseers. But there is logic in the theory of spectacle production as well as in graver matters, and the elimination of such "industrial exhibits" as belong to fireproof construction would deprive the whole show of a piquancy otherwise unattainable.

It requires, however, a spirit of resignation for an exhibitor to be satisfied with what takes place. There are undoubtedly invaluable inventions to be seen in the spaces assigned for the display of "industrial exhibits" at Earl's Court. But with so many counter-attractions, each of which strives to monopolise the attention, what chance of being recognised has a piece of concrete which no ordinary fire can overcome, or an apparatus which by timely use can prevent the extension of flames? It was an old fable that HERCULES, when placed between pleasure and duty, inclined to the former, and weak mortals should be excused if they prefer music, chutes, fiery lava, glacier glides and other sights and sounds to the modest triumphs of inventiveness, each one of which represents not only a large outlay of money, but years of patient labour in experiment. The exhibitors have of course the possibility of finding amidst such large crowds an occasional appreciator. On the other hand, a great many people visit the exhibition

repeatedly without condescending to cast a glance on the part which in one sense is of most consequence for the public, and the most deserving of attention. For that reason we have resolved to confine our notices to what are called "industrial exhibits"—a phrase that is not only inadequate, for it does not even suggest the scientific character of methods of construction, engines, apparatus, &c., but refers also to the polishes, lace, confectionery, tobacco, jewellery, which are assigned places near the inventions.

That martyr to duty, JAMES BRAIDWOOD, one of the victims of the great Tooley Street fire, considered that before means of preventing or extinguishing fires could be attained it was necessary to consider the causes of fire in this country. The result of his experience as superintendent of the London Fire Brigade he gave in the following enumeration:—(1) Inattention in use of fires and lights; (2) improper construction of buildings, &c.; (3) furnaces or close fires for heating buildings, or for mechanical purposes; (4) spontaneous ignition; (5) incendiarism. The order in which the causes were arranged corresponded with the knowledge acquired during his time, or about fifty years ago. The same causes still prevail, although their relative danger may have been altered. In the Earl's Court Exhibition there is nothing to suggest the improvements which diminish the risks of heating and lighting. Spontaneous ignition may be overlooked, for only two cases arose in 3,400 fires, and incendiarism, of which fortunately there were only six cases, is not easily prevented by inventions. We may therefore divide the exhibits in the section into two great classes—those relating to the construction of buildings and those relating to the extinguishing of fires. At present we shall deal with the former.

In construction what appears to be most remarkable is the attention given to concrete. The name is too generic, for there is not much affinity between the colossal masses used in Roman structures and the refined but tough material of which we see specimens in the exhibition. But there is still an inherited prejudice in favour of coarseness, for one of the drawbacks to the use of concrete is the prevailing belief that untrained labourers are adapted to carry out the work.

Messrs. HOMAN & RODGERS, who have been constructing concrete floors for about thirty years, use concrete in flat slabs of 6 or 7 inches. They employ a flat-boarded centreing which can be removed in four or five days. The construction has the advantage of tension bars between the steel joists, and therefore the concrete has rigidity in length and breadth, and can meet a variety of strains. Another method of theirs derives aid from the use of a fireclay hollow brick especially made in a manufactory of the firm at Parkstone. It is of triangular section, but the sides are not of uniform thickness, for each has ridges which form an excellent key for both plaster and concrete. With steel joists 18 inches apart this flooring is of great strength, and has been used in public buildings, factories.

warehouses and other places where heavy loads have to be sustained. From the experience of the firm in steel construction there is surety that the desired strength will be always secured.

The Columbian Fireproofing Company make floors which may well be described as monolithic. Their main girders are of the ordinary I section, but the ribbed bars auxiliary to them, and serving as cross-ties, may be called smaller I bars, with the web extended above the top and bottom flanges. The dimensions, of course, are adapted to the load and the span. In some cases the bars are much more elaborate, and resemble three or more small I joists superimposed. Care is taken in the arrangement to avoid rivetting, and from their peculiar sections the bars can be held firmly in stirrups. The concrete slabs for lower flanges of girders are held on by hoop-iron anchoring. The system makes an excellent floor. It is claimed that the floors are proof against falling loads on account of the action of the rib-bars. In a warehouse at Pittsburg a drop-test of 238 lbs. falling 8 feet was sustained. That is a more severe test of adhesiveness than a great but quiescent load. On a floor where the spans were 16 feet a load of 9,000 lbs. was placed on a base of 3 feet by 3 feet, or a load of 1,000 lbs. to the foot. In Boston a load of 1,400 lbs. to the foot was applied. A floor constructed to carry 175 lbs. per foot safe live load was tested by placing 24,000 lbs. on the centre of a 16-foot span. The floor was detached; that is to say, it was only partly constructed, and was not continued to the wall or abutment. The load was equal to a distributed one of 48,000 lbs. It was found that "the total deflection on a 16-foot span was $\frac{3}{4}$ inch, and the load remained on the floor for forty eight hours without any further deflection. The load was then removed and the floor returned to its original and level position without the slightest crack in concrete." The fire-resisting qualities are also remarkable. In New York a floor with a load of 150 lbs. per foot was subjected to 2,200 degrees of heat for five hours, then drenched with water and loaded to 600 lbs. to the foot without any injury. In London a floor with a load of 168 lbs. per foot was subjected to a heat of 2,500 degs. Fahr. for two and a half hours without the fire passing through the concrete, for the wood fillets on the upper surface were uninjured. The number of American buildings in which the system was employed is remarkable. The Boston Wharf Company have used 520,000 feet of it. There is a lengthy list of English buildings, including Windsor Castle, the Patent Office, many banks, theatres, large electric power-houses, &c.

Granolithic pavement has long been in request for out of door use. It is now extensively employed as a fire-proof flooring. The whole of the floors, roofs and staircases in the North British Railway station, Edinburgh, are of the material supplied by STUART'S Granolithic Stone Company, comprising 253,000 super feet of flooring, 43,000 lineal feet of casing of beams, 21 acres of plastering on walls and ceilings, 15 miles of cornices and 15 miles of cement skirting. The use of the material has enabled elaborate ceilings with very deep coffers to be constructed. Hence there is an impressive architectural effect obtained as well as safety. The building, it is known, was only lately constructed, and indicates the extended use of fireproof material in this country. The examples to be seen at Earl's Court show the applicability of the material to flooring, arching, columns, casing of girders, steps, &c.

There was at one time a belief that timber might be protected if covered with sheet-iron. But FARADAY and Sir WILLIAM TITE said if the heat were continuous, the iron did more harm than good. Uralite, which might be considered as flexible, can act as a preservative for wood or other substance for a long space of time regardless of the strength of the flames. If it were only as a protection, there would be a wide field for the employment of the material, but Uralite has many uses. Until an experiment is witnessed, a sceptic might doubt that what seems to be as frail as a piece of Bristol board can defy intense heat to which other materials succumb. It can be used for ceilings, partitions, and walls, with advantage. Messrs. MATHER & PLATT produce doors and fire shutters in which it is an essential element. Insurance offices accept the material as fireproof. It owes its fire-resisting qualities partially to asbestos being one of its constituents. It is

one of the materials which have given a new power to architects. As it is now made in the British Uralite Company's works at Higham, in Kent, it becomes a national manufacture of which the use will extend in course of time.

People have often wondered why the general use of the bamboo by the Japanese has not become suggestive in this country. It is an example of nature's mechanics, for it combines strength and toughness with economy of material. In the Mack slabs, of which Messrs. J. A. KING & Co. are the manufacturers, we have a material which seems to be peculiarly adapted for partitions. About the lightness there is no question, and as the slabs are made in lengths of 6 feet by 1 foot, they can be fixed with expedition. As sometimes happens with new materials the fire-resisting quality excites surprise; they have stood tests of more than 2,000 deg. Fahr. and remained intact. Another advantage is that they are sound-proof, owing to the air cells formed by the introduction of hollow reeds. They can be coated with plaster if desired, but they can be finished in such a way that plastering is not required, and the papering may be applied a few hours after erection. The Mack slabs can be used with steel joists and thus become a valuable fireproof flooring. They are also applied in connection with roofing, and remove some of the inconvenience of mansards and pitched roofs. They have also been applied as a casing for stanchions and girders. In the North British Railway hotel the slabs were employed for the fireproof partitions.

At the stall where the slabs are exhibited Gypo, a fire-resisting plaster, and LAWES'S Keene's cement can be seen. The name of the producers, JOHN BENNET LAWES & Co., is a guarantee of the efficiency. There is also a very ingenious steel corner plate, from Mr. W. F. PARKER, of New York. Many builders have wondered at the expedition with which American structures are raised. One of the aids and appliances is this corner. It removes the difficulties in forming vertical arrises, and serves as a trimming for windows and doors. It is at the angles that the wear and tear of buildings becomes most manifest, but with this invention even mischievous corner boys would have to respect masonry.

When expanded metal was first proposed to be used in connection with concrete there was some incredulity about the results. It was predicted there would be a repetition of the consequences following the employment of cast and wrought-iron for compound girders. Dissimilar materials could never, it was believed, co-operate at the same instant when the greatest strength was necessary. Experience has set aside all those apprehensions. The slight trelliswork has been found to impart new qualities to the material. Concrete can be used either as slabs or as flat-arching, in partitions, in ceilings, or in arches, and in all cases it is found that a vast accession of strength is acquired by the introduction of metal in a suitable form. The trelliswork has many properties of its own, but its main importance in construction is that by means of it the tensile strength of concrete, which was formerly one-tenth the compressive endurance, is now equalised. Or, to put it in another way, concrete represented the cast-iron beam; with the intercalation of expanded metal it becomes like a wrought-iron or a steel beam. The invention is exhibited by the New Expanded Metal Co., Ltd.

A system of construction largely employed in Scotland by such architects as Messrs. HONEYMAN & KEPPIE, Messrs. PEDDIE & BROWN, Mr. J. CHALMERS, Messrs. BAIRD & THOMSON, Mr. F. M'GIBBON, Messrs. H. & D. BARCLAY and Mr. W. LEIPER is the Fram arch-block. The system is ingenious. Let a small flat arch be supposed which is thicker at the haunches than near the centre; let it be divided in two for the sake of manufacture and that the centre part is thickened, and we then have a rough idea of the form of the blocks. The haunches are shaped so as to allow of seating on the flange of a girder or the off-set of a wall. The soffits form a not unpleasing ceiling which recalls an arch with fluting. The blocks are largely utilised for warehouses, factories, printing offices, &c. It is adapted to various kinds of floors, and time is saved because as soon as the blocks are laid they have no need of drying. All that is needed to be put up are the steel joists, and the arch blocks can be laid without staging or centreing. The system is exhibited by Messrs. G. ASTON & SON.

Another example of the applicability of hollow bricks for partitions is seen in the "Shepwood," called after the makers. The bricks are made in various forms. They can have grooves in which plaster may be inserted on both sides, and then the thickness is only about 3 inches. The face can also be left plain when there is lime-whiting or distempering. The system has been adopted in several hospitals, banks, offices, and for cubicles in homes.

A variety of the use of metal in connection with concrete is seen in HAYES'S patent. The sheet steel is punctured in oblong forms, the metal thus forming tongues which act as a key to the concrete or whatever material is employed. From their flexibility the plates may be used as a covering for boilers over which a non-conducting material can be placed.

Windows have long been recognised by firemen as among the most dangerous spots in a building. As BRAIDWOOD said, as soon as fire breaks through a window or skylight the whole place becomes an immense blast furnace. Every minute during which a window remains whole is therefore precious, perhaps more so than as regards any other part of the premises. Hence wired rolled glass, manufactured by Messrs. PILKINGTON BROS., of St. Helens, is a boon for which the public should be grateful. A window and a skylight in which wired glass was used have been subjected to flames and water without allowing an entrance to air. The case seems to bear some affinity with the use of metal netting in concrete, but however explained the result is most satisfactory.

In a constructive sense the St. Pancras Ironwork Company, Ltd., could hardly fail to be prominent in such an exhibition. They do not exhibit large buildings, but there are examples enough to suggest the wide range of their operations. Everyone who has taken an interest in fires must acknowledge how painful is the effect in seeing stables in which vigorous but helpless animals have been destroyed. The company were the pioneers of the revolution which has compelled every gentleman who professes to have tender feelings to secure his stables as well as his residence against fire. But there are other dangers to horses besides fire, and they also are overcome. The necessity for external staircases has enabled the St. Pancras Ironwork Company to extend a class of work long recognised as one of their specialties. The advantages of their system are manifested by the large number of hospitals at which their staircases have been set up. In times of panic the least vibration or slipping may lead to a catastrophe. A new patent non slipping stair tread has been introduced, in which steel and a peculiar concrete is combined. The new staircases can be adopted externally or internally, and there are many cases where they are urgently demanded.

THE PRINCIPLES OF ARCHITECTURAL DESIGN.

By PERCY L. MARKS.

CHAPTER XII. (continued).

IN designing terrace-houses it is unnecessary to consider any claim for symmetry in regard to a single house. The whole block may take a symmetrical form, or a lesser number of the houses may be so combined.

The first principle affecting the typical terrace-house is one of economy of construction; or, at the very least, the avoidance of extravagance. Consequently, everything tending to strengthen the expression of the principle is commendable—pretentiousness is particularly out of place. In the spirit of inquiry it might be asked, What constitutes the quality (or vice) of pretentiousness, and in what respects are columns, balconettes and pedimented windows, &c., more to be deprecated for terrace-house designs than are porches, gables, balconies and so on? Clearly the answer would be that all features which are solely ornamental are unsuitable wherever the requirements are strictly utilitarian, or, to word it scientifically—the use of ornament should vary inversely as the claims of economy. It might, however, be urged that the various specimens of the genus "speculative builder" pin their faith on features ornamental as distinct from utilitarian, with the hope of attracting victims, that is to say, householders. Defective principles,

however, cannot be justified by an appeal to the foibles of mankind.

Frequently speculative houses other than terrace-blocks are met with, where the principle of utilitarianism will be consistently modified in accordance with the rule stated above. It is well known that many blocks of terrace-houses are designed for tenants of wealth and consequence, and their treatment from a decorative standpoint will be in keeping with the altered requirements.

Some notes on the principle of *Continuity* may be included here.

It is largely dependent on that species of truth which appeals to the imagination, and which must be satisfied, in addition to what may be termed constructive truth. When the essential purposes of a column, an arch, and a lintel are under consideration, it will be observed that we obtain, in the first case, direct vertical support, and in the other cases, the support of evenly-distributed loads over voids.

It is desirable, for æsthetic reasons, to refrain from exaggerating supports, even as it is necessary to avoid overloading them constructively.

Recognising then, what are the essential purposes of a column, an arch and a lintel, the design should fully express these purposes. The arch should carry its burden from the centre to either side of the void that it spans, and the eye should be able to grasp clearly the fact that this is effected. If, however, as may so frequently be observed, square projecting voussoirs alternate with other voussoirs flush with the wall surface, or in a plane set back from that occupied by the square blocks, the effect of spanning the void is interfered with (see fig. 78); for the alternating faces

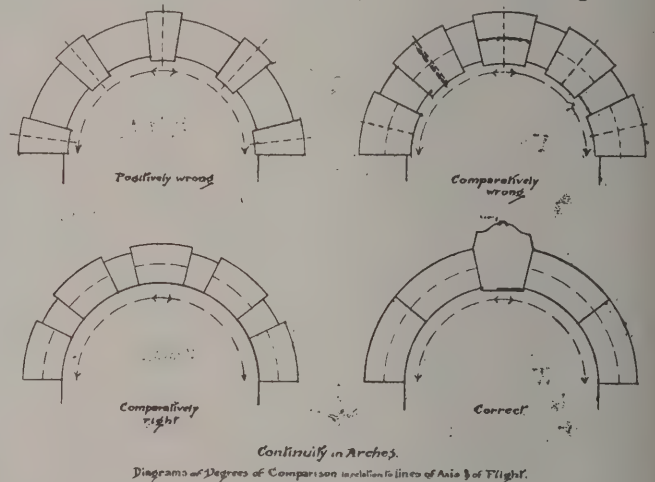

FIG. 78.

seem to break the continuity of the arch, though, as a detail of construction, adverse comment is uncalled for. The fault is greatly due to the misuse of contrast.

There would be less objection if the blocks were oblong, having the major axis in the line of flight of the arch; but still, the disturbance is æsthetically wrong. With arches objection cannot be taken to a projecting keystone, even though its main axis be vertical, as the distribution of the load is effected both ways from the centre to the sides of the void. If the voussoirs are all flush one with another, the manner of jointing is not of consequence, as the flight of the arch will then provide the lines of greatest prominence. Consequently, the knowledge that the radiating joints in a brick arch are both numerable and in a contrary direction to the axis of flight, does not act as a disturbing factor in good design.

The above remarks apply with equal force to the continuity of lintels; in truth, the application has rather greater force, as the basic idea or principle of the lintel is the spanning of a void by a single stone. It is wrong to use arcuate construction for a seeming lintel, and it is equally wrong to break up a seeming lintel into a succession of blocks. The eye should be carried from end to end of the lintel without pause, and most assuredly there should not be a keystone, to which the beam principle is utterly opposed.

A different line of reasoning is pursued respecting the necessity of continuity in columns. The support, in order to be effective, must have a good foundation, and though it is not necessary that the latter should be apparent to the

eye, there should not be any cause (real or illusory) to doubt that the support is both adequate and firmly based. Anything, therefore, that tends to destroy the line of continuity between the points of application and foundation of support interferes with the expression of the truth first alluded to—that is, perceptive truth.

There is also another element introduced by the want of continuity, and this is the appearance of malformation caused by the alternation of cubical and cylindrical blocks. The plea, often advanced, that an effective play of light and shade is provided, has a semblance of justification that does not outweigh or even balance the disadvantages. And if the alternation of blocks is merely as between cylinders of different diameter, an appearance of monotony is created, from which the continuous column is entirely free. And it is this element of malformation that is so frequently accountable for the feeling of repugnance created when viewing many modern buildings, whose squat columns and pilasters are still further dwarfed by this treatment of blocking-out, and whose window architraves, instead of forming a pleasing framing, are tortured to an extent that places the spectator's sensation of repugnance beyond the charge of affectation.

Whilst it is graceful, when writing, to indulge in praise or commendation of co-existent brother professionals, mentioning their names, it is invidious to specify those whose work gives occasion for detraction; and this is more especially the case, as it would be an obvious criticism against the critic that the latter might be condemning what was purely a matter of individual taste.

The use of this latter phrase leads by an easy process to some remarks on *individuality* in design, a quality that has legitimate scope for display. It is a quality of personalism, and academic rules cannot be laid down on any but the broadest lines; the utmost that can be advanced is that the creations of designers should faithfully interpret their ideals—granting, as a necessary preliminary, that the ideals are worthy. Amongst contemporary architects, Messrs. NORMAN SHAW and ERNEST GEORGE, in grafting their own artistic ideas on a good architectural trunk, have produced work whose individuality is both justifiable and satisfactory.

The effect of personalism may, however, in some cases be justifiable without being satisfactory, as some of the modern work exemplifies. In the ranks of historic architects, the works of WREN and ROBERT ADAM show this quality in pleasing fashion, that of the latter more especially in surface decoration. It is a quality that will admit of extension amongst architects; with artists it is prevalent, and to mention two merely as types, Mr. ORCHARDSON, R.A., is an individualist in colour, and the late GEORGE CRUIKSHANK in technique.

With the subject of personalism is connected the use of what may be termed *conceits*; that is, little tricks and mannerisms that may or may not be traceable to a logical basis. For example, Sir WILLIAM CHAMBERS introduced *bucrania* (ox skulls) on many of the metopæ in his designs, and this ornament (!) was as unpleasing as it was illogical; in the ancient temples there was sense in the use of this feature, symbolical as it would be of the sacrifices on the altars. As another case, consider the gryphons, to whose use ROBERT ADAM was so addicted; it may be granted that the feature cannot be justified on any grounds of distinct appropriateness, but this justification is unnecessary; the ornament is a graceful one, and does not carry with it any objective significance as noted above in the case of an ox skull; so that on negative grounds it may be permitted, even if some be found to demur as to its positive suitability.

Another feature whose use now is nothing more than a "conceit" is the gargoyle. Originally these grotesque figures acted as rain-water outlets from the roofs, and projected sufficiently to throw the water clear of the wall surface; passers-by below had, however, to look after their own interests, and in this very fact lies the justification for any grotesqueness or impishness conveyed in the carvings, though it is not claimed here that the mediævalists reasoned thus. Water is now carried from the roofs more soberly, and with due regard to the common-law rights of individuals; consequently, gargoyles are quite out of place, though their introduction may well be condoned on such a building as the

Natural History Museum, London, when its purport is remembered.

The use of MEDUSA's head, masks and satyr-faces on keystone voussiors, as also the use of a lion's face resting on the paws (as in fig. 79), and similar absurdities are all "conceits," and may all be advantageously avoided. That there are occasions when the employment of one or other of them is justifiable, does not detract from the value of the rule. For example, an exceptional case would be in connection with an art school, where there would be a certain appropriateness in portraying externally by means of sculptured masks the series of "passions" (as a distinguished physiognomist has called the various psychical emotions). Similarly, many of these might appropriately be used on the façade of a theatre. But when all is said, these are exceptional buildings.

It is on a par with the "knocker" designs so frequently met with. To employ a dolphin, a serpent, a human head and other images in places where their use will be to hammer a door for the purpose of attracting attention is the height of absurdity. But if a closed fist is represented, the appropriateness is at once apparent.

Any *conceits* partaking of the character of pretentiousness should be condemned. For instance, the use of eagles, couchant lions, &c., in statuary is absurd except on menagerie buildings or for heraldic purposes; when employed as "supporters" to the entrance of small suburban property, their inappropriateness is apparent.

Another feature calling for notice is the "Persian" figure. These carvings are often known by the generic name of "Atlantides," and the female basket-bearers are known as Caryatidæ; of the latter, further mention is unnecessary, except to commend their use, if they are merely employed for the purpose of carrying vases or baskets on the head. But to load—to overload—to an impossible extent, a "Persian" or "Atlas" is quite unjustifiable.

It is (though, perhaps, unwittingly) an attempt at *deception*, an inadmissible quality in art. Of course, the effigy of "ATLAS bearing the Globe," used symbolically by the proprietor of *The World* newspaper, is highly appropriate. This is illustrated in the sheet of symbols (fig. at *e*). Whilst on the subject of deception, a few remarks may be penned on the debated point whether construction should or whether it need not be expressed in the design; it must be premised that by the term "construction" is understood here the *materials used constructively*. The practice of deception has the sanction of very remote antiquity, and possesses the vigour of an old age, periodically rejuvenated with the elixir of expediency; but it might all the same be asked and seriously debated, whether it is not possible to allow the veteran to "cease to live" (as it has been euphemistically termed). Is it not worth an effort to try and avoid shams? always, however, bearing in mind that in art, as in religion, devotees should not be "righteous overmuch." The late EDMUND VIOLLET LUDUC was an ardent advocate of developing design on the basis of iron construction, to meet the extended use of that commercial product; this eminent architect's idea was that the employment of iron should be frankly recognised, and that utility and decoration should go hand-in-hand. What has always, since its erection, seemed to the writer, to be a very heinous example, is the Tower Bridge, London; it possesses a certain air of picturesqueness, it is true, but it possesses two faults at least which are sufficient to destroy any pleasure that might otherwise be experienced on beholding it: (1) the style of architecture is hopelessly antiquated, and (2) the method of construction is totally different to the semblance. An excuse or an explanation that might be offered respecting No. 1 is that the style of architecture is in keeping with the adjoining Norman fortress, but if good work and substantial progress can never be made by slavish copyism of *contemporary* work, how much more must it be retarded by reproductions of *antiquity*? Moreover, the juxtaposition of typical old work and typical modern work is both pleasing and instructive. As regards objection No. 2, the *method* of construction being steel framework, the *appearance* of stone construction is inartistic; it is not necessary that the steel framing should be shown in all its nakedness, if this be thought undesirable, for stone might have been freely

Absurd Carving

FIG. 79.

and justifiably used, as long as the truthful construction was made manifest.

This is altogether different in principle to the case of the new bridge in course of construction a few miles higher up the Thames at Vauxhall. Here the constructive material is Portland cement concrete* of varying strengths, and the facing in granite is quite justifiable; nevertheless, to mention two more London examples, the stone construction exhibited in Waterloo Bridge, and the iron construction exhibited in Westminster Bridge are preferable, and each in its way a work of art.

There is at times a good deal of affected declamation against the use of Classic ornament in ironwork, more particularly in cast-iron. As long as the moulds are prepared with due care, and allowance made for any idiosyncrasies of the ore in casting, there is not any æsthetic objection to the reproduction of any kind of ornament or decoration whatsoever, except where attempts are made to imbue one material with the appearance of another.

Remarks have been made elsewhere as to expression in buildings, and it will suffice here to inveigh against a too common practice of making a building look as though its purport was totally different to the reality; not long since this led to a curious error on the part of some members of the house-breaking fraternity, who broke into a gaol under the impression that it was a banking establishment; were this to be a matter of frequent occurrence the deception might be condoned, but otherwise it is advisable that buildings should bear their character on their façade, as far as may be possible. Architects are urged to "design in beauty," and it might be thought that this is a quality, a principle, as distinctive as any other; but in reality it bears the same relation to all the other principles *in combination*, as does the divine masterpiece—a human being—to all the factors that combine to form its entity. "Beauty is but skin deep" is a saying, the truth of which is seldom questioned, as the phrase possesses such quiet plausibility; as a matter of fact, human beauty is not dependent merely on the outer lineaments, but has as factors proportion, balance, intelligence, expression and other component qualities. To revert, therefore, to beauty in architectural design: what architects have to consider is how to invest their creations with the various qualities mentioned in the pages of this work, how to give to these qualities their relative value, which, if successfully accomplished, will produce a beauty of their own. To strive for beauty *quâ* beauty is an error, but on a framework of truth, and cemented with experience, the materials employed with discrimination will insure a *tout-ensemble* that will shed lustre on the designer.

(To be continued.)

THE ASSOCIATION SKETCH BOOK.†

THE Association Sketch Book resembles those poetic works which are supposed to contain an elixir which will make us young whenever we peruse them. A third series and a sixth volume of it renew the effect which the earlier examples made upon us. It is always interesting to know whether the latest representatives are better draughtsmen than their predecessors, and, what is no less important, whether they have sharper eyes and have been able to discover subjects which were either passed over or were postponed and neglected at an earlier time. There are advantages possessed by the present contributors which could not be used by those who made the first attempts. It is much easier for a novice to make a drawing on a piece of "Whatman" than on transfer paper, which often was too absorbent, and coloured drawings need not be translated into black and white. We say this because it must not be supposed that the latest collection of sketches is, when all things are considered, superior to those forming the earlier ones. To sustain the standard already achieved is creditable. In the comparison between old and new there is no doubt the old members were handicapped. It is only right that all the improvement which time has brought

should be utilised. But we think the editors should have insisted on keeping the pages free from photography, even on a small scale. The plates ought to be in keeping with the title and thus form a veritable sketch book. They are tests of drawing, measuring and sketching, and there should be no necessity to call on the sun to play the draughtsman. The production of a plate is generally laborious, and it would be far easier to take a snapshot and have it enlarged and manipulated to the desired size. But the useful exercise heretofore obtainable would be at an end.

The third series has an admirable title-page by Mr. T. FRANK GREEN. It is no easy task to group buildings in different styles with pictorial effect. In this instance they are supposed to be viewed through a columned opening. The cathedrals, palaces, mosques, campaniles, town halls, &c., occupy a plane which gradually rises, and the summits are crowned by the Parthenon and the temple at Tivoli, while in the remote distance Egypt is suggested.

There are seventy-two drawings derived from subjects in England, France and Italy, contributed by thirty members. That may seem an average of over two plates for each, but Mr. GREGORY has nine plates of Bolsover Castle, Mr. REYNOLDS five of Aston Hall, Messrs. NEVINSON & NEWTON five of Albyns, Mr. TOWSE five of Houghton Hall, Mr. DE GRUCHY six of St. Buryan Church, Mr. DETMAR three of Wolvesey House, Mr. E. H. BENNETT six of Chartres Cathedral.

Bolsover Castle could be accepted as a model set if the dimensions on the ground plan were legible. It is an error to draw continuous lines through measurements; no doubt it is suggestive of expedition, but the lines and figures get intermingled, and it becomes difficult to distinguish a three from a five or a one from a four. Mr. GREGORY's explanatory notes in a uniform block lettering are as ample as one can desire. The details are boldly drawn, and the outlines of the sculpture and ornamentation are vigorous. The building is one of those which have won admiration from Americans, and this has caused more damage in parts than decay during three centuries. Mr. GUNN shows the porch of the church of St. John the Baptist, Barnack, on two drawings which are very careful. Albyns, Essex, gives to Messrs. NEVINSON & NEWTON abundant details from the mansion, of which parts date from about 1620. The carvers evidently had not a large supply of patterns.

Everyone knows there are three porches to Chartres—the west and north, which Mr. E. H. BENNETT has represented, and it is to be hoped the south will appear in the next volume. There is no more severe test of power in drawing than these examples of architectural sculpture, which DIDRON compared to leaves, or, we may say, articles out of one of those colossal thirteenth-century encyclopædias or *Speculum Universale* of which architects were the authors. Mr. BENNETT appears to revel in the difficulties; he not only shows the figures in the round but also in outline, and we can give no higher praise to his plates than to say they would assert themselves in any former edition of the Sketch Book. Gothic art will never vanish while there are Englishmen capable of rendering its detail in the way we see in these plates.

Aston Hall should be considered as having historical interest in a double sense, for it was the first of the stately homes of England to be acquired for public use. It is well represented by Mr. REYNOLDS, and the dimensions come out clearly, but it is not always possible to indicate the exact points to which they relate. A fireplace in one of the rooms is drawn by Mr. J. A. SWAN. Porches seem to be in favour. Mr. JOHN STEWART gives a drawing of one at Worstead Church, Norfolk, in which flint filling to the ashlar is employed. The Black Swan inn, York, is drawn by Mr. W. S. A. GORDON; it is a good type of that class of building. St. Bartholomew's Hospital receives so much public attention, the view by Mr. THEAKSTON of King Henry's Gate is likely to have unusual interest. It was rebuilt by WREN in 1702, and is now used by the beadles. The masonry is arranged in the upper part as a pilaster order running through three floors. Another work is one of the archways in Somerset House, by Mr. MACLAREN ROSS, in which there is a good deal of variety obtained in a limited area, the vermiculated courses being well balanced by those which are plain. Mr. J. G. WILES has selected the porch

* Since writing the above, it has been decided to substitute steel construction for concrete and granite.

† The Architectural Association Sketch Book, 3rd series, vol. vi. Edited by W. G. B. Lewis and W. A. Pite. (London: 56 Great Marlborough Street, W.)

of St. Mary-le-Strand, and Mr. CLAPHAM LANDER some details from the palace of Bromley-by-Bow. One of the candelabra from St. Antonio, Padua, is drawn by Mr. A. HART; it is, however, too elaborate a work to be fully represented, but the general effect is at least suggested. An Italian wine-cooler from the South Kensington Museum has been drawn by Mr. R. C. AUSTIN. The upper part is heavy and the base might appear to be too light, but owing to skilful treatment that defect is avoided, and the load appears as light as a flower. Some sixteenth-century carving in the Cornish church of Altarnun is drawn with delicacy by Mr. DE GRUCHY. The subjects are curious, and indicate an effort towards forms more diffuse than were sanctioned by Gothic precedents. Houghton Hall was designed by COLIN CAMPBELL for Sir ROBERT WALPOLE, but was operated on by "RIPLEY with his rule" and KENT. The four domes have an unusual effect, but they are not ungraceful. The picture gallery, that is so often referred to by HORACE WALPOLE, formed a separate building of one storey, and there was also a kitchen wing. The five drawings by Mr. TOWSE form another excellent set. Mr. HAROLD GIBBONS has drawn the door to the north porch of the church of St. Peter's, Walpole, which is fifteenth-century work, as well as the elaborate font cover belonging to the fifteenth century. The patterns are very skilfully arranged, but it is remarkable that amidst the mass of ornament there is nothing that has any relation with baptism or religion. The south porch and a bay in the nave of the same building is by Mr. MYRTLE SMITH. The detail of a part of one of the pulpits in St. Mark's, Venice, is drawn with vigour by Mr. D. T. FYFE. Mr. VARDELL presents one of the capitals in St. Eustache, Paris, a building that deserves more attention than it generally receives. The Renaissance type adopted was remarkable for the freedom allowed to fancy, although logically there may be a want of fitness. Mr. HORSLEY has a drawing of the Broletto at Brescia, which was much altered at the end of the eighteenth century; the part shown suggests a model which might well be adapted for houses with narrow frontages. A doorway in the Palazzo Municipale is contributed by Mr. FYFE, who also shows a part of the great hospital at Milan. The gates to the Back at Trinity College, Cambridge, appear to have been carefully drawn by Mr. MYRTLE SMITH, but the reproduction is not satisfactory, for it does not express the rigidity of the iron. A drawing of the north door of the Florentine Baptistery is by Mr. P. E. NOBBS. The famous bronze panels by Ghiberti could only be indicated by the brush, but their relation to the other parts is well rendered. The figures above the doorway by RUSTICI are lasting records of the meanness of the Florentine Council, who refused to give more than 400 crowns for sculpture of which the price was 2,000 crowns. The cloisters of Sta Maria della Pace, Rome, are by BRAMANTE. From their simplicity of treatment they formed an easy subject for Mr. F. G. NEWTON. Wolvesey House, the bishop's palace at Winchester, is the most important mansion in the volume. It was rebuilt by GEORGE MORLEY in 1684, and although plain to excess in the exterior, has excellent detail within.

Eltham Palace is displayed in some admirable drawings by Mr. W. E. A. BROWN. Two delicate views are given by Mr. G. S. NICHOL of a church at Norraine, near Caen. It is remarked that "the architect of this church was an apprentice at Rouen during the building of the cathedral there." The details of the church are therefore similar to those at Rouen. The church of St. Buryan is shown in six drawings by Mr. DE GRUCHY. They show great mastery by their decisive lines and avoidance of any stroke that was unessential. There is only one plate by Mr. C. C. BREWER, a rood-screen at La Martyr and a tower at Lamballe. Both are skilful examples of freehand work, and the subjects have the advantage of not being hackneyed, and are adapted for use in buildings on a small scale.

The editors are to be congratulated on their success in securing a collection which will be valuable as records. It will be seen from what we have said there is a desirable variety in the examples, and all reveal earnestness as well as ability in the different authors.

Mr. Frémlet has prepared an equestrian statuette of Francis I.

THE BURIED CITY OF BRAHMANABAD.

IN the course of a paper on the province of Sind, read at a meeting of the Indian Section of the Society of Arts, Mr. H. M. Birdwood said:—The first of the incidents of special interest of which I wish to speak before closing this paper is the sudden destruction of the vast and ancient city of Brahmanabad probably by a sand storm about A.D. 1020. My object is to invite public attention to certain discoveries made by Mr. Bellasis and Mr. Richardson many years ago, because their researches were of the highest interest, and so far as I know, no further effort has been made up to the present time to investigate the ruins. With this same object I read a paper on "The Buried City of Brahmanabad" before the Sassoon Institute in Bombay in 1885, after inspecting the ruins myself in the preceding year. Again, I can enter into no details. It will be enough perhaps to say that Brahmanabad was the seat, or one of the seats, of more than one dynasty of Hindu kings. The first of whom we have any authentic account was the good King Sahiras, in whose time there was no disaffected person in the kingdom. But the best known was Chach, the Brahman usurper. It was a city of merchants and traders, large and populous, surrounded by battlements four miles in circumference, with 1,400 bastions. The streets of the city can still be seen as open spaces, but the buildings, except one tower—left standing, as the historian tells us, "as an example"—are shapeless mounds of sand and brick. There can be no doubt, from what has already been discovered, that these mounds cover not only the skeletons of men and animals who were suddenly overwhelmed by the sand, but quantities of old coins, ornaments of stained glass and ivory, tortoise-shell and precious metals, cornelians, onyx, agates and other precious stones, glazed pottery, earthenware and china, cutlery and vessels for household use, and old baked clay balls, evidently meant as ammunition for catapults, which, if not known before the time of Muhammad bin Kasim, were at all events a part of his equipment. He landed five catapults at Debal, each of which took 500 men to work it. Near Brahmanabad I saw a large number of these clay balls piled in heaps, just as round shot are now piled, in a field called the arsenal, which is said to have been an old battle-field. Mr. Bellasis has minutely described everything that he found, including a set of chessmen in black and white ivory, probably the oldest known set. At the time when I visited Brahmanabad, no excavations were permitted, evidently for good cause. But there seems to be no good reason why these ruins should not now be thoroughly explored under competent superintendence.

The popular belief is that the city was destroyed for the sins of the wicked king Dalurai, who was buried beneath its ruins. In a popular proverb and legend about Bibi Dali, the Cassandra of her time, who foretold the doom of Brahmanabad, we are told how she was asked to save the innocent when the city was destroyed, and adopted a remarkable expedient for testing the righteousness of the people. She placed a live fowl in the hands of her maidservant and told her to go through the streets of the city and to pluck the feathers off the bird with violence as she went, and to bring back word if any man or woman tried to stop the cruelty. But not a voice was raised, not a hand put forth, and so the city fell.

Mr. Andrew Carnegie has given 12,000 dollars of Steel Trust Bonds to the Royal Scottish Academy, the interest from which is to be voted to meritorious students as travelling scholarships. The Council has accepted the gift.

A New Church erected in connection with the United Free congregation at Patna, by Ayr, was opened on the 30th ult. It is situated on an elevated site facing the main road, and is designed in Gothic style of the Early Decorated period. Facing the road is a lofty gable, with entrance porch at one side, behind which an octagonal staircase turret rises to a height of 70 feet. A projecting buttress runs up the centre of the gable, and on each side of this buttress are triplet windows with richly traceried heads in the upper part. The buttress terminates with a canopied niche under the apex of the gable. The entrance porch has a deeply moulded archway opening into the stone-lined porch, within which double arches lead to the area and the gallery staircase. The stair turret is carried up quite plainly in the lower stages, but the upper part is pierced with four tall belfry openings, divided by mullions, and with tracery in the heads. Above this the spire is carried, and finished with red roofing tiles. Internally the church is cruciform in plan, with shallow transepts, one of which forms the chamber for a handsome pipe organ. The church will accommodate 422 sitters, of whom 86 will be in the end gallery. A roomy vestry is provided behind the church, and the likelihood of future extension is prepared for. The buildings were designed by Mr. John B. Wilson, A.R.I.B.A., Glasgow, and were carried out under his charge.

NOTES AND COMMENTS.

THERE are so many men of high distinction in the world who have promoted art, manufactures and commerce in some way, and are therefore worthy of obtaining the Albert medal of the Society of Arts, it is no slight to civil engineering to find so few representatives of it in the list of recipients. This year Sir CHARLES AUGUSTUS HARTLEY has been awarded the much-prized honour. Commerce especially is indebted to him, for in 1856 he was appointed engineer-in-chief for the improvement works to be carried out on the Danube by a European commission, and since 1872 he has acted as consulting engineer. The river is now one of the most important waterways in all Europe. In 1875 he was invited by the United States Congress to report on the improvement of the Mississippi, and since 1884 he has served as British representative on the International Technical Commission of the Suez Canal. Various other Governments have availed themselves of Sir CHARLES HARTLEY'S services, and the choice of the Society of Arts will therefore be generally approved. He was born in 1825, and in early years he was associated with railway works.

THE presentation to the POPE of OVERBECK'S large cartoons of the *Seven Sacraments* recalls the efforts which were made by that artist in combination with CORNELIUS and SCHADOW to reform modern painting. They went to Rome as students of art, and, like the pre-Raphaelites afterwards, came to the conclusion that the works produced in the Golden Age—i.e. later Renaissance period—were unworthy of attention. Lord LEIGHTON, in describing the reformers, said:—"Some men, carried away by an unrelenting logic working on an ascetic temperament, have been impelled to assert that the application of art to any save a definite religious life is little less than an act of moral depravity, and a great and nobly gifted artist, FRIEDRICH VON OVERBECK, has not hesitated to declare his opinion that when RAPHAEL painted his famous *Galatea* in the Farnesina the LORD had abandoned him." The late President of the Academy studied with STEINLE, who belonged to the school, and there is no doubt he was affected by the belief which was common among them, that the excessive love of colour was an almost culpable indulgence of the senses. Some of the members, including CORNELIUS, grew out of their restricted doctrine, but OVERBECK remained faithful to the belief in asceticism in art. The cartoons of the *Sacraments* were designed in 1860, and form a complete decorative composition.

THERE is no longer any doubt that the "Tiara of Saitapharnes," which was added to the Louvre collection at a cost of some thousands of pounds, is not what it was supposed to be, a veritable antique work. M. ROUKHOMOVSKI, who was discovered to have made the pseudo-Scythian ornament, came so willingly to Paris to demonstrate his dexterity, he gained a victory almost before he attempted to perform the trial tasks assigned as a proof of his ability. He arrived in Paris, saw his work, and conquered by producing figures of a similar character. What is more, he gained a medal from the Salon. It is not to be expected of an archæologist ever to acknowledge he was in error, and the recondite spirits who advocated the purchase of the tiara are now endeavouring to prove the accuracy of their statement. Possibly they have fear of a prosecution, for the French are always in want of a victim. According to M. THEODORE REINACH, a part of the tiara is ancient work. Enough of the topmost portion as well as the lowest border remain to make it possible for a metalworker to imitate the remainder of those parts in the same spirit. As there were no materials for the intermediary parts, it was necessary either to create them or to borrow them. He supposes that some of the figures were found in an old collection of plates by WIESELER. The book has, however, so fallen out of repute that no archæologist could be blamed for being ignorant of its existence. It appears that M. ROUKHOMOVSKI made no secret of his inspiration. Otherwise it would have been easy for him to make people

believe the classical figures were his own invention. For the forms derived from plants a work on the antiquities of Southern Russia was employed. M. REINACH consequently says that Herr FURTWÄGLER and his friends, who maintain that the tiara deserves to be melted down, have gone too far, for they have condemned authentic work as well as a modern imitation of it. The work should be preserved, and ought to be made an object-lesson for officials in all countries who may have charge of archæological objects in a museum. By means of it they might in course of time learn to mistrust that belief in their infallibility which is an official characteristic.

It was lately reported that the Naval Department in Gibraltar had to pay an extravagant price for magazines, depôts, &c., which were constructed by builders belonging to the Army. Evidently it has been resolved that the Admiralty Works Department should assert itself. An official paper just issued gives the pay and appointments of the establishment. There are two assistant directors of works with salaries of from 1,000*l.* to 1,200*l.* a year. The engineering staff consists of four superintending civil engineers, from 700*l.* to 850*l.* a year; seven superintending civil engineers, from 600*l.* to 700*l.*; thirty-four civil engineers, from 300*l.* to 550*l.*; twenty-one assistant civil engineers, from 200*l.* to 300*l.* On the surveying staff are one chief surveyor, from 800*l.* to 1,000*l.* a year; six surveyors, from 400*l.* to 600*l.*; nineteen assistant surveyors, 150*l.* to 400*l.* The appointments of superintending civil engineers and civil engineers carry in addition a house (or allowance in lieu) whilst employed at home stations, and all appointments carry in addition a house (or allowance in lieu), and a colonial allowance when employed at stations abroad. Entries to the staff are made in the lowest grades, viz. assistant civil engineer or assistant surveyor, by open competitive examination, held by the Civil Service Commissioners. The limits of age at entry are at present twenty-three to twenty-eight for the assistant civil engineers, and twenty-one to thirty for the assistant surveyors. As the works which exceeded anticipated cost were more architectural than engineering, the conclusion to be drawn is that there is need of officials who understand building. A more definite recognition of architects would therefore be advantageous to the Service.

LINDFIELD GARDENS, HAMPSTEAD, N.W.: THE ENTRANCE HALL.

ST. JOHN'S MISSION CHURCH, COBHAM: INTERIOR, EAST END.

THE subject of mission buildings, including churches, has recently received attention from the Archbishop of CANTERBURY, who at the last meeting of the Incorporated Church Building Society advocated their adoption. There is a special fund of the Society for the work. In the last report it is said:—"The committee appeal for increased support to the Mission Buildings Fund: it is a most important part of the Society's work and encourages the clergy to erect temporary mission churches which are often the forerunners of the consecrated building. At a time when new populations are springing up on the fringe of the Metropolis and other great towns, it is eminently desirable that the people should not have to wait many years for a church, but that one, however simple, should be ready for their worship as soon as the houses are ready for their occupation. In country parishes this special fund is the means of encouraging the erection of mission churches in small outlying hamlets, where services are held regularly for the inhabitants, who are often living at great distances from any place of worship."

MANCHESTER CATHEDRAL.

BEVERLEY MINSTER, YORKSHIRE.

THE EXCAVATIONS AT NIPPUR.

A CORRESPONDENT of the *Times* writes:—Already sufficient work has been done upon the great Temple of Bel to show that previous conceptions of a Babylonian temple will have to be modified considerably; and important light has been thrown upon the different periods of building—from pre-Sargonic times to early Arabic days—represented in the Nippur mounds.

One of the most interesting structures, and one which has been most thoroughly excavated, is a small Parthian palace, which lay on the south-west side of the Shatt en-Nil, the old canal which divided the ancient city into two nearly equal portions. Dr. Peters, the director of the first two excavations, partly cleared this building; and Mr. Haynes, his successor, made a more thorough examination of it; but it remained for Hilprecht to complete the work and determine the age and other particulars of the structure. Peters believed that the building was "erected somewhere between 1450 and 1250 B.C." Hilprecht has shown conclusively that it was built a thousand years later.

Roughly speaking, the palace is square on plan, each side being about 170 feet long. In its construction large (12 inches by 12 inches by $7\frac{1}{2}$ inches) unbaked bricks were mostly used, but in some portions baked bricks had a place. The walls varied in thickness from 3 feet in the partition walls to 8 feet 6 inches in the exterior ones. Externally the building was remarkably plain; the surfaces of three of the walls were broken by shallow buttresses, but the fourth, which faced the canal, was quite bare. There was but one entrance, which was placed nearly in the centre of the north-west façade. This doorway showed evidence of considerable skill and some taste on the part of its builders. It was constructed in baked brick and stuccoed with white plaster. On either side stood a pedestal, rising from an ornamental base and decorated with small pediments. The junction of the crude brick with the baked was concealed by plaster mouldings, and faint traces of fluting were visible on the pedestals.

Internally, the building was divided into two parts, one of which served for the men's quarters and public apartments, the other for the servants' quarters and the domestic portion of the household—corresponding to the harem buildings of the present day. By an ingenious arrangement of lobbies and narrow passages, the "harem" apartments and servants' rooms were completely cut off from the rest of the building. They comprised a kitchen, several store chambers, a bath-room—which was provided with a bitumen-covered pavement sloping towards a drain in its centre—and sleeping apartments, in which were raised platforms (or beds) of brickwork.

The most ambitious feature of the plan was an open court with a colonnade, which was reached from the entrance through a couple of ante-rooms. From this court a number of small rooms open off, and opposite the portico are the two largest apartments in the palace. A smaller court stood between the servants' quarters and the superior rooms of the "harem." In both these courts were columns of burned brick, stuccoed with fine plaster. In the principal one were four circular columns on each side, with a square one at each angle, all built up on foundations of burned brick, while the court itself was paved with crude brick. The columns were plainly "Babylonian imitations of Doric columns," and, in fact, the characteristics of the building throughout are, as Professor Hilprecht points out, entirely un-Babylonian and much more like the features "of the ancient Greek houses on Delos." The balanced plan, the treatment of the entrance, the columns themselves are all plain evidence of the correctness of Hilprecht's dating of the building.

In view of their very limited choice of material the builders may be pardoned for using stucco; and the ingenuity they displayed in constructing the tapering columns with specially moulded bricks and in building up the capitals with two distinct patterns of mouldings is far ahead of the work of the earlier builders at Nippur.

At many widely separated points of the site interesting buildings were discovered, including the now famous "Library," but it is impossible to give any description of all of them, owing to lack of space. All that can be attempted is to deal with the mound under which lay the remains of the great temple and ziggurat of Bel.

To the presence of this edifice ancient Nippur owed its sanctity and fame, if not its very existence; and to the unearthing of the temple and the attempt to restore its plan much of the energy of each of the American expeditions has been devoted. Owing to the unscientific methods of excavating followed by the early diggers, the task has been much complicated; and before an entirely trustworthy plan of the earliest buildings can be secured many of the dump-heaps deposited on and close to the mounds which cover the ziggurat and its enclosures will have to be removed. The particular mound which marks the position of the ziggurat is the highest point at Nippur, and it forms an important landmark for many miles in the flats of lower Mesopotamia. About a third of its

extent has been explored so far, and as a result of his personal study of the remains and the reports of the architects attached to the last expedition, Hilprecht is able to put forward a clear picture of the place at different stages of its history.

The upper strata of the mound contained the remains of a huge fortified building, grouped round a citadel which covered the ziggurat of the early temple. Hilprecht proves that this building belonged to the Parthian period (thus disposing of Peters's theories as to its very much earlier construction), and he regards it as the palace of a prince or governor. Originally he believes this fortress "consisted of two courts . . . which did not communicate with one another, except perhaps by means of a large staircase." The outer court has not yet been fully uncovered, but the other contained domestic quarters, barracks, store-rooms and offices in one quarter, in another part finely built rooms, which were in some cases constructed with double walls for the sake of coolness, and would therefore appear to be the apartments of the prince and his chief officers, and in a third section, which is only partially excavated, stood the "harem" buildings. The citadel was an immense platform, cruciform on plan, which rose about 30 feet above the surrounding buildings of the fortress, and had yet a second stage, not lower than 20 feet, rising from its centre. A well—the only one in connection with this structure discovered in the whole enclosure—was carried down from the citadel through the core of the ziggurat to water level, thus assuring a supply of water in case of the most stubborn siege. Indeed, this fortified palace must have been well-nigh impregnable, for all the buildings mentioned were enclosed by yet another strong wall, which, "when excavated, still rose to a height of over 60 feet . . . was more than 30 feet thick at the top . . . almost 40 feet at its base . . . and was strengthened by huge buttresses at its corners, and . . . smaller ones erected at equal distances between them."

Below this building were the remains of an earlier one, of a very similar character, of the Seleucid period, of which, however, the excavators discovered only the most fragmentary traces, so that it appears the later builders demolished the earlier work. Lower still were the remains of the old temple.

When it is remembered that the temple site was occupied over 4,000 years and that the building underwent many alterations, enlargements and patchings at the hands of successive kings and governors, who frequently paid scant attention to the work of their predecessors, tearing down walls and levelling buildings just as best suited their own schemes, it will be readily understood that the task of attempting a restoration of any particular period is no easy one. At present nothing in the nature of a final decision upon many points can be attempted. All that can be done is to present some general idea of the place. Fortunately in its main features the temple remained much the same through a period of some 3,000 years, as the excavations suffice to show.

By the discovery of a plan of the old city on a tablet which was discovered during the excavations in the "Library," the task of restoration was greatly facilitated; and Hilprecht's theories are supported not only by the evidence of the trenches and actual remains; but by a number of references contained in the cuneiform documents of the place which he has studied. He is therefore able to give an interesting sketch of the Temple of Bel.

The building, then, with its annexes, formed quite a town, which was enclosed by a strong wall and a moat on the north-east and north-west, while on the south-west the Shatt en-Nil probably formed sufficient protection. On the south-east there lay a branch of the canal, but it seems certain that there was also a wall upon this side of the sacred area. In the north-west half of this area there was a large open court, where stood shops and booths, outhouses, magazines, servants' quarters, and possibly (Hilprecht is led to believe) the palace of the *patesis* of Nippur. In the south-west half stood the temple buildings proper. From traces of a building uncovered by Dr. Peters (but now buried beneath a dump-heap) it seems that on the banks of the branch canal there was a quay or landing-stage, opposite which rose the great gate of the outer court of the temple. Each side of this outer court was about 260 feet long. Within its area Peters had discovered a small chapel dedicated to Bel, and Hilprecht believes that the "houses" of the other gods—at least twenty-four in number—who were worshipped at Nippur also stood there. But this portion of the ground has still to be cleared.

Opposite the gate of the outer enclosure stood a second one leading to the inner court. The exact dimensions of this court cannot be given until the upper strata of the mound are removed; but on plan the two enclosures formed a T, of which the outer one may be called the foot and the inner one the head. The enclosing wall was built of unbaked bricks, and its face was broken up by shallow buttresses placed at regular intervals along it. The gateway projected considerably on both sides of the wall; its faces were decorated with narrow panels, and it had the stepped recesses characteristic of Babylonian buildings. A similar gate was discovered

behind the ziggurat opposite the one between the two courts.

Within the second enclosure stood the famous ziggurat itself. From evidence which need not be set out in detail Hilprecht is led to the conclusion that it consisted of a tower of five stages, on the uppermost of which rested the shrine of Bel. It did not stand in the centre of the enclosure, but on the south-west side, and the ascent to the tower was not opposite the gateway, but somewhat to the left (west). It was largest in the time of Ashurbanapal, when it "covered an area forming a rectangular parallelogram, the two sides of which measured 190 and 128 feet respectively." At that time it was encased with burnt bricks, and on three sides at least its faces were decorated with panels, or shallow buttresses. Then also the courtyard was paved with baked bricks throughout, and the whole of the temple buildings seem to have been in excellent order. In pre-Sargonic days the ziggurat was much smaller, but successive builders, notably Naram-Sin and Ur Gur, enlarged and improved it, gradually substituting baked brick for unbaked, and the whole temple naturally kept on being improved in a like manner.

On the north-east side of the court stood a small building which was used as a storehouse for offerings, "the house for honey, cream and wine." Behind that, in the north angle of the court, was the "House of Bel," where "the household of the god and his consort was established . . . sacrifices were offered and the most valuable votive offerings of the greatest Babylonian monarchs deposited. In other words, it was the famous Temple of Bel, which, together with the stage-tower, formed an organic whole enclosed by a common wall, and was generally known under the name of *Ekur*, House of the Mountain." A complete investigation of this building has not yet been made. In fact, beyond ascertaining that it was enclosed by a finely-built wall of baked brick, with a panelled face, which enclosed an area of about 150 feet by 115 feet, and was pierced by a couple of doorways (one over 10 feet wide, the other about 5 feet), and that its interior was occupied by chambers of various sizes partitioned off with unbaked bricks, practically nothing of its plan is known. As Professor Hilprecht says, he "decided not to ruin this important section of the temple area" by adopting the hasty and unscientific methods of his predecessors, but to "leave its interior as far as possible untouched" in order that the next expedition may make careful clearance of the superincumbent rubbish, and so be in a position to study carefully the remains.

EDINBURGH ARCHITECTURAL ASSOCIATION.

A LARGE party of members of the Edinburgh Architectural Association journeyed to Perth and visited St. John's Church and St. Ninian's Cathedral on the 30th ult. At St. John's the members were received by the Rev. Walter E. Lee and the Rev. P. R. Landreth, ministers of the east and west churches respectively; the Rev. J. McGlashan Scott, minister of the middle church, being unable to be present. Mr. A. G. Heiton, architect, Perth, conducted the party over the church, and gave a descriptive account of it. The date of the original foundation is unknown, but there was a building erected by David I. about the year 1126. The church was consecrated A.D. 1242 by David de Burnham, Bishop of St. Andrews, and the choir and tower rebuilt by Robert Bruce in 1328. After the Reformation the settlement of a second minister to the charge was effected, and the partition wall erected separating the little church, now known as the west church. The nave arcade was probably erected at this time, A.D. 1598. The partition separating choir from transepts was built in 1773, and a third charge was created. The church formerly contained forty altars, richly decorated and endowed. The bells are interesting, and mention of them is made in 1403, 1506, &c, and there was an organ erected, probably on the rood-screen, in 1510. Seats were erected in the great church in 1582; galleries were erected in 1603, and various alterations took place in 1720, 1760, 1773. In 1892 a great improvement was brought about in the east church by removing the galleries and the paint and whitewash from the internal stonework. Similar improvements were effected in the west and middle churches in 1894 and 1896, the galleries, however, being left in these cases. At the close Mr. A. Hunter Crawford proposed a cordial vote of thanks to the ministers and to Mr. Heiton, and hope was expressed that the day was not far distant when the obstructing dividing walls would be removed, restoring the building to its original state and forming a really noble church. At St. Ninian's Cathedral the party were received by the Very Rev. Provost Campbell and Canon Farquhar, while Mr. Heiton again acted as leader. At the conclusion Mr. Hippolyte J. Blanc proposed votes of thanks to Provost Campbell, Canon Farquhar and Mr. Heiton. The members afterwards drove to Scone Palace, where they were received by Lord Mansfield and conducted through the

palace and policies. Before leaving Mr. Hunter Crawford, on behalf of the members of the Association, thanked his Lordship for his kindness in throwing open the palace that afternoon and showing them its interesting contents.

DISCOVERIES AT BENI HASAN.

IN a letter to the *Times* Professor Garstang says:—Excavations have been made during the past season in the hillside at Beni Hasan, a site already famous for its painted tombs and early architectural features. Below the gallery along which these lie there has now been found an extensive necropolis, remarkable both for the preservation of the furniture in its tombs and for the wealth of material which these supplied for illustrating the burial customs of the Middle Empire at a time when pure Egyptian culture was nearing its culmination.

Though the rock-hewn tombs for which the site has become known are themselves of the eleventh and twelfth dynasties, it had been supposed, from the composition of place-names mentioned on the walls and from other reasons, that the district was already of importance at an earlier period, dating back possibly as far back as the Old Empire. It is now seen that a gallery of smaller rock tombs at a lower level was hewn probably in the sixth dynasty. These tombs are eight or ten in number, two of them being inscribed in the style and with the names characteristic of the period. One of them, the tomb of a courtier named Apa (Her-ab-a), a chief man of his town, is also decorated in bas-relief and with paintings illustrating agricultural and other conventional scenes. The tomb had been reused later in the Middle Empire for burial of other persons, and had been subsequently broken into and plundered. But the thieves had failed in three instances to observe the original burials at a lower depth, leaving them entire, with their original deposits of alabaster vases and other tomb furniture undisturbed. This tomb (temporarily numbered 481) will eventually be made accessible to visitors, being the earliest yet found in the vicinity.

The other tombs were all of the early Middle Empire—the eleventh and early twelfth dynasties. Four hundred and ninety-two of them were opened and examined. These too were hewn in the rock, but were of the more familiar character known as pit-tombs, in which a vertical shaft gives access to a small burial chamber (or chambers) at the bottom. More than 100 of them had never been previously entered, and their doors were now opened for the first time since they had been closed 4,000 years ago at the time of the interment. In some cases the whole contents, being as it proved largely of wood, had been destroyed by worms, but a sufficient number of cases remained to render an unique series of observations possible.

In the tomb of one Nefer-y, a chief physician, it was seen upon opening the door which closed the burial chamber that upon the painted coffin and at its side were a number of wooden models of objects and scenes familiar from the wall-paintings of the larger tombs. Nearest to the door upon the coffin was a great rowing-boat, the twenty oarsmen standing and swinging back in time to the beat of two figures seated on a raised platform in the centre. Beyond this was the model of a granary with six compartments in rows of three on either side of the courtyard between them. Men are standing knee-deep in real grain filling baskets, while a scribe seated on the roof, pen in hand, keeps the count. A flight of steps leads up to the roof, which is pierced with holes through which the grain is poured into the chambers below, the doors being closed and sealed. The principle is natural, as it would be impossible to fill the chamber through the open door. The method is still employed by the richer cultivators of the country, even by the head man of the village nearest to this site (El Kram). Behind the granary in the tomb were representations of various occupations, also in models of wood. A man carries a large offering-jar; a girl supports with one hand a basket poised on her head, and in the other holds the wings of two geese. In a group, women are engaged in making and baking bread: one grinds, another kneads, a third is raking the fire in which are small charred embers of wood. Another well-executed group represents the making of beer from fermentation of bread, by a process similar to that employed in the native industry to-day. One man is seen inside a tub, pressing with his feet. Two others are bearing water in pitchers suspended from yokes upon their shoulders. Others are working at strainers placed loose upon the casks, while in front a number of casks lie naturally in a row. By the side of the coffin was a sailing boat, the numerous sailors assuming the attitudes necessary for hoisting the large square sail, of which the yards and rigging were preserved. Two men in characteristic postures are using poles vigorously over the sides. The steering is done, in all cases, by a large oar attached at the end of the shaft to a post fixed in the boat. A short stick then fixed into the shaft served the helmsman for a tiller by which to turn the blade as required. Finally, the

coffins themselves were found to be inscribed on the insides with new "Pyramid texts" of the time of Unas.

The furniture of this tomb is characteristic, and explains some of those in which the objects were found disturbed or less preserved. Occasionally rarer features are illustrated. In the tomb of one Mehti-em-hat were a number of warships. In the bow of one, by the side of the look-out, stands a negro soldier, bow and arrows in hand. Six sailors are rowing, others are hoisting the sail, which is preserved. Nearer the stern, and partly under the shade of a canopy which is protected seemingly by studded leather and by shields placed upon it, are seated two men playing a game of chess upon a table between them. A sheaf of spears is at hand, suspended from below the canopy.

In the tomb of Antef, a courtier, the boats had double steering oars. There was also the model of a white spotted ox led by a man, and in the tomb of one Khety there was further shown the actual sacrifice of an ox of this kind.

Objects of other significance were also found in the tombs. Musical instruments—a lyre, two flutes and a drum with barrel body of wood and parchment ends bound in the usual network fashion with thongs of leather. Basket and wickerwork was plentiful, much of it well preserved, and some examples curiously analogous to the work done in the oases and in higher Egypt of to-day. An object of special interest architecturally is a wooden capital in the form of a lily. Vases of stone of ornamental forms, beads of amethyst, carnelian and other stones, as well as glazed scarabs of the early kind and some quantity of jewellery were also found.

It seems clear from the titles recorded on the inscriptions and from the tomb furniture itself that this necropolis represents the middle classes, the minor officials and distinguished women of the locality, during the early Middle Empire. Many of the new tombs are those of personages whose names and portraits appear in the tombs of the princes and notables forming the gallery above.

The opening of each tomb was recorded by photography as the excavation proceeded step by step. As a result some 450 negatives, illustrating these observations and the funereal deposits, have been secured for the expedition, and will be published, it may be hoped, as soon as possible.

The objects themselves, it is pleasing to know, will enrich the museums of our Universities—Oxford, Cambridge and Liverpool being represented among the patrons—as well as some of the best known private collections of Egyptian antiquities in England. Previous to distribution, by arrangement of the Director of the Society of Antiquaries (hon. treasurer of the excavations committee), it is hoped to hold an exhibition of these antiquities at Burlington House during part of July in the present year.

A TALK ABOUT DESIGN.*

By WILLIAM L. PRICE, Philadelphia.

MR. PRESIDENT, brother architects, and friends of architecture.—I have not any paper to offer you, just a few remarks that I am afraid will be rather rambling because I want to touch on a great many subjects. I want first to speak on the question of making the talk a practical talk. We have heard a great deal of discussion to-day at dinner and at other times about being practical, but every time we try to be practical we turn to the ideal, because when we come to analyse what is ordinarily called the practical it is the transitory; it is the bread and butter that we eat, not for its own sake, but to make the man; the practical part of our work is only the mother of the ideal. Architecture could not exist, architects would be an absurdity if it were not that the ideal is after all the main object of mankind's search and endeavour. Now it so happens that architects are not only clothiers of mankind, but teachers of mankind; teachers for good or ill; teachers whether they want to be or no. Now I do not know of any royal road to the ideal; if I did I would not tell anybody about it, because the only thing that any man can get to help him towards the ideal comes from within and not from without. We spin our own cocoons (especially as architects), and it lies with us whether our cocoon shall be a monument or merely a sepulchre. And we must not compare those cocoons one with the other and say of this man that his cocoon is not as fine a monument as the other man's. Compare it with the man himself and ask, Did he build as well as he knew, or didn't he? That is the only question. If he built as well as he knew he couldn't help building to himself a monument and for the crowd a betterment. The architect's profession, or art, or whatever you choose to call it, is perhaps the most involved that there is. We have just been discussing a question of colour decoration; the architect that does not consider the question of colour in his buildings when he is designing his mouldings and ornaments is not designing

at all. It is just as much an essential part of the design, the colour of the walls or an approximate idea of the colour of the walls, as the moulding; they are there for the same reason—to give colour effects, light and shade. One of our architects some years ago denounced American architecture as "an attempt to make something look like something else that would not be desirable if genuine." That is a pretty savage arraignment, and it is perhaps not quite so true as it was; but still it is in a large measure the truth. When we build the big structures that we call buildings, office buildings or similar buildings (they are not buildings at all in the real sense, but are structures or erections), we clothe them carefully with building material nine times out of ten, stick it on, bolt it on. There is a building in Philadelphia in which the granite corner piers, a perfect absurdity in itself, are apparently of solid blocks, carefully and painfully cut out in the form of an "L" allowing the column to stand within it. If that is not an attempt to make something look like something else that would not be desirable if it was genuine, I do not know what it is. It is a lie that works both ways; it hurts the community and it hurts the man who did it, and hurts him worst.

Much of what I am going to say may appear reactionary, but I want you to notice one thing, that the man lost in the wilderness (and we are just a little lost in the wilderness in art matters), if he has not some guiding point, will go around in a circle—at least, I am so told. So while the line of progress may be something like an upward slope, we may be travelling on a horizontal line, believing all the while that we are on an upward course.

And we must not measure the line by what we can see of it; we do not see enough to make one part of it look different from another part at any time. We have to consider a great many outside things; to look at history and experience—to the architect especially that is essential. There is only one thing worse, in my judgment, than ignoring precedent, and that is following it.

Now I want to take you with me in a little practical talk—we are up against a serious proposition. Having secured our client, the first question for us is, What next? Shall we build around that client our shell or his fitting shell? Now, when we stop to think of it, how often are we trying to build the best possible monument to ourselves and not the best possible house or building for that man?

During a first interview with a client a year or more ago, after talking to him about an hour, he said, "I would like to see the house you would design for me, Mr. Price," and I said, "I would too." Being agreed on that, he then said, "Now I have told you the things that I want, the size of the rooms and the number of them; you know the site, make me a sketch of the house you think will fit these requirements." I said, "Mr. —, I will gladly do that; I can do that, I think, but if you take that design and build it you will be a fool." And then I went on to say, "For I do not know you well enough to draw a house for you." I hadn't the slightest expectation that I would get that job, but right there I got it, because that man began to see something different in architecture from what he had ever seen before; he began to realise that this was to be his house, not an architect's house merely. Afterwards, sure enough, to show you how the good work took effect, one of the leading finishers of the city went to him and said, "Mr. —, you are a busy man, you don't want to bother with the designs for the inside of your house; I will refer you to So and So—we did the work for him—47,000 dollars' worth of interior work, and we did not take up two hours of his time."

This gentleman said, "Well, that settles it; you could not decorate my house or do my interior woodwork because I can see that that is your interior woodwork and not mine, it does not fit me." I simply tell you that to point out that what we have to do if we are going to have real architecture is to make our product more than beautiful, more than fitting to the situation, primarily fitting the man that is to live in it or the purpose for which it is to be used. That means a pretty savage thing sometimes; it means that if we are going to build a house for a vulgar man that we must build a vulgar house. It wouldn't be architecture if we did not. It must be better than that man; it must be what that man might be, it must represent that, but unless it has in it some element of that thing which makes him the vulgar man, in my judgment it is not architecture at all. We are up against difficulties and limitations of that kind, and it does not seem to me to be such a bad thing after all. Fortunately the vulgar man usually goes to a vulgar architect, so that we need not often be seriously troubled that way. But the fact remains that it must fit the man in some way or other, and I think the most of us (even if we do not analyse these questions of design) naturally tend to draw a vulgar house for a vulgar man. But we must be mighty careful of what we mean when we call a man vulgar. A difference in taste does not constitute vulgarity, or the reverse. People have come to me and said, "I like that house out on Forty-ninth Street, in West Philadelphia, and that is the limit. I have been around

* A speech at the annual convention of the Ontario Association of Architects held in Toronto, and published in the *Canadian Architect*.

your town a little, but there is nothing that I have seen here that approached Forty-ninth Street; it is absolutely the limit." Most of the arches on the porches are wrong side up. Nearly all of them. My client will say, "I like this or that house at Forty-ninth Street." And instead of falling dead I go out and try to find what it is he likes about that house; very often it is a bay window on the side of it, or it faces this way or that way, or it has some other feature absolutely irrespective of design or drawing that fits the man. If, for instance, you take a man who likes brilliant colours and set him down as being ignorant and vulgar, because you have put two things before him—one good, in low tones that you care for, and one bad in high colours that you loath and that attracts him because he loves colour—you make a great mistake, for that is not a fair test; you ought to put before him things good and bad in both bright and quiet colours, and you will find ninety-nine times out of a hundred he will choose the good thing. Find out what it is he likes about the bad thing, give him a chance and he will choose the good thing rather than the bad. If that were not true there would be no civilisation; we would have devoluted back into oysters by this time, because we have done so many foolish things and so neglected the laws of nature that it must be some principle in us that seeks the right rather than the wrong to keep us going at all. As Professor Shortt said to us yesterday, we have gotten away entirely from the mainsprings of the art and architecture of the past, we have come to a time when neither the civic nor the religious is the ideal around which we build our civilisation, but the individual, the domestic. Take all these high buildings with which you gentlemen are wrestling in pain and trouble (and it is a serious trouble); what are they for? After all, are they not merely the places that we go to (to get away from as soon as we can), that we may have enjoyable surroundings in our home life? That is the sole object, and while we should make them as little obnoxious as possible and keep them as quiet as possible because they tend to ramp and rave—while we should do that it seems to me that our greatest effort should be put upon the making of the object of all this beautiful, and that is, after all, our homes. Therefore I am talking mainly about house design. I want to say though that your President yesterday pointed out what seems to me the only logical materials in which to design the office building, and that is a skeleton of steel clothed with a plastic material of some kind. I cannot conceive, though I admit I have done it myself, that it is proper to clothe a steel frame by putting brick or stone around it or any real building material; it is a lie on the face of it, for it would not stick there and stand unsupported. If we must have that kind of building let us encase it with some plastic material like cement. The engineers are looking after the bones and we are after all only the planners and decorators of it.

The most serious question, as I see it, in designing a house that we have to meet with is, What shall the concrete thing be made of, and how shall it be made? Or, perhaps, How shall it be made, and what shall it be made of? We will treat what shall it be made of first. The material must be moderately cheap. We do not often have palaces to build; we are not working for Gould or J. Pierpont Morgan, but for each other, the average community which we find around us, therefore the buildings which we build must be cheap. They must not, or should not, require any great amount of ornament, and I want to point out that the bulk of the ornament that we use is used purely to get surface, and not for the value of the ornament itself. The pressed brick of good old Philadelphia was so horrible that after we once walked up and got past the marble steps and marble lintels we flew to the other extreme and brought in the tortured mud (the terra-cotta man), with his substitutes for surface, and we put wriggles all over it to make up this surface; that is what it amounts to, most of the ornament is just that—wriggles; and we smear that over it for no other reason than that we want surface; I do not think that the lack of ornament enters our mind one time in twenty when we put that kind of stuff on—I do not refer especially to terra-cotta, but to all senseless ornament. It is because we are afraid the surface will look flat without the ornament, and that is a mighty poor excuse for putting it on. As I say, texture should be the first consideration, because the bulk of our building will depend for its beauty on texture and on the disposal of its masses and not on ornament. In the first place real ornament that really beautifies the building is too expensive to spread all over it; and, in the second place, you cannot see it if you do so, it becomes merely surface, and here is where fortune favours us, as it so happens that the cheaper and rougher materials naturally have the better textures. I remember when building a house some years ago I arrived on the scaffold just as the bricklayer was starting to build a high kitchen chimney—it was my own house, and I could do as I pleased—and he had there two piles of bricks, very nice bricks; one pile was of quite smooth, beautiful bricks, the other pile was of the roughest bricks that he could get. I said, "What are you going to do with those bricks?" He

said, "I am going to use these rough bricks for the lining and the others for the outside." I said, "Reverse it." He nearly fell off the scaffold. I said, "Won't those smooth bricks make a good lining for the flue?" He said, "Yes, very good, excellent lining." I said, "I am quite sure the other bricks will make a much better-looking outside, and that is the part I am interested in, apart from its drawing qualities." So he put the chimney up wrong side out; and when he had his scaffold down he said to me, "That is the best looking chimney in this town." The bricks on the inside cost probably 11 dols a thousand and those on the outside 6.50 dols.; and those rough, hard bricks are the only kind, in my judgment, of which to build a country house—the roughest ordinary hard brick that you can get. I will stand fight with a client on that before I will utilise anything else, because it is the brick with texture and colour, the brick that has the burnt head on it, not to be picked into a pattern necessarily, but put there to have its influence on the texture and colour of the building. What is true of brickwork is true also of stonework with us. When we really want to get expensive stone, then we get Avondale stone, which is as white as the driven snow and as uninteresting as anything in creation; or we use rubbed or sawed limestone, and if not satisfied with the surface being perfectly smooth, we specify that it shall be drove-tooled, when it is generally planed on a machine. Whenever they get the chance to put the machine on and make grooves, they do it, and all the texture and sense of stone is gone out of it. For house building, the rough stone, the common flat stone that we use down there, makes, in my judgment, the finest wall surface in colour and texture and interesting light and shade that we can get. Next comes another material, and, in spite of what our friends who like dark exteriors say, I am extremely fond of it, and that is rough plaster, the roughest sort of dashed work or pebble dash. I think that when we are considering the colour of the exterior we must remember, as your President said, shadow, the shadow of the eave—make it big if you want to; the shadow of the trees that overhang it, the shadows of the vines that grow on it. What is there more charming, more beautiful than the white cottages and thatched or tiled roofs of England, with their beautiful vegetation around them? We may, perhaps, consign white to a greyer climate than ours, but much of the time we could stand white or nearly white here. And this material, it seems to me, is a very valuable one that is much neglected. It gives us mass, it does not chop the surface up, and it gives us a fine contrast with either stone or brick, whether it be white or coloured.

Of course we use a great deal of timberwork down with us, and I am sorry to say we very seldom use it honestly, most of our timberwork being stuck on the outside of the house and not part of the structure. That of course is inexcusable, there is no possible excuse for it, as far as I can see—I do it myself, but I am ashamed of it, and I am trying to stop. It is almost impossible in this country to use it honestly; I doubt if the timbers will stand in our climate long enough when really built in the wall to make it a practical mode of building.

These are, to my mind, the kinds of material that it is worth while to deal with in house-building. Of course, we build wooden houses too. We build shingle-houses, and they rot out in from a year and a half to ten years—it is not a permanent building material. We have not used tile roofs nearly so much as we might; that is one of the things that I think the architects here and with us should steadily work for, to get some kind of roof that is not flat, stale and unprofitable like slate, or merely momentary like the shingles of to-day. Tiles are just about as hard to get, but as interesting as bricks or anything else in this machine-made age. I will give my secret away—it may be your secret too—the only tiles I ever put on a building are the seconds, the culls; they are the tiles that are uneven, rough and crooked, and of a good colour. The average American selected tile is about as good as red slate, but that is all; as far as texture goes it is about the same. It is worth while, it seems to me, to make a fight on some of these materials that we have to use.

Perhaps the most serious problem we are up against is, how to get this material put together so that it may properly be called architecture after it is done. How much of the building that we are doing in this country would we walk out of our way to see in the old country, or would we collect pieces of as we do pieces of the old buildings? That comes back to the proposition of my friend that the architect is not a designer of buildings but a designer of opportunities, and if we cannot find the people about us who will seize those opportunities and together with us make architecture, the net result will not be architecture; we will have design, but not architecture. Here is where I am going to get "reactionary" in trying to go on straight. People say that we are in a condition, and always have been, of evolution, and that we cannot fight against tendencies. But we know how mankind has evolved in the past; it has been in spirals. When they were rebuilding a brick Rome in marble they little thought that Rome was in its decline. Their literature they thought better than the more

aged and rough literature of former days; their architecture they thought better, more refined and elegant; but, just the same, Rome was in a decline and not on an ascent. It seems to me that it is worth while for architects especially to see what can be done in stemming the tide, at least in diverting the tide from methods that are suicidal as far as art goes. You must remember that though the body of architects is a very small one compared with the community, it has been a very efficient mover of the community. The difference between the Philadelphia—I speak of Philadelphia because it is my own place—of thirty years ago and of to-day is almost entirely due to the few architects who have worked for better things there. They insisted and insisted again and again in spite of the conservatism of client and builder that material and design should be better, and they have bettered them. Now it is in our hands very largely to influence the men who do our work by continually insisting on honest work, just as our friend who spoke here on decorative work, assured us of their willingness to co-operate with us. You will find that these men, who work with you in making buildings, will do exactly the same thing. They may be more stubborn about it, and they have a harder row to hoe than the decorators, for the decorators are more closely in touch with their own work than the builders are. They have the work more nearly in their hands than we have. The men who erect our buildings are divided into two classes, the contractors, with whom we come in touch, and the men who actually do the work. The contractor has in a large measure ceased to be a builder, he is simply a contractor; he gets a number of sub-bids, adds them together, and puts on his commission for profit and superintendence and finances the job, and to a certain extent sees that it is carried out, that the people working under him carry it out. But he has comparatively little touch and little sympathy with the actual workmen who carry out the work, and they are the men that we must go after. It is not the contractors who have much to do with the actual building, it is the craftsmen, if you can call them that, who do the work.

Now, it seems a reactionary proposition, and possibly a hopeless one, to fight against the machine. Here we are after the end of the nineteenth century, the century that brags more of its methods of production than any other one thing, and I say that those methods of production are themselves absolutely immoral and reactionary. And I mean it. I mean that the method of production that considers only the amount of the product and the profit that can be made upon it is absolutely immoral, and that the products of these methods are essentially artistic, especially in our decorative friends' materials. I know, for instance, what it is to try to select papers for other people; I know that always, or nearly always, when the people get the paper on the wall they think you have buncoed them; they will come into the room and say, "That is not the paper selected, it was not that colour, it was not that design." There is a difference between the design, which may be very beautiful, and the thing you get upon your walls wherever it is mechanically made. And that is an essential difference. It is a difference that is bound to exist. I do not care how far you may perfect your methods of production; if they are mechanical the result cannot be artistic, because art is, after all, as far as we can see it, only the expression of one's own individuality. Hubbard has said that art is the visible evidence of man's joy in his work. And that is almost a definition, but it is not the real definition, because the art is in the doing of the thing, and not in the product of the doing. You cannot, if that be true, get art material or art results without artists. The proof that it is true is that the artist never hoards the things that he makes; his real joy is in the making. The rich people do not possess the art of the country, they have the crumbs that fall from the artist's table, and that is all that they can get of it. The artists are the fellows that get the fun out of it. Art truly is to the artist. Now we architects are only half artists, because while we guide the hand we are not the hand. It is a pity, but it is true. And yet we have the biggest opportunity in the world, and that is the making of ourselves and the crowd better men at the same time, and it is in our hands to do it. We may be really leaders, but the evidence of leadership is a following. If we have not a following among the people that create the things that we are supposed to create then we are in no wise leaders, but we have the privilege of being leaders and educators of the people, and especially educators of our co-workers in making architecture. And how shall we go about it? Of course I do not want to be too savage against machinery and I do not want to repeat what I said last night, but I will repeat just one thing that came up in conversation with Mr. Langton and some others.

Mr. Langton: I think it was too good to be lost by not giving it to others.

Mr. Price: This machinery question is a vital one, and one we cannot ignore—as to where we can draw the line on the machine. I was trying to make a distinction, and I think I

can make one; I think you will agree that the place where we can draw the line is this—just so long as a machine is a tool with which a man works it is a benefit no matter how highly it may be developed, but the moment it ceases to be a tool and becomes a mere automatic machine into which material is fed, and out of which the product comes without any volition of the man who is working it, then that machine becomes an immoral affair, and the product of it becomes absolutely worthless as far as the art world is concerned. That seems to me to be the place to draw the line. That does not cut out band saws or turning lathes, or other power tools, but it does cut out much of the work we have to put up with; for instance, it cuts out machine carving in all its forms. It is an easy way to make a yard or a yard and a half or a whole piece of so-called ornament, but of what value is such ornament? Now, can we get the people we build for and the people we build with to go with us, and return—if it be a return—towards a more simple method of construction? I think we can. I think that there is one way we can do it if no other, but it would be a drastic method. That would be to cut off all the ornaments, make the thing absolutely simple and plain with only the essential features in it. Then at least there would be no bad ornaments in it. I think we can go a step further, and instead of cluttering up the inside or the outside of our houses with numberless mouldings and brackets and "the Lord knows what, of round and square, stuck here, there and everywhere," without any special meaning except that our ancestors or forefathers did it in marble or some other material—for I am afraid that is the reason we put most of those things in—we can eliminate most of these things and substitute for them extreme honest simplicity in construction and a little bit of good carving, for we still have the carvers left to us, and some of the carvers and decorators are really artists and artisans. I would rather have on my wall a patch a foot square of real decoration interesting enough to go and look at twice than to have the room covered with decoration that has no interest except as to design. That seems to me a most practical line of elimination; cut the quantity of it down to the quick if need be, to get the quality a little where we want it. We can do that, and the people will go with us, for they are just as sick of the uninteresting wall-papers and truck that their houses are cluttered up with as we are. I have had no difficulty in getting people to allow me to simplify their houses for them. The tendency to ornament comes from the architect rather than from the client almost every time. Of course there are exceptions, and people want a lot of gaudy ornamentation and display; and I think, in these cases, we had better give it to them. I think that is possibly the best way to cure them. It is a little rough on us, but I think we had better suffer if we can make architecture possible in the doing of it.

I have not talked to you about methods of design. I have not talked to you about what mouldings you should put here, there or the other place. I think that would be rather inconsistent since I have been advising you to cut them nearly all out. But what I have been trying to do is to point out certain lines along which we shall design, that we shall in the first place surround the client with a shell that shall be appropriate to its site and its use, that we shall simplify it so that we shall get in the main honest construction and honest ornament so far as we use ornament at all. I think you will readily agree with me as to that question of ornament, when you consider, for instance, the main building of your Toronto University and look at the carving on the inside of it (as I did yesterday with great pleasure), where you can walk along from step to step and find the ornament interesting and worth looking at. That was not the architect's fault altogether. When your President asked me to see it he explained to me very carefully that the architect brought out a real craftsman from Germany or some other place and put him to work there, and he put in those interesting spots. The architect can't do that himself.

The President: I told Mr. Price that the architect was entitled to the credit of bringing him out.

Mr. Price: Yes, you did, but the fact remains that it was the craftsman that did the work. The architect gave him, no doubt, an idea of what he wanted, but, like all these things that are worth doing or having, they must be designed in the doing, and not in the lay-out of the doing. You cannot design carving on paper, you can only design carving with a gouge and a mallet. You cannot design wrought-iron in any place in the world except on the anvil with a hammer. You can make a suggestion for wrought-iron or for carving. You can show the general design or character of it, but you cannot draw it until after it is cut or hammered, because otherwise it is not carving or wrought-iron at all. We must recollect that our position is the one that I have pointed out, a designer of opportunities; and what we must do to make architecture a possibility is to go to these craftsmen and ask them, if it be turning back, to turn back, and I think we will get something.

Possibly you are not up against the same difficulties that we are, but this is characteristic of what we have to contend

with. Take your carpenter, who is your highest class of craftsman because he does the most varied work, and he will plane and scrape and sand-paper the sill of a window and will then proceed to get up on it and stand on his heels to pull nails out above. I do not know whether that happens here or not, but it happens with us. And if the carpenter does not do it the decorator will do it for him.

The President: It is usually the plumber who does things in our buildings.

Mr. Price: The plumber generally does not get as good a chance at it as the decorator; and if he does not do it the man that puts up the curtains and window shades will do it. They are bound to have it in some way. Is it not a distressing situation that our highest class of craftsmen either do not know or do not care about much except Saturday night's part of their work? It is a pitiable commentary on our civilisation that the bulk of our people care for the wage and not the work, because the only thing that is worth doing, in my mind, in the world is work. I am quite sure that the same man, when he gets through working at the job he has to do, if he does not work too long and is not so tired as to kill his ambition, turns to other work. I am quite sure that what Professor Shortt said about himself is true of most of us, that he gets his recreation by turning from the work he is engaged in most of the time and making furniture, carving and doing such work, and he thinks his best thoughts when he is doing so. That our craftsmen should have abandoned that position and accepted the nineteenth-century ideal, that the way to get development is to make the greatest number of things with the least possible effort, or in the least possible time, so that he may have time to devote to something else, seems to me suicidal. There is something in work besides wages, and a good deal better than wages, and I think we can prove it by simplifying the work, by teaching him that he must do this thing in this way, because it is the right way to do it and because it is handsomer when done the right way, as well as more moral, and that it will be reflected in his character. But when our work is nearly all sham, as it is in one way or another, how can we expect a man working at that sham work to develop into an honest, straight thinker? He can't do it, and the consequence is he walks on our window sill. I do not want to talk longer about this matter; I would very much rather have a good lively scrap in which we all could join, so with your permission I will stop.

THE ROYAL INFIRMARY, GLASGOW.

THE following statement and correspondence have been issued by the Glasgow Institute of Architects:—

The managers of the Royal Infirmary having finally rejected the criticisms of the Glasgow Institute of Architects regarding their rebuilding scheme, and refused the advice and assistance offered by that body, the Institute feels it to be its duty to set the whole facts before the general public, those on whose behalf it has acted, and for whose benefit the Infirmary exists.

From 1897, when the scheme was first mooted, till the end of 1899 the managers were engaged in endeavouring to obtain under their direction satisfactory plans from an architect selected (despite outside and inside criticism) by themselves, but those were finally set aside, and a competition instituted. This was undertaken in January 1900, when ten selected architects were invited to send in designs, Dr. (now Sir) Rowand Anderson being appointed assessor. Undeterred by previous failure, however, the managers (together with the executive committee now acting with them) first proceeded to have a species of preliminary competition among themselves, and as the result produced and issued to the competitors two "suggestive and illustrative" sketch plans. Of both of these the "Jubilee block" fronting Cathedral Square was an essential feature. The general lines of the sketch plans thus produced, and especially the situation of the Jubilee block, were found so radically faulty by most of the competing architects that all of them who had a previous reputation as hospital experts found it necessary to depart more or less entirely from them in the designs they submitted. Of the ten designs the assessor made a short list of four, and a final selection of one, which he recommended for adoption. The committee, influenced apparently by their own sketch plans and their "own opinion as to style of architecture," set aside the award, and chose a design outside even of the short list, which was simply a more fully detailed copy of their "suggestive" draft.

The Institute of Architects, in May 1901, addressed to the managers its first protest and appeal, criticising both the way in which the competition had been decided and the result arrived at, objecting to the whole arrangement of the selected plan as inadequate and out of date, and to the Jubilee block as shutting out the sun and air from the south, as well as at the same time vitally injuring the appearance of the cathedral, and finally requesting that the whole of the plans should be submitted to one or more hospital experts before anything further should be done.

To this no reply was received beyond a formal acknowledgment and reference to an official statement to the public which appeared in the Press on May 18, 1901. In this the criticisms of the Institute were in no way answered, and its suggestion of expert assistance was ignored, but it included (with reference to points raised elsewhere) the important statement that the managers now recognised "that the new hospital and not section of it (*i.e.* the Jubilee block) should be regarded . . . as a fitting memorial to the sixty-three years illustrious reign of the Queen."

In June of the same year the Institute again addressed the managers, reaffirming its criticism, and offering to bear the expense of the course suggested should its opinions not be borne out.

To this no reply was received.

On several occasions during the past winter, and especially at the annual general meeting of the Infirmary, it was stated that the original scheme was to be retained *in toto*, and the work pushed on with vigour. Accordingly the Institute thought it necessary once more to draw the managers' attention to the fact that no adequate replies had been received to its previous communications, and to press for an answer, with the result only that it was assured by the managers that it was their intention after the plans had been more fully developed to submit them to "experts—surgical, medical and mechanical."

This the Institute, in reply, pointed out would in no way meet the difficulties raised, that expert guidance would then come too late and might well be set aside as at the first stage of the proceedings. To this last appeal the secretary has replied closing the correspondence.

It is only under a sense of duty to the public and after repeated and careful consideration, that the Institute has felt itself warranted in criticising and so far joining issue with the managers in their onerous and disinterested labours on behalf of a great public institution. In this instance the Institute believes the managers' labours to have been misdirected in matters of procedure, and yet of the utmost importance, and the managers declining, as they do so far, to meet in any way the advice offered, it remains only to communicate to the public this belief.

The following are the letters on the subject that have passed this year between Mr. MacLean, secretary, and Mr. Henry Lamond:—

115 St. Vincent Street, Glasgow:

February 10, 1903.

To the Chairman and Managers of the Royal Infirmary.

Gentlemen,—In the matter of the proposed rebuilding of the Infirmary, I am instructed by my Council to remind you that in January 1901, and again in June of the same year, a protest and appeal were put forth by this Institute, addressed in the first instance to yourselves, and in the second to the then "executive committee." To neither was a direct or adequate reply received at the time, and it has been recently stated in the public Press that it is proposed to proceed shortly with the work on the original lines. In these circumstances the Council of the Institute has again had the matter under consideration. It remains of the same opinions previously expressed (and unanimously confirmed by the general body of the Institute), as set forth in the memorials then submitted, and of which copies are enclosed. My Council would therefore again beg you, in the interests alike of the Infirmary and the city of Glasgow, to give the proposals therein contained your earnest and favourable consideration.—Yours truly,

C. J. MACLEAN, Secretary

93 West Regent Street, Glasgow:

February 26, 1903.

C. J. MacLean, Esq., secretary,

Glasgow Institute of Architects.

Dear Sir,—I am instructed by the managers of the Royal Infirmary to acknowledge receipt of your letter, dated 10th inst., and to say that they having accepted the plan adopted by the executive committee, believing it to be the best obtainable after a perfectly fair adjudication among ten architects of acknowledged standing, the Glasgow Institute of Architects may rest assured that the managers will spare no pains to make the new Infirmary conform to the most recent advances in hospital construction. I am to add that it is their intention, as it always has been, to submit the internal arrangements when further adjusted to experts—surgical, medical and mechanical—on whose knowledge and experience they can rely.—I am, yours truly,

HENRY LAMOND, secretary.

115 St. Vincent Street, Glasgow:

March 27, 1903.

Henry Lamond, Esq., secretary,

Glasgow Royal Infirmary.

Dear Sir,—I duly received your letter of 26th ult., which has been carefully considered by my Council, with the result that they cannot but hold it an unsatisfactory and inadequate

ply to this Institute's previous memorials and letters to you on the subject.

The Institute's objections to the proposed scheme as previously expressed may, in the main, be summed up under three heads:—(1) The setting aside of the assessor's award and other unsatisfactory features of the adjudication on the competition designs, with the resultant injustice to the competitors. (2) The nature of the design thus selected, as regards its faulty distribution of the buildings on the site, and especially the seven-storey "Jubilee block," placed so as to shut out the sun and air from the surrounding area. (3) The irretrievable injury to the cathedral from the contiguity of this abnormally lofty building.

Your intimation that "the internal arrangements will be submitted to experts—surgical, medical and mechanical"—after the further development of the plans, is therefore not to the point, as not one of the Institute's objections above stated will be met or satisfied by the course thus indicated. Further, there is no indication that other points in connection with the internal and external treatment of the buildings which the Institute objects to but has hitherto refrained from specifying in detail, will be satisfactorily dealt with by such experts, or, if they are, that they will be given effect to after the plans have been developed, especially as the expert opinion previously engaged by the Board in the person of the assessor was disregarded, and that which the Institute now proposes is apparently refused.

The submission of the whole scheme in its present state to one or more experts of acknowledged position from a distance which the Institute in 1901 offered to arrange for, and, if need were, to itself pay for, still seems the only way in which the Board can meet the criticism of the Institute and set itself right with the public. My Council is therefore at a loss to understand why the managers have not seen their way to adopt this course in the past, and, while giving no reasons to the contrary, from the tenor of your letter apparently still refuse to do so.

May I ask before making this further correspondence public if found necessary for a definite statement from you regarding the above policy?—In name and on behalf of the Glasgow Institute of Architects, yours truly,

C. J. MACLEAN, Secretary.

93 West Regent Street, Glasgow: April 9, 1903.

C. J. MacLean, Esq., 115 St. Vincent Street.

Dear Sir,—I am instructed by the managers of the Royal Academy to acknowledge receipt of your letter to me of the 17th ult., and to say in reply that, while they do not accept the criticisms of your Institute as accurate, they have given them further careful consideration, and are unable to see what good purpose can be served by a continuation of this correspondence.—I am, yours truly,

HENRY LAMOND, Secretary.

TESSERÆ.

The Roman Foot in Measuring.

THE Greeks and Romans adopted the human foot as the basis of their system of measures of length. There are five ways of determining the length of the Roman foot, viz. by ancient measures still in existence, by measuring known distances along roads, by measuring buildings, by derivation from measures of capacity, by measuring a degree on the earth's surface. The measurement of buildings is rather a verification of the value of the foot as obtained from other sources than an independent evidence. It very seldom happens that we know the number of ancient feet contained in the building measured. We have one such example in the Parthenon which was called "hecatompedon" (hundred-footed), from the width of its front, but even in this case we cannot tell exactly, till we know something of the length of the Greek foot, to what precise part of the front this measurement applies. Again, there is the obelisk in the Piazza del Popolo at Rome and the Flaminian obelisk, the heights of which are given by Pliny. But the actual heights of these obelisks, as compared with Pliny, would give a value for the foot altogether different from that obtained from other sources. Indeed, the numbers in Pliny are undoubtedly corrupt. An ingenious emendation by Stuart would remove the difficulty, but it is obvious that a passage which requires a conjectural emendation cannot be taken as an independent authority. There is another mode of deducing the value of the foot from buildings, of the dimensions of which we have no information. The building is measured, and the length thus obtained is divided by the supposed value of the ancient foot (as derived from other evidence), and if a remainder be left this value of the foot is corrected so that there may be no remainder. It is assumed in this process that no fractions of feet were allowed in the dimensions of the building, and also that the plans were worked out with the

most minute exactness, both of which assumptions are not very probable. In fact, these measurements have given different values for the foot. "Modern architects," says Mr. Hussey, "do not allow that such calculations could be depended on in modern buildings for determining the true length of the measures by which they were planned. Nor are the dimensions of the parts of buildings of the Middle Ages in our own country, as Gothic churches and cathedrals, found to agree exactly so as to give whole numbers of the standard measure." On the other hand, these measurements, like those on roads, have the advantage of involving in all probability very small errors, and of the diminution of the error by division. The average values of the Roman foot obtained from these various sources, in terms of the English foot, are the following:—From ancient measures, '9718; from itinerary measurements, '97082; from measurements of buildings, '96994; from the congius (a liquid measure), '9832; from the length of a degree, '9724; of which the first three are the most to be depended on, and of those three the average is '9708, or 11'6496 inches, or 11½ inches, which we may take as the probable value of the Roman foot. Cagnazzi, whose researches are said by Niebuhr to have placed the true value of the Roman foot beyond a doubt, gives it a greater length than the above, namely, '29624 of a metre = '9722 of a foot, but this calculation is objected to by Böckh as being derived by a process not perfectly true from the value of the pound, and as being confirmed only by one existing measure, and also as being at variance with the value of the Greek foot obtained from independent sources. Böckh's own calculation, which agrees with that of Wurm, gives a value very little less than the above, namely, 131'15 Paris lines = 9704649 of the English foot = 11'6456 inches.

Proportions in Architecture.

Many things dictated by instinct alone may produce beauties in architecture and yet not have proportions in the sense which ought to be attached to the word. Ask the Gothic architect if his pillars bear a fixed relation to their different parts. The answer will be that the pillar may have three, six, or even more times the height of its thickness, and that nothing of the sort is fixed in a determinate manner in any Gothic buildings, not even in a solitary edifice whatever may be its dimensions. Ask if the Gothic capital corresponds in size, form and ornament with its pillar; facts themselves will tell you that caprice or chance alone decides its shape. Inquire if the different members and details agree with such and such a part of the arrangement, and you will be informed that no trouble has ever been taken about relative affinities which do not belong to the executive department. You will be shown the clumsiest supports by the side of the slenderest shafts; groups of little columns supporting nothing, and masses quite out of the perpendicular without any support at all. If you wish for an account of the exteriors of the churches, none can be rendered of confused parts and incoherent details carved out by the most ignorant caprice. The elevations of this style are never proportioned to their groundwork, and great boasting is made of their height, which only aspires to appear as an effort of mechanical skill. Gothic architecture has, therefore, no system of proportions, and it contains no principle of order which will enable us to discover from each part, detail and ornament the reason which unites it to the whole and to the other parts, details and ornaments of which that whole is composed. It must be remembered that Grecian architecture as exhibited in its remains, with those developments and modifications which have rendered it applicable to all nations, had not for its origin only that instinct which everywhere teaches the hewing and collecting of stones. It also possessed a kind of model consisting in itself of a combination of parts, arranged and connected by reason and necessity. It therefore sprang from a pre-existing combination, of which it adopted the leading features, and hence arose its principle of order. In Greece the first edifices were formed of wood, which produced a combination of parts governed by a natural and uniform connection. This principle transferred to stone constructions a regularity of disposition which has been always subsequently followed too exactly to admit of anything merely dictated by necessity. The only model was the spirit of order and proportion, and this adhered to, the natural love of variety which exists in every human breast was sufficient to bring all the resources of the art in play to vary the expression; but, while following a system of proportions dictated by observing the construction of the wooden hut, architects found it necessary in order to arrive at perfection in their art to study the spirit that dictated the proportions observed in this construction from a still grander model—that of nature. This in Greece produced a result which did not occur elsewhere, and, in proportion to the progress made by Grecian artists in imitating nature in their images of the human body, did this spirit of imitation display its influence in architecture. In thus reflecting upon the common bond of union which exists between all the arts, we perceive at once how and why an ignorance of the proportions of the human frame must have had its reaction upon the

Egyptian, Gothic, Indian and other styles of building; also the reason why the architecture most distinguished for order and fixed proportions was that of a people who in painting, drawing and sculpture had carried the study of scientific proportions to a higher pitch than any other nation.

Greek Painting in the Alexandrian Period.

According to Quintilian there were several famous painters in Greece about the time of Alexander the Great. He mentions Protogenes was distinguished for high finish, Pamphilus and Melanthius for composition, Antiphilus for facility, Theon of Samos for his prolific fancy, and for grace Apelles was unrivalled; Euphranor was in all things excellent, Pausias and Nicias were remarkable for chiaroscuro of various kinds, Nicomachus was celebrated for a bold and rapid pencil, and his brother Aristides surpassed all in the depth of expression. There were also other painters of great celebrity during this period:—Philoxemus of Eretria, Asclepiodorus of Athens, Athenion of Maronea, Echion, Cydias, Philochares, Theonnestus, Pyreicus, &c. This general revolution in the theories and practice of painting appears to have been greatly owing to the principles taught by Eupompus at Sicyon, who advised that nature should be preferred to any artist. Pamphilus of Amphipolis succeeded Eupompus in the school of Sicyon, which from that time became the most celebrated school of art in Greece. Pamphilus had the reputation of being the most scientific artist of his time; and such was his authority, says Pliny, that chiefly through his influence, first in Sicyon, then throughout all Greece, noble youths were taught the art of drawing before all others. It was considered amongst the first of liberal arts, and was practised exclusively by the free-born, for there was an especial edict prohibiting slaves from exercising it. The course of study in this school occupied ten years, and the fee of admission was an Attic talent; Pliny mentions that Apelles and Melanthius both paid this fee. Apelles studied under Ephorus of Ephesus before he became the pupil of Pamphilus; Pausias also studied encaustic under Pamphilus. The course of study comprehended instruction in drawing, arithmetic, geometry, anatomy and painting in all its branches. Pamphilus was the first painter, says Pliny, who was skilled in all the sciences, particularly arithmetic and geometry, without which he denied that art could be perfected. By these sciences as applied to painting, we must probably understand those principles of proportion and motion which can be reduced to rule: by arithmetic the system of the construction and the proportions of the parts of the human body; by geometry, perspective and the laws of motion, that is, so much of them as is necessary to give a correct representation of and a proper balance to the figure. Pamphilus seems to have painted but few pictures, but they were all conspicuous for beauty of composition. Nicomachus of Thebes was, according to Pliny, the most rapid painter of his time, but he was as conspicuous for the force and power of his pencil as for its rapidity. Plutarch compares his paintings with the verses of Homer. Nicomachus had many scholars, of whom Philoxenus of Eretria was celebrated as a painter of battles; a battle of Alexander and Darius, by him, is mentioned by Pliny as one of the most celebrated paintings of antiquity, but they were all surpassed by his own brother Aristides, who appears to have been the greatest master of expression among the Greeks.

NORFOLK AND NORWICH ARCHÆOLOGICAL SOCIETY.

THE annual general meeting of the Norfolk and Norwich Archæological Society was held at Norwich Guildhall on the 28th ult. General W. E. G. L. Bulwer presided.

Mr. Leonard Bolingbroke read the annual report, which recorded the meetings and excursions for the year.

Dr. Bensly, as treasurer, read the balance sheet, which showed that the year began with a balance in hand of 501*l.* 7*s.* 2*d.*, and ended with a balance in hand of 455*l.* 19*s.* The report was adopted.

General Bulwer was re-elected president, Dr. Bensly hon. treasurer, Mr. Leonard Bolingbroke hon. secretary, and Mr. Barnard hon. auditor.

Prince Frederick Duleep Singh and the Rev. F. Procter were added to the list of vice-presidents.

Mr. Bosworth W. Harcourt then read a paper on "St. Walstan or Wulstun of Bawburgh," and Mr. R. J. W. Purdy "Notes on a Valley in East Norfolk."

After luncheon St. Stephen's Church was visited and a paper read by the vicar, the Rev. Dundas Harford.

The company then went to the High School for Girls, and Mr. G. E. Hawes read a paper on "The Chapel of St. Mary in the Fields." He said that he had discovered the wall of the north aisle and its buttresses, both walls of the north porch, a portion of the south wall of the nave, 38 feet long, the foundations of the east wall of the nave and of the north and south

transepts, the foundations of the north and south piers of the chancel arch, portions of the foundations of the north-east column of the nave, portions of the tower walls and of the south buttress of same, portions of the wall, with buttress, of the north aisle of the chancel, wall further south of nave wall and two graves, one in the nave and one in the north transept. It was surprising that in digging over this large area so little material was found, but it appeared that at the Dissolution the then Dean, Miles Spencer, got all he could and then sold what he could. The king had for his share all the bells in the steeple, and the lead on the nave, chancel, aisles, chapels and steeple. The great hall of the college was probably part of the present school buildings. The parlour was probably to the east and beneath it was a crypt. He had shown that a discovery had been made of buildings which were of historical interest to the city, the site of which for 400 years had been unknown.

GENERAL.

Mr. Pittendrigh Macgillivray has obtained the commission for the Gladstone Memorial which is to be erected in St. Andrew Square, Edinburgh.

A Memorial will be unveiled at Nauplia on July 11 which will commemorate the services of the Frenchmen who were killed in 1821 during the Greek war of independence. The work is by M. Caldoupiis.

The Memorial of Charles Garnier is likely to be inaugurated at the Paris Opera House on the 15th inst. The design was prepared by M. Pascal, the architect, and the sculpture is by M. Thomas. The bust of the architect is an enlargement of one by Carpeaux.

M. Patrice Bonnet, a pupil of M. Esquié, has obtained the Prix Deschaumes of the Académie des Beaux-Arts, which is intended for young architects who distinguish themselves by their aptitude for their art. The value of it is 1,500 francs.

The Baroness Adolphe de Rothschild has handed over to the Louvre, Paris, the last instalment of the sum of 250,000 francs which had been bequeathed by Baron de Rothschild. The money amounts to 40,000 francs, and will be used for the purchase of works of art to be added to the Rothschild collection.

A Royal Commission has been appointed to inquire into the subject of trade disputes and trade combinations and the law affecting them, and to report on the law applicable to same and the effect of any modification thereof. The following are the members:—Mr. Graham Murray, Lord Advocate for Scotland, chairman; Sir William Lewis, Sir Godfrey Lushington, Messrs. Arthur Cohen, K.C., and Sydney Webb. Mr. Hartley Mothersole, barrister, is to be the secretary.

A Collection of books bound in the Guild of Handicraft has been lent for exhibition to the Kunstgewerbe Museum, Berlin.

The Report of the Wesleyan Metropolitan Chapel Building Fund states that the income for the past year was 6,129*l.*, and that grants have been made or promised to the extent of 35,000*l.* Among these is a grant of 7,500*l.* to the Victoria Hall, Deptford, the outlay on which is 22,000*l.* The Leysian scheme in City Road is to receive a grant of 9,000*l.* The total amount granted to mission-halls is 40,450*l.* New chapels are being built at Finchley and at Waltham Abbey. Ten sites for new Wesleyan chapels are held in North London, seven in South London, five in the east and four in the western parts of the Metropolis.

The Government have introduced a "Bill to authorise the appropriation of the surplus funds derived under the Battersea Park Act towards the opening of the Mall into Charing Cross and other metropolitan improvements."

Mr. Roberts, the Australian artist who is painting an historical picture for presentation to the King, representing the scene at the opening of the Commonwealth Parliament in 1901, is now at work in a room placed at his disposal in the Imperial Institute. The Prince and Princess of Wales have consented to sit for Mr. Roberts.

The Next Ordinary Meeting of the Society of Engineers will be held on Monday next, June 8, at the Royal United Service Institution, Whitehall. A paper will be read entitled "Electric-Light Stations, their Design and Arrangement" (illustrated by drawings of the Bridlington electric-light station), by Mr. Ernest R. Matthews, C.E., F.G.S.

Mr. Batsford will publish in a few days an interesting volume illustrating old English doorways from Tudor times to the end of the eighteenth century, reproduced from photographs specially taken by Mr. W. Galsworthy Davie, whose delightful volume on "Old Cottages and Farmhouses in Kent and Sussex" has been so widely appreciated. The photographic plates will be supplemented by some historical notes and sketches by Mr. Henry Tanner, jun., author of "English Interior Woodwork."

Architect and Contract Reporter.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BRIDLINGTON.—June 19.—Schemes are invited for providing the village of Flamborough (1,000 inhabitants) with an efficient supply of water. Mr. John B. Simpson, clerk, Rural District Council, Bridlington.

CROYDON.—June 9.—Competitive designs and estimates are invited for a children's home and two relief stations to be erected in Croydon. A premium of £15 15s. is offered for the best design for the children's home and £10 10s. for the second best, and a premium of £10 10s. is offered for the best designs for the two relief stations. Mr. Harry List, clerk, Union Offices, Mayday Road, Thornton Heath.

IRELAND.—June 18.—The Trustees of the Limerick free library and museum invite designs from architects in independent practice for the proposed Carnegie library and museum to be built in the People's Park, Limerick. Prizes of 75% and 25% respectively will be awarded to the designs placed first and second in the competition. Mr. W. M. Nolan, town clerk, Town Hall, Limerick.

POPLAR.—June 23.—Competitive designs are invited for a public library to be erected in Cubitt Town, Poplar, E. A premium of 75% is offered for the design accepted by the

Council, which will be deducted from the architect's commission should he be employed as architect in the execution of the work. Mr. Leonard Potts, town clerk, High Street, Poplar.

SCOTLAND.—June 13.—Competitive plans are invited for the formation and laying-out of ground for new cemetery at Wellhall, extending to about 9½ acres. Mr. A. L. Smith, 25 Duke Street, Hamilton.

TAUNTON.—July 20.—Competitive designs are invited for a library building to be erected in Corporation Street, at a cost not exceeding 5,000% inclusive. Premiums of 30%, 20% and 10% will be awarded for designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. George H. Kite, town clerk, Municipal Buildings, Taunton.

WALES.—Designs are invited for a type of self-contained terrace house for the working classes. A premium of 10% 10s. is offered. Particulars, with a lithographed plan of the proposed site, can be obtained from the Borough Surveyor, Somerset Place, Swansea.

WALES.—June 24.—For additions, alterations and improvements to the Brynhyfryd Board school, Swansea. Mr. G. E. T. Laurence, architect, Chandos Chambers, 22 Buckingham Street, Adelphi, W.C.

WALES.—June 30.—For the erection of a schoolroom and reseating and erecting new galleries at Bethany Baptist chapel, Pembroke Dock. Messrs. George Morgan & Sons, architects, 24 King Street, Carmarthen.

WEST HAM.—June 15.—For the cleansing, repair and painting of schools during the summer vacation. Mr. William Jacques, architect, 2 Fen Court, E.C.

FOR several years past the increase both in the export and import trade of Cardiff has been such that, in spite of the 111 acres of water space covered by the three existing docks at that port, another dock, deeper and larger than any of the others was needed and will shortly be opened. The new dock is 2,550 feet in length, with a breadth of 800 feet to 1,000 feet, and a depth of 50 feet below the level of the coping. Its total area is 50½ acres, thus occupying 6½ acres more than the water space covered by the Bute East Dock, and 17½ acres more than the Roath Dock. A sea-lock connecting the new dock with the Roath Dock is now in process of completion. This is 800 feet long, 90 feet wide and 50 feet deep, with a total of 41 feet 6 inches of water over the sill at ordinary spring tides and 32 feet at ordinary neap tides.

A NEW parcels post office is being erected at Russell Road, Murrayfield, Edinburgh, and is expected to be ready for occupation at Christmas in time for the heavy parcel traffic of that season. The site of the building—which will be fairly large and constructed of brick—is the vacant piece of ground immediately adjoining the rubber factory at Russell Road. For years past the Drili Hall, Forrest Road, has been used for the heavy Christmas parcels traffic, and it would seem from the step now taken that the postal authorities had been anxious to have a building of their own, which would be specially adapted for dealing with that class of traffic. The work at Murrayfield is being pushed on with all possible speed.

TENDERS.

BARNESLEY.

For renewal of sewer in Mr. Matthewman's fields. Mr. W. P. YOUNG, surveyor.

BUILDING AND BUILDERS.

THE corner-stone of a new vestry in connection with St. Thomas's Church, Lower Crumpsall, has been laid. It is chiefly needed for the choir, and will cost about 450/.

THE Postal authorities have now, after a lapse of two years, invited tenders for the work in connection with the erection of a new post office for Linlithgow and district. The present accommodation is very limited, and two years ago a site for new buildings was secured at the east end of the town, adjacent to the railway station.

A NEW Wesleyan church is being built at Longwood, Huddersfield, the memorial-stone of which has been laid by Sir William H. Broadbent, M.D., F.R.S., his family having long been connected with Methodism in that neighbourhood. Sir William Broadbent was himself at one time a scholar and a teacher in the school.

FOUR men were lately at work on a scaffold which had been erected in the goods shed of the Great Northern Railway at King's Cross, London, for the purpose of whitewashing, when suddenly the scaffolding collapsed, throwing all four men to the ground, a distance of 20 feet. The men were removed to the Royal Free Hospital, where the house surgeon found that William Hawkins had sustained a fracture of the left leg and fractured ribs, in consequence of which he was admitted as an in-patient; George Carter had sustained injuries to the

head and both knees; William Lee sustained severe cuts of the right knee and left eye; whilst Robert Turner received severe injuries to both ankles.

ON Saturday afternoon the Bishop of Shrewsbury (Dr. Allen) laid the foundation-stone of a new Roman Catholic church for the parish of St. Philip and St. James, at Stockport, to be known as the Church of Our Lady Queen of Apostles. The church, when completed, will be one of the finest in the diocese, and it is estimated to cost about 11,000/.

THE church will be of Gothic design. Its length to the cloister behind the chancel will be 118 feet, and the length of the nave 87 feet, the sanctuary 24 feet, and the cloister 7 feet. A presbytery will be attached to the church, and is estimated to cost 2,000/.

THE foundation-stone was laid on the 27th ult of eighty-five dwellings on the Grove Vale Estate, Camberwell. These houses, with two storeys only and gardens in front and rear, will be models of comfort and suitability if they realise all the advantages depicted on the plans prepared by the borough engineer. The mayor of Camberwell (Councillor Goddard Clarke, L.C.C.) performed the inaugural ceremony, when a hope was expressed that some of the houses, which will accommodate 166 families, will be occupied in the early autumn. In addition to erecting these dwellings the Council has taken steps to purchase houses in the most congested and insanitary parts of the borough, and to improve them and make them more suitable for the needs of the persons who are compelled to live in the neighbourhood.

A MEETING of the executive committee of the Swansea Harbour Trust was held on the 28th ult. under the presidency of the Mayor for the purpose of considering the sketch-plans for the new dock, which is to be constructed at a cost of about 1,500,000/. Mr. Meik (the consulting engineer), with Mr. Schenk (the chief engineer of the Trust), were present, and the plans were exhaustively explained. No material alterations were suggested, and it was decided that the detailed drawings should be put in hand at once and assistance obtained to insure the utmost despatch. It is hoped these will be completed in two or three months, and then the Trust will be in a position to invite tenders for the carrying out of the great undertaking. The dock will cover an area of about 70 acres, and the lock will be 875 feet long and 90 feet wide. The capabilities of the lock were illustrated by diagrams, showing the accommodation needed by the largest vessel afloat, the *Cedric*, and the capacity of the proposed lock to more than meet the requirements.

VARIETIES.

THE Scottish Episcopal church of St. Adrian, Gullane, was opened on Whit Monday by the Very Rev. the Dean of Edinburgh.

A NEW Wesleyan chapel, which has seating accommodation for about 200 people, was opened at Bomere Heath, Shrewsbury, on the 28th ult. The cost of the building is approximately 1,200*l*.

THE restoration and enlargement of Hartsborne parish church, Derbyshire, has been carried out at a cost of 2,600*l*. The formal dedication and consecration of the new portion took place on Saturday afternoon.

A SAD accident has befallen two distinguished artists of Verona, named Zannoni and Rancani. They were engaged in painting the ceiling of a church near Verona, when a board on the scaffolding broke. Both men fell a distance of 43 feet and were killed. Signori Zannoni and Rancani were extremely clever artists, and were noted for their frescoes, many of which they had executed with great success.

THE new opera house at Buxton was opened on Monday evening. The new building, the architect of which was Mr. Frank Matcham, has cost 25,000*l*, is fireproof throughout, and the stage is entirely cut off from the auditorium by a fireproof curtain. It is illuminated with the electric light. The painting by Mr. Hemsley, London, is a very distinct feature.

ON the 30th ult. Mr. W. M. Crowfoot, chairman of the Beccles School Board, formally opened the new infant school erected by the Board for the accommodation of infants, whose numbers have outgrown the old building in Peddar's Lane, formerly known as the British schools. The new building was designed by Mr. A. Pells, of Beccles, and erected to his plan by Messrs. Grimwood, of Ipswich.

THE new English Presbyterian church at Holywell has now been completed, and arrangements have been made for the opening ceremony to take place at an early date. The site is in Whitford Street, and was purchased at a cost of 1,000*l*, while the building has cost another 2,000*l*. The building has a frontage of red Ruabon brick with ornamental tower, and has been erected by Mr. Richard Jones, contractor, Holywell, from the plans of Mr. T. G. Williams, architect, Liverpool.

THE directors of the London, Brighton and South Coast Railway Company are making vast improvements on the line. Last week the new goods station was opened at Bournemouth. The new premises occupy some 10½ acres of land and have cost over 250,000*l*. to erect. Without doubt the London, Brighton and South Coast Railway Company have now one of the finest and most up-to-date goods stations to be found in the United Kingdom, and the directors are to be congratulated on their enterprise.

THE large east window of Troon parish church has been filled with stained glass. The subject is the Ascension of Christ. In the upper part of the central and most important opening Christ is seen rising high into a firmament of seraphs where He is received by the heavenly host of praising and adoring angels which fill in the upper parts of the side openings. Occupying the lower part of all the five openings are the Apostles gazing upward with evident feelings of love, wonder and awe. The colour treatment of the window is full and rich.

THE new parish church of Dean, Edinburgh, which has been erected at a cost of nearly 11,000*l*, was opened on the 30th ult. The new building, which has been built from plans prepared by Messrs. Dunn & Findlay, architects, stands close to the margin of the Queensferry Road, is a substantial structure, and will have a prominent spire. The edifice is worthy of its surroundings and of its associations. There are 935 sittings, about 300 more than in the former church. There will be a new pipe organ, to cost 800*l*, which sum has been provided.

THE Lord High Commissioner and suite visited Blackhall, a rising suburb of Edinburgh, and laid the foundation-stone of St. Columba's parish church. He had laid, he said, the foundation of a large church, which would eventually meet the accommodation of not only the present population, but the increased population which would follow. The church will cost 6,000*l*. and will hold 900 people. The architecture of the building is a simple treatment of the Norman style, with a tower at the north-west corner. The interior will be finished in stonework with open timber roofs. Meantime only the nave is to be erected at a cost of about 4,000*l*, and it is expected to be opened in about ten months.

CREWE railway station is to be considerably enlarged to enable the officials of the London and North-Western Railway

pany to cope with the growing traffic between the north and the Midlands. The tunnelling arrangements to facilitate the through goods traffic took five years to complete, involved enormous cost. The new station needs an extension for passenger traffic. These extensions, which will facilitate the employment of hundreds of men for an indefinite period, have now been commenced. There will be eight platforms, each over a quarter of a mile long. The headquarters of the telegraph department are being consolidated at Crewe, and large suites of offices will be erected on the west side of the station. Mr. Arthur Moore, superintendent of the signalling and electrical department of the railway company, has been given entire charge of the whole telegraphic work on the system.

TRADE NOTES.

A mosaic in the entrance to the Sailors' Palace recently erected by the Prince of Wales was executed by Messrs. Speker, Ltd., Bath House, 57-60 Holborn Viaduct. The isolation hospital at the Rainhill Asylum, Liverpool, is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues by Messrs. H. Shorland & Brother, of Manchester. A LARGE clock, showing time on two 6-foot dials and running hours, has been erected at the church at Darley Abbey, Derbyshire, by John Smith & Sons, Midland Clock Works, Derby, and was started this Whitsuntide. The whole of the expense is being borne by Mr. Walter Evans, Darley Abbey.

ELECTRIC NOTES.

The Fife electric-power Bill has been passed by the Committee on unopposed bills of the House of Lords. The electric-lighting committee of the Edinburgh Town Council have recommended that the charge for private electric lighting be 3½d. per unit—the same as last year—and charge for motor-power 1½d. per unit instead of 1½d. as last year. A PETITION was presented at Dalkeith Dean of Guild Court on Monday, by the Electric Supply Corporation, Ltd.,

London, for permission to erect an electric generating station in Croft Street, Dalkeith. The magistrates granted the request. The Corporation will carry through their arrangements made with Messrs. Crompton & Co. for the electric lighting of the streets of Dalkeith.

A CONTRACT has been signed between the directors of the Wirral Railway Company and the British Westinghouse Company for the electrification of the railway on the same system as that now successfully working on the Mersey Tunnel Railway. The Wirral Railway is about fifteen miles in length, and connects Liverpool by means of the Mersey Railway with the residential district of the Wirral peninsula in Cheshire, West Kirby and New Brighton being the terminal points.

MR. F. H. TULLOCH (Local Government Board inspector) held an inquiry at the town hall, Wednesbury, into an application by the Town Council for sanction to the borrowing of £11,000 for electric lighting. The town clerk (Mr. T. Jones) said the Corporation had been induced to take this action by a demand for electricity, and that this actually existed was borne out by the fact that the Council was unanimous in resolving to incur the expenditure, which had not been opposed by a single ratepayer. The Corporation did not propose to generate their own electricity, but to take a supply from the Midland Electric Corporation for Power Distribution, who had obtained a provisional order to supply electricity to Wednesbury and neighbouring districts, but had undertaken to supply the Corporation in bulk upon certain agreed terms, which would enable the Corporation to recoup themselves for the cost of distribution. Mr. W. Stevens (electrical engineer) gave details of the scheme, and said the risk to the Corporation was very slight, as they would simply purchase to the extent to which they could sell current to their customers. They intended to cater for all classes, and to supply through 1d., 6d. or 1s.-in-the-slot meters when necessary. To begin with, the area of supply would be limited to a district in the centre of the borough. In reply to the inspector, the town clerk said there was a demand by manufacturers for electricity for motive purposes. The charges proposed to be made to consumers by the Corporation would compare favourably with those in vogue in other parts of the district, as they would be as low as at Walsall, lower than at Dudley, and considerably lower than in Birmingham. For a penny the Corporation would be able to give the use of an 8 candle-power light for 5½ hours. There was no opposition to the application.

AN ENGINEER'S TRIP TO THE ORIENT.*

FRIENDS and fellow-members of the Western Society of Engineers—I have not been on a junketing expedition this time. I have been abroad, going westward. Once before I started to go around the world, twenty years ago, to learn what I might about the world by such a trip, and I started eastward. I took a whole year for an examination of Europe alone, went through every country in it almost, through almost all of the large iron and steel establishments that seemed worthy of close inspection, and I found that I was going the wrong way. There was nothing in them that I had not seen before, and I concluded that I would go back home and take a rest, and the next time I started I would go the other way. And I would advise you, gentlemen, if you should ever propose to go around this globe with advantage, to go westward. That way the star of empire has taken its way, and that way the star of knowledge has also taken its way. Each thing is explained by what you have seen before as you go westward, and the other way it is all a puzzle.

I have recently gone through Japan, Corea and a portion of Manchuria on a business trip.

And, in the first place, do not get the idea that there are no engineers over there on the other side of the Pacific. There are a great many engineers, and there are a great many first-class engineers, not only Americans and Europeans, but among the natives themselves. I was brought into close contact with some of the most prominent engineers in the Orient, and I found many of them thoroughly educated and well posted. Take, for instance, Matsumoto, of Japan. He graduated at the Van Rensselaer Polytechnic Institute, at Troy, N.Y., went out to Japan, and, being of a high family, soon got into a fine position and for a great many years has been at the head of the Imperial railways of Japan. I had the good fortune to entertain him at my house when he was here and got quite intimate with him, passed many pleasant hours with him on the other side, and questioned him as closely as I could as to what he had been doing in Japan. I found him "up to date" and admirably informed. I also met N. Shiraishe and many others. They are thoroughly educated. They send their brightest young men to this country and to Europe. They have done so for a great many years, and they are thoroughly trained, and some of them remain in this country and Europe until they get

* An address by General William Sooy Smith, delivered before the Western Society of Engineers.

a knowledge of practical engineering in a practical way, then go back home prepared to take high positions.

There is one thing I would strongly advise engineers not go to the Orient without some previous understanding. Do not think there are not engineers, and good engineers, that part of the world. Another reason is that wages are exceedingly low, as compared with wages here. I think wages are not more than half as much as in this country, also, in Japan especially, there is a strong national feeling. They are a people ambitious to do for themselves, and therefore do not depend upon engineers from outside.

When I started East some twenty years ago I saw many things to convince me that we were then neck and neck with the best of them in Europe. Upon one occasion in London I was questioned by a party of eminent civil engineers something like this:—"You have been considerably about the country?" "Oh, yes." "And looked at our engineering works?" "Yes; as well as I could." "Well, won't you be kind enough to give us your impressions?" "Well," said I, "I have recently been up in Yorkshire and walked some miles over one of your lines and crossed a number of bridges and studied them as well as I could, and didn't find they were as good as ours." "Why not?" "Well, the box and plate girders of 50, 60 and 70-foot spans. Your joists transversely on your bridges and often on the flanges of your girders, giving them a tipping effect; on girders you then spring brick arches from one joist to another and on top of these arches put from 2 to 3 feet of gravel. You tell me why you build your floor-system in this way? What do you want with the gravel, and what do you want the arches, except to hold the gravel?" "Well," said I, "how do you do it?" I answered, "In the first place, we do not use box or plate girders to any extent; we can cut a large part of the material the girder contains and leave it as strong. We build trusses, putting the material in the direction of the strains. We attach our beams to the foot of these uprights, at the point of intersection of braces, and on these beams put the track-stringers and lay track on them." "With the floor all open?" "Why not?" "How do your men cross your bridges?" "Why, we employ sober men and put a running-plank on one side of the track and allow the men to walk it; if they don't, they can fall. They laughed, and some of them said, "The Yankee is right. And so the comparison stood at that time. Wherever I look over their structures—and some of them were admirably built

ly everywhere there was a great waste of material. They
e now learned to avoid this somewhat.

The circumstances surrounding the American engineer in
beginning were the most favourable possible to develop the
e spirit of the engineer, compelling him to do the very best
k he can with the least means. We were compelled to
nomise in every way in order to do that. First was the fact
t material was scarce and hard to get and, therefore, dear,
we had to build our structures on proper lines and in
ordance with the strictest requirements of economy. We
to borrow capital, for we had no money to build railroads.
e builders of the road, who furnished the money, were very
eful to get engineers who could do the most work for the
st money. That influence has followed our profession in all
work from the beginning to the present day, and that
ence I believe has been more potent than all others to
elop in this country a high order of engineering science, of
ch we may be justly proud.

At the same time, let us recognise the merits of engineers
other countries. Of all things vanity, such as we are liable
will be the most dangerous to the success of which we now
that we are justly proud. We have as a profession in this
ntry done our very best to ascertain the laws which govern
substances which we employ. We have analysed in the
st rigorous manner the strains and the different factors which
er into our structures, and we are certainly far in advance
anything we could boast of ten years ago, and I believe we
neck and neck with the best engineers in the world, if not
ttle bit ahead. At the same time, when we are speaking of
se other men, let us remember that these very men have
n taught in our schools, have been upon our works, and
e been educated here in our methods, and it is not fair to
that they are merely copyists, because in certain instances
ch I met with during my recent trip in the East, I found
t they have not only adopted our methods, but have
eloped them in some cases, and even improved upon them.
hile over there I happened to fall in with Shiraishe. He
l met me in this country, at Hâvre de Grace, while I was
lding the Susquehanna bridge at that point. I met him in
velling, and we fell into conversation accidentally. I soon
covered he was an engineer, and handed him my card. He
t, "I have met you before," and he referred back to our
eting at Hâvre de Grace. Then he told me he was about
ould a dry-dock at a certain place and was very much
led about the plan. He gave me the data and circum-

stances in detail, and I said, "That is an ideal case for the
application of the 'freezing process'." I explained it to him
and was astonished to see how quickly he took hold of it and
understood its advantages as applied to the very case he had in
hand. That led to correspondence and consultation, and he
has gone on and suggested improvements in the application of
it that were different and better than any that we knew before.
For instance, in this large excavation he suggested that we
should only freeze a portion of it at a time, using the same set
of pipes over and over again, thus saving a heavy expense. So
they are not mere copyists, for they have the ability to
originate, to adopt the proper methods, and to improve on
them and discover new processes of their own.

I saw a good deal of work that astonished me; some of it
very old work. Many of you may have seen such work. I
never did in my life. I saw a stone wall laid with blocks that
were about that large (indicating), and they were laid in
diagonal courses, not horizontal. Give this a little thought,
and you will see that it has advantages. There is no chance
of cracking vertically, the loads are distributed by giving the
compressive resistances of the stones a diagonal direction. I
never saw masonry built that way anywhere except in the East.

Now, in doing work they are very far behind American
methods. They employ hand-labour, but they have such an
abundance of it that you can't wonder. It is cheaper than the
best machinery we can employ. They coal a ship quicker and
cheaper by hand than we can by the very best machinery.
While they work for from five dollars to six dollars a month
and take care of themselves, they do not do near the amount
of work that our men do. It takes three or four coolies to do
as much as one of our labourers, but even then the labour is
very cheap. And if they were to substitute machinery much
the larger part of those people would be thrown out of employ-
ment, and starvation would stare them in the face. They have
built first-rate ships, from stem to stern. They make all the
machinery that goes into them. They man them and they run
them as successfully as any other people. The only objection
I have to them is that the doors are entirely too low. I con-
tinually bumped my head in going through them.

Now, as to the works that are to be done, there is no end of
them. Some works as great as the world has ever seen still
remain to be done there. The opening of the Yang-tse-Kiang
river is a tremendous undertaking. Great harbours have to
be built where there are none now. And the railway systems
are all in their infancy, but the whole country is developing

rapidly. It looks very much like our own country, consisting of mountains, hills and valleys, much of it fertile, with products very much like our own. I saw a great deal of Indian corn growing there, but it is of an inferior quality.

Now there is another thing that will retard our operations in that country. It is the very low price of everything. It is a cheap country, wonderfully cheap, and this is a wonderfully dear country. They only buy from us the things that they must buy. The only things we export to that country in any great amount are our bread stuffs. Our bread stuffs are in competition with their rice, which keeps the prices down very low. Almost everything else they can produce much cheaper than we can. Therefore I don't think that we need expect a great commerce with that country. I suppose we will get it gradually, in the course of a great many years. There is nothing could appear more stupid to anyone who looks at the country from that side than the Chinese Exclusion Act. There is a great surplus of labour and the best kind of labour, although their men are not as vigorous as ours. But if men are paid better they will work better. We are short of labour here; there is a conflict here between capital and labour that is becoming more and more troublesome and threatening, and I think none of us can look forward to what must be the status of that conflict without great concern. We, as lovers of this great country, must dread the conflict becoming more and more threatening every year, and must use our brains to the best of our ability to discover some way out of that trouble. There is no doubt that the Exclusion Act, instigated first for a very good reason, is now simply maintained through the influence of the labour of this country, to prevent the lowering of wages, which are now away beyond what they ought to be. We know the labour unions control the elections and the men to be elected must court their favour. That is the bottom of the whole thing and ought to be removed. A broader and a higher understanding of it should be obtained, and our conduct should be on a broader and higher plane. The conduct of our very wealthy people is reaching down to the lower classes, and instead of living simply and economically, there is a strife that is produced by it that pervades the whole of our national life from top to bottom, and we are on that road which the historians all point out as the one that leads to destruction. Almost every great empire that has existed since the beginning of the world to the present time has met with its end because of the luxury of its people. I think that is our greatest danger.

Now if we could get, under proper limitations, enough these labourers to do our work, the prices of everything would be brought down, and we would be getting on to the plane of common sense and our prosperity would be permanent.

ELECTRIC LIGHT IN LIVERPOOL.

Two reports have been presented to the electric power and lighting committee in reference to the electric lighting of the whole of the tramway routes of the city and other thoroughfares. The city lighting engineer states that the total road mileage of tramway routes is 57½ miles, four miles of which are already electrically-lighted. In dealing with these roads it would be desirable from every point of view to utilise the tramway poles where they exist and are available. These are fixed at an average distance apart of 40 yards which would necessitate approximately 2,054 lamps over the entire tramway routes. Tram poles do not exist over the whole of the tramway routes, and it is estimated that 5 electric columns would have to be provided.

"The following are the streets which the engineer considers are principal thoroughfares, in addition to the tramway route viz Great Homer Street, Fox Street, Old Hall Street, Boa Street, Mill Street, Myrtle Street, Brownlow Hill, North John Street (part), South John Street, Hanover Street. The total length of these streets is, about four miles, and it is assumed that the lamps in them might reasonably be placed at an average distance apart of 55 yards, which would necessitate approximately 145 lamps. On this assumption the approximate first cost and additional annual cost would be as follows:—Wiring and equipping lamps, switches, &c, on 15 tram-poles, at 77l. each, 119,042l.; wiring and equipping lamps, switches, &c, on 653 electric lamp pillars, at 84l. 10s. each, 55,178l. 10s.—174,220l. 10s., credited by cost of 3,278 gas lamps, pillars, &c, discontinued, at 1l. 5s. each, 4,097l. 10s. total first cost, 170,123l. Annual cost of 2,199 lamps at 16l. 1s. each, 36,503l. 8s., credited by present cost of gas-lighting 8,856l. 5s. 1d.; total additional cost, 27,647l. 2s. 11d."

The resident engineer states that if this scheme "were carried out in its entirety it would be necessary to add, say 2,000 horse-power to the generating plant in the stations, and to lay additional street mains in advance of the usual extension for ordinary supply purposes." The engineer estimates that capital expenditure necessary for the above plant and mains approximately at 50,000l.

THE COLUMBIAN FIREPROOFING COMPANY'S STAND.

give a view of the stand of the Columbian Fireproofing Company at the Earl's Court Exhibition. The peculiar interest it may not at first sight strike the stranger, but all parts in the railing to the summit are examples of the company's

6 inches span, which is adapted for a corridor, cloister or passage, and, as will be seen, there is no necessity for any tie-rods. On one side is a sloping roof with dormer; on the other a mansard roof. What is exhibited in the limited space will be as suggestive to the initiated of the difficulties which can be met by the material as if the Columbian Company had introduced some of their large and varied undertakings.

specialties. The railing, for example, exemplifies the peculiar fluted crossbars of steel which were introduced by the company. The columns are of their fireproof material; some of the shafts are plain, others fluted. The upper part shows a variety of roofing. In the centre is a concrete arch 9 feet

Sanitary engineers will be struck by the section of concrete and steel pipes. They can be adapted to any pressure by altering the thickness of the concrete and strengthening the bars in proportion. Similar pipes are now in demand on the Continent. Over 200 miles of them have been employed by

M. Bonna, of Paris, an engineer having large experience in hydraulic works. Some of them have been in use for as long a period as ten years without showing the least flaw. The system has been also adopted by the Municipality of Paris for the immense conduits required for carrying off the sewage of the capital.

INSTITUTION OF ELECTRICAL ENGINEERS.

At the Royal College of Science, Stephen's Green, Dublin, the Dublin section of the Institution of Electrical Engineers recently held their annual general meeting. Mr. A. E. Porte occupied the chair, and the attendance was large.

The secretary, Mr. Tatlow, read the report for the session, which was adopted, after which votes of thanks were passed to the Council of the Royal College of Science for the use of their rooms and to the outgoing chairman.

An interesting discussion followed on Mr. A. W. Whieldon's paper, "The Electric Generating Station of the Future." The paper dealt first with the coal supply, and went on to state that in connection with our limited coal measures the electrical distribution of power became a question of national importance, and the key for the solving of its problems could only be supplied by the electrical engineers of to-day and to-morrow. So rapid were the changes that were taking place that a time was not far distant when economy would require the linking together of the scattered installations in business centres, so that each might form a part of a concrete whole; and this centralisation, with a general feeding from a common source, would have a most important bearing when the wastage and diminution of the coal supply was taken into account.

WAGES IN GLASGOW.

EVIDENCE was given before the Glasgow Housing Commission by Mr. Andrew Smith, cashier and bookkeeper with Messrs. Charles Brand & Son, contractors, Glasgow, concerning the wages paid to labourers engaged in the construction of the Central Railway, Glasgow, from 1891 to 1896. The lowest paid men had 19s. per week of 57 hours, and the highest rate was 17 2s. 6d. given to bricklayers, masons and blacksmiths' labourers. Since that time the rate had risen, and at the present Grangemouth Dock contract the rate was 17 2s. 11d. for the lowest class of labourers for 55 hours. Witness esti-

imated loss due to broken time at one day a month; in addition to the holidays, would make an average loss of about three weeks in the year, but there was always more or less overtime, which would in some cases make up for the loss. Many of them, however, lost time through their own negligence.

In reply to the Chairman as to the habits of the men whom witness had to deal, he said that if they were sober men they would soon have a higher rate of wages.

Is there not something depressing in working in soft, mucky clay that tends to send a man to the solace which he finds in drink?—I do not think so.

Do you not think that overtime above a week of fifty hours is apt to tire a man, to weary him, as to make him unfit to prostrate and fit for nothing else but drink after that?—On the Continent they work far longer hours than they do in Scotland.

The Chairman: But they have different weather from us. By Mr. Brand: The tone as well as the wages of the men had been improved by the introduction of machinery. V

the exception of two separate years during the past twenty years, there had been more work than they could find labour for. He said that they were advertising at the present time for labourers for the Connel Ferry Railway at 6d. per hour. It was easier to get men in Glasgow than in the country.

Andrew Sharp, junior, cashier to Messrs. James Goldie & Son, contractors, Glasgow, submitted a statement of wages during the year ended March 31 last paid to the various workmen in the employment of his firm. Tradesmen received standard wages in their respective trades. In the case of labourers the wages paid were:—Timbermen and specialist labourers, 6d. to 7d. per hour; bricklayers and masons, 5½d. per hour; navvies 5d. and 5½d. per hour. Watchmen received 21s. 3d. to 22s. 8d. per week for seven nights; boys, 14s. to 18s. per week; carters, 26s. per week with a single horse, and 29s. per week with a pair. Labourers digging clay, 23s. 4d. per week; labourers wheeling clay and bricks, 33s. 7d. per week; labourers building kilns and burning bricks, 36s. per week; labourers jobbing about field, 23s. 4d. per week. Women—Dyers, 19s. 8d. per week; bogie fillers, 19s. per week; tiling bricks, 9s. per week. Boys—Bogie drivers, 17s. per week. Boys and girls—Drawers-off, 15s. 11d. per week.

Do you expect a higher tone of character from your labourers, seeing you pay them more than the minimum wages?—Not necessarily, so long as the work is carried out and the time kept. With regard to masons, he thought the

generation were steadier in their habits than their fathers

Chairman: That is very gratifying and very interesting. Applying to the Chairman, the witness said that navvies sit and starts, and were not at all regular in their hour. In the present warm weather they would work a when lie down for a few days.

Professor Glaister: Certain kinds of brickfield work for was very laborious. It was so hard that neither he nor Glaister could do it for two days.

THE INTERNATIONAL FIRE PREVENTION CONGRESS.

International Fire Prevention Congress, convened by the Fire Prevention Committee, will be attended by six delegates from our leading Government Departments, by six representatives of the City of London, three from Metropolitan Asylums Board, four from the London Board of Commerce, and quite a number from the other authorities and institutions. Nearly all the leading municipalities have also decided to be officially represented on this occasion, including cities such as Edinburgh, Glasgow, Aberdeen, Liverpool, Birmingham, &c., to the number of eighty corporations. The German, French, Italian, Belgian, and other continental Governments have intimated their intention of sending official delegates, and also a number of leading foreign municipalities. The distant colonies of Australia and Canada, as also India, are sending representatives of the various institutions included. Further, a particularly large deputation of engineers is coming over from the United States. The congress being mainly a technical one dealing with the "prevention" of better construction and equipment, by legislation and precautionary measures, the membership comprises public officials, architects, engineers and fire-brigade men, but the insurance interests will also be represented, as will the universities and other teaching bodies.

The congress will hence be essentially a working one, with no social organisation, but the evenings are to be devoted to a series of entertainments, including a congress banquet and several receptions. Special courtesies have been accorded to the members of congress during their stay in London, inasmuch as the Duke of Sutherland, the Duke of Wellington and others

have thrown open their private galleries; whilst the Speaker of the House of Commons, the Master of the Mint, the Secretary of the General Post Office and other public officials are according various facilities, and several clubs have nominated the visitors honorary members for the time of their stay in London. The great railway and shipping companies are also extending facilities to visitors by reducing their fares or making special arrangements.

Owing to the great demand for participation in the congress, it has now been decided to close the application lists, excepting in the case of the accredited representatives of public authorities, institutions and societies, as from June 5.

The congress bureau up to July 5 will be at No. 1 Waterloo Place, Pall Mall. All communications should be addressed to the General Hon. Secretary of the British Fire Prevention Committee, and not to individuals or sectional hon. secretaries.

THE NEW KURSAAL, HARROGATE.

HARROGATE was very jubilant on the 27th ult., the occasion being the inauguration of the new Kursaal which has been erected in a free treatment of the Renaissance style, adjoining the old Spa concert-rooms, and within a stone's throw of the Royal baths. The main vestibule leads to a spacious covered promenade, which practically encircles the whole building. On two sides it commands views of the theatre, from which it is separated by the glass doors which give access to the boxes. On a third it emerges into the open air, and affords charming views of the gardens at the back. By way of the promenade the restaurant and refreshment-rooms are reached, and it also gives entrance to the older building, which may be used either separately or in conjunction with its modern rival. At all events the complete scheme contemplates reading, billiard and smoking-rooms as convenient adjuncts. But the theatre or concert hall is, of course, the main centre of attraction. This is some 72 feet in width and 108 feet in length, roofed in a single rich span. There is a stage designed to accommodate a full orchestra and chorus, and capable of extension if needed. Shortly summed up, the interior is of ornamental fibrous plaster in gold, with marble pilasters and base; the boxes have hangings of Rose du Barry, which goes well with the cream and gold of their segmented fronts, while the upholstering in general is rich and effective, and in keeping with the decorative surroundings. A feature is that that portion of the hall which is nearest

the stage has a spring floor, enabling it to be used for dancing, while the seating at the back of the hall being raised will constitute a pleasant lounge when the theatre is temporarily converted into a ball-room. There is a capacious balcony, reached by handsome marble staircases—marble, in fact, seems everywhere—and altogether some 2,000 people may be accommodated without much difficulty in a building which is admirably light and particularly well ventilated. Mr. Robert J. Beale, of Old Queen Street, is the architect, and with him has been associated Mr. Frank Matcham.

THE HOUSING QUESTION IN LIVERPOOL.

COLONEL W. R. SLACKE, R.E., Local Government Board inspector, held an inquiry at the Municipal Offices, Dale Street, Liverpool, relative to an application of the City Council to borrow two sums of 150,000*l.* and 1,230*l.* in connection with the carrying out of the provisions of the Working Classes Act, 1890. The members of the Council present were Mr. J. B. Colton (chairman of the housing committee), Mr. E. Russell Taylor (deputy chairman), Mr. Alex. Armour, Mr. Austin Harford, Mr. Thos. Roberts, Mr. J. O'Shea and Mr. F. Harford.

Mr. Cripps, assistant town clerk, in explaining the application for sanction to borrow 150,000*l.*, said the money was required for the purpose of acquiring land and the erection of workmen's dwellings under Part I of the Housing of the Working Classes Act, in connection with the Hornby Street improvement scheme. The Corporation were not yet satisfied with the period allowed by the Local Government Board to repay the loans. Since the last application was made a Select Committee of the House of Commons, appointed to consider the subject, had reported that in their opinion the period to be allowed for housing and rehousing loans should be extended to eighty years. The Local Government Board had not yet power to sanction a loan for that period, but he asked that they should sanction this loan for the full period in their power, namely, sixty years. The Commissioners stated that there were two questions to consider in determining the period for which a loan should be sanctioned for repayment. One was as to the number of years which the buildings would last, and the second as to the length of time the demand would last for the houses. The deputy-surveyor would tell the inspector that the houses it was proposed to erect would last for 150 years—120 years at any rate. As to the time the demand would last, he pointed

out that Liverpool was a seaport, and that these houses were to be erected within half a mile of the river, and that they were to be occupied by dock labourers and people earning their livings at the docks. So long as Liverpool was a seaport, long would there be a demand for these houses. The second application was in respect of a small block of concrete cottages proposed to be erected on a site in Eldon Street, the land which had been acquired and paid for under the local Act, 1864. These concrete dwellings had passed the element stage, because the surveyor had already erected a similar cottage at Cobb's Quarry.

Mr. F. T. Turton, deputy surveyor, explained that the land in the first application was comprised in eight blocks. The estimate for acquiring the land was 64,840*l.*, and for the buildings 84,799*l.* The number of dwellings proposed to be erected was 444, containing 1,218 rooms, and providing accommodation for 2,446 persons. In addition there was a keeper's five-room house. All the obligations upon the Council under the provisional order had been complied with. By obtaining possession of a number of pieces of vacant land they had been enabled to get all these dwellings three storeys in height, which was an object to be aimed at. They considered that the houses they proposed to erect were an improvement upon what they had already put up. The land had been adapted for laying out for this class of property.

The Inspector said he thought they were very nice houses and wonderful for their money.

Mr. Turton, on the question of the rents to be charged, said he could not commit the committee at the present time because they had not considered the question.

Dr. Hope, medical officer of health, gave evidence as to the insanitary nature of the property existing on the site.

Mr. J. A. Brodie, the city engineer, was afterwards called to speak to the proposed erection of concrete cottages in Eldon Street. There were, he stated, twelve dwellings and thirty rooms. The cost was put down at 3½*d.* per cubic foot, estimated on the basis of the building experimentally erected. Concrete would last quite as long as brick or stone, and it was now being much used in the construction of large buildings.

Mr. Austin Harford urged that in view of the difficulties rehousing the people, fifty houses were quite sufficient to demolish at one time, instead of 150 as proposed.

At the close of the inquiry the inspector was thanked for his courtesy on the proposition of Mr. Colton, seconded by Austin Harford.

The Architect.

THE WEEK.

IT is understood that the King of the Belgians has determined to use his influence for the erection of a great church in Brussels which will correspond with the edifice crowning Montmartre, in Paris. The King has promised a first subscription of 4,000*l*. The State, it is expected, will vote a part of the cost, and the remainder will be obtained by public subscription. The Belgian Minister of Cults has visited Paris, and has confirmed the King's resolution. The site selected is on the plateau of Kockelbergh. As it is said the same religious organisation that carried through the arrangements for the immense building at Montmartre will have charge of the King's project, it is possible the church will dominate the city. At the present time the Palais de Justice holds that position, and is suggestive of the supremacy of law. It is therefore likely that, when the plans appear, opposition will be aroused.

THE account which Mr. ARTHUR EVANS gives of his recent discoveries at Knossos raises expectations that much else of value can be obtained if adequate funds were at his disposal. On Friday last he sent a telegram in which he spoke of finding two depositories in which votive offerings and other things relating to a sanctuary were preserved. There are several statuettes, one being a goddess having snakes coiled about her hair and forming her zone. The treasurer to the Cretan Exploration Fund two months ago said that 2,000*l*. would be required. About half that sum has been subscribed or promised, but each new development involves additional expense. Other countries which are poorer than England are giving liberally in order to uphold their reputation, and it will not be creditable if an enthusiast like Mr. EVANS is compelled to hand over his work to a foreigner in order that it may be completed. The place of operations is fruitful, showing that judgment was exercised in its selection, and an increase of knowledge must follow the continuance of the exploration.

THE old cathedral of Berlin was removed ten years ago and was succeeded by a new one, designed by Professor RASCHDORFF, with a dome 380 feet high. The style is Italian Renaissance. In Berlin sculpture must be largely employed or a building is not considered important. In the new cathedral the endeavour will be to suggest the history of the Reformation. People believed there was to be some lack of unity in the figures, as CHARLES V. would be seen near LUTHER and MELANCHTHON. But the Statues Commission do not support that view. CALVIN is, however, to be introduced. Most of the figures will represent princes whose protection was accorded to the reformers. Among them are FREDERICK the Wise, JOACHIM III., PHILIP the Courageous, ALBERT of Prussia. The statues are of heroic size, and will stand upon massive columns.

THE Palais Bourbon in Paris is generally considered by visitors from other capitals to be remarkably small for a legislative palace. This arises, no doubt, from the façade suggesting no more than a single storey. The history of the building is curious. The site belonged to the abbey of Saint-Germain de Prés, and it was acquired in order to erect barracks for the musketeers; but as there was not enough money the project was abandoned. A Dowager-Duchess of BOURBON obtained the ground and erected a mansion on it from the designs of an Italian architect, GIRARDINI. Her grandson, when he obtained the property, enlarged the palace by the amalgamation of other buildings. At the time of the Revolution it was arranged for the meetings of the Council of Five Hundred. Then under NAPOLEON the familiar peristyle was constructed by POYET. Amidst so many changes it would be strange if there was much unity in the buildings. The salle where the Legislature meets was constructed in 1832. Of late years the accommodation has proved to be insufficient, and various projects for a transformation have been prepared. A plan by M. BUQUET, the architect

in charge of the palace, has received approval and a model has been prepared of the proposed hall for the Assembly. Provision will be made for 622 members, and around the amphitheatre there will be twenty-one doors. Two galleries will be introduced, arranged in tribunes. It is proposed to occupy the wall behind the chair for the president and the tribune from which the members speak with three large paintings for which it is expected the commissions will be offered to M. BONNAT, M. JEAN-PAUL LAURENS and M. CORMON. Prior to 1848, when the Government of LOUIS-PHILIPPE was overthrown, the hall was found to be too small to contain the members who considered it to be their duty to take part in the historic events. It was necessary to set up a supplementary structure of wood and painted canvas. By M. BUQUET's arrangements a course of that kind will be unnecessary unless the number of representatives is increased.

THE city of Carlisle having obtained an Act in 1898 authorising the construction of works for a supply of water to be derived from Geltsdale, the committee have entered into arrangements with the firm of Messrs. JAMES MANSERGH & SONS for preparing the plans and superintending the works. The following are the terms of their engagement:—"We shall, of course, take no cognisance whatever of the plans, sections, drawings, specifications and bills of quantities prepared by your late gas and water manager, but make our own independent surveys and design the works just as if nothing had previously been done, being bound only by the provisions of the Carlisle Corporation (Water) Act, 1898. (1) Preliminary surveys, reports, interviews, consultations and correspondence, and all other work which may be done antecedent to the actual working plans and drawings, and which are not chargeable to commission, to be paid for at our usual time rates for ourselves and assistants, with all out-of-pocket expenses. (2) Commission work we divide under two heads, viz.:—Surveyor's Work.—Taking out quantities, printing bills of quantities and supplying one copy of the drawings to contractors. One per cent. on amount of accepted tenders. Engineer's Work.—Preparing designs, plans, sections and working drawings, specifications, making periodical inspections of the works in progress, examining, monthly, all statements of work done, made out by the resident engineer in charge, and certifying for payments on account and final. Five per cent. on the actual cost of all the works. Resident engineer, his assistants and inspectors, to be appointed by us and to be paid by the Corporation." The 5 per cent. commission, it will be seen, is exclusive of many charges which correspond with those that would be supposed to be included in an architect's commission. Civil engineers are realising that expenses are increasing, and they are justified in making larger demands for their work.

WHEREVER sailors congregate there are sure to be sanitary defects. There seems to exist a belief that anything will serve for them; and as a ship was defined to be a prison with a chance of being drowned, seafaring men are supposed to be content on land with accommodation which prisoners would reject. A deputation on Tuesday waited on the Portsmouth Town Council to represent the condition of the Portsea Ward, and made statements which should not be ignored by any authority having charge of public health in this country. A great many of the houses have been closed, but as they are used to deposit garbage and filth there is no improvement in the sanitary condition of the borough. One street was described of which the average width is 7 feet, while in a part it is limited to 3 feet. Another street has a width of 15 feet. In the area which was brought under notice it was calculated that 109 houses and stores should be removed. It has been found from an examination of the police court records that at least 90 per cent. of the cases heard by the magistrates come from that limited district. The workmen in the dockyard have to go a mile or two in order to find a shelter. All the Town Council could do was to refer the memorial to the health committee. But the deputation was reminded that there were other parts of the borough which were equally discreditable, and whenever a removal was effected it was necessary to pay six times the value of the property.

MASTERS OF ART: PAINTING.*

IT is easier to attain excellence in painting than in the other arts. This fact, which is almost self-evident, is demonstrated by the numbers of successful painters in comparison with sculptors and architects. We have only to look around and we observe painters, women as well as men, who have gained reputation, although they are still young. The readiness with which a mastery of the art is acquired has its counterpart in the knowledge of admirers. A man who has seen a picture for the first time is able to express an opinion upon it. He must have more or less acquaintance with the objects shown or with those which to some degree resemble them. He can at least judge of the correctness of the representation. But it requires education before anyone can understand the principles exemplified in the production of a work of sculpture or of architecture. Hence it is that in all ages painting has been the most popular of arts, for it appeals to the uninstructed as well as to those who have a right to be considered as connoisseurs.

This peculiarity has been exemplified in that part of the podium of the Albert Memorial which was assigned to painters. There were so many artists of that class in all times, the four sides would hardly be sufficient for their representation. It was therefore necessary to make a selection of a severe kind. The history of ancient art was ignored. There were able painters in Egypt, Greece, Rome, but space was not available to allow of the introduction of any figure to recall them. The painter's art might be supposed from the panelling to have had no existence until the thirteenth century. The figures chosen have, moreover, the effect of recalling artists connected with them. The three representatives of the English School make us wonder why so unique a genius as TURNER could not find a place, especially as the presence of the Frenchman CLAUDE calls for a rival landscapist. All such assemblies of artists as Mr. ARMSTEAD has brought together are suggestive of Elysium, and seeing GAINSBOROUGH we must conclude he would be unhappy to be in any distinguished company of which VANDYKE was not a member. REMBRANDT was undoubtedly a great genius, but he cannot be said to possess the accepted characteristics of the Dutch School in a sufficient degree to stand for it without a companion. FRA ANGELICO reminds us of another Dominican, FRA BARTOLOMEO, who was more closely related with mundane life. It is possible that much of the reputation of LEONARDO DA VINCI rests on works by his disciple LUINI. JOHN BELLINI and TITIAN seem to be incomplete in the absence of GIORGIONE, and CARPACCIO was also an influence in Venice. Of the three CARRACCI, AGOSTINO was the ablest, yet he is invisible. In the French School there was some continuity between POUSSIN and painters like DAVID, but the links were formed by such absentees as LE SUEUR, LE BRUN, WATTEAU and GREUZE. The names we have mentioned are, however, only a few of those which had to be sacrificed through want of room. The sculptor is not to be blamed for their absence, for if all the painters whose pictures have survived and find a place in public galleries were to be presented within the stipulated limits, the relief would cease to have the qualities of a work of art.

When describing the panels relating to architecture and sculpture we endeavoured to point out the difficulties besetting an artist who attempts to combine chronological succession with the progress of the art. Mr. ARMSTEAD has skilfully devoted the central part of his relief to the Italian School, which unquestionably merits so much prominence. With that part, by following the figures from left to right we have a suggestion of the history of the School. Beginning with a seated figure of CIMABUE at one end we pass on to the climax in RAPHAEL, who fills the throne, and then onwards to the relative decadence of the CARRACCI and the seated CORREGGIO. There is a figure or two on the right more than on the left, but the space is equivalent on both sides of RAPHAEL. We have consequently that symmetry which is desirable in all works of art, and especially in sculpture. The seated figure of RUBENS is balanced by another of POUSSIN, and the presidential robe of REYNOLDS at one extremity has a

counterpoise in the heavy cloak which enwraps the valedudinarian DELACROIX.

The emancipation of painting from Byzantine fetters is generally ascribed to CIMABUE. He was not the earliest pioneer. Sculpture, by an adaptation of Classic forms, was likely to have suggested that a prescribed system of proportions, colours and expression was out of keeping with nature. ANDREA TAFI may have been as serviceable as CIMABUE, but his name is almost unknown. CIMABUE had not the courage to abandon himself to nature, but there can be no doubt he was an observer rather than a repeater of stereotyped expressions. If he failed to accomplish the revolution fully, he discovered an artist adapted to that purpose in the shepherd boy GIOTTO. We can hardly imagine Ghiberti as being generous towards another artist, but he acknowledged that GIOTTO transformed art from bottom to top, and, as it were, translated it from Greek into Latin. GIOTTO abandoned Byzantine types not only in form but in costume. His success is suggested by the vast number of his imitators, who became known as the GIOTTINI. ORCAGNA went a step further, for he manifested the possibility of displaying a sense of force in action. He endeavoured to illustrate and, it may be, to compete with DANTE in exciting terror by the *Triumph of Death*, the *Judgment* and *Hell*. Pictures were then mostly demanded for the adornment of churches, and those by ORCAGNA were supposed to supplement sermons; but the versions of later painters were not always satisfactory, for they were deprived of his *naïveté*.

In the next group FRA ANGELICO is seen. He belonged to an Order that strove to strike terror into the souls of sinners by the sight of the severest punishments. But Brother JOHN of Fiesole must have had a disposition which shrank from such an exercise of power, and indeed he seemed to live in Paradise rather than in Foligno, Florence or Rome. His figures are not of this earth, but he used earthy materials in his colours in a manner which time has respected. If St. LUKE the evangelist was, as ROSSETTI said, the first who taught art to fold its hands and pray, FRA ANGELICO was one of the men who seemed to have inherited the spirit of the evangelist. GHIRLANDAJO was, like BOTTICELLI, the pupil of a goldsmith. His name is said to have been derived from a piece of jewellery he invented in the form of a garland. VASARI tells us he was not only the first frescoist of his time, but the delight of the Florentines. He must have possessed marvellous productivity, for one of his regrets was that instead of being employed in painting church walls he had not been commissioned to cover the entire walls of Florence with historical paintings. He was probably the earliest of the Renaissance artists to go to nature for the materials of a landscape background. About MASACCIO's greatness there can be no question, for the giant who stands next him honoured him by a testimony which all ages are likely to respect. "After the time of GIOTTO," says DA VINCI, "the art of painting declined again, because everyone imitated the pictures that were already done. Thus it went on until TOMASO of Florence, nicknamed MASACCIO, showed by his perfect works how those who take for their standard anyone but nature—the mistress of all masters—wear themselves in vain." It should be remembered that MASACCIO died at the age of twenty-seven and that his life was a struggle for bread. Yet in spite of his condition painting owed much to him. He went beyond his master, MASOLINO, in the display of the nude, and he was the first apparently to look on time as the Everlasting Now, for disregarding all imputations of anachronism, he represented Scriptural scenes as if they took place a few months before in Florence.

Who can say anything new about LEONARDO, RAPHAEL or ANGELO? As a painter, the greatest of the three would have been DA VINCI, if nature had not handicapped him with a morbid fastidiousness which deprived him of all satisfaction in his own work. What he must have suffered no pen can describe. He set himself tasks which even he could never accomplish, and we suppose there was not one of his works which corresponded with his intention in commencing it. RAPHAEL's receptivity is perhaps his most wonderful characteristic. He seemed to require a precedent for every one of his forms. When he says that his *Galatea* was derived from an ideal in his own mind, he gave

* See Illustration.

a revelation of the system he followed in the majority of his works. He could utilise and surpass every painter's style he came in contact with. It thus happens that by some critics he is considered seraphic, and by others the reverse. There is so much of a Greek character in certain of his paintings, it has been assumed that he must have had an agent in Athens who made elaborate drawings of the Parthenon sculpture for his use. It has even been insinuated the ornament found in the Baths of Titus was destroyed by his command in order that his indebtedness to it might remain unknown. All that has been recorded simply means that he was a many-sided man in all that relates to art, and that he possessed a confidence in his own powers of assimilation which nothing could daunt. As a consequence of what was said by the first President of the Royal Academy, it seems to be incumbent on every Englishman to be as reverential to MICHEL ANGELO as if we owed to him the Magna Charta of art. His works may express strength, terror, anatomical knowledge and many other qualities, but they do not affect us in the same way as pictures by inferior painters of the Italian School. He was indifferent to colour, and without it painting loses what is most essential to its success. He was discontented and unhappy, for, like FAUST, he could say to himself:—

From living nature thou hast fled
To dwell 'mong fragments of the dead,
And for the lovely scenes which Heaven
Hath made man for, to man hath given,
Hath chosen to pore o'er mouldering bones
Of brute and human skeletons.

It is easy to understand how a man like MICHEL ANGELO would condemn TITIAN and the Venetians because they were not better draughtsmen, or, in other words, had shown more acquaintance with the skeleton. TITIAN's defence is unrecorded, but Mr. ARMSTEAD suggests by the glaring look of the great Venetian and the restraining action of his master, GIOVANNI BELLINI, that one could be given which could sting the Florentine's pride. What critic would venture before one of TITIAN's masterpieces to suggest there was any shortcoming of the muscles? For physiology we can go to marble, bronze or clay figures, but colour is the life and soul of a painting. That quality TITIAN has given us, and consequently there is more enjoyment before one of his canvases in the National Gallery—without going further—than if we spent a season before works resembling the three by MICHEL ANGELO which are in the same building. MICHEL ANGELO is unapproachable in some things, but it is only cant and affectation which would make him supreme in all branches of art. With no man is he so little able to compete as with TITIAN. GIOVANNI BELLINI has a claim to immortality from being the master of TITIAN, although probably it was the influence of GIORGIONE and the "floating knowledge" of the *atelier* which were the true influences on the pupil. But the portrait of *Loredano*, the Doge, in the National Gallery, is by itself enough to suggest his power in painting. MANTEGNA was not by birth a Venetian, although he was connected by marriage with JACOPO BELLINI. He was a great artist, and one of the first to endeavour to be archaeologically true in his Classic scenes, but he is out of place in the company of TITIAN, VERONESE and TINTORETTO. The pageants of the Venetian painters do not reveal any indebtedness to the Paduan master.

The CARRACCI were introduced to students in the early days of the Academy by the discourses of REYNOLDS. In theory it may sound well to take a hint from the cookery books, and recommend everyone who wishes to become a good painter to combine "the design of Rome, Venetian action and Venetian management of shade, the dignified colour of Lombardy; the terrible manner of MICHEL ANGELO, TITIAN's truth and nature, the sovereign purity of CORREGGIO's style and the just symmetry of a RAPHAEL; the decorum and well-grounded study of TIBALDI, the invention of the learned PRIMATICCIO and a little of PARMIGIANO's grace," as if a painting were a pudding. But in art what is desired is individuality, and REYNOLDS in his own practice was not an eclectic. The influence of the CARRACCI was not beneficial. CORREGGIO never posed as a teacher, but his paintings, with their exaggerated foreshortening, were so much admired, they became more

dangerous than any lectures. Mr. ARMSTEAD evidently accepts the legend of the painter's ill-treatment, for he represents him as prematurely aged.

VELASQUEZ is now the most prized of Spanish painters. But when the French cleared Spain of masterpieces in the Peninsular War they declined to encumber themselves with his works. The reasons are not difficult to discover. The majority of his paintings were portraits, and the subjects were not beautiful, for VELASQUEZ could not flatter. It was not anticipated that realism was destined to have its turn, and the Spaniard was to become its expounder. One of the first painters to recognise the worth of VELASQUEZ was REYNOLDS, who said, "What we all do with labour he does with ease." Sixty years ago his qualities were assessed by RICHARD FORD as follows:—"In things mortal and touching man VELASQUEZ was more than mortal; he is perfect throughout, whether painting high or low, rich or poor, young or old, human, animal or natural objects. His dogs are equal to SNYDER'S; his chargers to RUBENS'S—they know their rider. When VELASQUEZ descended from heroes his beggars and urchins rivalled MURILLO: no TENIERS or HOGARTH ever came up to the waggish wassail of his drunkards. He is by far the first landscape-painter of Spain; his scenes are full of local colour, freshness and daylight, whether verdurous court-like avenues or wild rocky solitudes: his historical pictures are pearls of great price; never were knights and soldiers so painted as in his *Surrender of Breda*."

MURILLO is now in less favour than his friend, but the home-keeping painter who could produce beggar-boys and glorified saints with equal facility, and whose works are remarkable for harmony of colour, animation, truth to nature and a homely feeling can never be entirely neglected.

NICHOLAS POUSSIN can always be taken as an example by French students in Rome. With so much sculpture around him his impressible nature compelled him to believe that what was desirable was to impart to pictures some of the qualities found in bas-reliefs. It requires a knowledge of the art of the seventeenth century in order to appreciate his aims. Then it would be perceived that few painters were inspired by loftier motives. CLAUDE was one of his friends. His landscapes were always admired by English amateurs, and it cannot be said that in the competition between his works and those of TURNER the Lorraine painter is considered to have been defeated. CLAUDE died in 1682 and JACQUES LOUIS DAVID was not born until 1748. There was accordingly an interval between the two to which we have already alluded. DAVID's Classic paintings have been much abused, and they certainly are colder and stiffer than those of POUSSIN. But some of his portraits are remarkable for their realism. He helped in leading the Revolution onwards to Imperialism, and he deserved the recognition which NAPOLEON gave him. But on the Restoration he was forced into exile, and he died in Brussels in 1825. The Baron GERARD was one of DAVID's pupils. At the time of the Revolution DAVID saved him from the guillotine. He gained success as a portrait-painter, and, unlike his master, the Restoration brought him a peerage. There are some of his paintings in the Louvre and at Versailles. In the history of French art he holds an inferior position if compared with GERICAULT's, who lived for only thirty-three years, and yet in that time produced striking works. By accident he discovered his power as an animal painter, and he came to England in order to study horses of different types. But it was his *Raft of the "Medusa"* which gave the *coup de grâce* to French classicism. It may be said to have originated the modern School. EUGÈNE DELACROIX posed as one of the models of the crew, and the scene was in keeping with his own pessimism. He was also the successor of GERICAULT as the head of the mutineers against Academicism. He was partial to gloomy and tragic scenes, but he was one of the Frenchmen who preferred SHAKESPEARE to their own Classic dramatists, and his illustrations of "Hamlet" show an earnest desire to pluck out the heart of the mystery.

If we turn now to the left side of the panel we meet with representatives of the Northern Schools. Master

STEPHEN is assumed to have been the second chief of the Cologne School, and was probably the pupil of his predecessor, Master WILLIAM. There are some altar-pieces ascribed to him, among others the renowned painting of the *Madonna and Child* in Cologne Cathedral, which is supposed to date from 1410. Whether there was any connection between the School and the VAN EYCKS is uncertain, but the belief is sufficient to warrant the friendly action shown in the relief. DÜRER was separated from the brothers by nearly a century. He travelled in Italy, but his paintings do not display any Southern power. HOLBEIN might be claimed as an English artist. HENRY VIII. said he could make seven peers out of seven peasants, but not one HOLBEIN. English character was never more truly revealed than in his drawings. Wife and children and an increase of salary failed to attract him back to Basle. He preferred English freedom. He died somewhere in London, and was buried in the church of St. Catherine Cree. RUBENS also benefited by residing in England, and in the Record Office are many documents relating to him. REMBRANDT was no traveller, or we might have had a visit from him, and he would not have fared worse than HOLBEIN, RUBENS, VANDYKE and many other alien painters.

Foreigners must allow that Englishmen have not monopolised a large part of the podium. In that way the work differs from foreign examples in which artists are brought together. HOGARTH is the type of the English artist who can manage to dispense with Old Masters, GAINSBOROUGH'S indebtedness to them was limited, REYNOLDS perhaps overrated his obligation, and was more grateful than was necessary.

GERMAN TECHNICAL SCHOOLS.

IN the contrast between the ancient and the Baconian philosophy which MACAULAY drew it was pointed out that the former "could not condescend to the humble office of ministering to the comfort of human beings." It was considered an affront to mention the principle of the arch and the use of metals as among the blessings of philosophy, for the true philosopher does not care whether he has an arched roof or any roof. According to SENECA, the invention of transparent windows or of pipes for heating buildings was no more than drudgery for the lowest slaves, and "he labours to clear DEMOCRITUS from the disgraceful imputation of having made the first arch." We must not presume that such notions came to an end with the Dark Ages. They still survive in our universities. As late as Friday the Savilian Professor of Astronomy at Oxford informed an assembly at the Royal Institution that all who attempted to apply science to ordinary use were suffering from "vulgarity of mind." Anyone who is acquainted with the views which are current not only in Oxford but in the majority of European universities would not be surprised at the words. Outside college circles where certain books are supposed to be mirrors of life as it should be followed, there is believed to be a region of barbarism. With such authorities what chance is there for obtaining that technical education on which our existence as a nation may be said to depend?

In Germany there was similar scorn of all knowledge but that which makes of every old-fashioned college "a little academe still and contemplative." But there is a resolute ruler who can realise that what served for instruction in Athens and Rome does not correspond with the needs of our time. The EMPEROR believes there should be Doctors of Engineering as well as Doctors of Philosophy, and, regardless of antiquated privileges, he has given the right of conferring the degrees to the Berlin Technical High School, and in that way puts the institution on a level with the old classical universities. The director of the High School is also to have a title corresponding with the "Rector Magnificus" of a university. All this to busy men may seem to be only a childish settlement of a difficulty, but they can hardly realise how much depends on titles in all universities. Not only in Prussia, but the other German States, an educational revolution is in course of accomplishment. Indeed, there is now a misgiving of the universities having to hold a secondary position, for the success of technical education can be measured by the new

position acquired by Germany. Once it was supposed the Germans, by means of their university training, had obtained dominion of the abstract alone. GOETHE describes the shortsighted, pale, flat-chested students of his time as over head and ears in the Idea, and as having no interest in anything but the remotest problems of speculation. Now their successors are in the front rank of practical affairs, and it is the endeavour of the men of other nations to keep in line with them. Their chemical industries alone bring in about 50,000,000*l.* a year, and this large sum is "considered as the interest accruing from the capital invested by the German States in chemical instruction."

At such a time as the present, when what is called technical education is in a chaotic condition in this country—for it consists in the creation of appointments rather than in the development of a system of training—it is an advantage to have a description of what is in progress in Germany. It will be found in a report by Dr. FREDERICK ROSE, the British consul at Stuttgart. It shows in the first place that vested interests have to give way to the public good. For example, agriculture was at one time supposed to be the staple industry of the country. By means of it a race of proprietors well adapted to be officers in the army, and another with hardy frames, born to subjection and therefore fit for soldiers, were preserved. In 1871, after the war with France was over, 60 per cent. of the inhabitants were engaged in agriculture. A new policy was adopted. By 1900 the population had increased 50 per cent., but the percentage for agriculture had fallen to 35 per cent., while industries and trade employed 65 per cent. of the people. Between 1880 and 1895 there was an increase of 17·8 per cent., but the gain to agriculture was no more than 0·7 per cent. So remarkable a diversion of human power is comparable to some of the great strategical movements which occurred in the late wars of Germany, and through which armies were as easily moved in new directions as any company of infantry.

There is in truth an analogy between the modern industrial competition of the Germans and their military method. To impart the utmost efficiency to the people engaged in trades is the object to which school education is now being directed; to provide captains of industry is the work of the technical high schools. All are subjected to the various ministers of education. The first necessity is to provide qualified teachers. They are not paid extravagant salaries. There may be differences here and there, but at Stuttgart an ordinary professor has a salary of 200*l.* to 300*l.* paid by the State. He occupies sixth rank amongst State officials, and is pensioned after service by the State according to the following scale:—After ten years' service, 40 per cent.; after twenty years, 60 per cent.; after forty years, 90 per cent. of the total salary drawn during service. Then there are extraordinary professors, lecturers, private lecturers and assistants. The Berlin School, for instance, has thirty-six professors, besides directors of testing departments, assistants, clerks and servants.

It would take us into too much detail if we were to describe the extent of the various courses. It may, however, be stated that in the majority of schools a course in architecture, civil engineering or mechanical engineering occupies at least four years. There is a good deal of similarity between most of them. A mining engineer or electrical engineer, as well as a civil engineer, will have to learn the principles of building, and the same subject is included as parts of courses of metallurgy. The following programme of the department of architecture will suggest the extent of the instruction:—

First Year.—For students from real-gymnasium and upper real school:—Technical mechanics, light and shade illumination, perspective, mineralogy and geology, elements of architecture, building construction, freehand drawing, drawing of ornament, history of art. For students from classical gymnasium:—Analysis, trigonometry, differential and integral calculus, practical geometry, analytical geometry, experimental physics, experimental chemistry, freehand drawing, building construction, history of art. *Second Year.*—Practical geometry, geological excursions, advanced building construction, history of architecture, architecture, plan drawing, applied perspective, freehand drawing, drawing of ornament, styles of ornament. *Third Year.*—Architecture, history of building, architecture of Middle Ages, plan drawing, estimates, materials, freehand drawing, forms of ornament modelling, decorative design.

Term VII. (*half of fourth year*).—History of building, architecture of Middle Ages, plan drawing, water-colour drawing, modelling, decorative design, machinery, elements of physics, political economy.

A student, if he has time, can attend lectures in the general departments of the school. Thus, at Stuttgart the supplementary subjects are German literature, pedagogic methods, elocution, French, German, English and Italian, history of art, history of civilisation, philosophy, æsthetics, geography. There is some elasticity recognised in following out the system, and the normal plan of instruction can be modified to suit individual requirements or qualifications. It is expected that the students have acquired the best kind of preliminary knowledge by some experience of practical work. In mechanical and electrical engineering there must be at least a year spent in workshops before joining the classes. Students of civil engineering and architecture are also required to undergo a period of practical work before commencing their studies in the technical school, but the time exacted is less than for mechanical and electrical engineering.

The fees are fixed sufficiently low to allow a great many students who are not wealthy to take advantage of the courses. Dr. ROSE says it may be assumed that they range from 12*l.* to 16*l.* annually for lectures on practical work, and seldom exceed the upper limit. The Berlin fees are considered to be rather higher than elsewhere, and they may be judged from the following statement:—

Lectures: 4*s.* per term for each lecture of an hour per week. Thus five lectures of one hour per week cost 1*l.* per term; eight of one hour per week cost 1*l.* 12*s.* per term, and so forth. The Berlin fees for the organic, inorganic, technical, metallurgical and electro-chemical laboratories are somewhat higher than at other schools, namely, 4*l.* 5*s.* per term, electro-technical laboratory 2*l.* 10*s.* The engineering laboratories cost less, and the physical and remaining laboratories and practical work from 10*s.* to 1*l.* 10*s.* per term. Students engaged in laboratory work during the whole day seldom attend more than one or two lectures on different days of the week. Not fully qualified students pay higher fees. Entrance fee, 1*l.* 10*s.*; examination fees, 2*l.* and 3*l.* Degree of doctor of engineering, about 12*l.*

It would be impossible with fees so low to make the schools self-supporting. The Governments of the various States, therefore, have to meet annual deficits. Thus in Dantzic, when the school is complete, it is proposed to contribute 18,500*l.* a year. Berlin in 1899 received 33,675*l.* from the State, Hanover 15,094*l.*, Aix 16,581*l.* The building in Berlin cost 485,000*l.*, one at Hanover 79,000*l.*, and one at Aix 137,500*l.* It is of course to be understood that the above expenditure relates to the technical high schools alone, of which nine now exist, and is altogether independent of the large amounts devoted to technical education in other forms. In 1902 there were 14,986 students attending these schools. No less than 2,489 were foreigners. In the department of architecture in the nine schools 2,462 students attended, in civil engineering 2,672, and in mechanical engineering 5,830. Among the foreign States who take advantage of the teaching Russia is most prominent. In Berlin, by the last return, there were 126 Russian students, 152 in Darmstadt, 16 in Hanover, and 53 in Brunswick. Austria-Hungary stands in the second place. Dr. ROSE estimates the entire expenditure of a student at from 90*l.* to 100*l.* per annum, the amount being divided among the following items:—Lectures, 5*l.* 10*s.*; laboratory work, 9*l.* 10*s.*; books, 2*l.*; board and lodgings, 60*l.*; miscellaneous, 20*l.*

As each student costs the State about 12*l.* a year, there has been some discussion on the subject of foreign students. In 1900 they cost Germany 24,204*l.* Besides, they increase the duties of the professors, and what is done ends in creating a large number of competitors thoroughly familiar with German methods. On the other hand, it is considered that in that way new markets for German industries may be opened. It is not, however, the high schools alone which are sought by strangers. In 1902 there were in German technical institutions no less than 6,145 foreigners, or nearly 10 per cent. of the total number.

Whatever some discontented people may say, it is never likely that any German Government will prohibit the admission of foreigners to their schools. The least objection would

be a confession of fear. It would also be a departure from one of the grand traditions of civilisation. In Athens strangers were welcome, and when the Mediæval universities were established they were supposed to realise their title by teaching all subjects to people who came from all parts. The Germans are too proud of their own intellectual strength to be afraid of competition in classrooms. English students should attend in far larger numbers. According to the last return there were only 8 in Berlin, 6 in Darmstadt, 1 in Hanover and 1 in Brunswick. They have the strongest interest for mastering the German system, and they labour under the disadvantage of having no technical institutions which will bear comparison with those of Germany. The course of training is no doubt more rigorous than that practised in England, but, on the other hand, an efficiency can be attained which is remarkable.

WATER SUPPLIES FROM DEEP WELLS.

By F. J. WARDEN-STEVENS, A.M.I.M.E., &c.
(Consulting Engineer.)

THE supply of pure water requires most careful consideration for the purposes of fulfilling the demand of country estates, villages, public institutions, schools, &c., also for manufacturing purposes, and more particularly where a large town's supply is not available or where considerable quantities are necessary. The considerations affecting this question are of the utmost consequence to owners and officials concerned.

There are cases where a general supply from a river or stream may be reliable from the point of view of purity, but it must be borne in mind that in such a case the intake should be at a position above which there are practically no habitations. It is to be regretted that sewage is frequently deposited in a river or stream and often in an unpurified state, although it is a fairly ascertained fact that organic impurities cannot be destroyed except by the application of heat or by the addition of chemicals.

Usually in this country the varying amount of water available from a river or stream, and the liability to flood or drought, renders it necessary to provide a large storage capacity to insure a sufficient supply over those periods when the full quantity of water is not allowed to be drawn. Again, filter beds are necessary for removing the suspended matter and bacteria in all cases where water is taken from a river. It is also necessary for the intake to be so arranged that the water is free from floating matter—that is, it must face down the stream.

It is, however, the intention to refer here more particularly to deep wells rather than rivers or streams, as the latter are open to objection in most instances, and in any case are not very suitable for the supply of an estate, institution or village.

It is a question if sufficient purity is insured with ordinary or shallow wells; the supply should be obtained from a strata which is protected from the percolation of surface water or where such surface water cannot be contaminated, and preferably where the source of the water is at a considerable distance from the well and has to pass through a porous stratum. As an example of this latter instance the strata known as the London basin may be considered. In this case all surface water, including that from the Thames, is above the London blue clay, and below this stratum of clay, chalk is found. The water in this chalk is naturally supplied from the districts outside the outcrop of the clay, which may be taken to be the chalk hills north and south of the lower Thames Valley. The rainfall here soaks into the chalk, and finds its way to the whole of the chalk strata under London. Fortunately the hilly districts, where the chalk appears on the surface, are sparsely populated, and the water passes a considerable distance before it reaches London. It is therefore aerated and partially filtered during its progress, and in consequence is fairly pure and quite suitable for domestic use. London is thus satisfactorily situated with regard to a source of pure deep well water supply, free from serious risk of contamination. The same cannot, however, be said of the river supplies obtained from the Thames and the Lea, as these rivers receive the sewage of many towns above London.

There are of course places where deep wells are an impossibility, and when a town is built on the granite there is little hope of a deep well proving successful. It is in the deposited strata such as sand, clay, chalk, &c., that success with a deep well may be anticipated. There are, however, very few places where the under strata do not contain water, and these situations may be decided upon by reference to the geological formation of the district. It is far safer to trust to this guide than to water diviners.

It is, as before referred to, advisable to seal out from a well all water the source of which is in the vicinity of a town. An expert can most generally advise by reference to the geological and physical formation of, say, twenty miles radius of the district whether a good supply can be met with and at what depth, but the conditions cannot be here discussed in detail because they vary so greatly.

Referring to the general order of the strata, the following may be stated:—In the upper formation above the chalk (where this is found) are the alternate layers of gravel, sand and clay. In these are the surface waters, which, speaking generally, are impure except when below several beds of clay. The chalk usually contains a very large quantity of water, as also does the green sand underlying it. The reason for this is its porous structure and the fact that it is always on a bed of clay which retains the water. Underlying this stratum of clay is found ironstone, sandstone and hardstone, such as Portland stone. This must be pierced before further water-bearing strata are reached, when chalky sands and clays are met with containing quantities of water. Again, below the clay is found limestone, marble and freestone, also intermixed with clay seams, where water is plentiful if the boring is continued to a clay seam but not through it. The lias limestone beds also contain supplies of water, below which again are found the sandstones, consisting of layers of clay, gypsum, rock salt, limestone, &c. After this the coal measures are met with, and underlying them clay, shells, ironstone, grit, magnesite and other stratified rocks, where great quantities of water are found. The old red sandstone underlies these, and as it is stratified and traversed by impervious seams, there is an ample water supply retained in the strata. Yet again lower, limestones are found with layers of sandstone; then come the slate, mica and dark limestones, which are all water-bearing, and these rest on the Plutonic rocks, such as granite, which are not water-bearing, except where there are fissures. Of course, all these strata do not occur at any one place, but when they exist they are in this order, excepting for volcanic upheavals. Usually the upper layers are missing—that is where, say, Portland stone is on the surface, none of the strata mentioned previously need be looked for.

It is a matter of satisfaction that the methods of boring deep wells have been so improved and the cost reduced that a trial boring of reasonable depth can be made at comparatively slight cost and with rapidity, at once settling the question of the actual strata. It should be here mentioned that, owing to the dipping of the strata, the level of water may, of course, be very much higher than the point of entry into the water-bearing stratum, due to the relative level of the stratum at the point of boring and at the points where it receives its supply. In the London basin, for instance, near the centre the chalk is met with at, say, 150 feet, yet the water rises in a deep well to within about 30 feet of the surface. The usual conception of an "artesian well" is where the water actually rises above ground level. Such artesian wells are very seldom met with in practice, and it is perhaps best that this is the case, as a large amount of waste is usually permitted when an overflowing supply is available. It may be of interest to refer here to the methods of well construction which have been adopted.

The original method was the dug well of various depths, lined originally with brick and latterly with iron cylinders. This method is still carried out to an extent with wells of large diameter, and where the upper strata are fairly easy to work in. In other cases it is usual to dig within a few feet of the water-level, keeping the well dry, so that the pumps may be placed within the ordinary suction limits and still be accessible. The well is then usually continued by boring into the water-bearing strata. The dug well proper, however, has no such extension, and reaches direct

into the water-bearing stratum. Of course, if the supply is plentiful there is considerable difficulty in digging the last few feet, but if a large pump is used to keep the bottom dry (a pump of double the capacity to that which will afterwards be used) the well may be sunk to as low a point as will ever be required. A brick lining is naturally quite unsuitable where impure water-bearing strata have to be passed through, and the use of large iron cylinders is a matter of great expense.

The driven tube well is, perhaps, the simplest method of obtaining a water-supply. Steel tubes fixed to a perforated shoe are driven into the ground and passing through the upper strata to the water-bearing stratum, the tube itself is used as the suction-pipe, and the water drawn through the perforations in the shoe or lower portion of the tube. Where the water attains a level of, say, 20 to 25 feet from the surface this method is quite convenient, also where the water is at a lower level if the surface excavation is through comparatively soft and dry ground. The driven tube well is, of course, practically impossible in rocky or other hard soils.

The bored and tube-lined well is the form of deep-well construction most generally adopted. In this system the boring is followed by a tube lining as the descent progresses. The method of boring usual in this country is a combination of rotation and percussion. Where the stratum is soft the rotation alone is sufficient with the weight of the rods to carry the boring down. It is not here necessary to go into the details of boring, but it may be said that for large borings machines are used by which the rotation is kept continuous by means of gearing, and the percussion is also produced automatically. With such machines, however, it is difficult to obtain the same degree of judgment as to the strata being passed through as that obtainable by hand; this involves an increased risk of broken rods and drills. The difficulties met with in ordinary boring are chiefly due to broken drills in the bore, and many ingenious tools have been devised for extracting them, being usually various kinds of automatic grips. With very deep borings means have to be taken to reduce the weight of the rods coming on to the tool in the percussive action. This is usually accomplished (when more than, say, 500 feet long) by providing a telescopic joint in the rods, this joint being about 400 feet from the tool. The weight acting on the tool is thus limited to about 400 feet of rods, and by this means the risk of breakage is minimised. Another source of trouble is unsoundness of joints in lining tubes; the very best are the cheapest in the end, as a split tube or socket may mean a large expenditure, or even the entire abandonment of the well. A further cause of trouble is the difficulty of making the sump tight where the boring ceases and merges into it. It is usual to embed the end of the tube in a deep layer of concrete, but in some cases this does not suffice, and the seal if once broken is very troublesome. Where there is a chance of surface water leaking through, it is advisable to have the sump lined with iron cylinders, and the bottom made of cast-iron segments bolted together and to the lining and the bore, and caulked with lead. The tubes are usually wrought-iron or mild steel provided with flush sockets and threaded, the threads being very carefully cut, and the ends faced so that they butt; this provides stronger work than if the thread is taper. In some cases the tubes are merely brazed and banded, but these are not suitable for wells of considerable depth. Owing to its superior lasting quality cast-iron is preferable in sandy soils, where the weight alone is almost sufficient to drive the tube, and where the tube is of large diameter.

In cases where very hard rocks have to be penetrated, machine boring, using special cutters, is resorted to, but it is a somewhat exceptional occurrence that such rocks exist between the surface and the water-bearing stratum, as the strata can hardly be covered by other than deposited beds, such as clay, sandstone, gravel, flints, &c., all of which are comparatively easy to penetrate. As an illustration of the strata met with in the east of London the following particulars of a deep well may be of interest. These particulars relate to one of two deep wells constructed under the writer's supervision in connection with an independent water supply:—Made-up ground 5 feet, blue clay 2 feet, black fen peat 2 feet, soft blue clay 5 feet, live grey sand

3 feet, hard ballast 3 feet, London blue clay 10 feet 6 inches, large black pebbles and water 3 feet 6 inches, dark green sand 7 feet, mottled clay 6 feet, dark brown sand 5 feet, blue clay 2 feet, blue clay and shell 8 feet, hard shell bed 4 feet, congealed black pebbles 6 feet, green sand and small black pebbles 9 feet, dark green sand 3 feet, green sand and hard blue pebbles 11 feet, dark grey hard sand 9 feet, blowing grey sand 7 feet, hard grey sand 20 feet, grey chalk 30 feet, chalk and flints 65 feet, very hard chalk 48 feet; the depth of the boring being 285 feet, and the internal diameter of the lining tubes $8\frac{1}{2}$ inches. The water rises to within 30 feet of the surface, and the suction of the pump is 120 feet from the surface. The pump plunger is 6 inches in diameter and has a stroke of 3 feet. The pump works at nineteen revolutions per minute, and lifts 4,000 to 5,000 gallons per hour.

The size of a deep well boring is a question which can only be discussed with certainty after consideration of the particular case, but where a stratum such as the chalk under London is being dealt with the output of a deep well is limited entirely by the pumping capacity. If the pump barrel is to be lowered into the boring this is certainly the case. The boring must be made large enough to contain the pump necessary to raise the desired quantity of water, and there is a certainty that the boring, if carried down sufficiently into the chalk (say 100 feet beyond the tube lining), will supply more water than the pump can lift. In connection with this question of the capacity of a boring, it is to be remembered that with a deep well there is always an uncertainty—that is, there are certain risks which must be taken, and unless great care is exercised and accurate local knowledge obtained, there is always a chance that, though water may be found, the quantity may be deficient; and there is in some cases a risk that adjoining owners may construct deep wells near by and so reduce the level that the supply falls off. In the event of a decreased supply due to this cause, it has often been found beneficial to explode a dynamite cartridge in the boring.

The supply from such strata as chalk is almost always obtained not by direct percolation into the boring, but by collection from fissures cut by the boring. In this case the action of the explosion is to open these fissures, which has the effect of increasing the supply. In some instances the supply falls off, due to the boring becoming choked with sand or chalk, and then of course the only remedy is to shell the sediment out. This is, however, not a difficult or very expensive matter.

It is to be remembered that there are no special consents necessary in obtaining water from a deep well, notwithstanding the fact that the water level in other wells may be reduced. If, however, the source of supply to a stream should be tapped by the well and water is pumped to such an extent from the well as to considerably reduce the water level of the stream, then it is probable that the owners of the well can be restrained from pumping to such an extent as to reduce the level of the stream below a certain limit.

It is advisable to have a test made occasionally of the available supply from a deep well, say twice a year, in the summer and in the winter. Also an analysis of the water should be made at not less frequent intervals than six months.

The consumption of water per person per day varies considerably, from as low as five to as much as fifty gallons or even more; it also varies, of course, according to the season of the year. About thirty gallons per day per person may be taken as a fair average of general requirements, but, of course, local considerations largely affect the demand. Besides the private or personal demand there must also be considered the demand for other purposes—steam raising, manufacturing purposes, flushing, &c.

In the area known as the London basin the cost of boring and lining a deep well, together with the provision of pumping gear, may be taken at from 2*l.* to 3*l.* per foot for, say, 300 feet boring into the chalk with 8-inch diameter tubes. The cost of boring is about from 1*l.* per foot and the lining about 15*s.*, while the pumping gear absorbs the balance. Taking everything into consideration, the whole cost of such a deep well with a 6-inch pump and all accessories, including the motive power, may be stated to be about 1,000*l.*, but of course conditions

must be considered in each case. Such a well should insure a supply of 4,000 gallons an hour, and motive power equivalent to about 10 horse-power must be provided, 6 horse-power being used continuously when working, assuming 60 feet lift and 60 feet delivery. Allowing 1 horse-power to cost 1*d.*, the cost of power for pumping is thus 1*½d.* per 1,000 gallons. It may be taken that where 4,000 gallons per hour will meet the demand working twelve hours a day, the consumption will be, say, 17½ million gallons in a year. In this case the cost of pumping will be about 110*l.* A fair figure for interest and depreciation would be 10 per cent., that is, 100*l.*; 25*l.* should cover all ordinary repairs, and a further 25*l.* for labour, making 260*l.* in all, or just over 3½*d.* per 1,000 gallons. If a satisfactory water supply is not already available at 4*d.* per 1,000 gallons, it should then more than repay the expense to adopt a deep well. Smaller wells are, in proportion, more expensive in capital charges, and large wells are more favourable both as to working expenses and capital in proportion. Where a deep well supply has to be depended upon entirely two wells should be adopted, and in that case the cost would be about:—Pumping 110*l.*, capital charges 175*l.*, attendance and repairs 50*l.*, making a total of 335*l.*, and in this case the cost per 1,000 gallons is about 4½*d.* under these conditions. It must be remembered, however, that if the demand for water rises to above an average of 12 hours working per day, the cost of the extra water is only about 2*d.* per 1,000 gallons. Reliability can be assured as regards the pumping at little extra cost by duplication, but on the question of failure of the supply, of course this is to an extent beyond control. It is, however, well known that the supply if the level falls can be increased in some cases by use of dynamite, as mentioned, and by deepening the bore. The chance of pollution of the supply depends greatly upon the workmanship, but, unfortunately, not only on the particular well but on others in the neighbourhood.

ST. STEPHEN'S, CAEN.

NO one ever doubted that in the nave of St. Stephen's there were two Romanesque dates, that the clerestory had been recast, and that the vault was an addition to the work of William and Lanfranc. The question was whether there were three Romanesque dates. Some people, we need hardly say, think it almost as impossible that anything now standing should be the work of William as that it should be the work of Harold. We believe that this is part of the old "Saxon" confusion. William of Normandy was not indeed exactly a "Saxon," but thirty-eight years of his life was spent in "the Saxon period," and he had so much to do with "Saxons" in one way and another, that some portion of "Saxon" incapacity for building might well have been communicated to him. We were therefore told at one time that there was really little or nothing of William's work at St. Stephen's, that if he and Lanfranc did contrive to put a few rough stones together they had all been cased and put out of sight, even before the late Romanesque additions, which nobody doubted to have been made towards the end of the twelfth century. M. Bouet, on the other hand, shows plainly enough that, except of course the choir, which was rebuilt on a larger scale in the thirteenth century, the church of William and Lanfranc is there still. There can be no doubt that of the three dates given for the consecration, 1077 is the right one. The other two, in 1081 and 1086, mark, according to M. Bouet, the completion of the building by the addition of the western towers; towers were sometimes specially consecrated. "On pisan gere was se stypel gehalgad æt Burh," says the Worcester Chronicle, under the year 1059. The relation of these towers to the church is very remarkable. The towers were contemplated from the beginning, and their foundations were laid at the same time as the foundation of the nave, but they were not carried up till after the nave was finished. That is to say, the lowest part of their masonry is continuous with that of the nave, while a vertical seam separates the upper part. The towers are thus in a certain sense an addition, but an addition made only a very short time after the original building. There is no change in style; if there is any difference, the later work is rather the plainer of the two. Of course, in speaking of the towers, we mean only that part which can be reasonably assigned to the eleventh century, not the upper stages, which were clearly added when the clerestory and vault were made, still less the spires, the types of so many others in Caen and its neighbourhood, which are later still.

NOTES AND COMMENTS.

THE two buildings in New York for the erection of which Mr. ANDREW CARNEGIE will give a million of dollars will stand on sites on the north side of Thirty-ninth Street and south side of Fortieth Street, west of Fifth Avenue. The Societies to occupy them are the American Society of Civil Engineers, the American Institute of Electrical Engineers, the American Society of Mechanical Engineers and the American Institute of Mining Engineers. The Engineers' Club will also find a habitation in one of the buildings. The arrangements are to be settled by a joint committee representing the different Societies. On the planning a resolution has been passed as follows:—"Said joint committee shall, by the affirmative vote of at least two-thirds of all the members thereof, select and employ an architect to prepare the plans and specifications for the building to be erected on the site on Thirty-ninth Street and for the club building to be erected on the site on Fortieth Street; and shall also obtain proposals for the erection of both of such buildings; and shall have power to make and enter into such contract or contracts as shall be approved and authorised by the affirmative vote of at least two-thirds of all the members of said joint committee for the erection of both of such buildings; and shall have charge of the erection of both of such buildings." It is satisfactory to know that no attempt is to be made to supersede architects by engineers. We may also assume that at present the intention is to obtain plans without employing the process of competition.

THE Emperor of GERMANY appears anxious to show his judgment in sculpture, especially when it is intended for public places. Already an avenue in the park of Berlin has been made to record the history of his race. For another open space in the neighbourhood he has decided to have groups of animals representing German hunting in various ages. Professor SCHAPER has modelled a prehistoric buffalo hunt. Professor BEGAS has been assigned a boar-hunt. There are also groups of fox-hunting, hare-hunting, &c. The old legend of St. HUBERT is to be treated by Professor VON UECHTRITZ. The figures will be in bronze, which is supposed to be best adapted for that class of work, above all when in a place like the Zoological Garden; where there may be a great many mischievous youngsters. The pedestals will, however, be of stone. It is feared that German sandstone will be used, which is easily scratched and injured. What is preferred is Italian, Silesian or Bavarian marble. It has been proposed to reduce the height of the pedestals from 8 feet to 6 feet, but the alteration, it is feared, will not add to the dignity of the groups. The Emperor is, however, more amenable to argument than the majority of the officials.

If all counties resemble East Sussex the new educational committees will have to face unanticipated difficulties in dealing with the school buildings. From a report prepared by a sub-committee it appears that out of 42 schools examined only four can be considered as in a good state, 21 are moderately good and 17 are distinctly bad. The sub-committee do not wish to excite alarm, and they propose to defer action in "good" and "moderately good" schools, and for the present to deal only with the "bad" buildings. In almost every case ventilation and water supply are neglected. In East Sussex there are 170 schools, but time did not allow of the examination of more than 42. It is not likely there will be much difference in the character of the other buildings. The explanation of the neglect is to be found in the desire to keep down expense, and buildings are easily imagined by amateurs as able to exist without repairs. Inspectors also make recommendations which are impracticable or could not be realised without a large expenditure. On the new committees an architect is rarely found, although the advice of one would often promote economy.

ALTHOUGH it is difficult for a visitor to Paris to avoid Passy, which is among the suburbs of the city, yet few strangers are aware that at one time the place gained considerable renown for its mineral waters. There were several sources, but one belonging to the Abbé LE RAGOIS was declared by the Faculty of Medicine to have special

qualities. J. J. ROUSSEAU went there in the hope of a cure, but without success. BENJAMIN FRANKLIN was also a resident during the time he was Ambassador in Paris. The Friends of Parisian Monuments organised an excursion to some of the sources a few days ago. The eighteenth-century buildings still exist. There is a small pavilion, a reading-room and a billiard-room. A few people continue to believe in the springs. The visit was directed by M. CHARLES NORMAND, the architect, who has done much to make the nooks and corners of Paris known to the inhabitants. Passy was at one period selected as a residence by many writers, musicians and artists. Among them were the Abbé PRÉVOST, the author of "Marian Lescaut;" ANDRÉ CHÉNIER, the poet, who was arrested there during the Revolution; BÉRANGER, the song writer; ROSSINI, the composer; LAMARTINE, JULES JANIN, PAUL DE KOCK and others.

THE library of the Patent Office, which is open on most week-days to the public, is becoming very valuable to all who have an interest in technical studies. A series of handy catalogues is in preparation, the latest of which relates to "Architecture and Building Construction." It is a model of its class. Although of small size and costing only 6d., it gives the full titles of over 3,000 volumes. The contents are also classified, and the works are not confined to those in English. Every architectural student will find it advantageous to possess a copy, although he may not be a visitor to Southampton Buildings.

THE variety of books which bear the name of Mr. PERCY FITZGERALD on the title-page testify to his versatility. He has also shown some skill as an artist. Some years ago he modelled a pulpit for a church, which had an imposing effect. His latest effort is a memorial of the late Cardinal MANNING, which can be seen on the left wall of the Catholic church in Maiden Lane. The building is very dark, but the work is visible on most days. The cardinal's head was well adapted for representation, and there were few figure-painters in London during his life who were without a photograph of it. Mr. FITZGERALD has modelled it in profile, and the gilt bronze does justice to it. It is about life-size. There is a wreath around the head. Above is a cross, and below the cardinal's seal. The slab is of red-veined marble, with a border of black marble. Altogether the memorial is effective, and should have for a companion a similar memorial of the cardinal's more learned, and in an artistic sense at least more able, predecessor.

As the American Institute of Architects has its central offices in Washington the members are justified in believing that the rights of the profession against the Government will be asserted whenever there is a necessity. It would not be wise to enter into a quarrel rashly, but it is supposed arrangements are nearly completed for testing the legality of some acts by officials against which architects are bound to rebel. For instance, several Government buildings are about to be erected which must necessarily cost large sums. There is a willingness on the part of the authorities to obtain designs and plans from architects, but their co-operation is expected to be limited to the production of drawings. The realisation of the designs is to be entrusted to agents of a different class, often military engineers. That is a new arrangement, which does not appear to be warranted by the history of architecture in the States. Americans are envious to have their buildings admired by European travellers, but the proposed division of labour will not give the qualities that are necessary to gain praise. It is no excuse if a building should present perverted detail to say the plan was prepared by an architect of reputation. The true amateur is indifferent to plans, and would be satisfied if one did not exist, so long as the actual building can afford him pleasure.

THE ZIMBABWE RUINS.

IT is a satisfaction to feel assured that the control of the British South Africa Company will prevent any danger arising to the mysterious remains which are found in their territory. All over Southern Rhodesia ruins of stone buildings or enclosures are to be seen. In the beginning of the sixteenth century some of them were noticed by Portuguese travellers. There are various native traditions about their origin. The most important are those of Zimbabwe. A special report on them has been prepared by Mr. F. P. Mennell, F.G.S., the curator of the Rhodesia Museum, Bulawayo, and we are indebted to the Company for a copy, from which the following extracts will be read with interest by all archaeologists:—

The first authentic account of the ruins was that of Karl Mauch (1874), who visited them in 1871. After the occupation of the country by the British South Africa Company, general attention was attracted to them, and Mr. Theodore Bent in 1890 made the first systematic excavations, which laid the foundations of our present knowledge of the ruins. The work which Mr. Hall is now carrying out on behalf of the British South Africa Company in removing debris and undergrowth has enabled me to gain a much better idea of the main ruins than has hitherto been possible for visitors. Previous excavators had little regard to those who might come after them, depositing their debris on the tops of walls, and in some cases completely concealing important features. Mr. Hall's work has been more carefully executed, and it is to be hoped that the Government will make some permanent arrangement of a similar character to insure the preservation of these unique structures, an archaeological heritage such as no other part of the British Empire can boast.

The ruins themselves are situated somewhat south-east of the intersection of the 20th parallel of south latitude and the 31st meridian east of Greenwich. They are about 16 miles from the town of Victoria, and 230 from Sofala, which is due east and the nearest point on the coast. The ruins are splendidly situated for purposes of defence. Those on the hill are practically impregnable and have been much strengthened artificially. They overlook an immense stretch of country, and care has been taken to erect what are evidently small forts on every eminence around, whilst chains of forts at intervals of 10 miles or so have been traced in many directions, and obviously served for the protection of the roads. The country around is very fertile, and it is probable that the unhealthy swamps to the south were rendered innocuous by drainage, as could easily be done at the present time. It is curious that though gold mining seems to have been the main object of the "ancients" and many gold ornaments have been found in the ruins, there are no old workings within a radius of about 20 miles. It is true that the buildings are on granite, but the metamorphic rocks of the gold belt approach within a few miles.

Zimbabwe is, of course, a native name, and according to several gentlemen who are well acquainted with the native language, it is derived from "zimba," a place, and "ibgwe," plural "mabgwe," a stone, so that it would mean place or building of stones. Others have suggested that it means place of the king, which would accord well with the idea that it was given to the residence of the Monomotopa, once the paramount chief of the country, to which his name was even applied by the Portuguese. They inform us that any place where the Monomotopa had his court was called Zimbabwe, while on the other hand they state that his kraal was a marvellous building of stones, ascribed by natives to the devil, as it was quite beyond their power to build.

The kopje on which one group of ruins is situated occupies a most commanding position. The north-east side is quite inaccessible, and from each end of the smooth face of rock which protects it a wall extends, which must originally have enclosed the main group of ruins on the plain and have been between two and three miles in circumference. The great care taken on the hill in strengthening an already almost inaccessible position seems to show that the builders (who may be termed "the ancients" for want of a better name) were menaced by a large hostile population, and there can be little doubt, as suggested by Bent, that the buildings below were not erected till they had made good their footing in the country. The great elliptical building on the plain is, however, so well preserved and of such importance that it is well to take it into consideration before referring to the other ruins.

The temple, as this remarkable structure has universally and correctly been termed, is undoubtedly the most interesting in many respects of all the Rhodesian monuments. Its external measurement is roughly about 300 by 230 feet, and its walls still rise in places to a height of 30 feet. It stands at the southern extremity of the complex of ruined walls and is constructed without mortar, but with great regularity and solidity. The part of the wall which extends without a break from the west to the north entrance varies in thickness from about 10 to 16 feet at the base and narrows to about 8 or 9 feet at the top. The dressed rectangular blocks of granite with which it is faced

probably average about 6 by 12 inches on the outside, being rather larger than those at most other ruins. The inside blocks are much more roughly trimmed, but the regularity of the courses is preserved throughout the thickness of the wall. A double row of chevron pattern extends for a considerable distance round the outside of the wall near the top, the central part facing about south-east. Monoliths of granite are fixed in the top of the wall, and if these originally projected at all it can never have been more than a few courses higher. The northerly walls are not so thick, but they are of similar construction, and there is no reason to suppose with Mr. Bent that they are of later date. If the southern portion has stood down to the present day, it is hardly conceivable that the original northern part should have required to be rebuilt at a remote period; it is much more reasonable to suppose that where the enclosure is joined by the walls of other ruins, so great a thickness was not considered necessary as on the south, where there are no outlying buildings. The ends of the walls are rounded off on either side of the three entrances, which lie north, north-west and nearly west of the centre of the building. The western entrance has two rounded buttresses of unequal size on the inside. These buttresses are simply built up against the main wall, and the blocks do not dovetail into those of the wall in any way. The same thing applies to all walls meeting at an angle—a fact which renders it very easy to suggest that any particular one may be of later date than some other. The interior of the temple is divided up into separate enclosures by numerous walls, some of which are straight and others curved. They vary greatly in thickness, and while some are as well constructed as the exterior walls, others are much more roughly built, but still essentially similar. The clearing away of the rubbish which formerly obscured all details has revealed a number of interesting features. The entrances to the various enclosures usually have the ends of the walls rounded off on either side; those of what was apparently the most important division (that termed by Willoughby No. 1) are both, however, rounded on the inside and square on the outside. Nearly all the entrances are built in such a way as to remind one of the stone stiles seen in England. The walls rise a foot or two above the floor-level, and there are steps on either side. The different enclosures were evidently at slightly different levels, those nearest the centre being the highest. Traces of cement flooring which has been disregarded by previous excavators are everywhere to be found. That this was part of the original plan is shown by another feature and itself throws light upon the latter. At intervals along the outer wall are square holes which penetrate it from side to side, and have caused much discussion as to their use. Bent came to the conclusion that they could not be drains, which they much resembled, no doubt from the fact that it was difficult to see how they could carry off the water. Willoughby concluded that they were drains, as he found they were flush with the floor. The recent clearing of the remarkable passage-way which leads from the north entrance to the cone leaves no room for doubt on the point. There is a well-made floor of cement running all along the passage, rising and falling slightly in places and with occasional steps. Wherever a hole occurs—and a number have now been found—it is exactly at the level of the floor, and, further, it has been found that similar holes open on to the passage through the inner wall. Similar drains have been discovered in places on the hill, and the fact that such careful provision was made for carrying off the rainfall is in itself sufficient to show that the builders possessed a considerable degree of civilisation.

The most remarkable feature of the temple is undoubtedly the great cone at its south-eastern end. This object, apparently unique in Rhodesia, is sufficient to show the religious character of the building, for here we have beyond question the symbol of nature worship, a cult which long flourished amongst the Phœnicians and other Semitic races, and which has survived down to the present day in a few obscure localities. It is frequently referred to in the Old Testament, and the orgies connected with its observance, associated with the worship of Venus, gave notoriety to the Isle of Cyprus. If further evidence is needed of the religion of the builders, we have it in the phalli which have been unearthed in the great passage almost under the shadow of the cone, as well as upon the hill. Like the walls around, the cone is built of granite blocks and is solid throughout, as has been proved by several investigators who have not hesitated to pull down portions of it for the purpose. It is much to be deplored that this remarkable structure should have been subjected to so much unnecessary vandalism. The destruction appears to have been commenced by Carl Mauch, who destroyed most of the dentelle pattern which ran round it a few feet below the original top and took out a number of stones from the west side. Bent, however, did much more serious harm, and the hole he made on the south side of the cone is likely to cause its collapse at no distant date unless steps are taken to rebuild

the damaged portion. The "smaller cone" which stands by the side of the large one, has already been almost demolished by the growth of a large tree close by. Is it possible that this object, of which only a few courses remain, is the altar?

The hill ruins are situated north of the temple, and the hill itself rises abruptly to over 200 feet above the plain. Two passages leading to the top have now been cleared out, and that on the southern side of the hill, where all the most important buildings appear to have been situated, is especially interesting. It leads in a zigzag course up an almost perpendicular face of rock, and its construction evinces considerable engineering skill in the way difficulties are surmounted; indeed, standing at the foot of the slope, it is difficult to believe that the ascent is practicable. It has (or had) walls on either side, and seems to have been paved with stone blocks, while it gives access to a number of enclosures on the way up. Near the top it traverses a cleft in the rock about 2 feet wide and some 50 feet in length, and is finally carried along the edge of the cliff, overlooked by a wall on which stand five monoliths, to the foot of the elevated platform at the north-east end of what has been termed the "Western Temple." The platform itself is reached by a narrow winding passage through two covered entrances, while on the other side of it a series of steps lead past a dentelle pattern into a more northerly enclosure. On the platform are two granite monoliths still in position, and one of schist which has fallen. The western wall of the enclosure is of special interest owing to its great thickness, careful construction and the unique decoration of round towers and monoliths placed alternately along the summit. It is from this part of the hill that the talc or "soapstone" birds were taken by Mr. Bent, and it is certainly regrettable that we have no records of their original situations. The one lately found by Mr. Hall had evidently fallen from the northern wall of the enclosure where only a single rough granite monolith is now in position.

One of the most easterly enclosures on the south side of the hill has been termed the "Eastern Temple" by Mr. Bent. It has a well-constructed curved wall with a dentelle pattern which probably extended all round the outside from south to east, though there is now a big gap on the south-east. A cemented floor rising to the north in terraces is still traceable, and the ground on which the lower part is laid has been rendered level by filling in with stones as far as the retaining wall. A rounded entrance gives access by a way carried across a cleft in the rock to what Mr. Bent has termed the gold furnace enclosure. I am inclined to agree with Mr. Hall that the so-called gold furnace was nothing more than a Makalanga iron furnace, and that the "rejected casings" of the reef ("banded ironstone") which Mr. Bent speaks of are in reality the leavings of the ore smelted, as they would yield an excellent quality of iron and are of the same nature as the natives smelted until the industry became practically extinct as it is at present. It is only right, however, to mention that Sir John Willoughby found in the cleft below "numerous fragments of clay crucibles containing small beads of gold," so that whatever the nature of the furnace, it is quite possible that gold smelting was here carried on. There were evidently other walls still further east, but only traces of them now remain.

On the north side of the "Eastern Temple" there are two passages between the clefts in the rock. One leads on to the north slope of the hill, while the other ascends to a kind of platform, the highest bit of building that remains, which commands an extensive view towards the north and the south-east. On the other side it is cut off by towering rocks. Round the west side of the "Temple" runs a passage which presents a feature of great interest in the shape of a curious recess. This is roughly rectangular in form with the rounded-off end of a wall at one side and a boulder at the other. A curious system of steps runs towards the wall at the back, but does not admit of its ascent. Just below there is an enclosure with a rounded exterior wall which has six spaces left, evidently for the insertion of posts. It is of interest to note that some excavations recently made at the Khami ruins near Bulawayo have revealed similar features. A passage-way leading up to the highest point of what has always been regarded as the main ruin has a similar stepped recess near the base, and there are post holes along the passage, in at least two of which were found vestiges of wooden posts. Mr. Franklin White found similar post holes at Dhlo-Dhlo and recently also at Regina ruins, and in each case remains of wooden posts were discovered. It has been suggested that these wooden posts were not original, but were inserted at a comparatively recent period in place of earlier stone ones. This is, however, mere conjecture, probably arising from doubts as to the probable antiquity of the wood, and even apart from the question as to the likelihood of any one undertaking repairs of the ruins, there is every indication that they have stood from the time the buildings were erected. It may also be mentioned that in the case

of many entrances there is a space left on either side for a post, and in some instances stone posts are still found in position. As there seems no reason why the posts, if of stone, should have vanished in other cases, it appears probable that wood was a material largely employed.

A detailed description of the remaining enclosures cannot be given here, and a few brief remarks must suffice. One striking feature of which mention must be made is the remarkable passage leading from one of the southern enclosures into an upper enclosure north-east of the platform. It is a narrow cleft in the rock, perhaps 3 feet wide, and for some reason it has angular buttresses built alternately on opposite sides which make the pathway barely admit of ascent. It is now impossible to actually get into the higher enclosure, but this appears to be due to the collapse of some of the masonry. The upper enclosure itself is notable for the great cleft rocks which bound it on most sides and the fine square entrance by which it is approached from the west. Inside this are round buttresses with spaces for posts on either side. The Kaffir occupation of the northern side of the hill has resulted in much destruction, though here and there interesting bits remain, such as the fine wall following the contour of some of the great boulders, and the cracks, sometimes only a few inches wide, carefully filled in with masonry. One passage-way has been cleared out for a considerable distance, and at the base of the hill where it originally ended there is the only example of "herring-bone" ornamentation yet found at Zimbabwe, where decorative patterns are remarkably rare. Extensive excavations would be necessary to gain an adequate idea of the original aspect of this side of the hill, and should yield much valuable information when they can be performed.

In descriptions of a number of ruins, and of Zimbabwe in particular, a great feature has been made by several writers of supposed systems of orientation which were said to be observable. In Mr. Bent's work there is a special chapter contributed by Mr. Robert Swan on orientation and measurements which has attracted considerable attention, and Mr. Swan subsequently extended his theories to other ruins in a paper read before the Anthropological Institute in 1896. Mr. Franklin White was the first to independently investigate the points on which stress was laid by Mr. Bent, and in his excellent description of the Dhlo-Dhlo ruins he showed that there at least none of the rules enunciated in Mr. Bent's book are found to apply. I accordingly paid special attention to the matter and carefully went into the facts on which Mr. Swan's theories are based. It is at once evident, as Mr. Swan himself admits, that "the plan of the great temple suggests that the architects had carelessly drawn a great ellipse on the ground and built round it, getting occasionally out of line and leaving occasional doorways;" but he nevertheless comes to the conclusion "that what were regarded as careless irregularities in construction are, in reality, carefully constructed architectural features," though it is obvious that he takes no account of them in many of his subsequent calculations. It would be waste of time to go into these in detail, but there are some points which cannot be passed over. It will be obvious from a mere inspection of Swan's plan that there is no apparent purpose in the direction of the long axis of the building or in the position of the cone or of the chevron pattern on the wall; they do not bear any definite relation to the rising or the setting of the sun or its greatest altitude. The only basis for assuming the ancients to have taken astronomical phenomena into consideration in their building operations is consequently the position of the altar, which according to the plan in Mr. Bent's book is situated on a line which if continued through the main entrance would point due north. There are, however, no signs of his having made any excavations at the spot indicated; indeed, much of his débris was deposited upon it. Now that this has been cleared away, it even appears that there is a wall running through the supposed site. The altar therefore seems to have no existence in point of fact, and all theories based on its assumed position consequently fall to the ground. The same thing applies to the hill, where there are no traces of an altar in the so-called "Eastern Temple" and where the supposed altar in the "Western Temple" is evidently, as Sir John Willoughby suggested, part of a ruined wall.

Another point on which stress was laid by Mr. Swan was an assumed standard of measurement adopted in the construction of walls both at Zimbabwe and other ruins. Thus, according to Mr. Swan, "the diameter of the great tower seems to have represented the unit of measure in the construction of the curves of the outer walls and all the regularly curved inner walls." He further states that the "diameter of the great tower at its base is 17.17 feet, or 10 cubits, and this is exactly equal to the circumference of the little tower." It is elsewhere stated by Mr. Bent that "by digging to their foundations" very accurate measurements of the cones were obtained. Personally, I am unable to see how the figures were arrived at. On the northern side of the large cone

there are cement steps abutting upon it which effectually prevent any measurements being taken for some distance above the base, so that it is evident that the circumference must have been computed by some indirect method, a fact which should have been stated. In any case the best measurements that could be obtained give the circumference as 57 feet about on a level with the floor, whence we arrive at a diameter of 18.13 feet, which scarcely accords with Mr. Swan's figure. The "smaller tower" has its foundations on the cement floor (the larger one goes down below), and as all débris has now been removed, measurements can be made with as great accuracy as the nature of the structure allows. The figure I arrived at for the circumference was 21 feet 3 inches, which can in no way be reconciled with Mr. Swan's deductions. Yet upon a basis which is now shown to be unsound, a theory has been founded which can only give rise to the gravest misconceptions, and some of its consequences are even more serious. In my opinion none of the walls are sufficiently regular to admit of any theoretical deductions being made from them. Yet when their radius of curvature (some, by the way, are portions of the ellipse) cannot be brought into supposed agreement with the system of measurement based on the diameter of the great tower, all discrepancies are removed by regarding any such parts of the buildings as "rough reconstructions of older walls." Among these "rough reconstructions," it may be stated, is the magnificent western wall on the hill with its unique decoration of monoliths and round towers.

Reference is also made in Mr. Bent's work to supposed observations of northern stars, though no evidence is adduced in support of the statement. If the ancients had any such observations in view when building their enclosures, they certainly selected a very unsuitable site. Most of the buildings on the hill have the view to the north entirely cut off by the great granite boulders, and the majority of monoliths supposed to have been utilised as gnomons are on the southern walls both there and in the temple. The remainder are to the west, and the only ones with a northern aspect are those which formerly stood on the divisional wall of the so-called "Western Temple" which is not an external wall as would be expected, and has a large part of the view interrupted by boulders. I have already referred to the platform overlooking this part of the hill. It has upon it two large monoliths, one upright and the other slanting, which is supposed to have been its original position. Here, if anywhere, one would be disposed to find evidences of astronomical observations being made, and it is remarkable that Mr. Swan has no definite suggestions to make on the point. I should not, indeed, like to say that observations of some kind were not made, but considering how elementary and empirical were ancient notions of astronomy, it is certainly remarkable that the relative positions of the monoliths do not immediately suggest their object. It is needless to discuss their relations to a possible altar, for here again, as I have stated, there is no evidence of such a structure having ever existed. I can only conclude that if the ancients had any system of orientation or measurement, we have not yet arrived at any reliable conclusion as to its nature.

Mr. Menell examines various theories of the origin of the buildings, and in conclusion says:—As to the Rhodesian ruins, there is no definite evidence to show that they were not the work of an indigenous race, and there are many difficulties to be explained away before any theory of their origin can be expected to meet with general acceptance. It certainly seems probable that Rhodesia was the source, or one of the sources, of the "Gold of Ophir," and that the gold was brought thence by the Sabæans. Whether the Sabæans themselves erected the remarkable structures under consideration is quite another matter, and no definite conclusion regarding it can be reached until further evidence is available.

ARBROATH ABBEY.*

THE abbey church of Arbroath was founded by King William the Lion in 1178, eight years after the murder of Thomas à Becket, and five years after his canonisation. The ceremony is said to have been performed on August 9. The foundation-stone seems to have been laid with great solemnity. There was a religious service at which King William, the Bishop of Brechin, the Bishop of Aberdeen and a number of other ecclesiastics were present. The exterior of the abbey church was completed in the year 1233, thus being fifty-five years in building, and it was dedicated in the same year. It is likely that the chancel and transept had been built first and brought into use before the nave was completed. Nothing is known of the designer of the building nor of its builders, but the appearance of the ruins after seven centuries is such that we need not doubt but that they did their work well. The

church, however, is the only part now standing. The other part of the buildings that have come down to our time is the abbot's house, and this building is further interesting as being almost the only abbot's house in Scotland still standing.

The church was in the form of a Latin cross. Its length from east to west within walls was 276 feet; width of nave, 35 feet; and of the side aisles each 16½ feet—making the whole width within walls 68 feet. The height of the walls of the nave was about 67 feet, and the walls of the side aisles were 30 feet high. The length of the transept from north to south was 132 feet. The church is Early Pointed, and shows a transition from the Norman to the Early English. The mouldings are very much decayed owing to the soft nature of the stone of which they are built. The church has been described as consisting of a presbytery, a choir of two bays with aisles and sacristy off the south-east aisle; transepts of two bays with eastern aisle, nave of eight bays with western porch between the two western towers, which are built within the external walls. The western doorway, the principal access to the church, has six columns and a round arch, but the mouldings are in the Early English style. Over this door, on the inside, is a gallery with a double row of pillars, those of the arcade next the nave being octagonal, with pointed arches over them, while those behind are round and carry lintels. Two tall and widely splayed lancet windows, with a round window in the gable, light the south transept. The round window is 12 feet in diameter, and is generally termed "the round O," and may have been filled with tracery in the form of a St. Catherine wheel. The altar of St. Catherine was placed in the south transept under this window. The pillars between the nave and aisles were clustered. Four of these placed at the junction of the nave and chancel and transepts supported the principal tower of the church. This tower was probably 140 to 150 feet high. Of the two western towers considerable portions still stand. The north-western tower, popularly known by the name of St. Thomas, is 103 feet high.

The building on the south side of the chancel was erected by Abbot Walter Paniter about two centuries after the dedication of the church. It was the vestry. The chapter-house was to the south of the church, but only a small fragment of it remains. Of the buildings to the west of the principal entrance to the church enough remains to give a good idea of their general character. These were the parts of the abbey devoted to the transaction of its civil business. They include the gatehouse or pend placed at right angles to the west front. The pend is 61 feet in length, and it had originally a vaulted roof. In it may still be seen the groove of the strong portcullis which defended the entrance to the abbey, and which has for centuries been the heraldic emblem of the corporation of Arbroath. Cardinal Beaton is credited with making some alterations on the pend gateway. To the west of the pend were the regality offices and the castle or donjon tower, now locally known as the Tower Nook. The tower is almost entire and is high-roofed, but the parapet is gone. It was in a ruinous state, and was taken down many years ago. The tower is a grim-looking building, and served the purpose of a fort. The building is 70 feet high, 24 feet square and walls 4½ feet thick. The abbot's house is of several periods. The abbey precinct was enclosed by a lofty stone wall, and extended along the east side of the High Street as far as the present parish church.

A very interesting description of the abbey, written in 1517, was found about thirty years ago in the Vatican Library, of which the following is a translation:—"The monastery is under the invocation of St. Thomas and of the rule of St. Benedict, situated in the county of Angus, distant one mile as the arrow flies from the German Ocean. Close by runs a stream, which in their language is called Brodet, whence the abbey takes its name. The town has about two hundred hearths, is under the regality of the abbot, and inhabited by husbandmen, labourers and a few merchants. The abbey was founded 350 years ago by William King of Scots, who was school companion of St. Thomas and a sharer of his tribulations in England. The form of the church is like that of S. Maria del Popolo, but nearly double in size. It is oblong, with a double line of pillars, almost all of square dark stones. The pavement is similar, and the church truly is a noble and royal work. It has four gates—the principal to the west, two to the south whereby one enters the cloisters, and a fourth to the north, which leads to the cemetery. It has three naves, the largest in the middle and the lesser on the sides, and these lesser ones are formed of the same square stones. But the centre nave is roofed with wood. It is covered in the main part with lead, and the rest of it with wooden shingles. It has a splendid tower with four sides, somewhat higher than the campanile of St. Peter's at Rome, and it has many most excellent bells. The high altar is situated at the top of the church, near the east, at a little distance from the wall, and on it daily two, and frequently three, masses are celebrated with the chant. On the altar for an ornament there is a wooden tabernacle, gilt, in which are these sculptured images: the Saviour, having the world in His hand; St. Mary, the Mother of God, with

* A paper read by Mr. A. Symon at the visit of the Dundee Institute of Architects.

the child Jesus in her bosom; St. Thomas the Martyr, and King William offering the church. Round the altar is an ancient wooden choir, with a double row of stalls. There are besides twelve altars, with three chapels, sufficiently decorated, at which daily masses are read. The sacristy at the south side of the choir possesses a silver cross, very many chalices, other vessels, and silver images of the saints. Also many suits of vestments of gold and silk. In it also are preserved a pastoral staff and a mitre. At the right side of the church is a large and most beautiful organ. Outside the church towards the north is a cemetery, enclosed by a low wall. On the opposite from the cemetery to the south is the cloister, the very ample habitation of the monks, square in form and surrounded by very high walls. In this are two refectories, one for the common days and one for feasts. There is also a dormitory. The chapter-house, the infirmary, the hospice for pilgrims and strangers are ample and well furnished. There is a library which contains 200 and more books. They have many gardens wide and fair. The house of the abbot, though in the same cloister, is separated from the habitation of the monks. The tables of the monks and the abbot are united, and the abbot freely administers ale. There are various parochial churches under the monastery to which the abbot has the right of presentation, and receives from them the tithes, &c. In the monastery there is wont to be an abbot, a prior of the cloister and a sub-prior, both removable at the will of the abbot, and besides that forty monks who live there in good report and most religiously worship God. They ring the nocturnes at midnight and chant the other canonical hours at the proper time. The revenues of the monastery may perhaps amount to 2,000 ducats or thereabout, and consist in the revenues and fruits of the churches and in those of their lands and possessions. Such is the evidence of Sir Arthur Boece, a priest of the diocese of Brechin, Master of Arts and licentiate in civil law, aged thirty-two, when on the 15th day of the month of October he appeared before James Collis, Canon of Glasgow, to whom the case was referred. The monks were Benedictines of the Tyronensian order, and the first colony came from Kelso."

FURTHER DISCOVERIES AT KNOSSOS.

IN a communication to the *Times* from Mr. Arthur J. Evans, he writes:—The fourth campaign of excavation in the great prehistoric palace of Knossos—"the House of Minos"—opened under exceptionally difficult conditions. Already before the work began in February there had been forty days' persistent rain, and for another forty it continued almost without a break. The pits were repeatedly swamped, and the extrication of every spadeful of the sodden earth involved about treble the normal amount of labour. It has needed the furnace blasts from Sahara that have swept over the site during the last few weeks to remind us of our proximity to Egypt. Happily, with this exception, the weather showed itself more favourable during April and May; for the work on this incalculable site has found a quite unlooked for extension, and, vast as the palace area was already ascertained to be, a large tract, including one of the most striking features of the building, has now to be added to it.

In the contemporary Cretan palace excavated by the Italian mission at Phaestos—another traditional foundation of Minos—nothing is more imposing than the broad flights of steps rising about the western court. Of these one forms the actual approach to the great hall, or megaron, but the broader flight, running up immediately from the court at right angles to the other, is backed at the top by a line of wall and is in no sense an approach. It is evident that the steps in this case served the purpose of low seats for spectators, and that in all probability at Phaestos some of the shows in which the lords of Minoan Crete delighted took place in the area below. A great deal of parallelism is observable in the two palaces of Knossos and Phaestos, but hitherto nothing at all answering to this theatral arrangement had come to light on the former site.

This has now been found. In the examination of the northern boundaries of the paved court that lies to the north-west of the palace a broad double flight of steps came into view, descending at right angles to one another, while between them, affording an exceptional point of vantage, is a square bastion with a paved floor at top. The higher of the two flights—that to the east—consists of eighteen steps, about 35 feet in breadth where complete. Unfortunately, owing to the made character of the ground, a large part of the limestone slabs had collapsed, and the whole of those belonging to the north-east corner were missing. Happily, however, not only did enough remain to give the complete height and breadth of the flight, but the lower courses of the supporting wall to the north were preserved throughout its length. In order to restore the original effect and to preserve what remained of this part of the monument from further ruin I have not hesitated to undertake a considerable work of restoration. The

supporting wall has been built up to its original height and the missing sections of the steps replaced.

The southern flight is broader and attained a width of about 50 feet. That it was not primarily an approach is here made clear by a small wall backing one section of it, while the real access to the court above from the region outside the palace is supplied by a raised causeway that cuts the stone tiers diagonally. The diagonal course of this paved path has the effect of diminishing the number of the rows of seats—for so we must call them—on one side so that they vary from six to three. In the middle here there are traces of an entrance from above standing in direct relation to another line of causeway leading to the state entrance of the palace that opens near its south-west angle.

The tiers of seats, rising as described to east and south look down on a square area, the rough paving of which seems to have been originally covered, as elsewhere, with a cement floor. Traces of its original boundary walls are seen to the north and west; and on the west side it is approached by another paved path which traverses the middle of the area and runs thus to the centre of the higher flight of steps. The broad steps at Phaestos are approached by a similar paved way; and this analogy makes it probable that the steps themselves in this case too simply led to a paved platform backed, as there, by a wall—in other words, that they served the purpose of seats rather than of an approach. It is certain from other evidence that they did not lead to any great hall or megaron on this side, and it is also clear that the direct line of access to the palace was not by either of these broad flights, but by the diagonal causeway already mentioned, which runs outside them. The principal function for which this stepped area was designed was certainly of a spectacular nature. The plan is not yet fully systematised, but we have here the germ of all future theatres. It seems to grow out of the informal use for sitting purposes of the spacious stepways in vogue in the Minoan palaces. But the initial stage of evolution is here already reached. The steps are here no longer directly connected with a line of approach, and the enclosed area beneath them serves an independent purpose.

Including the square paved platform—a kind of royal box—that rises between the two tiers of seats, this primitive theatre would have accommodated somewhat over 500 spectators. What shows were provided for them in the area below? It was hardly adapted for the Minoan bull-ring. That something like the sports of the Roman amphitheatre were already known here is shown by a boxing scene exhibited by a vase relief from the palace, and still more clearly by a similar design recently found by the Italian mission, in which the pugilists are seen equipped with the cestus and gladiatorial helmets. Still more do one's thoughts turn to that famous dancing scene of old Knossos, the "Choros of Ariadne," the subject of Daedalos's masterpiece, immortalised by Homer. Profiting by the occasion of the recent visit of a party of German and American archaeologists, conducted by Dr. Dörpfeld, I arranged for a dance of our Cretan workmen and their womenfolk to take place in this prehistoric orchestra. With the peasants seated tier above tier on the low seats on either side, and a more distinguished group (provided with chairs) on the intervening platform, the adaptability of the building to such a purpose received a living illustration. The dance, executed to the strains of the Cretan lyre, was itself a Choros of immemorial antiquity. As the leader, with slow or quickened step according to the measure, sometimes leaping high with an inarticulate cry, led the linked train of dancers round in a mazy course with tortuous turns and sinuous meanders reminiscent of the traditional labyrinth, the onlooker might well forget for a moment that over thirty centuries of ruin and desolation lay between this and the last performance of the kind in the court theatre of Minos.

Between this stepped area and the western court of the palace a conglomeration of irregular small-roomed buildings came to light, and it was hard to understand why such apparently unimportant structures should have been preserved so near the walls of the royal dwelling. The block, as was shown by the fine painted pottery of its lower floor-levels, was of great antiquity—its foundation going back to the Middle Minoan Period, before the date of the later palace—and the reason of its conservation is possibly explained by the occurrence of a miniature example in bronze of the sacred horns that characterise the old Cretan sanctuaries, and of painted pottery showing the same cult object placed before the fetish double-axe of the Cretan Zeus. Whether or not we have here represented an early shrine and its dependencies, it is certain that these irregular buildings contained some objects of exceptional beauty and value. Here were found two large jars of the best palace style—one with naturalistic figures of octopuses, the other showing a design composed of rockwork and Egyptianising plants. Still more important was the discovery of a whole deposit of bronze vessels wedged in between two walls. This consisted of an ewer with a bold embossed pattern and a group of four basins, the rims and broad handles

of which were chased with exquisite bands of relief severally representing a succession of lilies, ivy leaves and fern-like foliage. It is not too much to say that no metal objects of the kind found at Mycenæ itself can compare with these either in technique or in beauty of design. The vessels belong to the latest period of the palace—say to the sixteenth century B.C.—and serve to explain why the metal vases of the “people of the Isles of the Sea” were so highly prized at the Court of Thoëmes III.

Of the wealth of precious vessels once contained in the palace itself the wall-paintings exhibiting cup-bearers and, still more, a series of inscribed tablets containing inventories of metal vases accompanied by illustrations have already supplied sufficient indication. At the time of the final destruction of the building it is evident that objects of metal were very carefully searched for and carried away. There seemed strong reasons for supposing that the remarkable stone chests concealed beneath the floors of the magazines had once contained treasure in various forms. Traces of this had indeed been already found in these so-called “Kaselles” in the shape of abundant remains of gold foil. The renewed exploration of this part of the palace during the present season has now revealed a long line of some 30 additional cists beneath the pavement of the long gallery, and in one of these more distinct evidence of the former concealment of valuables in these receptacles than has yet come to light. The burnt remains of a wooden chest were here found which had been covered by a rich mosaic of porcelain and crystal plaques, forming a pattern largely composed of trefoils. The woodwork, and to a great extent the porcelain, had originally been coated with gold leaf. The chest has a large bronze handle, and other similar handles of bronze were found in neighbouring cists. It is probable that some of these receptacles contained bronze ingots of the kind carried by the Ægean tributaries on contemporary Egyptian monuments. A fragment of a large ingot of this kind was found near a magazine on the east side; and not only are there frequent references to such in the clay archives of the palace, but the Italian explorers have now brought to light a whole hoard in the royal villa at Hagia Triada, near Phaestos, weighing about 70 lbs. a piece.

A greater obscurity attaches to the deep walled chambers of the northern palace region, the exploration of which was already begun last season. A whole system of these, consisting sometimes of long rectangular rooms, sometimes of large square pits, has now, at the cost of much labour, been uncovered. The walls descend over 25 feet sheer below the upper floor level, and it is now clear that these dungeon-like structures belonged to the earlier palace, and were to a great extent filled in at a later date. Here and elsewhere the continued investigation of the earlier strata has produced a multiplicity of new evidence illustrative of the long course of civilised development which on this site preceded the “Late Minoan” stage represented by the palace in its present shape. This “Late Minoan” foundation—the history of which itself covers two distinct periods—cannot, as the Egyptian comparisons supplied by its latest relics show, be brought down beyond the sixteenth century before our era. The Hyksos and thirteenth dynasty objects found in it, but even more the considerable evolution of art perceptible in its different stages, take us back at least to the beginning of the second millennium. But in some respects, especially in the early ceramic fabrics (of which some of the finest examples have come to light within the last few days), the most brilliant days of this early Cretan civilisation lie well beyond this sufficiently remote date. It is satisfactory to be able to record that Egyptologists, including Professor Petrie, who have been recently able to inspect the early objects from this site, have unanimously confirmed the opinion that they point to the civilised intercourse between Crete and the Nile Valley extending back to the time of the earliest dynasties—in other words, at least to the middle of the fourth millennium B.C. And it must be remembered that below this early civilised stratum a vast neolithic layer some 25 feet in thickness, itself divisible into different periods, covers the whole surface of the hill. An entirely new perspective of antiquity has here opened, and the superposition of the successive strata is as clear as in any geological section.

The evidence supplied by the palace itself is confirmed and supplemented by that derived from the private houses of the extensive prehistoric city by which it was surrounded. Investigations carried out during the present season show that on the north-east side these extend to a distance of over a quarter of a mile from the palace walls. Of these by far the most remarkable was one brought to light somewhat below its north-eastern angle facing what seems to have been the former channel of the stream. This house is, in truth, a miniature palace, and from the fact that it is partly built over an area cut out of the rocky steep of the hill it has been preserved in a manner not less extraordinary than the domestic quarter of the palace itself. Here, as there, the whole upper-storey plan can be made out, and of the two staircases that it contains one has a double head above. Unlike the palace, however, which is

largely composed of earlier elements, this building shows a striking uniformity of structure, and exhibits the architectural style of the later palace period in its purest form. There is proportionately less rubblework here, many of the walls consisting entirely of fine gypsum blocks which had been covered by a thin coating of painted plaster. One room so constructed, with a monolithic pillar of the same material in its centre, is specially interesting from the fact that the sockets for the massive beams of the floor above are cut into the stonework, so that the whole can be reconstructed. Of the magnificent furniture once contained in this house the best idea is supplied by a tall painted jar found on the landing of the principal staircase adorned with rich papyrus sprays partly in relief—a hitherto unexampled ceramic technique. But the centre of interest in the house itself is the principal hall, or megaron. The body of this hall, with its light area, column bases and pillars, resembles the hall of the Double Axes of the palace itself on a smaller scale, but its inner end shows a wholly unique arrangement. It terminates here in a kind of cancellus, or raised balustrade, which originally supported two columns. Between these the balustrade is broken by a small ascending flight of three steps, on one of which stood a tall columnar lamp of porphyry-like stone in the position in which it had been originally set. This stepped central opening in the balustrade leads, after a narrow interval, to a square niche in the back wall of the room, lined with gypsum slabs, and containing the remains of a gypsum seat or throne—the occupant of which must have commanded the entire hall. It will be seen that the whole arrangement anticipates in an extraordinary manner that of the later basilica—the columnar nave, the cancellus and tribune. The throne and apse-like recess may all, in one way or other, be brought into the comparison. The very name, indeed, of “basilica,” or “royal hall,” seems here to have been applicable in its most literal sense. The exceptionally fine construction of the building makes it, indeed, natural to suppose that it was in reality, as well as appearance, a miniature palace or royal villa, and that a Minoan prince once filled the seat of honour in its principal hall. Placed as the house is near the stream, in a cool and leafy valley, outside the walls, but close at hand, it must have offered special attractions as a summer pleasurehouse.

CHESTER AND NORTH WALES ARCHÆOLOGICAL SOCIETY.

AT the annual meeting of members of the Chester and North Wales Archæological and Historic Society the Ven. Archdeacon Barber presided. The financial statement showed receipts amounting to 146*l.* 18*s.* 5*d.*, and expenses (including a deficiency of 49*l.*, brought forward from last account and 60*l.* contributed to the museum management committee), amounted to 204*l.* 6*s.* 8*d.*, leaving a balance against the Society of 57*l.* 8*s.* 3*d.*. The Council's annual report having recorded the lectures delivered during the past session, and referred to the visits paid under the guidance of Archdeacon Barber to the cathedral, stated:—“In consequence of the inconvenience occasioned by the subscriptions becoming due on January 1 in each year, and the usual session of the Society not commencing until October 1 following, it has been decided to alter the date upon which subscriptions shall become due from January 1 to April 1 in each year, thus permitting the first half of the Society's year to be set aside for summer excursions, and the latter half for winter evening meetings at the museum. The subscriptions will, therefore, be collected in the summer. During the year volume ix, new series, of the Society's journal was issued to the members, and the thanks of the Society are especially due to the Rev. F. Sanders (the hon. editorial secretary), and also to Mr. R. Newstead, for indexing it and providing most of the illustrations. The volume was of especial interest to the members and to citizens of Chester generally, containing as it did the papers, with illustrations, of the various visits to the cathedral. The hon. treasurer's statement of accounts is submitted, showing a deficit of 7*l.* 16*s.* 5*d.* for this year. It is the endeavour of the Council to issue every year a volume of the Society's transactions, but to do this more members are required. Eighteen new members were elected during the year, and it is hoped, now that the subscription is reduced to 10*s.* 6*d.* per annum, that members will induce their friends to join during the current year. We regret to announce that Mr. Edward Hodgkinson, who for many years has acted as hon. curator and librarian of the Society, has resigned his office in consequence of ill-health. Mr. Hodgkinson has not, however, severed his connection with the Society, having undertaken the duties of honorary secretary. Mr. Robert Newstead has been elected honorary curator and librarian in place of Mr. Hodgkinson. The following gentlemen have been elected to represent the Society upon the Grosvenor Museum management committee, viz.:—Ven. Archdeacon Barber, Mr. T. S. Gleadowe, Mr. Henry Taylor, Mr. Edward Hodgkinson, Dr. J. C. Bridge and Mr. W. W. Tasker.”

Archdeacon Barber, in moving the adoption of the accounts and report, said he thought the Society could congratulate itself upon having if not an eventful a successful year of the Society's work, and they could only hope that their numbers would go on increasing, and that the citizens of Chester and neighbourhood would take an even more lively and practical interest in the work of a Society which had a wonderful field for its operations in that ancient and historic city. It would be out of place for him to make any remarks on the recent journal, but he would call the attention of the public to one paragraph in the report, which said, "The volume is of special interest to the members and citizens of Chester generally, containing the papers of the various visits to the cathedral." He was sure they owed a great deal to Mr. Newstead's labours, and it would certainly fail utterly of its purpose and of the interest he was sure it would excite if Mr. Newstead had not embellished it and enriched it with those excellent illustrations he had supplied. The Archdeacon, after referring to a special donation by the Rev. H. Grantham, said it had been pointed out again and again that they also had to pay a large and heavy rent for their location in that building, hence the necessity of having a substantial income. He hoped they would grow in numbers to such an extent that they would not be faced with that serious difficulty of how to make both ends meet. He reminded the members that during the past year they had had to draw upon capital in order to put themselves straight and pay their proportion to the arrears of debt of that building.

MUD BRICKS IN EGYPT.

EVERYONE who has been to Egypt has at least a passing acquaintance with mud bricks; but when one has lived in a mud-brick hut, cooked food over a mud-brick fireplace, kept chickens in a mud-brick coop, fed one's horse out of a mud-brick trough, and used the same mud-bricks for tables, chairs and missiles, the acquaintance, says a correspondent of the *Manchester Guardian*, grows into something like friendship. One's first introduction to them in such a place as Alexandria is not a very great surprise, because the bricks used, at all events in the modern part of the town, are kiln-burnt like our own at home, and a beautiful rich terra-cotta red. But how a member of the union would scoff at the slow-drawn mule waggon with its scanty load of little irregular oblongs, and how he would fling down his trowel in disgust when they brought him water in an old petroleum tin with an improvised wooden or string handle. But these red bricks are, after all, the newest of new-fangled notions to Egypt, and so are the petroleum tins, for Egypt, as an architectural expression, despite Sphinx or Pyramids or the great halls of Karnak, is from the beginning sun-dried brick. This, of course, is the outcome of the climate, and the mud hut is as obviously Egyptian as the chalet is Swiss, the snow hut Eskimau, or the bamboo house Japanese. Look at its surroundings. On the one hand is the Nile, on the other the desert. The former with its yearly overflow and deposit of thick, rich mud from the equatorial lakes, the second with its barren, lifeless stretch of flint and sand stretching away from the river's flood limit to the massive cliffs of limestone east and west. Of wood there is practically none, save that provided by the tapering branches of the palms or in old age by their rugged, spongy stems, so that we are thrown back for building material upon the Nile mud or the desert limestone. Then the climate. Brilliant sun pours down day after day, and in Upper Egypt there is scarce a cloud in the sky from year's end to year's end; nothing from sunrise to night but dry, shrivelling heat—for baking bricks and never a drop of rain to spoil them. Now the average fellah cares little or nothing for the outer aspect of his house, nor does he wish to have the trouble of taking care of it. What he does want is a shelter warm by night and cool by day, something which it costs little to build, and which when a few years have passed over it he can afford to let fall in ruins, exchanging for another of the same kind.

Obviously, therefore, he does not go to the expense of quarrying limestone. What he does is to puddle some mud at the nearest pond, canal, cut or shadouf, mix with it a little sand to make it hard and prevent its cracking in the sun, press it in a wooden mould, and set the resulting cakes in the sun to dry. There you see them, row upon row, laid out like squares of oatmeal bread prepared for the baker's oven, basking in the sun week after week, or piled one against the other in rough criss-cross jumble, so that they may get well blown and aired in the dry breeze. By-and-by our brown labourer takes his bricks, piles them into four walls in rough regularity, treads down a mud or sand floor, thatches with a bundle or two of durra stalks, and the house is finished. Sometimes a few conical points of clay are added to a gateway or a fantastic pigeon-cote breaks the monotony of the square grey walls, or perhaps a circular granary resembling nothing so much as a

huge church font, in and out of the base of which chickens hop through a tiny opening, and in whose upper basin corn is stored or the householder sleeps in the summer nights. Sometimes the inside of the hut, sometimes the outside, is plastered with sandy mud or a row or two of bricks are laid so that their ends form a rough herring-bone pattern; sometimes a coat of whitewash is added to the interior; or, again, shelves or windows are formed in the walls. But these are superfluous ornaments merely, and the essentials for fellahen comfort remain four mud-brick walls and a cornstalk or palm thatch, as at any time these last 7,000 years.

The mud brick has from time to time been supplanted by stonework for buildings of importance, but there is no doubt that it reigned supreme in earlier ages, and I suppose no place in Egypt can so well prove this point as the old city of Abydos. Here all that is ancient (I speak from an Egyptologist's point of view), all the oldest structures, all buildings that have borne the brunt of time, are made of mud brick. Take, for instance, the Shuneh fort, which stands out alone upon the desert, gaunt and mighty yet, in spite of the thousands of years which have passed over it; there is not a stone used in the whole length and breadth of its massive walls. Or take the royal tombs of the kings, the Kom es Sultan, and the thousands of smaller tombs and ruined pyramids which cover some three or four square miles of desert upon which we are camped; they are built of brick without exception; and in the Temple of Osiris, which forms this winter the centre of Professor Flinders Petrie's work for the Egypt Exploration Fund, all the construction of the more ancient buildings is being traced through endless intricacies of mud-brick wall, and it is only here and there, where extra strength was required for pillars, door jambs, thresholds and pavements, that the old-time builders seem to have employed masonry at all. It is here, if anywhere, that one has the opportunity of learning something about bricks, and this for the very reason that every inch of the final plans of what is considered the most important temple site in Egypt depends upon the accuracy with which the walls of brickwork are disentangled from the rubbish which has filled and buried them.

In the actual practice of excavating in Egypt this is one of the most difficult bits of work. Had one to deal with walls of hard-baked brick nothing could be simpler than to clear rubbish from between them and trace them out to their furthest limits. It would be easy with a stroke of the pick to distinguish walls of that kind from the hardest bed of clay. But with unbaked bricks it is quite another matter. With bricks, which were in the first instance nothing but rectangular blocks of mud dried in the sunshine, and whose only practicability rests in the fact that the climate is almost rainless and the air always ready to absorb moisture, the tracing of ancient walls, in anything like damp ground is very much like looking for a bucketful of fresh water which has been thrown into the sea. In sand, of course, the heat which at a very short distance from the surface retains an average temperature of 80 degs. Fahr. throughout the year tends rather to bake and further harden them. Up to the surface of the sand too they remain perfect in a most wonderful way, and on very old buildings the line of the desert or the curve of any big sand drift can often be traced clearly along the brickwork, those parts which have been exposed being pitted and broken away, while the faces of the bricks below the sand line remain still firm and square. On the Shuneh fort there is an almost perfect arch traced in this way on the surface of the walls, both north and south, and looking as if this had been part of the original plan of the builders.

There could probably be no better example of the fact that the facility with which walls of this kind may be traced varies with their age and depth beneath the surface than that given by the excavations on the Temple of Osiris. Here the surface rubbish was composed almost entirely of limestone chips and dust. As this was cleared brick walls gradually appeared. They were bared without difficulty, and as they dried out in the hot sun it was easy to trace the divisions in the brickwork, and to measure the sizes of the bricks. But in the next clearance matters were not so simple. Below our first lot of walls were others which had borne not only the weight of the massive temple of the twenty-sixth dynasty, but for thousands of years previously the pressure of the other brick walls upon which these had been founded and the tons of rubbish which had accumulated between them. The result of the pressure, combined with the yearly soaking of the Nile water, had been to consolidate the rubbish until it was as hard and firm as any of the walls. In a case of this kind the feel of the pick ceased to be any guide, and it was necessary to have recourse to numerous sections and cross-sections. The faces of the cuttings were all carefully scraped with a knife or trowel, and where this was not sufficient to prove the existence of brickwork they were left to dry in the sun.

In theory wall hunting would appear to be the simplest thing in the world, and yet it must be admitted that there is no royal road to perfection in its practice. Experience and

constant careful attention alone can develop the excavator's skill. Theoretically, brickwork cuts uniformly with a knife, and where a few feet have been trimmed in this way the bricks, which were probably made in different batches and of slightly varying mixtures of clay, will show up as contrasted light and dark oblongs and squares. Where these lie in even horizontal lines they may be taken as showing untouched walling, where they are found lying at various angles surrounded by rubbish and of uneven shape they represent the ruin of a building and cease to be any guide to the size or direction of the walls they once belonged to. When the bricks are of such uniform composition that a section presents no differences of colour, a sufficient exposure to the sun will generally bring out the divisions between the bricks, since the brick surfaces themselves dry out more quickly than the clay with which they were mortared together. But, unfortunately, ancient brick-makers were not always so particular about the material they used; house refuse was often mixed with the clay they moulded, and the resulting brickwork shows in section almost as large a proportion of charcoal and broken pottery as the rubbish which surrounds it. In deep cuttings also weeks may elapse before the sun and wind can make any progress with the drying, during which the excavator is kept kicking his heels in suspense, unable to proceed with a portion of his work until he has puzzled out the meaning of what has already been brought to light.

It has always appeared to me that the Children of Israel must have been in very prosperous circumstances when they were driven to raise such a lamentation at their inability to make bricks without straw. Judging at least by what one finds among the older ruins of Egypt, straw was quite as frequently omitted, in the puddling of the brickmakers' clay, as it was used. In the construction of the Shuneh fort straw was used, and can still be seen, but in many walls quite as old no trace of it is found, and curiously enough those bricks in which some sand only has been mixed with the mud have lasted the best. There seems to have been no definite tradition on the subject. I have spent a whole day sitting on a rubbish heap breaking mud bricks, and I am convinced that as many were made without straw as were made with it.

Whatever may be their defects, it must be admitted that mud bricks have their uses. They cannot, it is true, withstand wet, nor are they calculated to inspire great architectural achievements, but in a climate like that of Egypt what does this matter? The last thing a fellah would think of is to keep in repair what he has built, and even if the wall of your bedroom does melt away (as mine has) under the too vigorous splashing from an early morning tub, this is of little consequence. The price of lunch at a West End London restaurant will build you another just as good. In a sling and for scaring sparrows there is nothing better, and for anyone who is pestered by Arab boys a prehistoric mud brick is probably the best remedy that can be devised. In this country they are always at hand, and the sight of a good shot bursting like a bomb about the offender's ears is a joyful remembrance for many a day.

THE SILCHESTER EXCAVATIONS.

WHILE the excavations at Silchester during the past year have yielded fewer objects than usual of a kind that appeal to the general public, valuable discoveries of a topographical nature have been made. Work was done in parts of four insulæ (28, 29, 30, 31), and in the eastern angle of the old town wall it was found that the main line of street through the city from west to east was deflected near its east end, so as to meet the gate in that quarter, which lay somewhat to the south. One part of the area appears to have been devoted to religious uses in pagan times and to have served as a temple enclosure. In 1890 two temples were found, partly in the churchyard and partly under farm buildings. Not far from the church another has been unearthed, thus illustrating the well-known principle of the continuity of religious sites. It is noteworthy that the axis of the parish church practically coincides with that of a temple a little to the west of it, and it may well be that the present twelfth-century church occupies the site of a temple. The excavations have also resulted in the discovery of several houses of considerable interest. These were originally of the corridor type, but four successive enlargements show a near approach to the courtyard type. Six other buildings were uncovered, and of these two are of a character unknown before. One has a gallery nearly 60 feet long, with a series of openings on one side, as if there had been a portico. To the south is a semicircular structure, which appears to have been entered by a wide arched opening. The long building is suggestive of a modern skittle-alley; and both not improbably stood in the pleasure garden of the small house hard by.

Owing to the circumscribed nature of the sites and the

number of buildings they carried fewer pits than usual were sunk, and consequently the relics found are less in number than in previous years. The principal finds are some fragments of marble, one bearing some letters, which may have come from a temple. These were built into the hypocaust of a house, proving that the temple was ruined before the dwelling was erected. Noteworthy also are some large trays of Kimmeridge shale; the exceptionally large upper stone of a quern of Andernach lava, still retaining the iron loops by which it was turned; and two pots of black Upchurch ware, both covered, one with a tile and the other with a piece of clay, but containing nothing of value. Among the smaller objects are the fragments of a large pane of window-glass, ornaments and toilet implements, a terra-cotta figure, probably a little household deity; a torque, apparently of some alloy of silver; and a silver ring and pin. It may be remarked that very few objects of any metal more precious than bronze have been found at Silchester. Mr. Clement Reid's work on the identification of seeds found in soil undoubtedly Roman has yielded important results. He has added from last year's excavations no less than twenty-four species to the plants already known to have flourished in this country in Roman times. Included in the list are the meadow buttercup, the carrot, knapweed, black nightshade, bugle, three species of bedstraw and two of goosefoot, dock and sedge. Clippings of box were also found, supposed to come from garlands. Some writers claim that this species is indigenous, but this find appears to be the first evidence that it grew in Britain in Roman times. Summarising the work of the committee, it may be said that between 1890 and 1902 inclusive the sum of 6,387*l.* has been spent in excavating about four-fifths of the area, and the cemeteries outside the walls are still to be dug over. The work entails an expenditure of about 500*l.* a year, entirely defrayed by subscriptions, which may be sent to Mr. W. H. St. John Hope, Burlington House, Piccadilly.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A SPECIAL general meeting was held on Monday. The following resolution was carried. "That, subject to the sanction of the Lords of the Privy Council, the words 'during the five years from the date of approval of this provision by the Privy Council' be omitted from the proviso of by-law 9."

The Hon. Sec. announced the decease of Valère Dumortier, president of the Société Centrale d'Architecture of Belgium, hon. corr. member. The Hon. Sec. also gave a description of some recent additions to the library.

The report of the scrutineers appointed to direct the election of the Council, standing committees, &c., for the year of office 1903-4 was read, and the following were declared elected:—

President.—Aston Webb, A.R.A., F.S.A.

Honorary Secretary.—Alexander Graham, F.S.A.

Vice-Presidents.—John Belcher, A.R.A., Thomas Edward Colcutt, Alfred Darbyshire, F.S.A. (Manchester), John Slater, B.A. Lond.

Members of Council.—Frank Thomas Baggallay, Charles Edward Bateman (Birmingham), George Frederick Bodley, R.A., F.S.A., John James Burnet, A.R.S.A. (Glasgow), Alfred William Stephens Cross, M.A. Cantab, Ernest George, James Sivewright Gibson, John Alfred Gotch, F.S.A. (Kettering), Edwin Thomas Hall, Charles Henry Heathcote (Manchester), Arnold Mitchell, Edward William Mountford, Professor Beresford Pite, George Halford Fellowes Prynne, Samuel Bridgman Russell, William Howard Seth-Smith, John William Simpson, Leonard Stokes.

Associate Members.—Robert Shekleton Balfour, Henry Vaughan Lanchester, Walter John Nash Millard, Edmund Walter Wimperis.

The unsuccessful candidates were Messrs. A. C. Blomfield, M.A., W. D. Caröe, M.A., H. O. Cresswell, F. R. Farrow, W. M. Fawcett, M.A., W. Flockhart, G. E. Grayson, E. A. Gruning, J. D. Mathews, F. L. Pearson, S. P. Peck, H. H. Statham, C. H. Townsend, S. Trevel, P. Waterhouse, M.A., R. S. Wornum, A. T. Bolton, H. M. Wills.

Representatives of Allied Societies.—George Cappinger Ashlin, R.H.A. (Royal Institute of the Architects of Ireland), James William Beaumont (Manchester Society of Architects), Arthur William Brewill (Nottingham Architectural Society), Horatio Kelson Bromhead (Glasgow Institute of Architects), Alexander Hunter Crawford (Edinburgh Architectural Association), Arthur Harrison (Birmingham Architectural Association), Butler Wood (Leeds and Yorkshire Architectural Society), Joseph Wilson (Bristol Society of Architects), John Woolfall (Liverpool Architectural Society).

Representative of the Architectural Association (London).—Henry Thomas Hare.

Auditors.—J. Ambler, W. A. Forsyth.

Art Standing Committee.—Fellows: J. M. Anderson, W. D. Caröe, M.A., T. E. Colcutt, Sir William Emerson, Ernest George, J. S. Gibson, H. T. Hare, E. W. Mountford,

J. W. Simpson, Leonard Stokes. Associates: R. S. Balfour, H. V. Lanchester, W. J. N. Millard, P. E. Nobbs, M.A., W. H. Romaine-Walker, E. W. Wimperis.

Literature Standing Committee.—Fellows: John Bilson, F.S.A., A. W. S. Cross, M.A., Francis Hooper, W. A. Pite, G. H. Fellowes Prynn, R. Phenè Spiers, Hugh Stannus, H. H. Statham, C. H. Townsend, Paul Waterhouse, M.A. Associates: A. S. Flower, M.A., C. H. Reilly, M.A., Professor R. Elsey Smith, Percy Leslie Waterhouse, M.A., A. M. Watson, B.A., P. S. Worthington, M.A.

Practice Standing Committee.—Fellows: Thomas Batterbury, S. Flint Clarkson, Ernest Flint, George Hubbard, F.S.A., A. Henry Kersey, J. D. Mathews, W. H. Nash, J. O. Smith, T. H. Watson, E. Woodthorpe, M.A. Associates: W. H. Atkin-Berry, C. H. Brodie, Max Clarke, H. H. Langston, A. W. Tanner, W. H. White.

Science Standing Committee.—Fellows: T. Blashill, E. Flint, J. S. Gibson, F. Hooper, George Hornblower, W. E. Riley, H. D. Searles-Wood, A. S. Snell, B. Tabberer, K. D. Young. Associates: H. W. Burrows, Max Clarke, B. J. Dicksee, E. R. Hewitt, G. Pearson, A. D. Watson.

The following candidates for membership were elected:—

As Fellows.—William H. A. Berry, B. W. H. Brameld (Manchester), W. J. Burrows, E. Guy Dawber, Horace Field, J. W. Fisher (Wellingborough), John Gibbons (Manchester), H. J. Lanchester, H. C. Pegg, Reginald Pope (Folkestone), Harry Redfern, H. W. Rising, A. H. Ryan-Tenison, F. W. Tasker, W. H. White.

As Associates.—C. H. Ballantyne (Melbourne), E. A. Jollye (Spalding), A. Woodroffe (Vancouver, B.C.).

As Honorary Associates.—Alfred East, A.R.A., T. H. Mawson, S. J. Solomon, A.R.A.

As Hon. Corresponding Members.—Jean Louis Pascal (Paris), Heino Schmieden (Berlin).

Conditions of Contract.—The Chairman moved with regard to the negotiations with the Institute of Builders in the matter of the "Schedules of Conditions of Contract," that Clause 1 of both documents be amended to read as follows:—1. The works shall be carried out in accordance with the directions and to the reasonable satisfaction of the architect, in accordance with the signed drawings and specification, and in accordance with such further drawings, details, instructions, directions and explanations as may from time to time be given by the architect. If the work shown on any such further drawings or details, or necessary to comply with any such instructions, directions or explanations be, in the opinion of the contractor, extra to that comprised in the contract, he shall, before proceeding with such work, give notice in writing to this effect to the architect. In the event of the architect and contractor failing to agree as to whether or not there is any extra, and of the architect deciding that the contractor is to carry out the said work, the contractor shall accordingly do so, and the question whether or not there is any extra, and if so the amount thereof shall, failing agreement, be settled by the arbitrator as provided in Clause 32, and the contractor shall be paid accordingly. The contract drawings and specification shall remain in the custody of the architect, and shall be produced by him at his office as and when required by the employer or by the contractor.

TESSERÆ.

Portrait Statues in Greece.

IN the early period of sculpture only statues of divinities were made, and up to a comparatively late time these archaic figures were copied for religious and superstitious reasons, and the old formal hieratic type was strictly observed. It was not until the fifty-eighth Olympiad that iconic statues began to be made in honour of the victors in the national games, and these for the greater part were rather portraits of the peculiarities of general physical developments than of the face. Portrait statues of distinguished men now began to be made, but they were very few in number and only exceptionally allowed by the State. The first iconic statues, representing Harmodius and Aristogeiton, were made in 509 B.C. by Antenor. Phidias followed (480 to 432 B.C.), and during his period the grand style was in its culmination, and for the most part divinities or demigods only were thought worthy subjects for a great sculptor. Iconic statues were, however, executed during this period, and among the legendary heroes and divinities which formed the subjects of the thirteen statues erected at Delphi and executed by Phidias out of the Persian spoils, the portrait of Miltiades was allowed. The erection of public portrait statues was, however, very rarely allowed, and the introduction by Phidias of his own portrait and that of Pericles among the combatants, wrought upon the shield of his ivory and gold statue of Athena occasioned a prosecution against him for impiety. It is said that Phidias, in his statue of a youth binding his hair with a fillet, made the portrait of Pantarces, an Elean who was enamoured of the great sculptor and who obtained the victory at the Olympian games in the eighty-sixth Olympiad (B.C. 435).

But this story which is given by Pausanias rests, even by his own account, purely on tradition, and was apparently founded upon a supposed resemblance between Pantarces and the statue. Portraiture in its true sense, however, now began, and soon after the death of Phidias, about the ninetieth Olympiad, Demetrius obtained celebrity as a portrait sculptor. He it was who first seems to have introduced the realistic school of portraiture, copying so carefully from life, particularly in his likenesses of old persons, that he was reproved for being too faithful to nature. Quintilian accuses him of being "nimius in veritate" (xii. 10), and Lucian in his "Philopseudes" calls him an anthropopoios, and describing a statue by him of Pelichus the Corinthian, says it was like the very man himself. Callimachus, also, at the same period obtained a nickname on account of the extreme detail and finish of his works. These artists flourished nearly a century before Lysistratus, and Pliny therefore is incorrect in his sweeping statement that before the time of Lysistratus sculptors had only endeavoured to make their statues as beautiful as possible, and not to give accurate portraits. Still, these men must be considered as exceptions to the general practice, and it was not until the time of Alexander that portrait-sculpture in the sense of accurate likeness was developed.

The High Cross of Bristol.

The history of the High Cross, the "Alta Crux," of Bristol, is curious enough. Built in 1373 on the site of an older one, it was adorned with statues of John, Henry III and the reigning king Edward III. John, be it observed, had, doubtless not without valuable consideration, granted various privileges to Bristol, as to many other towns. Edward IV. was afterwards added. In 1633 the structure was repaired, raised and received four new sovereigns, Henry VI, Elizabeth and the reigning King and his father. We do not hear what happened to the cross in the Civil Wars. It had a better chance of escape than most of its fellows, as at the very moment when most destruction was done in that way, Bristol was held for the king. In 1697 it was again repainted and gilded, and that in such a costly manner that no cross in the kingdom is said to have exceeded it. All this time it had stood in its natural place in the middle of the city. But in 1733 a silversmith, living hard by, was frightened lest the cross should fall and crush him. It was therefore taken down and "thrown by in the Guildhall as a thing of no value"—a process of "throwing by" which we do not quite understand when applied to a stone structure 39 feet 6 inches high. At some time between 1733 and 1763 it was moved from civic to ecclesiastical ground, and with the approbation of the Dean and Chapter re-erected in the centre of College Green. In 1763 it was again pulled down, on this occasion because it was considered an obstruction to the promenade, and deposited in a corner of the Cathedral. Again, we must remark that the deposition of so large an object in a corner of so small a cathedral as that of Bristol must have been a serious obstruction to something or other. At last, in 1766, it was rebuilt in Sir R. C. Hoare's grounds at Stourhead, and in 1851 the good people of Bristol built themselves a new cross.

GENERAL.

The Society of Architects have arranged to visit the International Building Trades Exhibition at the Royal Agricultural Hall, Islington, on Wednesday next, June 17, at 2.15 P.M.

The Annual Fête in honour of Corot, the landscapist, has been held at Ville d'Avray. Among the French artists who participated in it were MM. Gérôme, Carolus-Duran, Guillemet, André Brouillet, Bouché, Barrias. M. Harpignies acted as president.

Canon Routledge, one of the trustees of the ancient Roman remains of Richborough Castle, near Sandwich, is arranging to have excavations carried out of the great mass of concrete there, which has been the subject of much speculation amongst antiquarians. The opinion of Canon Routledge is that this is hollow, and, if this is the case, it is considered it might have been used for storage purposes by the Romans, and possibly for a treasure-house. Further explorations may bring to light all sorts of valuables deposited there by the Roman legionaries and auxiliaries.

The Technical Institute at Portsmouth will cost at least 69,976*l.* Messrs. Armitage & Hodgson's tender would amount to that sum by the omission of various items from the specification. The original amount was 83,583*l.*

The Cottage at Chalfont St. Giles, Buckinghamshire, in which Milton lived, is to be restored at a cost of 300*l.* The building is used as a public museum, and contains a first edition of "Paradise Regained," and some cannon balls fired into the church.

A New Monthly Magazine entitled *Pros and Cons*, and costing only 2*d.*, has appeared. It relates mainly to archaeology, and should help in popularising that and similar subjects. In the last number is one of Mr. S. W. Kershaw's articles on "Kent County Records." It deserves support.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BRIDLINGTON.—June 19.—Schemes are invited for providing the village of Flamborough (1,000 inhabitants) with an efficient supply of water. Mr. John B. Simpson, clerk, Rural District Council, Bridlington.

IRELAND.—June 18.—The Trustees of the Limerick free library and museum invite designs from architects in independent practice for the proposed Carnegie library and museum to be built in the People's Park, Limerick. Prizes of 75*l.* and 25*l.* respectively will be awarded to the designs placed first and second in the competition. Mr. W. M. Nolan, town clerk, Town Hall, Limerick.

NEWARK-ON-TRENT.—Competitive designs are invited for Grammar School buildings, to accommodate not less than 150 boys, including 30 boarders, head-master's residence, &c. Premiums of 25*l.*, 15*l.* and 10*l.* are offered. Mr. Godfrey Tallents, clerk to the Governors.

POPLAR.—June 23.—Competitive designs are invited for a public library to be erected in Cubitt Town, Poplar, E. A premium of 75*l.* is offered for the design accepted by the Council, which will be deducted from the architect's com-

mission should he be employed as architect in the execution of the work. Mr. Leonard Potts, town clerk, High Street, Poplar.

TAUNTON.—July 20.—Competitive designs are invited for a library building to be erected in Corporation Street, at a cost not exceeding 5,000*l.* inclusive. Premiums of 30*l.*, 20*l.* and 10*l.* will be awarded for designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. George H. Kite, town clerk, Municipal Buildings, Taunton.

CONTRACTS OPEN.

ALLENDALE.—For additions to residence at Ashleigh, Allendale, Northumberland, for Mrs. Lee. Mr. A. B. Plummer, architect, Newcastle and Tynemouth.

ASHTON-IN-MAKERFIELD.—June 17.—For the construction of a boundary wall, about 120 yards long, at the gasworks, Princess Road. Mr. Albert Sykes, clerk, Council Offices, Ashton-in-Makerfield.

BATLEY.—For the erection of twenty new beehive coke ovens at West End Collieries, Batley. Mr. T. H. Brierley, manager.

BEDFONT.—June 22.—For the erection of a new chapel, being first portion of scheme known as Bedfont Tabernacle, near Feltham and Hounslow. Mr. Percy H. Grove, architect, Alma Road, Windsor.

BIRMINGHAM.—June 17.—For the construction of underground sanitary conveniences at Moseley village. Mr. Ambrose W. Cross, surveyor, 23 Valentine Road, King's Heath.

BISHOP AUCKLAND.—June 15.—For alterations and additions to York House, North Bondgate, Bishop Auckland. Mr. William Perkins, architect, Victoria Street, Bishop Auckland.

BRADFORD.—June 15.—For the erection of premises for special classes, with cookery and laundry over, in Usher Street, Bradford. Quantities and form of tender may be obtained at the office of the Architect to the School Board.

BRADFORD.—June 15.—For alterations to premises, 15 Bridge Street, for central tramway offices. Mr. F. E. P. Edwards, city architect, Whitaker Buildings, Brewery Street.

BRIXHAM.—June 16.—For rebuilding the Buller's Arms inn, at Brixham, Devon. Mr. Fred Wm. Vanstone, architect, Palace Chambers, Paignton.

BUCKFASTLEIGH.—July 21.—For pointing and rough-casting the Buckfastleigh parish church spire. Mr. Andrew Warren, surveyor, Buckfastleigh.

BURNLEY.—June 19.—For the erection of a western tower, at Worsthorne Church, near Burnley. Messrs. Austin & Paley, architects, Castle Park, Lancaster.

CANNOCK.—June 25.—For the construction of a road bridge over Goldie Brook, Saredon. Mr. Herbert M. Whitehead, surveyor, Penkridge, near Stafford.

CROYDON.—June 30.—For the erection of fifteen rows of cottage dwellings (146 cottages) for the working classes on the Norbury Estate, London Road, Croydon. Particulars may be obtained at the Housing Section of the Architect's Department, L.C.C., 19 Charing Cross Road, W.C.

DEWSBURY.—June 17.—For the erection of a choir vestry at St. John's Church, Boothroyd, Dewsbury. Messrs. John Kirk & Sons, architects, Dewsbury.

DEWSBURY.—June 25.—For the erection of a boiler-house at the electric-lighting station, Bradford Road. Mr. H. Ellis, town clerk, Town Hall, Dewsbury.

EALING.—June 25.—For the erection of stabling and cart-sheds at the central depôt, Longfield Avenue. Mr. Charles Jones, surveyor, Town Hall, Ealing, W.

NORTH OF ENGLAND SCHOOL FURNISHING CO., LTD.

MANUFACTURERS OF COMPLETE FITTINGS FOR
LIBRARIES, TECHNICAL & ART SCHOOLS,
SCHOOL DESKS, &c., and CHURCH FURNITURE.

Catalogues and Estimates Free on Application.

Sole Makers of WILKS PATENT "CLIMAX" SLIDING PARTITIONS.

Contractors to H.M. Government, London and Birmingham School Boards, &c.

Addresses: DARLINGTON, NEWCASTLE, SUNDERLAND, MIDDLESBRO, and NORWICH.

EAST DEREHAM.—June 20.—For the repair of the bridge at Worthing. Mr. Walter M. Barton, clerk, Guildhall, East Dereham.

HALIFAX.—June 17.—For the erection of two houses in Halifax. Mr. Lister Coates, architect, Yorkshire Bank Chambers, Waterhouse Street.

HALIFAX.—June 24.—For the erection of a pair of semi-detached villas and appurtenances on the Upper Greenroyd Estate, Shircoat, Halifax. Mr. W. Clement Williams, architect, 29 Southgate, Halifax.

HELE.—June 19.—For the erection of sorting-room, dining-room, lavatories, &c., at the paper works, Hele, Devon. Mr. C. J. Bulgin, architect, City Chambers, Exeter.

HALEWOOD.—For additions to the Rectory, Halewood, near Liverpool. Mr. A. B. Plummer, architect, Newcastle and Tynemouth.

HEREFORD.—June 19.—For erection of proposed isolation hospital, caretaker's house and other works at Stretton Sugwas, in the county of Hereford. Mr. Ernest G. Davies, architect, 7 Bridge Street, Hereford.

HOUGHTON-LE-SPRING.—June 20.—For the erection of a Wesleyan minister's house, Houghton-le-Spring, Durham. Mr. J. P. Tulip, 6 William Street, Houghton-le-Spring, R S O.

HULL.—June 13.—For the erection of a new entrance and boundary walls in Durham Street, in connection with the Mersey Street Board school, Kingston-upon-Hull. Mr. D. J. O'Donoghue, clerk to the Board.

HULL.—June 16.—For alterations and additions to the Sir Henry Cooper Board school, Bean Street. Mr. D. J. O'Donoghue, clerk, School Board Offices, Albion Street, Hull.

ILFORD.—June 15.—For the erection of a boys and girls' school for 960 children, and an infants' school for 480 children, with latrines, play-sheds, fencing and schoolkeeper's house, on the Highlands site, Cranbrook Park, Ilford. Mr. C. J. Dawson, architect, 6 Cranbrook Road, Ilford.

ILFORD.—June 22.—For the erection of a lodge and convenience at the north-west entrance to the South Park, Green Lane, Ilford. Mr. John W. Benton, clerk, Town Hall, Ilford.

IPSWICH.—June 16.—For the erection of an infants' school and alterations to the existing buildings at Wherstead Road school. Mr. T. W. Cotman, architect, Northgate Street, Ipswich.

IRELAND.—June 15.—For the erection of a chapel of ease at Portadown. Mr. J. H. Chambers, Ulster Bank, Portadown.

IRELAND.—June 15.—For the erection of dwelling-house, shop and out-offices at Muckamore, Antrim. Mr. F. E. Lockwood, architect, 91 Victoria Street, Belfast.

IRELAND.—June 15.—For the erection of five shops at Cromac Square and Cromac Street, Belfast. Mr. Thomas Pentland, architect, 35 High Street, Belfast.

IRELAND.—June 15.—For (1) the erection of a cottage at Shannally, Lintathen; (2) addition to steading at Whitehillocks, Cortachy; (3) addition to steading at Shanzie, Alyth; (4) addition to steading at West Pitnacree, Alyth; (5) covered court at Cullow, Cortachy; (6) covered court at Glenmoy. Mr. John Black, factor, Cortachy.

IRELAND.—June 16.—For the erection of twelve cottages and the fencing of fourteen plots. Mr. Michael Flynn, acting clerk, Rural District Council, Dungarvan.

IRELAND.—June 16.—For the erection of sixteen labourers' cottages and the construction of a main sewer in the town of Carlow. Mr. James Kelly, town clerk, Town Hall, Carlow.

IRELAND.—June 17.—For the erection of three blocks of semi-detached houses on the Douglas Road. Messrs. W. H. Hill & Son, architects, 28 South Mall, Cork.

IRELAND.—June 17.—For erection of eight cottages, with out-offices, piers and gates, and for the fencing of eleven 1-acre plots in various townlands, Kinsale, and for alterations, additions and repairs to two houses in the townland of Kilnaglery, including the erection of out-offices, piers and gates for each house. Mr. R. Evans, engineer, 53 South Mall, Cork.

IRELAND.—June 17.—For erection of two semi-detached residences at Tipperary. Messrs. W. H. Hill & Son, architects, 28 South Mall, Cork.

IRELAND.—June 18.—For the erection of a dispensary residence at Ballinvullen, Mitchelstown. Mr. T. A. O'Brien, clerk to the Guardians.

IRELAND.—June 27.—For the erection of a golf house off Hamilton Road, Bangor. Mr. F. C. Doran, hon. secretary, Bangor Golf Club, Ward Avenue, Bangor.

KENSINGTON.—June 18.—For the enlargement of the operating-room at the infirmary, Marloes Road. Mr. Jno. H. Rutherglen, clerk, Guardians' Offices, Marloes Road, W.

WOLVERHAMPTON.—For alterations and additions to the Guardians' offices, St Peter's Close, Wolverhampton. Mr. Frank Harrison, clerk, Union Offices, St. Peter's Close, Wolverhampton.

MR. R. A. FARRAR, on behalf of the Local Government Board, held an inquiry at Oswestry on the 5th inst. into the application of the Town Council for sanction to borrow £20,000 for the purchase of land for hospital purposes. The town clerk (Mr. S. Pryce Parry) gave evidence as to the Corporation's borrowing powers; as to the necessity for the provision of a site for dealing with any outbreak of contagious disease in a growing town like Oswestry, and as to the difficulty that had been experienced from time to time in dealing with properly isolating cases of infectious disorders. Dr. Aylmer Lewis, the chairman of the committee, said he considered the site well adapted for hospital purposes, being within easy reach of the borough and in a position well isolated. Evidence was also given by the mayor (Mr. Maclardy), Dr. Beresford (medical officer of health for the borough) and Dr. Wheatley (the county medical officer). There was no opposition, but Alderman Bremner Smith informed the commissioner that if there should be any reversal of policy on the part of the Council, and instead of holding the site in reserve for dealing with smallpox cases as they arose they put up a permanent infectious diseases hospital, he should at once petition the Board against it. A visit was afterwards paid to the site.

VARIETIES.

A RETURN shows that the Co-operative Societies of the United Kingdom have built and own 8,247 houses. The number of houses built and sold was 5,080, houses built by members on advances made by the societies numbered 23,940, while the expenditure in this direction totalled 8,127,155/.

THE Benchers of the Temple have not yet considered the report recently made respecting the renovation and repairs necessary for the preservation of the Temple Church. These include the rebuilding of the turret and steeple and the renewing of the great west doorway and the three arches of the porch. The estimated cost of the repairs is over 2,000/.

THE Governors of the Royal Hospital for Children and Women in the Waterloo Bridge Road being in need of funds for rebuilding, &c., have hit on the expedient of setting an illuminated captive balloon, with an appeal for the 50,000/ urgently needed thereon, afloat about 500 feet above the hospital site.

CARBORUNDUM melts only at a temperature far above that ordinarily generated for smelting ores and metals. It is therefore proposed as a coating for fire-bricks, to be applied as a paste with sodium silicate, and tests have shown that $\frac{1}{16}$ th-inch coating protects the bricks from the greatest heat of ordinary work with metals.

THE new police court erected at Ton, South Wales, to serve the upper division of the Rhondda, was opened on Monday afternoon. The building, which cost 3,500/., was erected from designs by Mr. R. S. Griffiths, provides good accommodation, and has been furnished by Mr. Morgan, the Hayes, Cardiff. On a site adjoining a police station is being built at a cost of 2,800/., and this will be in charge of Inspector Williams.

MR. MARTIN, who has been appointed town clerk of Dundee, is a native of that place. He qualified as a solicitor twenty years ago, and since then he has been a partner of the firm of Messrs. Gray & Martin, solicitors. Since 1896 he has held office as one of the directors of the Commercial Union Assurance Company, Ltd, and has a seat on the Edinburgh Board. Under the conditions of appointment Mr Martin will devote his whole time to the duties of the office.

A MEETING of the Council of the Institution of Civil Engineers of Ireland was held on the 3rd inst. at Dawson Street, Dublin, when the annual report was considered and adopted. It showed a satisfactory condition of the Institution, both from the point of view of increasing membership as well

as in the interest taken in the sessional meetings. The facilities afforded for reference and study, particularly to the junior members of the profession and those about to enter it, by the new library and reading-room, were particularly referred to.

A NUMEROUS party of members of the Manchester Field Naturalists and Archaeologists' Society, accompanied by their president, Mr. L. H. Grindon, visited Coventry last week, they being on a brief tour in Warwickshire. On arrival in Coventry the visitors lunched at the Queen's hotel and listened to a paper on "St. Michael's Church," read by Mr. A. J. Brookes. Subsequently they visited St. Michael's Church, Holy Trinity Church and St. Mary's Hall. The mayor (Alderman A. S. Tomson) at St. Mary's Hall expressed the hope that the Manchester tourists would find their visit to Coventry both profitable and interesting. The party subsequently left for Kenilworth.

THE roof of Holy Trinity Church, Southport, has been condemned as unsafe, and the congregation find themselves committed to a considerable building scheme. A proposal for building the nave would mean an expenditure of 12,000/., while the remaining portion of the chancel would absorb 5,000/., of which 2,000/ is to hand. The expenses will be defrayed by voluntary contributions, and a tablet will be erected in memory of the 32nd Company Imperial Yeomanry (Lancs Hussars), who fell in the late war. Holy Trinity Church was built in 1837, and is the third oldest in Southport, ranking after St. Cuthbert's (1730) and Christ Church (1821).

THE great memorial church of the Sacré Cœur in Paris is, like the Westminster Cathedral, to have its campanile. The quadrangular tower on the summit of Montmartre will, when completed, be nearly twice the height of the towers of Notre Dame. According to the plan, the monotony will be relieved by light casements and pillars, and the tower will be surmounted by a dome. Unfortunately, the nature of the site will not allow the structure to bear the weight of the Savoyarde, which will be replaced by a peal of bells, the project of a separate tower for the giant being already prepared.

THE new isolation hospital for smallpox cases lately erected at the Pigeon House for the Dublin Corporation is capable of accommodating thirty-two patients. It is fitted with wards for male and female patients, doctor's quarters, rooms for nurses, kitchen, pantries, bathrooms and lavatories. The building is

over 200 feet long with administrative block, constructed of strong timber framing, covered externally with thick non-conducting felt (which renders the building cool in summer and warm in winter), over which is laid galvanised corrugated iron sheets. The interior of the building is lined with varnished match-boarding, and the floor is composed of tongued and grooved boards on strong joists.

TRADE NOTES.

SELBY ABBEY new clock and chimes, erected by Messrs. W. Potts & Sons, clock manufacturers, Leeds, was set going on Tuesday, June 2, by Mr. Mark Scott, J.P., chairman of Selby Urban Council. Messrs. Potts are also replacing the chime clock at Marshes-by-Sea Church, given by the Marquis of Zetland and destroyed by fire last year.

MESSRS. DEFRIES have executed a special design in their new crystal mosaic and relief process for the decoration and illumination of the Council Buildings of the city of Westminster. The main design consists of the arms of the city on an amber crystal ground, relieved with green foliage in alto-relievo. The lions supporting the shield are modelled in high relief in pure white crystal, blue and amber collars, affording a brilliant contrast. No less than 30,000 crystals have been employed in the construction of this decorative illumination, which represents approximately 1,000,000 facets of exceptional brilliancy due to the new mosaic process of producing the crystal. The space occupied by the whole design, including the huge letters "A. E.," is 20 feet by 8 feet in height, and it is expected that the first occasion upon which this resplendent device will be submitted to the public will be when lit up for the King's birthday. The illuminant employed is gas. This is the second largest device produced by Messrs. Defries for any of the boroughs. Birmingham still holds the lead with the huge crystal device provided by the same firm for the Council Hall. Westminster now ranks second, Kensington being third on the list.

BUILDING AND BUILDERS.

THE great epileptic colony of the Lewes trustees at Warford, Cheshire, is now nearing completion. This gigantic establishment, which will cost nearly 100,000l., will accommodate a large number of epileptics, who will be treated on the latest principles. All the houses are fitted up in elaborate style. The institution is undoubtedly the finest of its kind, and stands in a charming part of Cheshire. The opening ceremony is expected to take place in the autumn.

THE foundation-stone was laid on the 4th inst. of a new Wesleyan chapel to be erected at Scriven, near Knaresborough. The chapel will supply a want in a district fast increasing in population, where building operations have for some time past and are still being carried on. The cost of the new chapel and land is estimated at 1,500l. Mr. Danby, of Leeds, is the architect.

IN the Consistory Court of London, held in the Wellington Chapel of St Paul's Cathedral, Dr. T. H. Tristram, K.C., chancellor of the Metropolitan Diocese, granted a faculty to the rector (the Rev. Charles J. Proctor) and the churchwardens of the parish church of St Mary's, Islington, authorising the carrying out of extensive alterations and improvements to the church, at a cost of 12,000l. The terms of the faculty give power to the authorities to extend the church at the east and west ends, to extend the chancel, to remove the existing staircase to the galleries and construct new ones, and to place two other doorways to the church, as well as to reseal the whole of the gallery. Counsel for the petitioners pointed out that there were human remains under the site of the chancel, and as these were to be removed he asked for leave to have them reinterred in some other place. The Chancellor gave the order asked for.

THE LONDON HOSPITAL NEW OUT-PATIENTS' DEPARTMENT.

THEIR Majesties the King and Queen, accompanied by Princess Victoria, proceeded to Whitechapel yesterday in order to formally open the extensive new buildings which have been erected for the accommodation of the out-patients of the London Hospital.

This important building takes the place of the old out-patients' department which occupied a part of the cramped, dark and

Main Entrance

213-204 TOTTENHAM COURT RD., LONDON, W.

Opposite Goodge Street.

badly-ventilated basement of the old west wing of the hospital. To form a site, it was necessary to demolish forty houses on the hospital estate. The building as completed is the largest of its kind in the United Kingdom, occupying nearly an acre of ground, but is only of an extent necessary to cope with the number of out-patients who require treatment. The total number treated last year was 162,147 persons, and it is anticipated that larger numbers will come to the enlarged department.

The building is entered from Oxford Street through a large vestibule, capable of seating 200 patients, in which are the registration and ticket offices at which new patients are registered, and old cases receive their tickets.

In the centre of the ground floor is a spacious waiting-hall, 105 feet by 55 feet and 40 feet high, having a seating accommodation for 1,000 persons. It has an open steel roof with a lantern the whole length, in addition to large windows in upper part. It was in this hall that the opening ceremony took place.

At the east end of the building there are two complete suites of rooms forming the surgical department. Each suite consists of a surgeon's-room 28 feet by 19 feet, clinical assistant's-room, an operating-room with a recovery-room adjoining, two examining-rooms, and in both male and female sides there are waiting-rooms for old and new cases, with separate surgical dressing-rooms.

At the west end is situated the medical department. This has also two suites of rooms, and each consists of physician's-room 30 feet by 19 feet, clinical assistant's-room, two examining-rooms and waiting-rooms for both old and new cases for each sex.

There are two private entrances from the street for the use of the staff and the officials.

This out-patients department is connected with the west wing of the hospital by means of a subway which is constructed under Turner Street. This enables the officials and indoor hospital patients to get from one building to the other without crossing the public street, and allows of the medicine and stores from the laboratories to be taken direct into the hospital.

On the first floor are situated the aural, dental, obstetric and massage departments, each of which are complete in themselves, having the necessary consulting, operating and waiting rooms.

The aural department at east end has a consulting-room 60 feet by 19 feet, fitted with thirteen tables, two operating-

rooms, with anæsthetising and recovery-rooms and a dark-room, together with male and female waiting-rooms.

The dental department at west end consists of extracting and stopping-rooms, with anæsthetising and recovery, teeth cleaning and waiting-rooms.

The obstetric department has two consulting-rooms, with dressing and waiting-rooms. The massage-room has waiting-room for each sex, and the staff sitting-rooms are also on this floor.

The second floor is devoted to the ophthalmic, photographic and electrical departments.

The ophthalmic department has rooms for surgeons and clinical assistants, large refraction and dark rooms, also operating-room with anæsthetising and recovery-room adjoining. There is a large photographic studio with two dark-rooms and workshop and store attached, also a separate room for radiography.

The electrical department has large consulting-room with electric bath-room, Röntgen ray-room and dressing-rooms adjoining.

The lupus department is also on this floor, and contains the "Finsen" lamp which Her Majesty presented to the hospital, together with several other lamps. There are separate rooms for the surgical dressing of wounds, medical officer and nurses. The motor-generators and other apparatus for the transforming of the electric current to supply this department are situated in a room on the roof above. Their Majesties inspected and the Queen opened this department.

These upper floors are approached by four staircases and two large lifts.

The basement contains a large laboratory department, fully equipped for the manufacture of medicines, pills, lozenges and soda-water, and has large stores for drugs, dressings and other necessities for medical and surgical treatment. The bath department consists of medicated and Turkish baths, with the necessary dressing and waiting-rooms, and is also in the basement, together with the boilers, isolation-rooms, and accommodation for students, dispensers, porters and other officials.

The whole building is of fireproof construction, and the floors throughout finished with mosaic, and where necessary the walls are glazed with either glazed brick or opalite; the remainder are finished with sirapite plaster. The whole of the rooms throughout the building are fitted up with sinks, lavatories and other fittings, as required for the various purposes.

he whole is fitted with electric light and electrical appliances. he internal and external areas are faced with white glazed icks. The external elevations are of plain utilitarian aracter, being faced with red brick and artificial stone ressings. The large waiting-hall and principal rooms are entilated by a system of inlet and forced outlet ventilation. The total cost of the building is 80,000/., of which sum

the superintendence of Mr. Rowland Plumbe, F.R.I.B.A., of 13 Fitzroy Square, London, W.; Mr. Henry J. Wagg, 15 Great George Street, acted as consulting electrician, Mr. William Shepherd being the builder, and Mr. G. T. Murton, clerk of works. The whole of the mosaic flooring was laid by Diespeker & Co., Ltd, of 57 Holborn Viaduct. The work is on the most up-to-date lines,

28,000/., was given by a friend of the hospital. The balance of 55,000/., still remains to be collected. The buildings have been carried out in accordance with instructions given by the chairman and house committee of the hospital, many months having been taken up in elaborating the scheme in consultation with the medical and surgical staff. The whole has been erected from the designs and under

all angles being rounded to avoid any possibility of the lodgment of dust and dirt. The sinkings to the various gulleys have also been formed in mosaic. The total quantity of mosaic laid by this firm at the London Hospital amounts to nearly 9,000 yards super. They have also fixed in the front block their patent mosaic steps, which are also formed so as to avoid any sharp internal or external angle.

THE BUILDING EXHIBITION.

It is creditable to Mr. H. Greville Montgomery's power of organisation that each Building Exhibition is an improvement on its predecessor. There is no doubt that when all is arranged the collection this year will in variety and excellence be more representative of the auxiliary industries of architecture than what was seen in 1901. It is needless to say that none of the varied exhibitions which are held at Islington during a year can vie in interest, inventiveness and form with the examples which are produced in connection with building. This year the collection of architectural drawings is more representative of modern style than last year's, and we take this opportunity to express our thanks to the contributors. By their aid the keystone, as it were, has been introduced, for a building exhibition could not be considered as complete if the designers were not able to co-operate. If regarded as the union of art, inventiveness and manufacturing industry, what will be seen in the Agricultural Hall may be taken as forming an industrial spectacle without any parallel. We hope that all who have laboured so efficiently will obtain the reward they desire.

It is not possible in this issue of our paper to give more than a preliminary list of names of the firms exhibiting, with the briefest mention of the specialties shown on their stands, for to attempt a description of them before the exhibits are ready, and in many cases the spaces reserved are still empty, would not only be misleading to our readers, but unfair to the exhibitors.

In the following list some few names may have been omitted, due to the difficulty of collecting information in advance, but they will be dealt with in our succeeding issues containing the full report of the exhibition.

The following firms will be found on the ground floor of the Hall:—

C. Chancellor & Co.—"Velure" Japan elastic paint, "Stripso" paint remover, Coxhead's ventilating cowl, Cowell's iron louver air bricks, &c.

L. Lewis & Co.—Flexible mastic damp course, roofing felt and slaters' felt.

Ewart & Son, Ltd.—Baths, "Lightning" geyser, "Empress" smoke cure and "Victoria" ventilator.

The National Opalite Glazed Brick and Tile Syndicate, Ltd.—Opalite tiling for wall surfaces.

Safety Lift and Elevator Co. (M. T. Medway).—Electric lifts, dinner lifts, electric-lift controllers, &c.

Maughen's Patent Geyser Co., Ltd.—Their well-known specialties, including "Teba" auto-geyser for household supply, both geysers and copper and steel baths.

Fredk Jones & Co.—Silicate cotton applied for fire, sound and heat proofing.

F. A. Fawkes.—Wood mantels, mouldings, panellings, &c.

Simplex Steel Conduit Co., Ltd.—Specimens of their conduits for encasing electric wires, with complete set of fittings.

Columbian Fireproofing Co., Ltd.—Examples of fireproof construction by their system of steel-ribbed bars and concrete.

The London Fireproof Plasterwall Co., Ltd.—Partitions constructed of solid plaster plates grouted together.

Mellows & Co., Ltd.—A roof glazed on the well-known "Eclipse" system.

Cloisné Glass Co.—Windows, fanlights, door panels, window screens, &c., showing the application of "Cloisné" decorative glass.

Walter P. Nottcutt.—A full range of "Bommer" spring hinges, fitted to single and double action doors, &c.

The British Compo-Board Co., Ltd.—A pavilion showing the various applications of compo-board.

The Wood-Carving Co., Ltd.—Fittings, balusters, newels, overdoors, mouldings, &c.

Crittall Manufacturing Co., Ltd.—Metal casements, sashes, iron doors, wrought-iron gates and constructional ironwork.

The Decorative Marmorite Co.—"Marmorite" (a composition of metal and glass), as used for facias, wall panelling, &c., &c.

Thos. Wragg & Son—Stoneware pipes and connections, Hassall's and Stanford's patent pipes, Wakefield's corrugated socket pipes and street gullies, Jennings's patent joinder, chimney-pots, sinks, glazed bricks and blue bricks, &c.

George Jennings, Ltd.—Numerous specimens of their sanitary specialties, including baths, closets, lavatories, radial urinals, water-waste preventers, automatic latrines, school latrines, &c.

Venesta, Ltd.—Door, wall and ceiling panels, partitions, &c., embossed and poker-worked in various kinds of wood.

F. McNeil & Co.—Asphaltic roofing, dry-hair felt, frost and sound proof, slag wool for fire and sound proofing, &c.

The New Expanded Metal Co., York Mansion, York Street, Westminster, are showing a structure with a concrete floor 13 feet 6 inches clear span, having an expanded steel tension bond, built 3 feet off the ground so as to show the method of temporary centring, and a strip of the metal tension bond is left exposed throughout the length of the floor so that anyone can see the form of construction. On two sides of the structure is shown 2 inches solid partitioning with window and door details. Expanded steel and brass panels are substituted in place of wooden panels in the door. The other two sides are enclosed with expanded steel verandah railings. Girder and stanchion encasing with expanded steel lathing and plaster, false columns formed of expanded steel lathing and plaster, panelled ceilings, suspended ceilings, coving and false beams of expanded steel and plaster are also shown. A very attractive feature of the exhibit are the sky-signs of expanded steel around the top of the structure.

The Pulsometer Engineering Co., Ltd., of Reading, the well-known firm of pump-makers, have an interesting stand. They are showing, in the first place, the Pulsometer itself, a pump whose name is a household word in the trade. As most people are aware, this ingeniously constructed pump works as well hanging on the end of a chain as on a solid foundation, and visitors to the stand are shown the method of slinging it. The simple valves which work the entire "internal economy" of the pulsometer may be inspected, and anyone who opens the hinged doors that close the valve chambers will admit that simplicity of construction could not well be carried further. Pulsometers will pump practically anything—anything, that is, that will flow at all. Stone, sand, &c., that cut the valves of ordinary pumps to pieces, have no effect on them. Dirty water suits them as well as clean. All those whose business brings them constantly face to face with the problem of removing water from positions where it is not wanted will realise the comfort of having always ready for work a pump that requires no nursing. The company are also showing a singularly handy

contrivance which is certain to attract the attention of those—and they are legion—who realise the advantage of a really portable steam pump. This is a boiler on wheels, carrying a pulsometer attached to its side on a bracket, from which at a moment's notice it can be detached. For temporary work the arrangement is one that should be singularly useful, and it is another proof of the careful way in which every detail that can add to the usefulness of these pumps has been thought out by the makers. An air-lift pump is a novelty, and a working model of one of these of the Pulsometer Company's manufacture will be found at this stand.

It is claimed that these pumps will bring up more water than any other form of pumping apparatus from great depths, and they are of the utmost utility in cases where the water supply is obtained from a borehole. The pump is composed of two tubes, which are let down through the borehole and terminate in a special footpiece. Compressed air passes down one tube

and the water is forced up the other. The Pulsometer Company's "Union" pipe should also be specially noted. The pipe is of wrought-iron fitted with faced malleable flanges with slotted holes for the bolts. The ease with which the pipes can be shifted, being very light although strong, insures a great saving in time, and they are particularly suitable for sinking work and where pumps have to be suspended. "Deane" pumps, "Caryl" donkey pumps, centrifugal pumps, &c, are also shown.

Messrs. John Bennet Lawes & Co., Ltd, Atlas Works, West Ferry Road, Millwall, exhibit at stand 38, row B, specimen work in "Gypo" fire-resisting plaster and "Lawes" Keene's cement, comprising girders and columns encased in "Gypo" plaster and covered with Portland cement, and galvanised corrugated sheet iron partitions covered in "Gypo" plaster sections papered and painted. All "Gypo" work on iron is placed direct on to the surface of the metal without the aid of any key whatever. Messrs. Bennet Lawes & Co. have just completed covering 50,000 square feet of iron columns with "Gypo" fire-resisting plaster, 1 inch thick, covered with Portland cement and sand 1 inch thick at Millwall Dock granary, this replacing the 4 inches concrete usually adopted, and saving the cost of metallic lathing cradles, &c. The firm also show Mack's fireproof partition slabs covered with "Gypo" polished, mouldings and cornices in "Lawes" Keene's cement, brick and lathwork covered with "Gypo" sections painted and distempered, &c, sundry small specimens of "Gypo" work, &c.

Matthews & Yates, Ltd., of Cyclone Works, Swinton, Manchester, are again exhibiting, amongst other things, their refuse collecting plant. This is, of course, a small plant just intended to demonstrate the principle. It consists of one of the firm's Cyclone steel plate exhausters collecting wood refuse from a hopper and delivering it into one of their improved Cyclone separators, where the material is separated from the air, the former dropping back into the hopper to be re-collected by the blower, and the latter being delivered at the top of the separator and becoming free air again. In a complete installation in a sawmill or joinery works, for instance, each saw, planer, moulder and other machines would be connected by sheet iron branch pipes to a centrally located main of the same material, the main itself being carried to the inlet of the fan. The fan would deliver all the material it collected into the separator, which is as a rule installed in the boiler-house, and the refuse used for firing the boiler. In some installations,

where it is desired to separate sawdust from chips, shavings, &c, two exhausters and two separators are used, one for each kind of material, or by making special arrangements the plant may be used alternatively for chips and sawdust, and each kind therefore kept separately as desired. Another type of fan of which the firm make a specialty is their Cyclone electric blower, shown with open-type continuous-current motor. These are now being extensively used for general ventilating purposes. The firm also show what is absolutely unique, viz. a 48-inch Cyclone electric fan with alternating-current motor. The Swinton patent ventilating gas radiator is also on view, the specialty of which is that they admit into the rooms in which they are placed large volumes of fresh air, warmed without being brought into contact with the gas products.

Messrs. Watson & Co., 119 Victoria Street, Westminster, exhibit specimens of their different asphaltes and bitumens. Their standard asphalt, which has been used for Government work in London and elsewhere, is well known and largely used for cavity and insertion work. They have a section of brickwork built with it, and it is their intention to have a trial of its breaking strength. Their Wassal-Seyssel and other mastic asphaltes are too well known to require commenting upon. They also exhibit a specimen of Trinidad bitumen. By extracting the residuum from the Trinidad asphalt, a product is left containing 20 per cent more bitumen than any other and at a lower price.

At Stand C 54 will be found an exhibit which will doubtless attract a large amount of expert attention, comprising as it does a number of specimens of Ford's silicate-of-lime stone, shown by *The Silicate-of-Lime Stone, Ltd.*, of 32 Victoria Street, S.W. This new artificial stone, which we have already had occasion to describe with some minuteness, is composed of pure silicate sand with a small admixture of lime, and is an attractive stone of excellent colour, close texture and great strength and durability. It has been proved, we understand, to be invulnerable to the action of acids as well as to atmospheric deterioration, is very easily worked, and can be made in blocks of practically any size; a block weighing over 2 tons, for instance, will be found here, as well as blocks of smaller dimensions, slates, bricks, carved mouldings, cornices, a font, &c. It may be mentioned that any sand is suitable for the manufacture of silicate limestone. Specimens of excellent quality are shown made from the tailings of the Johannesburg mines, others from sand from Leighton-Buzzard, Glasgow

JENNINGS' PATENT

DUPLEX BATH VALVES

(For Hot and Cold Water Supply), and
HALF-TURN LEVER WASTE.

Upwards of 5,000 in Use in Various Parts of the Country
in Public Baths, Asylums, Hospitals, Infirmarys, Hotels,
and Private Houses.

Cold water can only be admitted first, thus preventing
damage to the Bath, and injury to Bather from scalding.

Supplied to H.M. the King at Windsor Castle, and various
Residences of the Nobility.

AWARDED THE MEDAL OF THE SANITARY INSTITUTE.

Birmingham, &c., and all is found equally suitable. Indeed, it is explained that wherever sand exists works can be set up and stone and (which is perhaps of more significance) bricks manufactured at the minimum of cost. Among many advantages that Mr. Ford maintains for his stone is its cheapness, as it can be manufactured at 3d. per cubic foot, and the bricks at about 12s. per 1,000.

Many important exhibits are located in the Gallery, amongst them being:—

The Patent Victoria Stone Co, Ltd, who are showing a moulded carved porch with moulded eills, columns, jambs and circular arch; also flight of moulded bracketed steps and landing.

The Hard York Non-slip Stone Co.—Stone flags for footway paving, radiated corner cut from square flag; also sunk rebated channelling, moulded and plain steps, copings, &c.

The British Paving and Granite Co.—Norwegian non-slippery granite setts, Irish and Swedish macadam, Welsh and Irish setts. This company and the Hard York Non-slip Stone Co. are branches of Messrs. Brookes, Ltd.

Empire Stone Co. (Mr. T. J. Dowell, managing partner)—Flight of moulded steps, doorway entrance in Portland and yellow Mansfield, windows in red Mansfield, paving, &c.

Acme Wood-Block Flooring Co, Ltd.—Duffy's patent wood-block flooring.

J. Defries & Sons.—Equifex disinfectant appliances, Pasture Chamberland filters.

W. E. Farrer.—Automatic alternative distributing apparatus for small bacteria beds, Tarfit urinals, patent syphon flushing apparatus.

Jas. Wainwright & Co., Ltd.—Seysse and metallic asphalte, asphalte for damp-course, tar macadam.

Wm. Griffiths & Co., Ltd.—Broken granite, setts and curbing.

Ames Crosta Engineering Co, Ltd.—Ames Crosta's patent self-adjusting pipe joints, Crosta's surface-water gullies, Ames's stoneware conduits for electric cables.

Sutton & Co.—Impermeable stoneware sewerage pipes, with junctions, bends, yard and street gullies, Henman's channel gully and trap, Stanford jointed pipes, Sutton's patent flush joint, Green's patent "Wyvurst" channels.

Joseph Richmond & Co., Ltd.—Working models of electric push-button lift, self-sustaining dinner-lift, street orderly bin.

W. F. Stanley.—Surveying, measuring and drawing instruments.

Imperial Stone Company.—Paving, copings, steps and sewerage pipes.

Bradshaw & Co.—Samples of asphalte, asphalte cauldrons, contractors' trestles.

W. Salter & Co.—Asphalte paving for floors, paths, roofs and damp-courses.

E. J. Smith.—Venetian, Florentine, duchesse and other kinds of window blinds.

G. W. Riley, F.R.H.S.—Summer-houses, rustic benches, chairs and various specimens of rustic and garden furniture.

Sam Deards's system of self-locking glazing.

Messrs. Robert W. Blackwell & Co, Ltd, of 59 City Road, are showing at Stand No. 30, in the Gallery, specimens of their "Ruberoid" roofing and dampcourse and the purposes to which it and other preparations of "Ruberoid" can be applied. This material is practically new to the market, but has, where used, met with gratifying success. "Ruberoid" dampcourse contains no tar or asphalte in its composition and will not become brittle, dry up, rot, decay or shrink or squeeze out, and, most important of all, it is said to be an absolutely permanent insulation against damp. This pavilion illustrates the method of applying "Ruberoid" over boards in the usual way and also over wire netting. The material as used as a siding and lining for buildings can also be seen. Messrs. Blackwell & Co. are also exhibiting their well-known "P. and B." "Giant" insulating paper for cold storage work and their "P. and B." building and sheathing papers. It is worthy of note that these materials have secured eighteen medals at various exhibitions, including Paris and Pan-American.

Messrs. Major & Co, Ltd, of Hull, exhibit the effects of their wood-preserving stain—Solignum—in a most effective manner. Their stall consists of a model half-timber house in an enclosure, a railing and gate in front separating it from the gangway. All the half-timbered work of the house is treated with the medium and dark shades of Solignum, and looks very well, these two shades being most suitable for this class of work. The fence work and gate in front is treated with light Solignum which matures to a fine brown tone. There are specimens of different sorts of wood treated with Solignum, and small samples of the fluid are obtainable at the stall. To exemplify its effect as a preservative three post ends are exhibited which have been buried in the ground for four years. The post end untreated with Solignum shows considerable rotting, whereas those treated with one and two coats are perfectly sound. The roof, inside walls, window sills, and door of

model house are treated with Major & Co.'s Solignum B in green and red shades, and have a very pleasing ect. On the inside walls are displayed photographs of rious work in connection with which Solignum has been ed. A book of original letters which speak in glowing terms the advantages of Solignum shows how highly it is appreciated by those who have used it.

Messrs. Sutcliffe, Speakman & Co., Ltd., engineers, Leigh, ncashire, are exhibiting in operation their new process for laking indurated cement concrete paving flags. By this ocess they can manufacture and harden these flags in three ys' time, and they claim that they can obtain results in that ort period superior to those obtained in three years on the l-fashioned method. We understand that they have obtained engths (tensile) of 936 lbs. per square inch, and in six weeks ve obtained crushing strengths of 7·84 tons per square h, thus far exceeding the strength of granite. Their process said to entirely prevent the objectionable air-cracking which is en shown in concrete goods; on the same process, and where nd is used, they can obtain a finish and appearance exactly e sandstone.

Messrs Elliott, Caversham, Reading, are exhibiting a odel window (patent applied for), of which they are the sole anufacturers, that has been invented to reduce the effect of terior sounds usually audible in buildings. It embodies the st already known method of two panes in two frames, in one ame or sash. Model on view at their stand at No. 97, Row E. may afterwards be seen at their offices.

NEW CATALOGUES.

LARGE variety of plumbers' fittings are depicted in the ustrated catalogue which the Falcon Brass Works, Ltd., of olkland Streer, S.E., are now issuing to their customers, and ill be pleased to send to all applicants. This firm makes a pecialty of keeping an extensive stock of the various fittings rder to enable the trade to execute promptly small urgent ders requiring immediate attention.

MESSRS. J. H. HEATHMAN & CO., of Fulham, Endell treet and Pentonville Road, have prepared a new illustrated ice-list of their very useful extending ladders (double, treble ad quadruple). These ladders are exceedingly portable. hey can be carried round short corners, stored out of the ach of burglars, carried into rooms without damaging the

furniture, and used in situations quite inaccessible to old-fashioned ladders. The extending sections (which are detach-able) are lifted and adjusted at any height by one's hand, as there are rests to grip any rung. We are able from personal experience to speak of the great utility of these ladders.

IN a circular issued by the Patent Steam Carpet Beating Company, Ltd., of 196 York Road, King's Cross, the following table is given, showing the relative efficiency of their system as compared with the so-called vacuum processes of extraction by suction :—

THE foundation-stones of a Wesleyan church and school at Kirkley have been laid. The building is being erected at the corner of Lorne Park Road and Lawson Road. The contractors are Messrs. Smith & Wolfe, Lowestoft, carrying out designs by Mr. G. E. Smith, of Southsea. The stonework is being executed by Messrs. Wolfe & Brown. The building will be used for the present as a school-chapel, and when the contemplated church is built in London Road, this present erection will be used as a Sunday-school. It will be 53 feet long, 36 feet wide and 36 feet high, of red brick with carved stone dressings, in the Perpendicular Gothic style. There will be two entrances—one from Lawson Road and another from Lorne Park Road, each with double lobbies paved with wood-blocks. The church itself will be boarded. There will be a gallery, and the joinery of this will be in pitch-pine. The roof will be open timbered with plaster ceiling, and the windows lead glazed. An angle turret at the south-west corner will be quite a feature of the building. The heating will be by low-pressure hot-water apparatus, and the lighting by electricity. There will be a vestry and basement. The place will seat between 350 and 400 persons. The total cost will be 2,700*l.*, including 40*l.* for the land.

A NEW PROTRACTOR.

THE protractor is so old an instrument, and so many improvements have been introduced in those needed for special purposes, it might be supposed there was no room for novelty. There are some who believe that a table of chords with a scale and a compass are preferable to a circular protractor, or a ruler on which the edges are graduated to correspond with angles. Mr. F. Seaton-Snowdon has brought out one which, it will be seen from the reduction we give, possesses several advantages. It is made in various materials, the most expensive being aluminium and the cheapest glazed cardboard. Two small set squares enable the angles most often required

to be set out without delay. The circle is of course divided into the usual number of degrees, and angles can be marked off without difficulty. In addition the natural sines, cosines, cosecants, tangents, &c., are given, and in that way trigonometrical ratios become familiar to the user. An ordinary pro-

tractor only partly fulfils its purpose, but by means of the figures the various functions in relation to the angles become impressed on the mind. It is possible to obtain the figures from a book of mathematical tables, but one is not always at hand. The new protractor has received the approval of practical men, and we have no doubt it will be found useful in drawing offices by facilitating the laying off of angles. As the diameter is 8 inches all the figures are legible. It can be obtained from any dealer in drawing instruments.

ROYAL HOSPITAL FOR SICK CHILDREN, GLASGOW.

THE Glasgow Royal Hospital for Sick Children was opened twenty years ago, and since then the population in and around Glasgow has grown enormously, and further, medical and more especially surgical, science has made such progress that now it is in many instances possible to treat and cure the youngest child where formerly it was impossible. The work that can be done in this direction is testified to, says the *Glasgow Herald*, by the fact that now there are about 30,000 attendances at the Children's Dispensary every year. In these circumstances, it is matter of no surprise that the seventy-four beds provided at the hospital twenty years ago are now quite incapable of meeting the demands made upon them. The result is that, even after selecting only the more urgent cases from among the numerous applicants, there are on an average the names of 100 little patients of under twelve years of age waiting admission. In these circumstances the directors gratefully accepted the most generous offer made by Miss Margaret Montgomery Paterson, Learmonth Terrace, Edinburgh, to spend about 6,000*l.* in erecting in memory of her parents an extension or branch of the hospital in the country, to which certain classes of cases which require somewhat prolonged treatment can be taken, thus in some measure relieving the pressure in the hospital, and giving patients so removed the chance of a quicker and more complete recovery in the country air than they would have in Glasgow. After careful consideration a splendid site was secured on elevated ground, with a southern exposure, situated on the Drumchapel estate, a few minutes walk to the east of the station of that name on the main line of the North British Railway from Glasgow to Dumbarton. The building, which has been erected from plans prepared by Mr. Robert A. Bryden, architect, is designed mean-

TOTTENHAM COURT ROAD
OXFORD ST. END.

to contain two large airy wards with twelve beds in each, provision has been made for adding two other wards as occasion may require. The wards are on a line running north south, which is considered the best method of placing such buildings, and the walls are finished in Keene's cement and the floors laid with polished oak. Off the wards, but separated from them by a ventilated corridor, there is suitable latrine accommodation, consisting of bath-room, steep-room, with fittings of the most modern design. Each ward has also a duty-room for the nurses' use, from which all the patients in the wards can be observed, and there is connection with the lower ward, a sun-room about 40 feet long by 10 feet wide enclosed in large glass windows and doors into which the beds can be rolled. Access to the roof of the sun-room, which is surrounded by a stone parapet, and will also be useful for airing patients, can be had from the upper ward. The walls have been built of brick, an arrangement which secures greater warmth in winter and coolness in summer, and excellent ventilation is obtained by means of ventilating radiators placed upon the windows, assisted by Birmingham valves set in the walls at intervals, Munn's extra ventilators in the roof, and ventilating open fireplaces, which also give the wards a bright and warm appearance in winter. A small separate or isolation ward with lavatory accommodation in case of an outbreak of infectious disease is provided, and the building further contains surgeons' room, iron's parlour and bedroom, sisters' room, rooms for nurses, servants, kitchen, scullery, wash-house, laundry, store-rooms, pantries, boiler-house, &c. There is an abundant supply of Loch Katrine water, and the building is supplied with fittings in view of the immediate introduction of Glasgow Corporation gas into the district. Elaborate fire-extinguishing apparatus is provided both inside and outside the building. The building has now been completed at a total cost of fully £100,000.

ELECTRIC-LIGHT STATIONS.

A meeting of the Society of Engineers held at the Royal Institution, Whitehall, on Monday evening, June 8, Mr. J. Patten Barber, president, in the chair, a paper was read on "Electric-light Stations: their Design and Arrangement," illustrated by drawings of the Bridlington Electricity Works, by Mr. Ernest R. Matthews, C.E., F.G.S., a thorough engineer of Bridlington. The author commenced by observing that during recent

years the supply of electricity for lighting purposes had become one of the chief municipal industries in this country. He then sketched its early history and its development, pointing out that in 1882 the attention of Parliament was drawn to it, that the Board of Trade was then convinced that electricity for lighting purposes had a future before it, the result being that the Electric Lighting Act, 1882, was passed. The result of this was that numerous local authorities and private companies applied to Parliament for provisional orders enabling them to proceed with installations. Private companies very soon found out that the conditions of the Act were somewhat unfavourable to them, and so they appealed for an amendment, the outcome being that the Amended Electric Lighting Act was passed. The author then noted the rapid progress that was made under this Amended Act, and stated that during the past three years about 320 provisional orders had been granted, and that of these upwards of three-fourths were for local authorities or private companies in small towns, namely, towns under, say, 25,000 population.

The author then gave a detailed description of the various points necessary to be observed in designing an electric-light station, illustrating his remarks by drawings of the proposed Bridlington electric-light station, which he had designed and which was about to be carried out. He first dealt with the engine-house, and pointed out that it was a great mistake to cramp up an engine-house, that the floor area should be full and sufficient, and that ample space should be left not only between each engine, but also adjoining each wall of the engine-house. He then referred to the necessity of making provision for future extensions by building a temporary end. He stated that plenty of head room was necessary in order that the overhead crane could run to and fro with perfect freedom. The walls, he considered, should be built in cement mortar, and should be calculated to withstand not only the strains due to the overhead crane and the thrust of the roof, but also the vibration set up by the engines. Piers built in cement should support the girders or arches carrying the overhead traveller, and he stated that it was a most decided advantage to have the walls of an engine-house lined with glazed bricks, and he described such a method which he had adopted in the Bridlington engine-house. He considered that a 10-ton crane, worked by hand from the floor by ropes, was quite sufficient for a small station. Plenty of light was necessary, and he recommended that one-seventh of the roof surface should be skylight, and about one-sixth of the total wall area

STRIPSO

In 7, 14, 28 and 56 lb. kegs.

Quickly and thoroughly removes **PAINT, VARNISH, STOVE ENAMEL, RUST or GREASE**, however old or thick, without injury to the Wood or Metal, leaving the surface perfectly clean and ready for applying new Paint or Varnish.

C. CHANCELLOR & CO., 13 CLERKENWELL ROAD, LONDON, E.C.

WHAT WE SAY

VELURE

A new and perfected JAPAN PAINT, superseding varnish, with remarkable spreading, elastic and weather resisting properties. One coat equals two coats of ordinary paint and one of varnish. In 120 colours. Any shade matched. Sanitary washable. Will not crack, chip, peel, blister, or fade. Twelve months' guarantee given by the manufacturer. Saves time, labour, varnish and money.

C. CHANCELLOR & CO.,

13, CLERKENWELL ROAD, LONDON, E.C.

WORTH

One Gallon will
Cover about 90
Square Yards.

TRYING.

FINISHED LIKE A MIRROR.

Your white Velure is the best we ever tried on the Yachts. Two coats really finished like a mirror. It far surpassed any enamel or ivory japan we ever used. I have done all the Windows in the house with it.

HUGH DORRIAN, Yacht Builder.

Nunsquarter, Kirkcubbin, Co. Down, June 24, 1901.

**BETTER FINISH. BETTER WEAR.
FEWER COATS. LESS MATERIAL.**

WHAT CUSTOMERS SAY

H.M. THE KING.

I have had it used at Sandringham for H.M. the King and found it most satisfactory. It was used on some large additions last year.

C. SMEDLEY BECK, Architect.
11a, Prince of Wales Road, Norwich, Jan. 21, 1903.

ARCHITECT.

I am exceedingly pleased with the result of the Velure I had last year. Our doors look and feel like ivory, and show every appearance of great durability. I find that they keep very clean, and do not take the dirt.

A. E. PURDIE, F.R.I.B.A.
Meadow Grange, Blean, near Canterbury, Jan. 2, 1902.

IN A STEAM DISINFECTOR.

I am pleased to state that the Velure has been a perfect success so far. It has been subjected to great heat, steam pressure, and withstood the expansion and contraction of the iron, and there are no cracks or flaws to be found, the surface being perfect. It was applied by unskilled labour, the hospital porter doing the work.

J. BROOK, S.I.C., A.S.I., Surveyor, R.D.C.,
Stratford-on-Avon, 5th December, 1902.

UNDER WATER.

Velure gives a beautifully smooth surface, which remains hard under water, and does not foul easily.

JOHN MACKENZIE, Sail Maker.
Sandbank, Argyllshire, Sept. 26, 1901.

**STANDS ANY AMOUNT OF EXPOSURE TO SUN OR FROST,
HEAT OR DAMP, WITHOUT CRACK OR BLISTER.**

windows. Ample ventilation should be provided, chiefly by means of hopper ventilators in the windows, and by means of the glazed roof ventilators.

The engine bed would vary from 5 feet to 20 feet in thickness, according to the type and weight of the engine. The floor might, with advantage, be paved with red Staffordshire encaustic tiles, laid herring-bone fashion on 6 inches or 9 inches of concrete, the cover plates of the trenches being filled in to match the floor. A convenient size for the trenches, he thought, was 2 feet 6 inches wide by 2 feet deep. The drains should have manholes at intervals; the roof should be supported by light steel roof trusses; brackets should be inserted in the walls to carry pipes, and there should be a pair of broad doors, running on rollers at the temporary end.

The floor area of the boiler-house would depend on the number, size and type of boilers. The Bridlington boiler-house measured 63 feet by 33 feet 6 inches, and it accommodated two Lancashire boilers, each 7 feet 6 inches diameter and 30 feet in length. In calculating the weight of the boilers for foundation purposes it was necessary to include water and fittings. Concrete 2 feet in thickness should be sufficient. Provision should be made for future extensions by building one side of the boiler-house in a temporary manner. The height might with advantage be from 24 feet to 30 feet, and the floor should be sunk several feet.

The walls should be built in cement mortar, and plenty of light should be provided by means of a number of large windows placed on the permanent side, and about one-fourth of the roof covered with patent glazing. The ventilation might be by means of hopper ventilators in the windows and louvre ventilators in the roof. The floor might with advantage be paved with flags on 6 inches or 9 inches of concrete, and the trenches should be covered with wrought-iron checker plates.

The roof should be supported by steel roof trusses, and should be close-boarded. Drainage for the scum and blow-off cocks, water-gauge cocks, &c., should be provided. The coal bunker should be placed as near to the furnaces as possible, and an inclined footway should lead to the boiler-house for the purpose of wheeling ashes out. Care should be taken in the arrangement of the doors, and the flues should be lined with 9 inches of firebrick, radiated bricks only being used.

The accumulator-room should not be cramped for room; it should be light, well ventilated and might be paved in the same manner as the engine-house. It should not be less than 13 feet or 14 feet in height. Two store-rooms should be pro-

vided, one to contain heavy goods, the other oil, waste and lighter goods. No works are complete without a meter-room. There should be a workshop sufficiently large to contain lathes, drilling and milling machines, fitters' bench, forge, &c. A convenient size is about 25 feet by 14 feet. Ample lavatory accommodation should be provided. The engineer should have a private office, fitted up with desk, drawing table, cupboard and other suitable fittings. A convenient size for the men's room is 20 feet by 10 feet. The water-storage tank should be formed of square cast-iron plates, planed to template, and strongly stiffened with brackets and flanged.

Referring to the chimney-shaft, the author observed that where the buildings were intended to be permanent, a brick shaft should be erected, which might be square, octagonal or round. The wind pressure on the two latter was stated to be considerably less than on the former, the relative pressures being:—Square, 1.0; octagonal, 0.65; round, 0.5. The external width of the shaft at the base should be, if square, 1-10th of its height, if octagonal 1-11th and if circular 1-12th.

The author then dealt with the foundation, observing that given a good clay foundation, a chimney 150 feet high might stand on a good bed of Portland cement concrete (5 or 6 to 1), 20 feet or 22 feet square by 7 feet or 8 feet thick. The concrete should remain three weeks before any brickwork is placed upon it, and all the bricks should be of the same density.

He then dealt with the thickness of the brickwork, also the bond, which should be one course of headers to three or four courses of stretchers. The mortar, he said, should be lime mortar and not cement mortar, which was too rigid. The brickwork should proceed slowly, say three or four feet per day. He said the cap might be of iron, terra-cotta or stone, and should not project more than the thickness of the brickwork. The shaft should be lined to a height of at least 30 feet for ordinary beats with a fire-brick lining. The lightning-conductor should not be carried around projections, but through them. The author then gave particulars of how the lightning-conductor should be fixed; also as to how the inside diameter or area of a flue should be determined, and as to the height of a shaft.

The author stated that the tender of Messrs. G. Storr & Son, contractors, of Bridlington, for the buildings had been accepted, the contract amount being 5,283/. The consulting electrical engineer is Mr. J. H. Medhurst, B.Sc., M.I.E.E., of Westminster, and the total estimated cost of the works is 26,000/.

The Architect.

THE WEEK.

THE late SAMUEL E. WALLER, who died on the 9th inst., was not only one of the most popular of modern artists, but as the son of Mr. FREDERICK S. WALLER, of Gloucester, the cathedral architect, he was an example of hereditary influence. In his painted dramas old buildings may be said to have been mute actors, and they were selected and represented with a skill that was almost unique. In that way he should be regarded as an agent in popularising the architecture of England. Whether he depicted a gateway, a flight of steps, a porch, an interior, or a village, he was always accurate. But to attain that quality he spared no pains in his search for suitable models. His success testifies that attention to architecture need not diminish the attractiveness of a picture, but much depends on the style of production. Having gained public attention by one class of subject he was faithful to it, and critics had to own it was not exhausted. His works were well adapted for reproduction. The story which each expressed was dramatic and could be realised at a glance. They would, no doubt, be considered as sentimental, but they were not unhealthy or mawkish, and publishers found the plates from them were in demand as soon as published. Tested by the returns of the print shops few living artists could stand equally high with the public. Among the best known of his paintings are *The Day of Reckoning*, *The Runaway Match*, *Alone, Safe, The Empty Saddle*, *The White Cockade*, *The Secret Panel*, &c. Only occasionally he meddled with highwaymen. His pictures are so clear it might be supposed he was facile in their production. But from what he said his first ideas of them were very different in their protuseness, for "the mind becomes, like the cook's stock-pot, filled with material, and every after process with me consists, like the cook's, in boiling down and flavouring." Mr. WALLER had almost reached his fifty-third year, and his death closes one prolific source of innocent pleasure.

A NEW law has come into operation for the regulation of the sale of works of art in Italy. It will be applicable throughout the kingdom. The export duty on works which are under 5,000 lire will be 5 per cent. on the value. Between 5,000 and 10,000 lire the duty will be 7 per cent. For every 5,000 lire an additional 2 per cent. will be paid. The highest rate that can be levied will be 20 per cent. The regulations concern private collections. Works remaining in churches, monasteries, convents or in public buildings cannot be sold. An inventory is to be taken of all works of art to be found in Italy which can be considered as having importance, and without special permission they will from the date of the registration be considered as alienable. The valuation of works for export duty will be declared by the owners, but will have to be confirmed by officials. It is fortunate that the law was not earlier enforced, for then it would be impossible to possess such treasures as are exhibited in the Victoria and Albert Museum. But although hard on impecunious patricians, it will put some check on the production of ancient masterpieces by modern journeymen.

FOR some time past an action has been before the Irish courts in which Messrs. H. & J. MARTIN, contractors, sought to recover 5,000*l.* from Messrs. ARNOTT & Co., LTD., damages. Mr. G. P. BEATER, the architect to the company, was made a separate defendant. The plaintiffs' statement was that they were compelled by Mr. BEATER to execute works which were not provided for in the bill of quantities, and that the plans and specifications on which they undertook to build the premises for 18,400*l.* were not the same plans and specifications upon which Messrs. GRIBBON & BUTLER, who were employed by the defendants to take out the bill of quantities, had worked, with the result that plaintiffs' work was increased by several thousand pounds. Defendants replied that the plaintiffs were bound by the contract, and that the plans and specifications signed

by them were the same as those used by the surveyors, and that any additional work that the plaintiffs were called upon to perform was occasioned by errors and mistakes of the quantity surveyors. Plaintiffs contended that Mr. BEATER, having received from the surveyors one-third of the commission paid to them for taking out the quantities, was thereby constituted a partner with the surveyors, and that he was responsible to the plaintiffs for any errors or mistakes in the quantities, by reason of which additional work was cast on them. The defendants counter-claimed 1,850*l.* as penalties for seventy-four weeks' delay in completing works. The case was partly heard in the last term, but had to be reopened owing to the illness of a juror. After plaintiffs' counsel had stated the particulars, counsel for defendants said they were most anxious to be examined and to repudiate the false charges which had been made against them, but there was no evidence of fraud against them that could be submitted to the jury, and their counsel therefore considered it their duty to rely upon their strict legal rights and to decline to enter into any evidence. No case had been made against them, and if they went into evidence on behalf of the defendants the action would occupy several days. Mr. Justice MADDEN expressed surprise at the resolve, which was, however, justified. His lordship proposed a series of questions to the jury. In reply it was stated that Mr. BEATER was a partner with Messrs. GRIBBON & BUTLER in taking out the quantities, that the quantities were in fact taken on the document relied on by the plaintiffs, that the works provided by the contract and specifications differed from the bill of quantities, that Mr. BEATER knew the quantities were taken out on the document relied on by the plaintiffs, and that Mr. BEATER represented to the plaintiffs that the quantities were taken out on the specifications, but that he did not do so fraudulently. They also found that Mr. BEATER acted as agent for the defendants. As there was no fraud imputed the answers were taken to be a verdict for the defendants, and judgment was given in their favour with costs. As to the counter-claim his lordship left the parties to move for judgment. The issue corresponds with that of the well-known English case, *PRIESTLEY v. STONE*. The quantities were alleged to differ from the plans, but as there was no evidence of any fraudulent representation, the verdict was given for the defendant.

EXAMPLES of the painting of the ancients are so rare, it was anticipated that a representative of the British Museum or National Gallery would have attended the sale of the frescoes from Bosco Reale which took place on the 8th inst. in Paris. They were discovered in the same district from whence the gold plate presented to the Louvre by the late Baron ADOLPHE DE ROTHSCHILD was derived. M. SANDHERR, who has described them, obtained *The Lyre-Player* for 100,000 francs, and for a similar sum the paintings which adorned an alcove. For a painting of a Winged Genie the authorities of the Louvre paid 15,300 francs. The prices were much lower than had been expected, but the recent exposures of the trade in pseudo antiques have made amateurs more cautious than formerly.

THE reports of the juries for the Great Exhibition of 1851 in Hyde Park formed a single volume. Although containing some valuable information, it was not appreciated, and copies may now be obtained for a shilling or less. Afterwards an illustrated catalogue came out in four volumes. For all the international exhibitions held since 1851 reports were prepared, and their voluminousness has increased as time advanced. The reports on the Paris Exhibition by French experts will comprise fifty-two octavo volumes of about six hundred pages each. Six of them are the work of M. PICARD, the commissary-general. It was arranged that the volume on Painting was to be produced by M. LARROUMET, the secretary of the Academy of Fine Arts. Owing to illness he was compelled to decline the task. Eventually it was undertaken by M. DUBUFE, the painter, and it was completed a few days ago. The series is ended, and can be printed.

ARCHITECTURE AT THE BUILDING EXHIBITION.

ANYONE who will go from the Architectural Room of the Royal Academy to the gallery of the Building Exhibition containing similar drawings can hardly fail to be struck by the difference in general appearance between the two collections. It is imperative at the Academy for all pictures and drawings to be in gilt frames. A like rule does not prevail in other countries. French artists believe the frames should be adapted to enhance the character of the work enclosed, and therefore should vary not only in colour, but in material. CHEVREUL explained on scientific grounds the necessity of respecting the law of contrast of colours in such cases, and demonstrated that a bronze, black, grey, yellow, green or blue frame might become more advantageous than one which was gilt. In shops where frames are sold which are to be placed in drawing-rooms and boudoirs a variety of colours as well as of forms will be seen. The drawings at the Building Exhibition were framed in any way the owners considered to be most suitable, and it cannot be said the absence of uniformity is detrimental to the designs or to the general effect. There are some examples which are unframed, and they have received as much attention from visitors as any of the others. The drawings of the Gore Farm Hospital, which cost 250,000*l.*, and had to be erected in twelve weeks, are shown on the original strainers by Messrs. ALDWINCKLE & SON, and their appearance suggests building operations rather than pictorial display. It would also have been absurd if Mr. H. CURTIS CARD increased his outlay on his "Seven Unsuccessful Drawings for the Harrogate and Knaresborough Infectious Hospital," which are all of double elephant size, by paying for gilt frames to contain them. They are eloquent enough as they stand of the risks of modern practice. In the French Salon unframed strainers are admitted.

That gilt frames can be often efficacious in enhancing representations of buildings must of course be allowed. The three series of photographs of a few of his works which Mr. J. A. CAMPBELL contributes in massive gilt frames with broad gilt mounts are very striking, and could hardly be passed over in the most cursory examination. With gold the tendency is to plain forms. The Academy's warning about the risk of breadth and mouldings in frames has given encouragement to the use of plain flats or bevel and flats, classes which when seen together become monotonous. If flats must be used it is better to have them of oak gilded, of which several successful examples are in the gallery at Islington.

Another rule of the Royal Academy is the exclusion of photographs. Wherever designs alone are allowable for exhibition the regulation would be applicable, especially if, as in Paris, geometrical drawings are permitted. When the object is to suggest, not the original intention of the architect, but the effect of his building in its completed state, then photography becomes a record which has the advantage of being impartial. It could not be denied that the large photograph showing the tower of Mr. MOUNTFORD'S Sheffield Town Hall is impressive, as well as faithful. The detail of the ceiling of the Royal Military Chapel, Kilmainham, lent by Mr. ROBERT COCHRANE, would fail to be expressed by any drawing unless the artist had the enthusiasm and patience of a pre-Raphaelite. The merits of drawing and photography can be compared in the views of Cowley Manor, for Mr. R. A. BRIGGS has had the building shown in both manners. In the exhibitions of the Royal Scottish Academy photographs of new buildings are admissible. Such examples as those sent by Sir R. ROWAND ANDERSON, Mr. J. A. CAMPBELL, Messrs. COLSON, FARROW & NISBET, Mr. ELGOOD, Mr. BANISTER FLETCHER, Mr. HOWGATE, Mr. RYAN-TENNISON, Messrs. WARD & LEE, Messrs. BUTLER WILSON & OGLESBY and others need colour only to be perfect as representations.

Perspective drawings of buildings can become valuable works of art. Those by Mr. JOHN FULLEYLOVE, some of which are in colour and some in pencil, would be precious additions to any public gallery or school of art. Mr. C. J. LAUDER'S Italian scenes are also adapted to serve as models of style for architectural draughtsmen. Such effect as we see in them is, however, only attainable by devotion to that class of work, and we doubt whether anyone who

has to take part in the varied occupations of an architect's office dare hope to rival the water-colour drawings of the two painters. Brushwork, whether in monochrome or unrestricted in colour, is, however, well exemplified. Mr. F. G. KNIGHT'S Staircase at Broom Hall, Mr. IBBERTSON'S Houses, Mr. A. HILL'S drawing of Salford, near Birmingham, Mr. LUCAS'S Dock Lights, Southampton, Mr. O. M. AYRTON'S villas, Mr. EMANUEL'S foreign sketches, Mr. E. NEWTON'S Glebe Lands, Mr. DAVIES'S Italian views, &c., suggest the level which can be reached by practitioners, without any neglect of the care demanded by architectural practice. A man is not, however, always in the mood to represent his own works, and an artist may not be available when required. In such cases photography becomes a substitute, and there would be no great departure from the character of any institution if examples were accepted in its exhibitions.

The Royal Academy no doubt is convinced that the tradition of art is preserved by the exclusion of everything which is not produced by hand. But it is well to remember how few architectural painters have existed if compared with figure-painters and landscapists. The time required for painting one of the scenes by HOOCH or HEYDEN must have seemed wasted to most of their contemporaries. The buildings painted by the Italians consisted of few parts, and those introduced in their landscapes were usually of a simple kind. Unless we are mistaken, the Renaissance architects rarely attempted such elaborate representations as are to be seen every year in England. VASARI, for example, was an architect in a more definite sense than the majority of the Italian painters. The drawings exhibited in Lille which he is supposed to have prepared for MICHEL ANGELO denote his skill and comprehension of planning and construction. But although he often speaks of his painting architectural ornaments and allegories relating to the art, he makes no mention of any attempt to produce a view of a building. The drawings by architects which have come down to us are not elaborate. Instead of perspectives models were likely to have been prepared.

We have been led into offering these remarks from a consideration of the difference between painting and architecture as regards exhibitions. While exhibitions of pictures are held in most towns every year, it is supposed to require a combination of favourable circumstances to warrant an exhibition of architecture. London appears to be as indifferent to the subject as any remote town. About forty years ago there were attempts to have such exhibitions, but they were abandoned owing in part to the expense they involved and partly to the neglect of the public to attend.

It should be accepted as inevitable that for some time to come there is little likelihood of the public caring for an exhibition which is essentially technical and requires more or less knowledge to understand. Architects and others who have a personal interest in building may be assumed to be the only patrons of any display which depends for attraction on architectural drawings. But the number of such men is not few, and is yearly increasing. If the standard of the Royal Academy were adopted and only elaborate perspectives in gilt frames were hung on the walls, the expenses which would fall on every exhibitor if counted as a whole would not be insignificant. But the interest taken in the collection at the Building Exhibition indicates that it is not necessary to have a uniform and costly standard. The criticism expressed was altogether different from what is occasionally heard in Burlington House. The variety of character in the drawings suggested that they were not all prepared for display, and this gave a new interest to the collection. The drawings of decoration by Mr. T. W. HAY also reveal that there are artists who are able auxiliaries, but who rarely have an opportunity of announcing their capabilities.

From the experience derived from this last venture at Islington it seems to us that architectural exhibitions could be more often held without involving the organisers in any heavy expenses. If it were recognised that architects and representatives of building were to be the spectators there need be no stipulations about style of drawing or framing which would lead to any special outlay. A good design can be appreciated although it is without a frame. Such exhibitions would, we think, help to remove that mysterious secrecy which is one of the characteristics of the

profession and which is allied to the alarm prevailing among inventors. They would also be serviceable in other ways, and it is doubtful whether any contributor would suffer through his co-operation.

PROFESSOR COCKERELL'S TRAVELS.*

AT all times there were men who gained distinction among their contemporaries, although for what reason may not always be obvious. Professor COCKERELL was one of the instances which the nineteenth century afforded. There was no question among architects who knew him about his ability as a designer, a scholar, or a judge. In the relief on the Albert Memorial he appears engaged in conversation with CHARLES BARRY. There would have been no dissatisfaction if COCKERELL alone were introduced as the representative of architecture at the period. But it is now difficult to explain his position to a foreigner, and in the course of not many years it is likely English architects will wonder at the reverence accorded to him. Some of the buildings on which his reputation rested have been removed. Those remaining suggest that he laboured under restrictions. His contemporaries allowed that he never had free scope for the display of his genius, but posterity probably will not accept an explanation of that kind. Judging by his contributions to Academy exhibitions, it might be presumed that COCKERELL preferred his restorations of ancient cities and ancient buildings rather than his designs for offices and banks. These "professor's dreams" were indeed his most characteristic works, and the only books he cared to publish related to Classical or Mediæval antiquities. It was not, however, as an archaeologist that he was most esteemed, but as a possessor of artistic power. There could be little doubt of his ability. But it is possible that he gained his position partly by the fascination of his manner. This is the conclusion likely to be drawn by those who read the journal of his travels between 1810 and 1817, which has been edited by his son, Mr. SAMUEL PEPPS COCKERELL.

CHARLES ROBERT COCKERELL was the son of SAMUEL PEPPS COCKERELL, surveyor to the old East India Company. He was born April 17, 1788, and was taught in Westminster School. At sixteen he entered his father's office, and after about five years' training he became an assistant to ROBERT SMIRKE, then engaged in rebuilding Covent Garden Theatre. SMIRKE had journeyed in Greece, and no doubt was loud in praising what he saw, so it was arranged that COCKERELL should acquire a similar advantage. Through the influence of the Under-Secretary for Foreign Affairs he was able to travel as king's messenger, which was an advantage in so disturbed a period. After some adventures he reached Constantinople. At the time STRATFORD CANNING was beginning to exercise the power which afterwards made the "Great Elchi" feared throughout Europe. COCKERELL said of him, "For me he is rather too grand to be agreeable." In those days it was risky for a Giaour to make sketches in the Turkish capital. The subjects most admired by COCKERELL were the mountains and the grand kiosks or summer residences. He became acquainted with a Turkish architect in the expectation of gaining information, but had to own that he was "too great a rogue to keep company with, for he gets drunk and stabs his friends, and as for his art he is not worth cultivating for that, for it is confined to the chisel and mallet. And his promises are false promises, for with all my hopes I have never got him to show me anything." In a few months he exhausted Constantinople and wished to travel in the Levant. The passport was filled up by CANNING, who described COCKERELL as if he were an animated statue, viz. "Statura, mezzana; viso, triangolare; occhi, negri e splendenti; naso, fino; bocca di ermiglia; fronte, di marmo," and below "in somma Apollo in stesso." Evidently the traveller was endowed with an attractive appearance or a fortunate exterior, as his son says, "which had probably something to do with the good reception he generally met with in society throughout his life."

Athens at the time possessed more than usual interest for an Englishman of the character of CHARLES COCKERELL. Lord ELGIN had taken the marbles from the Parthenon, but they had not been removed out of Greece. LUSCIERI, his draughtsman, was still in the city. One of the first visits of COCKERELL and his party was to the Island of Ægina. He examined the ruins of the temple, and in a few days "had learnt all we could wish to know of the construction, from the stylobate to the tiles, and had done all we came to do." A labourer engaged in excavation at the interior portico struck a piece of Parian marble, which was found to be the head of a warrior and perfect in every feature. This led to further examination, and sixteen or seventeen statues besides fragments were unearthed. It was then easy to carry off spoils from Greece, but at Ægina the authorities protested, as they feared calamities might fall on the island if the remains were disturbed. A payment of 40% overcame the difficulty. They were able at last to bring the sculpture to Athens, and then the question arose what was to be done with it. COCKERELL had for companion a very young English architect named FOSTER, but he also picked up a couple of Germans. The Englishmen were anxious the marbles should be secured for the British Museum, the Germans wished to have them for their own country. Lord HARDWICKE and the other trustees of the British Museum obtained the authority of the Government to make an offer of 6,000% for them. But it was expressed in such official language as to excite doubts about the conditions, and the bid was therefore rejected. Afterwards Mr. COMBE, the superintendent of antiquities in the Museum, was sent to Malta, where it was expected the marbles would be sold, and he was instructed to go as high as 8,000%. In the meantime the collection was sold at Zante to the PRINCE ROYAL of Bavaria for 6,000%. There was disappointment in England, for archaeologists prized the figures as examples of architectural sculpture in the pre-Periclean age, and also as evidence of painting and gilding. COCKERELL and FOSTER had both generously agreed to abandon their share of the purchase money. All that would have to be paid by the English Government was therefore only 3,000%. The sculpture is now in Munich.

A discovery of that kind within a year of his arrival in Greece was enough to raise anticipations about the success of COCKERELL. He was more fortunate at Bassæ. He was scrambling among the ruins of the temple with HALLER, who was one of the party, when they disturbed a fox. In hope of meeting with another, COCKERELL, as became an Englishman, ventured among the lower stones and found, not what he expected, but a relief in marble. Then he carefully re-covered the stone, as he believed the whole of the frieze to be there. Afterwards other members of the party returned with the requisite powers, and during COCKERELL's absence removed the stones. There were a great many fragments, but without restoration about 96 feet of the frieze was put together. Another part was obtained in 1816. COCKERELL has given an account of what took place, which is interesting from the contrast afforded to the modern and more prosy process of exploration. The party consisted of about fifteen persons. He said:—"They established themselves for three months, building round the temple huts covered with boughs of trees, until they had almost formed a village, which they denominated Francopolis. They had frequently fifty or eighty men at work in the temple, and a band of Arcadian music was constantly playing to entertain this numerous assemblage. When evening put an end to work, dances and songs commenced, lambs were roasted whole on a long wooden spit, and the whole scene, in such a situation, at such an interesting time, when every day some new and beautiful work of the best age of sculpture was brought to light, is hardly to be imagined. APOLLO must have wondered at the carousals which disturbed his long repose, and have thought that his glorious days of old were returned." COCKERELL, being a skilful draughtsman, made drawings of the reliefs, which he sent home, and they were greatly admired at meetings of the Dilettante Society and elsewhere. The fiasco in the case of the Ægina marbles, which by one Government department was ascribed to another, moved people to desire that energetic action should be taken to acquire the Phigaleian marbles. Mr. COCKERELL,

* *Travels in Southern Europe and the Levant, 1810-17.* The journal of C. R. Cockerell, R.A. Edited by his son, Samuel Pepys Cockerell. With a portrait. (London: Longmans, Green & Co.)

senr., had submitted the drawings to the PRINCE REGENT, who expressed the wish for their immediate purchase. The price demanded was 15,000*l.* Mr. HAMILTON, the under secretary, applied to the First Lord of the Treasury, the Chancellor of the Exchequer and the Colonial Secretary of State, and obtained permission for their removal. A messenger was sent to Zante, who arrived in time. The price given was 15,000*l.*, but through the process of exchange it amounted to 19,000*l.* They reached England in 1815. The subjects represented are the contests between Centaurs and Lapithæ, and between Athenians and Amazons.

COCKERELL also visited Crete in order to examine the labyrinth, of which he gives the following account:—

We had brought a quantity of string for a clue, which we rolled on two long sticks, then lit torches and went in. At first one enters a vestibule, out of which lead several openings. Two of the three, perhaps four, dark entrances are blocked up, but one remains open. This we followed, and for three mortal hours and more we groped about among intricate passages and in spacious halls. The windings bewildered us at once, and my compass being broken I was quite ignorant as to where I was. The clearly intentional intricacy and apparently endless number of galleries impressed me with a sense of horror and fascination I cannot describe. At every ten steps one was arrested and had to turn to right or left, sometimes to choose one of three or four roads. What if one should lose the clue!... We entered many chambers; in some were Venetian names, such as Spinola; in another, "Hawkins, 1794," "Fiott," and other Englishmen, and many names of Jews. All the *culs-de-sac* were infested with bats, which were very annoying, and rose in thousands when one of our party fired a pistol. In one place is a spring. Here and there we saw some lichen, and there were occasional signs of metallic substances, but not enough to support the idea of its having been a mine. The stone is sandy, stratified and easily cut, the air dry, and it appears to me that the most probable purpose of this wonderful excavation was as a secure storehouse for corn and valuables from the attacks of robbers in the days of Minos. The work was plainly all done with the chisel.

COCKERELL could not have anticipated that the labyrinth was to be explored by another English traveller, and that most accurate representations of the interior would one day be displayed in an exhibition of the Royal Academy. Indeed, in many places which have since been the scenes of discoveries he passed over the ground as if it were hopeless. Thus, at Ephesus he says:—"The remains are very trifling, and what there are are in a very poor style. I did not any more than other travellers find out the Temple of Diana, though, of course, I have my own opinion as to the site." At Olympia he could not make out a trace of a stadium or theatre. He attempted some work at the temple, but achieved next to nothing. To do it completely, he declared, would be a work for a king. The substructure of the temple at Pergamo he described as prodigious and very noble, but the remains were disappearing, for the Turks were cutting them up into tombstones. He also travelled in Sicily, and spent a long time in endeavouring to reconstruct the Temple at Girgenti. His diary is a very good record of the state of affairs in Greece, Turkey and part of Italy in the years preceding the decline of NAPOLEON.

The fall of the Emperor allowed more freedom to students like COCKERELL. In Greece he was under Turkish dominion, but the wandering life made him lose sight of the task before him if he sought practice in London. As his son says:—"He had been forming a taste, but a taste in the externals and details of building only. Of composition and of planning he had seen as yet no fine example and had learned nothing." As he moved westwards he found that his collection of drawings and the interest of his travels, together with his charming manners, caused him to be sought after. From Rome he wrote:—"I get so many invitations and am so harassed to show distinguished persons of all nations my drawings that I can get no time to myself. And in order to have something to show, I have been obliged to finish up some of my sketches, which has occupied the whole of the last two months." It was, no doubt, very delightful to be lionised. But the only practical benefit he derived was a request to send in designs for a palace for the Duke of WELLINGTON, which was to surpass Blenheim. He set about the work with zeal, but his lack of experience was an obstacle.

As he confessed, "Plans would not agree with elevation, doors and windows would not come into their right places, I invented roundabout ways for simple ends." He was so worried by his difficulties with the abortive scheme that he asked his father's permission to become a painter. When he reached Paris he received a letter advising him about the preparation necessary to undertake work in London. "If," his father wrote, "you can bend to the consideration of what is called the 'fittings-up' of the interior of the best hotels and palaces of Paris, the graces of their *meubles* and the harmony of their colours in hangings, painting and gilding, you may be the general arbiter of taste here; and as there are very few persons who are real judges of compositions even Classical, much less sublime, and there must be few opportunities of exercising those parts of your studies here, it will be really useful if you allow yourself to look at those minor objects at Paris which in truth they judge well of." Mr. COCKERELL, senr., was proud of his son. The Duke of GLOUCESTER sought his acquaintance, and he was spoken well of in Carlton House. But, he added, "you must not be disappointed to find very common things occupying the minds of a large majority of a nation of *boutiquiers*, and we must take the world as we find it, believing always that good sense, refined judgment and true taste will ultimately prevail."

He had left London on April 10, 1810; he returned June 17, 1817. It was his resolve to bring out a treatise on Greek architecture, which was to be the joint production of his companion HALLER and himself. But his friend died suddenly in 1818, and it was not until 1859 that the work on the temples of Jupiter Panhellenius and Apollo Epicurius appeared. Like many artists, he disliked writing, and on that account in his Academy lectures he never did justice to himself. But the information he acquired was utilised by others. As his son remarks, "his collection of inscriptions was picked over by WALPOLE; HUGHES fills out his pages with his letters; BRONSTEDT uses his drawings. It is STACKELBERG who relates how he discovered the bas reliefs at Phigaleia; BEAUFORT anticipates anything he may have had to tell of Karamania; WORDSWORTH plundered his portfolio."

MR. S. P. COCKERELL has rendered a service by the account which he gives of his father's "Wanderjahre." It was in the seven years he spent in the South of Europe that Professor COCKERELL's character as an artist was mainly formed. Like most things in this world, the travels were not an unmixed benefit. We must remember it was the age of BYRON, when it was almost impossible to be considered a gentleman unless one possessed some disgust of modern society, with a desire to make time retrograde, and to become once more a sharer of the old life of Greece. CHARLES COCKERELL enjoyed the privations he met with, for they made him acquainted with conditions which were opposed to what was respectable in London. Competition in the Metropolis was to be conducted under other forms, for there was nothing in Greece to prepare him for the peculiar power by which a man like WILLIAM TITE became his temporary partner in spite of himself, and shared his fees without performing any of the work required. On such occasions he may have regretted the evenings he spent among the Turcomans sitting cross-legged on a mat and smoking. The diary explains a period of the Professor's life which was heretofore generally unknown, and enables us to comprehend some of his peculiarities which have been generally misunderstood.

THE PRINCIPLES OF ARCHITECTURAL DESIGN.

By PERCY L. MARKS.

APPENDIX A.

THE following extracts from an article written very many years ago by a Mr. SAMUEL HUGGINS are worthy of being brought to the front. He remarks:—

"Expression in architecture is given by three different means:—

"(1) Truthful adaptation of form and arrangement of the parts to the destined purpose of the edifice.

"(2) Form and proportion and general style of decoration under the guidance of analogy.

"(3) Allegory, *i.e.* symbolic sculptural (and other) illustration.

"If we were more truthful generally, we should be more expressive. The ancients availed themselves to the utmost of the labours of their predecessors, but imitated in the right spirit and adapted their buildings to their own purposes in all their peculiarities. . . . Form and proportion should be so used as to excite emotions in harmony with the purpose—feelings which are sympathetic with the spirit of the plan, so that the front, say, of a theatre, will be a kind of preface, a prelude in stone, to the entertainment within. If the building be for a gay purpose, the architect must employ those forms and lines and that style of composition that will express gaiety. If for a solemn purpose, such a character of design and such proportions as will yield a solemn aspect. Thus, rough-hewn and boldly rusticated masonry, harsh angular lines, lofty and unpierced walls will give the idea of a prison; prison-like strength, combined with palatial sumptuousness of decoration, will characterise a bank; severity of outline and form, a character grave and solemn, of patriarchal simplicity, in which nothing is hidden, intricate, or but partially told, and the absence of all imaginativeness, will distinguish a justice court."

APPENDIX B.

REMARKS BY VITRUVIUS.

THE following selected extracts from the work on "Architecture" by M. VITRUVIUS POLLIO may be fitly introduced here. The translation is by the late Mr. JOSEPH GWILT:—

"As the distances between the columns increase, so must the shafts of the columns increase in thickness . . . because the air interposed between the columns . . . apparently diminishes their thickness. . . . Columns at the angles, on account of the unobtrusive play of air around them, should be . . . thicker than the rest. . . . *The deception which the eye undergoes should be allowed for in execution.* . . . Always remembering that as the upper parts of column are more distant from the eye, they deceive it when viewed from below, and that we must therefore *actually* add what they *apparently* lose. The eye is constantly seeking after beauty, and if we do not endeavour to gratify it by proper proportions and an increase of size, where necessary, and thus *remedy the defect of vision*, a work will be always clumsy and disagreeable. . . . In proportion to the height of the column is the architrave to be proportioned; always remembering that the higher the eye has to reach, the greater is the difficulty it has in piercing the density of the air, its power being diminished as the height increases, of which the result is, a confusion of the image. Hence, to preserve a sensible proportion of parts, if in high situations, or of colossal dimensions, we must modify them accordingly, so that they may appear of the size intended. . . . All members over the capitals of columns . . . should not be vertical, but inclined forwards, each a twelfth part of its height. And for this reason, that when two lines are produced from the eye, one to the upper part of a member, and the other to its lower part, the upper line (or visual ray) will be longer than the lower one, and if really vertical, the member will appear to lean backwards; but if the members are set out as above directed, they will have the appearance of being perpendicular. . . . Where the air does not play around them (*i.e.* internal columns) the diminution thus made will not be perceived; lest, however, they should appear slenderer, when the flutes of the external columns be twenty-four in number, these may have twenty-eight, or even thirty-two. Thus, what is taken from the absolute mass of the shaft will be imperceptibly aided by the number of the flutes, and though of different thicknesses, they will have the appearance of being equal. This arises from the eye embracing a greater number of surfaces, and thence producing on the mind the *effect* of a larger body. For if two columns, equally thick, one of them without flutes, and the other fluted, are measured round with lines, and the line is passed over the flutes and their fillets, though the columns are of equal thickness, the lines which girt them will not be equal, for that which passes over the fillets and flutes will, of course, be the longest. This being the case, it is not improper, in confined and

enclosed situations, to make the columns of slenderer proportions, when we have the adoption of the flutes to assist us. . . . Nothing requires the architect's care more than the due proportions of buildings. When the proportions are adjusted, and the dimensions found by calculation, then it is the part of a skilful man to consider the nature of the place, the purpose of the building, and the beauty of it; and either by diminutions or additions to find expedients, by means of which the appearance may not be injured by the additions to, or diminutions of, the established proportions that may be necessary. For an object under the eye will appear very different from the same object placed above it; in an enclosed space, very different from the same in an open space. In all these matters it requires great judgment to adopt the proper means, since *the eye does not always form to itself the true image of an object, and the mind is often deceived by the false impression.* Thus, in painted scenery, though the surface is a perfect plane, the columns seem to advance forward, the projections of the mutuli are represented, and figures seem to stand out. The oars of ships, also, though the parts immersed in the water are really straight, have the appearance of being broken; those parts only appearing straight which are above the level of the water. This arises from the part immersed in the water reflecting its image in an undulating state up to the surface of the water, through a transparent medium, which, being there agitated, gives the oar a broken appearance. But whether the sight arises from the impression which images make on the eye, or by an effusion of visual rays from the eye, as naturalists contend, it is certain that, in some way or other, *the eye is often deceived.* Since, then, some images are falsely conveyed, and others appear different from what they really are, I think it beyond doubt that, according to nature and the circumstances of the place, diminutions or additions should be made, so that no defect may be apparent."

APPENDIX C.

THE LONDON BUILDING ACT, 1894 (57 & 58 VICT.
CAP. CCXIII.).

PART VI. SEC. 73.

RULES AS TO PROJECTIONS AS AFFECTING METROPOLITAN BUILDINGS.

THE following provisions shall (*except with the consent of the Council*) apply to projections from buildings:—

(1) Every coping, cornice, string-course, fascia, window-dressing, portico, porch, balcony, verandah, balustrade, outside landing, outside stairs and outside steps and architectural projection or decoration whatsoever, and also the eaves, barge-boards and cornices to any overhanging roof, *except the cornices and dressings to the window fronts of shops*, and *except the eaves, barge-boards, and cornices to detached and semi-detached dwelling-houses, and to other dwelling-houses in which the party-walls are corbelled out so as to project four inches beyond such eaves, barge-boards or cornices*, shall be of brick, tile, stone, artificial stone, slate, cement or other fireproof material.

For the purposes of this sub-section, a pair of semi-detached houses shall be deemed to be one building.

(2) Every balcony, cornice or other projection shall be tailed into the wall of the building and weighted or tied down to the satisfaction of the district surveyor, and no cornice shall exceed in projection 2 feet 6 inches over the public way.

(3) In a street or way of a *width not greater than 30 feet*, any shop front may project beyond the external wall of the building to which it belongs to any extent not exceeding 5 inches, and any cornice of any such shop front may project to any extent not exceeding 13 inches; and in any street or way of a *width greater than 30 feet*, any shop front may project to any extent not exceeding 10 inches, and any cornice of any such shop front may project to any extent not exceeding 18 inches beyond the external wall of the building to which it belongs *over the ground of the owner of the building*, provided that this provision shall not authorise in any such street the projection of any part of any such

shop front other than the cornice on or over the public way or any land to be given up to the public way.

(4) No part of the woodwork of any shop front shall be fixed higher than 25 feet above the level of the pavement of the public footpath in front of the shop. No part of the woodwork of any shop front shall be fixed nearer than 4 inches to the centre of the party-wall (where the adjoining premises are separated by a party-wall), or nearer than 4 inches to the face of the wall of the adjoining premises (where the adjoining premises have a separate wall), unless a pier or corbel of stone, brick or other incombustible material 4 inches wide at the least be placed as high as such woodwork and projecting throughout an inch at the least in front thereof between such woodwork and the centre of the party-wall or the separate wall, as the case may be.

(5) In a street of a width not less than 40 feet, or to a building the front wall of which is not at a less distance than 40 feet from the opposite boundary of the street, *bay windows to dwelling-houses* may be erected on land belonging to the owner of the building, notwithstanding the provisions of this Act relating to buildings beyond the general line of buildings in streets, provided that such bay windows:—

(a) Do not exceed three storeys in height above the level of the footway.

(b) Do not project more than three feet from the main wall of the building to which they are attached.

(c) Do not project in any part within the prescribed distance of the centre of the roadway.

(d) Are in no part nearer to the centre of the nearest party-wall than the extreme amount of their projection from the main wall of the building to which they are attached.

(e) Do not, taken together, exceed in width three-fifths of the frontage of the building towards the street to which such bays face.

(f) Are not constructed upon any part of the public way or upon any land agreed to be given up to the public way; and

(g) Shall not be used for trade purposes.

Bay windows to which the foregoing rules do not apply shall not be erected without the consent of the Council after consulting the local authority.

(6) In a street of a width not less than 40 feet, or to a building the front wall of which is not at a less distance than 40 feet from the opposite boundary of the street, projecting oriel windows or turrets may be constructed, provided that:—

(a) No part of any such projection extend more than 3 feet from the face of the front wall of the building, or more than 12 inches over the public way.

(b) No part of any such projection be less than 10 feet above the level of the footway of the street.

(c) No part of any such projection (where it overhangs the public way) be within a distance of 4 feet of the centre of the nearest party wall.

(d) On no floor shall the total width of any such projections taken together exceed three-fifths of the length of the wall of the building on the level of that floor.

(e) Every such projection be constructed to the satisfaction of the district surveyor, or in the event of disagreement, to the satisfaction of the superintending architect, whose determination shall be final.

Oriel windows or turrets to which the foregoing rules do not apply shall not be erected without the consent of the Council after consulting the local authority.

(7) The roof, flat or gutter of every building, and every balcony, verandah, shop front or other similar projection or projecting window shall be so arranged and constructed, and so supplied with gutters and pipes, as to prevent the water therefrom from dropping upon or running over any public way.

(8) Except in so far as is permitted by this section in the case of shop fronts and projecting windows, and with the exception of water pipes and their appurtenances, copings, string-courses, cornices, fascias, window dressings and other like architectural decorations, no projection from any building shall extend beyond the general line of buildings in any street, except with the permission of the Council after consulting the local authority.

THE NATIONAL GALLERY.

THE King has graciously given permission for the two great pictures from Hampton Court, by Tintoretto, "The Muses" and "Esther before Ahasuerus," which His Majesty lent to the Royal Academy for the winter exhibition this year, to be shown to the public for a few months in the National Gallery. The pictures, which were very much obscured by dirt and varnish, have now been cleaned; and they are hung in the Venetian Room No. VII., the large altar-pieces by Romanino and Moretto being temporarily removed for the purpose.

Mrs. Seymour, of Chesterfield Gardens, has presented to the National Gallery the large picture by Mr. G. F. Watts, R.A., called "Life's Illusions." It is hung in the Tate Gallery in Room No. VIII.

The daughters of the late Mr. H. T. Wells, R.A., Mrs. G. E. Street and Mrs. Hadley, have presented to the National Gallery their father's picture called "Victoria Regina," representing the announcement by the Archbishop of Canterbury and Lord Melbourne at Kensington Palace of Her Majesty's accession to the Throne. It is hung in the Tate Gallery in Room No. II.

A picture by Paul C. La Fargue, a Dutch painter of the eighteenth century, representing the market-place at The Hague, has been purchased for the national collection out of the Lewis fund. It will be hung in Room VI. at Trafalgar Square as soon as the redecoration of the room is completed.

ART FOR SCHOOLS ASSOCIATION.

THE annual general meeting of the Art for Schools Association was held at 46 Great Ormond Street, Bloomsbury. Mr. Lionel Cust presided in the absence of Canon Scott Holland. The report for the past year, which was read, stated that though the year had been a somewhat uneventful one for the Association, the work had nevertheless progressed steadily. The number of pictures sold during the year was 3,566, as compared with 3,338 in 1901, and it was satisfactory to note that the increased sales were chiefly of the publications of the Association, the amount received for these alone being 283% as compared with 166% in the previous year. The list of schools and School Boards supplied also showed further extension, and many orders continued to come from the colonies.

An expression of thanks having been made to Dr. Robertson, the late chairman of the executive committee, who was congratulated on his promotion to the Bishopric of Exeter, the accounts were presented.

Sir Joshua Fitch, in moving the adoption of the report and accounts, spoke of the great usefulness of the Association, which was not to be measured by the number of its members or of its publications that had been distributed. It had been the pioneer of a new set of thoughts and aspirations as to the proper functions of a school, which should be beautiful, interesting and attractive.

Miss Mary Christie seconded the resolution, which was carried.

THE GLASGOW SCHOOL OF ART.

THE governors of the Glasgow School of Art, as authorised by the Scotch Education Department, offered five maintenance scholarships and seven bursaries for competition during the session now concluding. The judges appointed by the governors have now made their awards. The judges were:—For drawing and painting—Mr. Alexander Roche, R.S.A.; Mr. W. H. Lorimer, R.S.A.; Mr. William Leiper, R.S.A.; with the headmaster. For architecture—Mr. W. Forrest Salmon, F.R.I.B.A.; Mr. John Keppie, I.A.; Mr. W. J. Boston, I.A.; and the director for architecture, Mr. Alexander M'Gibbon, F.R.I.B.A. For modelling—Mr. A. M'F. Shannan, A.R.S.A., and the director for modelling, Mr. Johan Keller. For design—Mr. W. Forrest Salmon, F.R.I.B.A.; Mr. Arthur L. Gwatkin, Mr. D. H. L. Young, and the design master, Mr. A. Aston Nicholas. The following are the winners:—Five maintenance scholarships, value 20% each—Drawing and painting—Upper school, Reginald Duncan; lower school, Daniel P. Davidson. Architecture—J. M'Nee Jeffrey. Modelling—Gilbert Tait. Design and decorative art—Adam Jenkins. Seven local bursaries, value 10% each—Drawing and painting—Peter Mitchell, Mary J. Dempster. Architecture—James Govan, William J. Wright. Modelling—Peter M'Laren. Design and decorative art—Florence Jacob, Peter M. Somerville. The gold medal instituted by Mr. Bram Stoker for "the best imaginative work of the session in any branch of effort in the school" has been gained by David B. Carter, and silver medals have been awarded to Isobel Hotchkis and Annie French. The Glasgow Institute of Architects' prizes have been gained by Evan D. Smith, 1st prize; T. Dunlop Rankin, 2nd prize.

TESSERÆ.

Reynolds's Historical and Imaginative Works.

AS many lovers of painting may wish to have a catalogue of Reynolds's historical pieces, we subjoin the following:—Hope nursing Love; Venus chastising Cupid for having learned to cast Accounts; Count Ugolino in the Dungeon; the Calling of Samuel; Ariadne; a Captain of Banditti; a Beggar Boy; a Lady in the character of St. Agnes; Thais; Dionysius the Areopagite; an infant Jupiter; Master Crewe in the character of Henry VIII.; the Death of Dido; a Child Asleep; Cupid Sleeping; Covent Garden Cupid; Cupid in the Clouds; Cupids Painting; a Boy Laughing; Master Herbert in the character of Bacchus; Hebe; Miss Meyer in the character of Hebe; Madonna, a head; the Blackguard Mercury; a little Boy (Samuel) Praying; an old Man Reading; Love losing the Zone of Beauty; the Children in the Wood; Cleopatra dissolving the Pearl; Garrick in the character of Kiteley; Garrick between Tragedy and Comedy; Mrs. Abingdon in the character of Comedy; a Child surrounded by Guardian Angels; Miss Beauclerc in the character of Spenser's Una; Resignation; the Duchess of Manchester in the character of Diana; Lady Blake in the character of Juno; Mrs. Sheridan in the character of St. Cecilia; Edwin, from Beattie's "Minstrel"; the Nativity, Four Cardinal Virtues, and Faith, Hope and Charity, for the window of New College Chapel, Oxford; the Studious Boy; a Bacchante; a daughter of Lord W. Gordon as an Angel; the Holy-Family; the Cottagers, from Thomson; the Vestal; the Careful Shepherdess; a Gipsy telling Fortunes; the infant Hercules strangling the Serpent; the Mouse-trap Girl; Venus; Cornelia and her Children; the Bird; Melancholy; Mrs. Siddons in Tragedy; Head of Lear; Mrs. Talmash in the character of Miranda, with Prospero and Caliban; Robin Goodfellow; Death of Cardinal Beaufort; Macbeth, with the Cauldron of the Witches.

Anglo-Saxon Masonry.

The Pharos in Dover Castle is a fine specimen of Roman excellence; its builders could not get hewn stone, but they so bound their flint rubble with bands of brick that the tower stands like a rock. Close by is the desecrated church, with a good deal of undoubted British masonry in its shell. Here, too, there is "Roman brick" in the quoins, &c.; but the general inferiority of the masonry to the real Roman work is very striking. Then again the fine Romanesque ashlar in the chapel of the Norman keep in the same fortress is a specimen of the reviving art of masonry, but it is in kind like that of the little parish church near the Caen quarries. The stones are all small, though beautifully and effectively used; there is no single stone to tempt you to measure its length and width and to exclaim at its bulk, which seems to be the general effect produced on people's minds by modern masonry. As a matter of fact, it must, we suppose, be granted that the architects of the Romanesque and Early-Pointed styles could not procure large stones; they were compelled to use even fine building stone—like that (which they so highly valued) of Normandy—in small masses, as they could inartificially obtain it from the quarries. So late as 1841 there was not a single crane at Caen by which to ship the stone had it been extracted in very large blocks, a fact that may assist us to comprehend the great mechanical disadvantages under which the Mediæval architects laboured. But though their stone was in such small pieces, how beautifully they used it. Of course there is a great deal of ancient work that is very bad; although what has stood for six or seven centuries may seem fairly entitled to entire exemption from any blame. But as a general rule early masonry—at least after the later Romanesque had superseded the Anglo-Saxon kind—is surprisingly excellent, not only for solidity, but for keeping and harmony. It suits the style. The eye is satisfied entirely, without knowing or inquiring why. You admire the design, and feel almost unconsciously that it is worthily embodied in its material exhibition. You are neither induced to examine and commend the ingenuity with which the difficulties of a bad building stone are overcome, nor are you called on to join in the vulgar admiration of "such big blocks." In a word, you forget such a mere detail in the whole; but when you can descend from the whole into particulars you find them all that can be wished.

Guatemala Cathedral.

The old churches in Central America are, or are intended to be, in the Italian style. Guatemala Cathedral is the only correct and fine church in the country. It was built by an Italian architect in the last century, after the destruction of the cathedral of Old Guatemala by an earthquake. In general correctness of style it is perhaps equal to St. Paul's Cathedral, London; and the churches generally are nearly as good as provincial churches in Italy. This cathedral is perhaps about 300 feet long. There is a lady chapel east of the high altar with an apsidal end. The nave, which is about 35 feet wide and 40 to 45 feet high, has double aisles, each 15 to 20 feet

wide, north and south clerestory and transepts, or quasi-transepts with chapels. The walls are of great thickness and the windows rather small for the size of the building, which has a gloomy appearance. The window frames are of wood, and do not open sufficiently to ventilate the buildings properly. The orientation of the churches generally is correct or nearly so; and the principal entrance almost always in the west front or portico. Guatemala Cathedral has a dome over the choir. The other churches generally have a kind of dome or dome-covered tower. It has a good peal of deep-toned bells; and the organs, clocks and bells generally are good, and of Spanish manufacture. The roofs, both of the nave and aisles, are plain semicircular stone vaults, covered externally with stucco or cement; there is no timber, lead or slate used.

An Irish Hermitage Settlement.

Ardoilen, or High Island, is situated about six miles from the coast of Omey, and contains about 80 acres. From its height and the overhanging character of its cliffs, it is only accessible in the calmest weather, and even then the landing, which can only be made by springing on a shelving portion of the cliff from the boat, is not wholly free from danger; but the adventurer will be well rewarded for such risk, for, in addition to the singular antiquities which the island contains, it affords views of the Connemara and Mayo scenery, of insurpassable beauty. The church here is among the rudest of the ancient edifices which the fervour of the Christian religion raised on its introduction into Ireland. Its internal measurement, in length and breadth, is but 12 feet by 10, and in height 10 feet. The doorway is 2 feet wide and 4 feet 6 inches high, and its horizontal lintel is inscribed with a cross, like that on the lintel of the doorway of St. Fechin's great church at Fore, and those of other doorways of the same period. The east window, which is the only one in the building, is semicircular-headed, and is but 1 foot high and 6 inches wide. The altar still remains, and is covered with offerings, such as nails, buttons and shells, but chiefly fishing-hooks—the most characteristic tributes of the calling of the votaries. On the east side of the chapel is an ancient stone sepulchre, like a pagan kistvaen, composed of large mica slates, with a cover of limestone. The stones at the ends are rudely sculptured with ornamental crosses and a human figure, and the covering slab was also carved, and probably was inscribed with the name of the saint for whom the tomb was designed, but its surface is now much effaced; and as this sepulchre appears to have been made at the same time as the chapel, it seems probable that it is the tomb of the original founder of this religious establishment. The chapel is surrounded by a wall, allowing a passage of 4 feet between them; and from this a covered passage, about 15 feet long by 3 feet wide, leads to a cell which was probably the abbot's habitation. This cell, which is nearly circular and dome-roofed, is internally 7 feet by 6, and 8 feet high. It is built, like those in Arran, without cement and with much rude art. On the east side there is a larger cell, externally round, but internally a square of 9 feet, and 7 feet 6 inches in height. Could this have been a refectory? The doorways in these cells are 2 feet 4 inches in width, and but 3 feet 6 inches in height. On the other side of the chapel are a number of smaller cells, which were only large enough to contain each a single person. They are but 6 feet long, 3 feet wide and 4 feet high, and most of them are now covered with rubbish. These formed a Laura like the habitation of the Egyptian ascetics. There is also a covered gallery or passage, 24 feet long, 4 feet wide and 4 feet 6 inches high, and its entrance doorway is but 2 feet 3 inches square. The use of this it is difficult to conjecture. Could it have been a storehouse for provisions? The monastery is surrounded by an uncemented stone wall nearly circular, enclosing an area of 108 feet in diameter.

The Bridges Committee of the London County Council have written to the Woolwich Borough Council regretting that, owing to the County Council's heavy commitments, it cannot proceed at present with the scheme for a subway under the Thames at Woolwich.

The First Summer Excursion of the Leeds and Yorkshire Architectural Society took place on Saturday, the 13th inst., when the members visited the new St. Anne's (R.C.) Cathedral now in course of erection in Cookridge Street, Leeds. The visitors were met and conducted over the works by the architect, Mr. J. H. Eastwood, to whom a vote of thanks was accorded on the motion of Mr. Butler Wilson, president of the Society. The members then inspected additions to Messrs. Spark & Son's printing works, where a new system of fireproof flooring known as the "Fram" has been introduced into Leeds by the architects, Messrs. Butler Wilson & Oglesby. The party afterwards journeyed to Seacroft, where a new infectious diseases hospital is in progress from the designs of Mr. Edwin T. Hall.

NOTES AND COMMENTS.

THE decision of Mr. CURTIS BENNETT in a case of seven summonses issued by the Hampstead Borough Council against Mr. TENNANT, a contractor, for making structural and sanitary alterations at the Finchley Road Station without giving notice to the Council must have excited commotion in the offices of railway engineers and architects. It is generally understood that, as the premises of railway companies exist by means of special Acts, they are exempted from the operation of ordinary by-laws. The London Building Act affords evidence of the fact. But the Hampstead Council contend there is no clause in the Public Health Act and Metropolitan Management Act which authorises any exemption of railway premises. In section 45 of the Public Health Act, 1891, which relates to management of public closets by sanitary authorities there is the usual formula:—"Nothing in this section shall apply to railway stations." The Council say the exemption proves that the other sections are to be applied. Mr. CURTIS BENNETT adopted that view. He considered the company had not acted wisely from a health point of view in the alterations they had made, and that the Public Health Act did apply to this case. He had come to the conclusion that the company had offended in reference to all the summonses. Fines and costs amounting to 11*l.* 6*s.* were inflicted. This, Mr. CURTIS BENNETT remarked, was the first case of this kind which had ever been decided, and if the decision he had come to was right, it would have a far-reaching effect, for it would touch every railway in the country. It is not surprising that notice of appeal was given.

WE referred lately to the condition of the schools in East Sussex which were taken over by the new educational authority. The West Sussex schools appear to be in a more satisfactory state. Sixty-five of them were examined, and according to the surveyor the matters requiring chief attention were poor sanitary arrangements, faulty ventilation and lighting, and unsuitable playgrounds. In some small schools infants' classrooms were badly needed. In larger schools improvement would sometimes result from the more general use of suitable partitions. It was always possible to suggest improvements, but in some cases these were of a minor character. As in East Sussex the sanitary arrangements were often found to be very unsuitable. The sub-committee recommended that notice be sent to all schools stating that a good and sufficient supply of water is necessary for every school, and that such supply should be provided quite separate from the teacher's dwelling-house where such dwelling-house adjoins the school. An amendment was proposed that the question of water supply should be postponed, and it was agreed to by a majority of one.

THE "James Forrest" lecture was intended to be a memorial of the late Secretary of the Institution of Civil Engineers, who applied a part of the money subscribed for his portrait to that purpose. This year Mr. W. H. MAW was selected as lecturer, the subject assigned being "Some Unsolved Problems in Engineering," and his discourse was delivered at the opening of the Engineering Congress on Tuesday. In the course of it he referred to the so-called "factors of safety" employed in the design of structures, and which, he said, might more properly be described as "factors of ignorance." It was pointed out that a more exact knowledge of the effect of wind pressure, especially on the lee-side of roofs, might result in a revolution in the construction of such structures; whilst the question of stresses in girders, the effect of compound stress in stayed plates, girders and boiler shells, the determination of elastic resistances, the effect of alternating bending stresses, elastic fatigue and other problems of this nature were referred to, and instances were given of the influence they should exert on design of engineering structures. To the employment of the microscope, it was said, we must look for our chief aid in determining the changes which the structure of metal undergoes as the result of the application of repeated loads. The action of oil tempering, the thermal treatment of steel, and the action of the alloys, especially the alloys of nickel and iron, were also considered. On the latter point our knowledge was meagre, and consisted

chiefly of isolated tests. The results obtained had shown the material to be of the greatest value, and the time had come when an exhaustive examination should be made. An alloy iron containing 35 to 36 per cent. of nickel had an exceedingly small change of volume, the linear expansion and contraction under the influence of heat being only about that of one-tenth of platinum, that is to say, it was practically insensible to ordinary atmospheric changes. They had there the singular case of two metals, possessing about the same coefficient of expansion, giving when mixed under certain conditions only about 1-13th to 1-14th of that of either of the metals separately. In conclusion Mr. MAW spoke about the progress of electrical engineering, which he considered as exemplifying what can be done when physical research is combined with engineering.

THE narrowness of Balls Bridge, which carries the main road from Kingstown to Dublin over the river Dodder, was found to cause so much inconvenience on the occasion of the last visit of Queen VICTORIA to Ireland, there was a resolve to widen it. Plans were prepared by Messrs. PARRY & ROSS for the work. The lowest tender received was from Messrs. H. & J. MARTIN, which amounted to 7,230*l.* Afterwards the design was modified, and the tender was reduced to 6,643*l.* That was in 1899. The work was not commenced, and in 1902 an inquiry was held, after which a loan of 8,000*l.* was sanctioned. After another delay it was decided to have the quantities again taken out by a different firm of surveyors, but from the same plans. Messrs. MARTIN's tender was 8,397*l.*, while another from Messrs. STEWART was received for 7,645*l.* There seems to be no prospect of saving by the experiment, but the reverse. Both sets of quantities will have, we suppose, to be paid for, and the bridge will cost more than if constructed four years ago. In such a case the auditor of the Local Government Board would do well to withhold his approval of the unnecessary surveyors' work, and to let the expense be borne by the members of the local Urban Council.

M. ANTONIN MERCIÉ, the French sculptor, is a sufferer through the Servian tragedy. He had completed the model of the equestrian statue of King MILAN, which was to bear the inscription, "Regi Milano patriæ gratitudo erexit." The pedestal is flanked by symbolic groups, and on two of the sides are reliefs, one showing the King receiving the keys of the city of Nisch, and the other the King reading his proclamation before the Servian Assembly. The work was to be erected on a part of the fortification of Belgrade, near the Danube. M. MERCIÉ was about to start for that city to submit the model and to prepare busts of King ALEXANDER and his Queen when the news arrived of the assassination. It is, of course, doubtful whether the Servians will care sufficiently for the memory of a King who abdicated to undertake the expense of a costly monument of him.

UNTIL a recent time Mr. WATERHOUSE could be considered as physically among the few vigorous Academicians, and no architect was more vigilant in the practice of his business. It was hoped that with his constitution his attack of illness would cause no more than temporary weakness. The announcement of his joining the retired Academicians therefore caused regret, and the accuracy of the news was doubted. On Wednesday, however, there was an election to fill the vacancy caused by his retirement. It was anticipated that Mr. DAVID MURRAY, who has quickly secured position by his fine landscapes, which seem to be as unstudied as natural scenes, would be successful. Mr. ASTON WEBB has, with more fitness, become the successor of Mr. WATERHOUSE. It is not often an architect who is so comparatively young has attained a similar position, as well as the Presidentship of the Institute. Mr. WEBB has done and is doing excellent work, but it is safe to anticipate, if opportunities are given, he will exceed his past in the future.

PROPOSED HOUSE AT HIGH WYCOMBE.

HOUSE, BRANKSOME PARK, BOURNEMOUTH.

WARNHAM COURT AND CHRIST'S HOSPITAL.*

THE Manor of Warnham is traced back to 1272, when it was held by William de Saye. It passed in turn to Sir John Doyley, to the De Lewknors and the Coverts, and eventually the main part was acquired by Sir John Caryll, Kt., who died in 1613. In those days the manor house was known as Warnham Place. Warnham Court lies near the village of Warnham, which is about three miles from Horsham, and a very pretty Sussex village it is. It consists mainly of one long street running north and south, and has many pleasant residences in its neighbourhood, of which Warnham Court is a good and pleasing and fine example of a modern Elizabethan home, the characteristic features of which have been made suitable for the tastes and requirements of the present day. Its beauties are manifold, but they are purely of that quiet, domestic character that is utterly opposed to ostentation and show, and that give it an air of comfort possessed by but a few of its more pretentious neighbours. Sussex is a county of many mansions," and they are as varied in their style and their architectural character as they are in the periods in which they have been erected; but few can, out of the whole, compare with Warnham Court in pleasantness of situation, in beauty of external surroundings or in comfort of internal arrangements; it is a house fitted for hospitality and for the enjoyment of the guests its owner delights to have around him—it must be ranked as a home of taste. Mr. Lucas is a liberal patron of art; the walls are hung with pictures of matchless excellence, chiefly by modern, and most of them by British, artists. A list of them would include nearly all the best painters of the age. Warnham Court was built in the Elizabethan style, in place of an older house, in the beginning of the last century, by Henry Tredcroft, of Horsham, a fine old Sussex squire, and at his death was sold to Sir Thomas Pelley, Bart., who made it his residence. The whole estate passed by purchase from the executors of Sir Henry Pelley in 1866 to its present owner, Mr. Charles T. Lucas, the head of the well-known firm of Lucas Brothers, the eminent builders and contractors, to whom we are indebted for the privilege of visiting the place to-day. By Mr. Lucas the house has been remodelled and considerably enlarged, its Elizabethan character being, however, carefully preserved in every detail. Mr. Lucas is the eldest son of the late James Lucas, and is Lord of the manor of Warnham, a governor of Christ's Hospital and a magistrate for the county of Surrey, and is highly esteemed and honoured, and no one is more thoroughly entitled to the lofty position to which, by honourable industry, great ability and high character he has attained. The mansion is approached from the principal lodge entrance by a drive through the park, which is finely timbered with forest trees of large growth; these are chiefly oaks, of which there are some remarkably fine and gigantic examples. Under these roam innumerable herds of red and fallow deer, which add much to the beauty of the park scenery. The lodge, with its overhanging roofs, its mullioned windows, its geometrical chimney-shafts and its advanced porch, is one of the most picturesque and pleasant in the county. The mansion itself is situated on an eminence, and commands extensive views of the surrounding country. On the east side is the carriage entrance, which is a spacious gravelled courtyard, enclosed next the park by a stone balustrade. On the south side is the grand terrace, a fine promenade walk some 600 feet in length by 20 feet in width, adorned with statuary, and overhung and shaded by magnificent trees. This terrace is supported at an elevation from the park of about 10 feet by a massive stone wall and elegantly designed balustrade; in the recesses are fine examples of sculpture, and the balustrade itself supports a number of elegant vases, terminals and other ornaments, placed at regular distances. The park from this point slopes gently away till it ends in a fine ornamental lake. Looking to the eastward down a lovely glade in the park, another and more magnificent piece of water, covering an area of over 30 acres, is seen in the distance. On the right, while passing along to the west end of this terrace, stands the conservatory, which is filled with the choicest exotic palms, tree ferns and flowering plants. In the centre, on a massive marble base, stands a magnificent sculptured group of figures in white marble. The surrounding grounds are beautifully undulating and diversified, and comprise the flower garden, croquet lawn and American garden. The latter is situated in a natural dip of the ground, and is completely encircled and sheltered by a dense mass of oaks and other forest trees, at the foot of which is a broad belt of common laurel, rhododendron, &c. Then follows a winding walk, encircling about an acre of grass lawn, on which are planted masses of azalea, rhododendron, kalmea, andromeda, specimen coniferæ, &c, the whole producing a strikingly pleasing effect. At the end of this terrace is a broad flight of

steps, leading to another terrace walk nearly a quarter of a mile in length, and flanked for most of that distance on each side with masses of rhododendrons, alternated with some fine specimens of Cedrus deodara and the Chinese juniper. Again descending by another flight of steps, access is gained to the rose garden. This garden of roses, which is of perfect Eastern loveliness, takes the form of a half-circle, filled entirely with the choicest roses, backed by a broad belt of flowering rhododendrons. It contains upwards of a thousand standard roses, and nearly as many dwarf roses, which comprise examples of every colour, shade and variety that are worth cultivating. The effect when these are fully in flower is enchanting in the extreme. There is a very choice collection of dwarf Japanese forest trees, some of which are 150 to 300 years old. The forcing and plant houses occupy three sides of a square, and are kept gay with flowers all the year round. In the camellia house is a plant of the old double white camellia, 20 feet across and more than that in height. The rose house is filled almost entirely with tea scented roses. The vineries and the peach houses are simply splendid, with their luscious treasures in different stages of growth. The orchid house is full of the choicest and rarest plants, and the mode of their cultivation is seen and is most interesting. The kitchen garden comprises about four acres. The park is some 350 acres in extent, and the farm occupies about 600 acres more; the pleasure grounds add another 50 acres, so that Warnham Court is a fine and noble property, unmatched in its district.

Warnham Church we visited last year, and its history and monuments were fully dealt with by Mr. Truslove.

The new Christ's Hospital Schools at Horsham, which, by the kind permission of the Rev. Arthur W. Upcott, we have been able to visit to-day, occupy a charming position in thickly-wooded surroundings, and when viewed from Tower Hill, across West Horsham, present a very picturesque scene,

[WARNHAM COURT.]

with their dignified and stately turrets. The ground upon which they are built was but a few years since the estate of the Aylesbury Dairy Company, which has now become the home of one of the largest historical educational institutions in the world, and is undoubtedly admirably suited for the purpose. From them you get in one direction distant views of the Surrey hills and in another the Sussex downs, and from the point of view of healthfulness the position cannot be surpassed. The ground covers an area of nearly 1,400 acres, the part allotted to the school buildings extending to about 120 acres; the frontage is a quarter of a mile long. The general design of the new structure possesses as its central feature the great hall, with its entrance leading into the quadrangle; that on the northern side being the dining-hall, while the chapel is on the west and the science and art school on the east. All are so

* A paper read by Mr. Henry Virgoe before the members of the Upper Norwood Athenæum.

designed that one may pass through them all without leaving a covered way, the same passage giving access to the classrooms on the south and east. The great hall is somewhat larger than its predecessor and is noticeable for its fine interior. The chapel is perhaps the most handsome building; although treated on similar lines to the great hall, it has the advantage of bearing a more elaborate character. With regard to the dining-hall, the lines of the old hall have been followed to some extent and with great success. On the side facing the quadrangle are fixed the beautiful stained-glass windows from the old hall, the Royal windows being at the head, and those bearing the well-known coats-of-arms at the side. On the north side is placed Antonio Verrio's huge picture.

The quadrangle has been admirably laid out with the statue of Edward VI. in the centre, accompanied by a fountain, while in four niches of the buildings forming the quadrangle are statues of Queen Victoria, King Edward VII., the Duke of Cambridge, and the treasurer, Mr. Alderman Vaughan Morgan.

The house blocks, of which there are eight, are divided into two houses, each for fifty boys and two house masters, besides the domestic staff. It may be interesting to mention that the school houses are named after old boys, viz.:—Maine, Barnes, Lamb, Coleridge, Middleton, Thornton and Peele, and that over the doorway of each is a sundial. There are 800 boys in the schools, and thirty-two classrooms.

The architects were Messrs. Aston Webb & E. Ingress Bell, and the builders Messrs. Longley & Co., of Crawley. The cost was about 300,000.

CHRIST'S HOSPITAL.

the foundation and endowment of this hospital and the Royal Mathematical School by His Majesty King Charles II. by letters patent in 1673 and 1675."

With regard to the controversy which arose respecting the centre figure, as to whether it was Charles II. or James II., it was Mr. Carey's opinion that it represented James II. He said:—Verrio having been engaged some years upon the picture, he probably completed the middle part of it during the first two or three years of the dates given on the tablet. Samuel Pepys, at whose instigation the picture was painted, had some difficulty in getting Verrio to finish it, and said the sides of the huge painting were probably hurried off at a later date by him and his assistants. This accounted for some of the work at the sides being inferior to the centre piece. The notorious Justice Jefferies and Samuel Pepys are portrayed and also the founder, Edward VI.; while the lord mayor, in a red robe, is drawing the king's attention to the work of the scholars, the head master being in a kneeling position before a globe, representing the world. On the right of the picture, behind the head master, are depicted the boys, and on the left of the canvas are the girls, while the masters and professors are also represented, together with Verrio, whose back, however, is only shown, as he has turned, and is, presumably, speaking to the attendants. The picture has a new frame of Oregon pine, the ceiling of the huge dining-room being of similar wood.

Another ancient picture of the school, representing King Edward VI. presenting the Charter to the Lord Mayor of London, is extremely interesting; the lord mayor, aldermen

CHRIST'S HOSPITAL.

The boys from both Newgate Street and Hertford took possession of the schools in June 1902. The girls remain at Hertford.

The following figures show the magnitude of the work. There were used:—20 millions of bricks, $1\frac{1}{2}$ millions of tiles, 31,000 tons of sand, 5,000 tons of cement, 15,000 tons of beach, 5,000 tons of coke breeze, 21,000 yards of wood-block flooring, which was equivalent to 5 acres; 100,000 cubic feet of Bath, Portland and York stone; and the approximate amount of tonnage was 150,000 tons. In addition there were 40 miles of hot-water pipes, and 98 miles of electric wires.

A few notes which I have come across may not be uninteresting, relating, as they do, to the removal of various statues and pictures from Newgate Street to their new home. With the statues this was found to be not an easy task by any means, considering the fact that some weigh nearly a ton. Great skill and care had to be exercised to remove them and transfer them to the new school, where they are raised and fixed on alcoves at a great height without the least damage. In order that the school should retain some of its ancient associations, the whole of the brickwork around the alcoves was transferred from the old school to the new. Another and important work was the cleaning and restoration of the famous school picture. This required a great amount of delicate treatment, and it has been admirably carried out by Mr. C. W. Carey, curator of the picture gallery at the Royal Holloway College, Egham, assisted by Mr. Ralph Warner, and has undergone quite a transformation. This picture, which is hung in the dining-hall, is 90 feet in length and 15 feet high, and for the purpose of removing it was found necessary to cut the canvas in three pieces. The tablet affixed to the picture states:—"This monumental picture, the work of Antonio Verrio, was designed and painted in 1684-90, to commemorate

governors and masters of the school, and Bishop Ridley, in his robes, are depicted, with the boys on one side and girls on the other. This picture, reputed to be by Holbein, Mr. Carey considers to be the work of Sir Antonio More, Holbein having died before the incident depicted took place. More was a Dutchman, educated by a Dutch painter, and thus was practically equal to being a Flemish painter. He then went to Italy and studied for a few years; afterwards he went to Spain, where he became eminent. He was then sent over to England by Charles V. to paint the portrait of Queen Mary for her future husband Philip. More was so successful in England that Queen Mary appointed him court painter. He came to England about the year that the incident in the painting happened. The picture, when in the old school, was indistinguishable, owing to dirt and dust, but after undergoing a thorough process of restoration, the original colours are now showing considerable richness, the figures being seen clearly and vividly. The tablet states:—"This great picture, attributed to Hans Holbein, commemorates the incorporation by the future King Edward VI. of pious memory of the three Royal Hospitals of Christ, Bridewell and St. Thomas the Apostle by a common charter, dated June 26, 1553."

I have not thought it necessary to go over the history of the Bluecoat School, as it was so exhaustively done by our friend Mr. Alexander when he conducted us over the buildings in Newgate Street some three years ago—a full account of which appears in our annual volume, and is most interesting.

I am indebted to Mr. Alderman Vaughan Morgan, the *Architect and Contract Reporter*, the *Sussex Daily News*, the *Southern Weekly News*, Llewelyn Jewitt, F.S.A., S. C. Hall F.S.A., H. S. Vaughan and W. F. Harradence for the foregoing particulars. The illustrations are from photographs by Mr. Wheeler and Mr. Virgoe.

THE CELTIC GOLD ORNAMENTS.

ON Thursday in last week the unique case Attorney-General v. Trustees of the British Museum began in the Chancery Division of the High Court before Mr. Justice Farwell. The claim was for the delivery of certain ancient Celtic ornaments, some time since found near Limavady, County Derry, and now in possession of the defendants, being alleged to be treasure trove belonging to His Majesty the King by virtue of his prerogative royal and in right of his royal crown. They consisted of (1) a hollow collar in two sections, with elaborate repoussé ornament of eccentric curves, of Celtic workmanship, and dating probably from one of the early centuries of the Christian era; (2) a model boat with eight (originally nine) thwarts and a number of oars, spars, &c.; (3) a hemispherical bowl of thin metal, with four rings at the edges for suspension; (4) a solid gold torc of stout wire, with thinner wire twisted round it; (5) one half of a similar torc; (6) a necklace formed of three plaited chains, with a peculiar fastening; and (7) a thin single chain necklace of the same plaiting.

The Attorney-General, in the course of his address, said all the ornaments were found within a space of 9 inches, and seemed to have been concealed. The land was not reclaimed from the sea. The question to be decided was, Were they to be considered as treasure trove? According to Coke:—Treasure trove is gold or silver in coin, plate or bullion, which hath been of ancient time hidden wheresoever it be found, whereof no person can prove any property; it doth belong to the King, or to some lord or other by the King's grant or prescription." If the British Museum could prove the title of the person who sold the articles, the Crown would have no right, and a suggestion had been made that the sea flowed over the land where the articles were found, but in some unexplained way they had remained after the sea had receded. He need not inquire how many thousand years before the Christian era the sea flowed over the ground. It was also said the articles were a votive offering to a heathen deity, but he maintained, whether that was the fact or not, it would not affect the question of the articles being treasure trove. The trustees of the British Museum contended that by a charter of James I., 1613, treasure trove in this part of Ireland where the articles were found belonged to the Fishmongers' Company, on whom it was conferred by the Irish Society. This defence, however, was not open. Treasure trove belonged to the class of rights known as *jura regalia*, and the right could not pass from the Crown as suggested. The charter of James I. was forfeited by a judgment of a Court of Chancery, but in 1662 King Charles II. gave a fresh charter to the Irish Society. It was contended for the British Museum authorities that the charter conferred the right to treasure trove upon the Irish Society. He argued that it would not avail the defendants to set up a title to the gold ornaments found at Limavady in a third party against the King, but they must aver the right in themselves. It would be most inconvenient that our title should be tried by third parties and not by the Irish Society and Fishmongers' Company, who are not here making the claim.

Mr. Warmington: The trustees have an order from the Fishmongers' Company to the effect that they had passed a resolution passing their rights in the relics to the British Museum authorities for the better preservation of the relics.

The Attorney-General suggested that his lordship should deal with the case as it stood, and if the Fishmongers' Company had any right they could proceed by petition of right, and if they succeeded they could hand the relics over to the British Museum. He understood, however, that the Fishmongers' Company did not care about the articles.

His Lordship: Must you prove that the things were hidden? It would be a very difficult thing to prove. There might have been a landslip. Must you prove that they were hidden?

The Attorney-General: Yes, my lord; but the fact that they were found in the condition they were, all together in a few inches, indicates that they were hidden there by someone, and that shows that they were treasure trove.

His Lordship: Supposing they were dropped by accident?

The Attorney-General: I could not then contend that it was treasure trove; but I maintain that here the ornaments were placed or hidden intentionally. They were found all together in stiff clay 14 inches deep, and the inference is that they were placed there.

His Lordship: If they had been found at intervals of 30 or 50 yards you would not say they were treasure trove?

The Attorney-General: No, my lord; in those circumstances I could not maintain that they were.

Thomas Nicholls said that in 1896 he was engaged in ploughing land known as the six-acre field. A man named Morrow, since dead, was working with him, Morrow being in front and witness followed after, making a deeper furrow with an American plough. The land was of stiff clay. Suddenly

the plough met with a hard substance, and was turned out of its line. He examined the plough and found something fastened on it. He looked and found the gold ornaments produced. They occupied a space of 9 inches. The spot was 15 yards from the hedge. He took them in and had them washed by Mrs. Nicholls, subsequently handing them over to Mr. Gibson, the farmer. The ornaments were about 16 inches below the surface.

Cross-examined: The occasion when he found the ornaments was the first time he had worked in the field. In ploughing he occasionally turned up shells. They were the same sort of shells as those found on the shore. When he examined the ground where the ornaments were found he had not to dig for them. They were on the surface at the bottom of the furrow. They were bright just as they were now, but not the same shape. The boat was more like the bowl than its appearance presented now.

Mr. H. Myers, surveyor, stated that the last witness pointed out to him where the ornaments were found, which was marked on a map.

Mr. Justice Farwell: What am I to assume as to the age of the articles?

The Attorney-General: It is common ground that they are very old.

Mr. Warmington, in opening the case for the defence, said that the Attorney-General had taken his authorities from what in another place might be called a high Tory source. But there was another high Tory authority, whose views on treasure trove were a little different. He would not argue the point now, but merely indicate what Blackstone laid down, as set out in Stephen's Commentaries, 3rd Edw., vol. ii., bk. iv., part 1, p. 530. On the evidence, their case was that this was not a case of abandonment at all, but a case of a votive offering made to a deity. In comparatively recent times there had been an upheaval of land formerly covered with water in this and other localities, and it was a well-known custom of the ancients to place votive offerings in the water to propitiate the water deities. They contended that these articles were so placed in the water and that the spot where they rested afterwards became dry land. This contention would involve evidence from geologists and from persons who had made a study of votive offerings. The period to which he alluded might be roughly put as extending from the third century B.C. to the first century A.D.

Mr. J. L. Myres, student and tutor of Christ Church, Oxford, and lecturer in Classical archaeology in the University, was then called and a question was put to him as to the general characteristics of a votive offering.

The Attorney-General objected to the evidence.

Mr. Justice Farwell: I am unwilling to shut out evidence, but I cannot have a lecture on votive offerings. This is not pleaded. However, I will hear the evidence *de bene esse*, but will take a note of the objection.

Mr. Myres said that in general a votive offering was some offering given by somebody to a deity either to secure a future advantage or as thank-offering for an advantage already received. As to offerings to water deities, if the deity had a recognised place on land where he might be easily approached the offering was placed there. If not, it was placed in the water. Offerings were sometimes wrapped up. In some cases they were disfigured before being put in the water in order to liberate the supposed soul of the offering. The same thing was still done in the Malay Peninsula. He had read of cases of offerings which had been placed in water being recovered, but he had not himself come across such a case.

The witness was then examined as to specific instances of offerings made to water deities. He gave instances from Greek literature. Pausanias, book 8, ch. vii., mentioned horses being thrown into the sea as an offering, and Herodotus related how Xerxes threw a gold cup and a sword into the Hellespont. Tacitus, in "Germania," ch. 40, spoke of slaves being drowned in pools. There were other instances in Frazer's "Golden Bough" and in Hartland's "Legend of Perseus," among the latter being the case of a well in Roscommon into which offerings were thrown. In Denmark offerings had been discovered in lakes which had gradually been filled up. The model of a boat had been found in what was once a branch of the Humber.

Mr. Justice Farwell: What you have to show, I think, is that within any reasonable period in this district of Ireland there was a water deity to whom it was customary to make votive offerings. I shall have to hear what the Attorney-General has to say on all this evidence. As at present advised the evidence, though interesting, does not help me very much.

After the witness had been briefly cross-examined by the Attorney-General, the Court adjourned.

On the second day Mr. Warmington read the depositions of Mr. Arthur Evans, keeper of the Ashmolean Museum at Oxford, who had the objects in question at his own house for some time in order to study them, and who communicated a paper on the subject in 1897 to the Society of Antiquaries,

which was embodied in the present depositions. Mr. Evans arrived at the conclusion that the articles constituted a votive offering. He thought that the chains were of foreign work, the collar of Celtic work contemporary with the chains, and that the boat was made expressly for a votive purpose. He could not imagine that any one could have the idea that the articles formed part of the treasure of a monastery, and considered as far-fetched and improbable the suggestion that they might have been stolen and hidden by a robber. Nor did he think that they had been collected as works of art and hidden for security in comparatively recent times. It would be a curious coincidence that so many contemporary things should have been placed together by a person who had not our present knowledge of the subject. He did not look on the boat or the bowl as works of art.

Mr. McCausland Stewart, harbour engineer, Londonderry, said that the place where the articles were discovered was about 4½ feet above ordinary high-water on Lough Foyle. There was a specially high tide in February of this year, which washed over the embankment of the Lough, and the level of the water must then have been higher than the spot where the articles were found.

Professor Edward Hull, F.R.S., said that he was formerly director of the Geological Survey of Ireland. The spot where the articles were found was part of what was known to geologists as a raised beach. The raised beach extended all along the north coast of Ireland and down the east coast as far as Wicklow. In the north it was about 15 feet high, but towards the south its height was only about 4 feet. Its general character was that it was a nearly flat terrace of varying width, with the old coast line on the inland side and a slope down to the sea on the other side. A similar formation was found in Scotland, but there the height was generally greater—about 25 feet. The Carse of Gowrie was an example. In the raised beach in the north of Ireland were found not only shells of the present period, but flint arrow-heads and other articles made of flint. In Scotland there was stronger evidence of the date of formation. There had been found skeletons of whales and canoes, some hollowed out of single trunks, but others clinker-built of sawn planks with holes for rivetting. Iron anchors and boat-hooks had also been found in the raised beach in Scotland. The raised beaches in Ireland and Scotland were a simultaneous formation in his opinion. The iron implements were important in fixing the date. He should say that the beaches began to be formed about the fourth century A.D. His opinion was founded upon all the sources of information available. In his opinion, the articles were deposited in the sea as votive offerings and were found on the upper surface of the raised beach. The soil above them was not marine, but had accumulated after the raising of the beach. The inference to him as a geologist was that the articles were originally under the water and were raised about the fourth century A.D.

Cross-examined: It was impossible to say how much the beach would rise in a century; it might be 20 feet, or less than 1 foot.

By the Judge: The movement of the beach was simultaneous.

Cross-examination continued: He could not say when the articles came to the top. It might have taken 100 or 200 years for the beach on Lough Foyle to form.

The Solicitor-General: Have you anything as quick as that in any other country in the world?

Witness: It was the case that he said in his own book that the beach was formed since the occupation of the island by prehistoric tribes. It was a disputed question when the sea retired from these raised beaches. The flint implements dated from the Celtic era, which might be from the second century B.C. to the second century A.D. He could not say how long it would take to form the 16 inches of clay soil on the surface.

Mr. Wallace, an employé of Mr. Johnston, a Dublin jeweller, said that Mr. Day brought the articles to him to be repaired in April 1896. The collar was flattened. The boat was crumpled up like a bit of paper, and witness did not know what it was until it was restored to its original shape. The bowl was in even a worse condition. There was reddish sand in all the articles.

Cross-examined: There was no mutilation.

This closed the evidence for the defence.

The Attorney-General then obtained leave to call rebutting evidence.

Dr. Munro, a vice-president of the Society of Antiquaries of Scotland, said that he knew of no votive offering of this kind either in Scotland or Ireland. He regarded the theory put forward as very improbable. He believed that the collar belonged to the pre-Christian era in Ireland. He had studied the question of raised beaches, and believed they were formed some time before the Christian era and after the appearance of man. It was impossible to fix the date more nearly.

Mr. George Coffey, keeper of antiquities in the National

Museum in Dublin, said that he did not think the articles were votive offerings; more probably they had been concealed.

Mr. Justice Farwell: What I should like to have evidence of the existence of a water deity in the north of Ireland to whom votive offerings were made.

Mr. L. Horton Smith, as *amicus curiae*, referred the Court to Brash's "Ogham Inscribed Monuments of the Gaedhil" p. 22.

Mr. Coffey said some of the objects were damaged and some not, so that if they were delivered to the god mutilated that would be an insult to the god, and, conversely, if a mutilated ornament were offered when it ought not to be mutilated. The strong ornaments were broken and the slender ones, such as the bowl and boat, were crumpled up. These supported the theory that they were hidden, and not intentionally abandoned.

Cross-examined: Pagan tribes undoubtedly did offer votive gifts to the gods. He accepted the view that there were Pagan deities in Ireland. He could not, however, accept the statement that votive offerings were made in Ireland until they found them there.

Mr. Warmington: How many finds would you require to satisfy your archaeological mind?

Mr. Coffey: Ten or fifty. But it is not numbers that are to be regarded, but the consistency of the evidence. The whole question of votive offerings is obscure, and we are gradually opening it up. There are many finds in Scandinavia, but even here archaeologists of the first rank disagree as to the nature of the finds.

Continuing, the witness said the work of the ornaments was Late Celtic. There was nothing on the bowl or boat to indicate age. The wearing of a torc by Irish chiefs was mentioned in the early legends. Archaeologists regarded legends as evidence of something.

Mr. Robert Cochrane, superintendent of the National Monuments, Ireland, said he knew of no pre-Christian votive offerings in Ireland. He had never met with any reference to an Irish sea-god. A collection of gold ornaments found in county Clare in 1854 was accepted as concealed treasure. The Tara brooch found near the seashore at Drogheda and all such gold finds in Ireland had been regarded as of Christian origin. He knew of the theory with regard to the mutilation of these votive offerings, and he saw no evidence of mutilation in the Celtic gold ornaments found at Limavady more than might be accounted for by the impact of the plough. There were shrines in Ireland containing articles of much value, and there was no evidence of a shrine near this place. He thought the collar might date from any time up to the fifth century.

Cross-examined: As no votive offerings had been found in Ireland, this lent support to the view that there were no votive offerings there.

Mr. R. L. Praeger, Bachelor of Engineering and a member of the Royal Irish Academy, was next called. He said he had made a hobby of the geology of the north of Ireland and the raised beaches to be found there. He knew where the gold ornaments were found. Within a mile of the spot where the ornaments were he found that clay of the same kind as that at the spot was 25 feet deep. He thought the raised beach was in existence considerably before the Christian era. He thought the peat lands must have been in the stone age.

Cross-examined: Where he made his investigation was reclaimed land, and it was also part of the raised beach.

Mr. E. H. P. Coles, Professor of Geology, Ireland, said he thought there was evidence to support the view that the raising of the beach was of pre-Christian date.

Mr. Warmington, arguing from the definition of treasure trove in "Chitty on Prerogative," p. 152, submitted that there had been no evidence of actual deposit. The evidence had merely been of the finding of the articles some 18 inches below the surface and in a comparatively narrow compass. The Crown contended that mere finding in these circumstances was sufficient evidence that these articles constituted treasure trove. Articles might find their way into the ground by various methods, and the question was, Must the Court infer that these articles were intentionally hidden? Articles must be hidden for the benefit of the depositor in order to constitute treasure trove. There was nothing in the evidence to show a definite intention of hiding. [Mr. Justice Farwell: If that is carried too far I do not see how the Crown could ever succeed.] The presence of the boat, which was not a common form of ornament, was strong presumption of a votive offering. The pressing together of the sides of the boat and the bowl could not be attributed to the action of the earth—it was clearly intentional. If it was suggested that the articles were stolen from a shrine and concealed, there was no evidence of any shrine in the vicinity containing such articles. The idea of a votive offering was not arrived at for the purpose of the action, but was contained in Mr. Arthur Evans's account of the articles before their purchase by the museum. He discussed the authorities relied upon by the Attorney-General when opposing the contention that under the charters pleaded the

right to treasure trove had passed to the Fishmongers' Company. He would deal only with the grant to the Irish Society, or if that grant did not include the right to treasure trove, it was clear that the Irish Society could not grant the right to the Fishmongers' Company. In the first place, the grant by the Crown to the Irish Society would naturally include more than would be granted to a mere individual. The Irish Society was to plant and to have control of a very large tract of country. In the second place, he contended that the word "franchises" in the charter would pass the right to treasure trove. If it did not, it was a word of mere surplusage. What franchise could the Crown grant except a Royal franchise? Franchise was what the subject received, royalty was what the Crown granted, and when the Crown granted franchises, they could only be royalties. When the wide extent of the grant to the Irish Society was considered, the only reasonable construction was that the intention was to free the land granted from the exercise by the Crown of all Royal prerogatives.

Mr. Haldane, K.C., said the theory put forward by the defendants that the ornaments were votive offerings was quite plausible. It appeared to be the custom in pre-Christian times for the person making a voyage of peril to propitiate the deity of the sea by making some offering. This took place in all parts of the pagan world. The ornaments might have been deposited by some person sailing on the Irish seas, and in course of time, when the bed of the sea began to elevate, they came to the top. From the battered condition of the articles, the theory that the person who made the offering desired to allow the soul of the ornaments to escape to the deity was not improbable. A man who desired to conceal the treasure would have dug much deeper than 18 inches.

Mr. Justice Farwell: But a man making a votive offering would not conceal part of one ornament in another, as in this case. He would naturally want to make as good a show as possible and spread them out before the deity.

The Attorney-General argued that the unmistakable conclusion to be drawn from the concealment of the chain inside the gold collar was that the ornaments were concealed treasure. The Court was gravely told that in these pre-Christian periods there was a sea god, and that it was the habit of the people to throw things to him into the water. Further, it was contended that when the bottom of the sea became elevated and the water retreated these ornaments were exposed to view on the sea-shore for 300 years. Life and property in Ireland, even at that period, were never very secure, but still these gold articles remained untouched, although in full view of everybody. With regard to the practice of making votive offerings, no such recorded case as the present had ever been known in Ireland. He asked his lordship to treat these speculative hypotheses with all the respect they deserved. The obvious inference was that the articles were hidden treasure, probably on the part of some robber who feared being robbed by others, or the keeper of a shrine, who hid them from the Norsemen, who were very active in those parts, and made a famous raid up Lough Foyle in the year 850.

Judgment was reserved.

ARCHÆOLOGY IN THE SOUTH TYNE VALLEY.

A PARTY of members of the Architectural and Archaeological Society of Durham and Northumberland visited last week some interesting places in the valley of the South Tyne. Beltingham Church was described by Mr. C. C. Hodges. Twenty years, he said, had passed since the Society previously met there. A restoration scheme was then contemplated, and the work proposed was of such a character that they felt it their duty to enter a protest. The latter unfortunately, in the opinion of archaeologists and antiquarians, had no effect. Everything ancient was practically swept away. In the unrestored church were two very large pews resembling somewhat an old-fashioned four-poled bed; also a three-decked pulpit. These were destroyed, together with stone memorials of the departed, which in all probability were broken up and used to form the concrete of which the floor is now composed. One of these stones was of exceptional historic value, being the oldest memorial extant of the Ridley family. The name inscribed was that of Nicholas Ridley, who died about the year 1550. Beltingham Church was built a few years prior to the Reformation, and was an interesting specimen of Late Perpendicular work. It was not however, as often stated, the only church of that type in Northumberland. There were two Alnwick was Perpendicular from end to end.

Canon Greenwell differed from Mr. Hodges in regard to the state of the church. The building, he asserted, was much better now than it was when he last saw it. It was then in a deplorable condition. The three-decked pulpit was an interesting object, but there was nothing special about it. They sometimes, he thought, carried their views with regard to the

alteration of churches a little too far. He condemned, however, the destruction of old monumental inscriptions and other antiquarian relics.

Willmoteswick Castle was next visited. It was the chief seat of the ancient family of Ridley, one of the most illustrious members of which was, as Canon Greenwell reminded the visitors, Bishop Ridley the Martyr. Here, it is recorded, that famous man was born. Commenting upon claims put forward by different individuals of the present day that they were descendants of the old family, Canon Greenwell said he doubted very much whether any of them could prove their right to the distinction. He would leave the several branches to fight it out among themselves. Passing from the family itself, Canon Greenwell spoke of pele towers generally and of this one in particular, describing their uses in the days of Border raids and warfare. Mr. Hodges added a few details of the structure, which he characterised as one of the most interesting. The two towers, he said, were simply the ends of a long basil house similar to those at Doddington and Longhirst.

The next place of call, according to the original arrangements, was Haltwhistle, but no stay was made there, it having been decided to reach to Featherstone Castle, some four or five miles further up the valley of the South Tyne. Bellister Castle, which it had also been intended to inspect, was merely viewed from the roadway. Nothing was more admired than the extensive parks which surrounded Featherstone Castle, the old home of the Featherstonehaughs. The building itself has many attractions, especially for the archaeologist. Altogether there was ample material at hand for a delightful hour or more, but time forbade.

LIVERPOOL CATHEDRAL.

ON Friday last a meeting of the general committee of the Liverpool Cathedral was held at the Church House.

Mr. R. A. Hampson read the report of the executive committee, which stated that competitive designs were sent in by the five selected competitive architects—Messrs. Austin & Paley, Mr. C. A. Nicholson, Mr. G. Gilbert Scott, Mr. Malcolm Stark and Mr. W. J. Tapper—on April 30, and the advisers, Mr. Bodley, R.A., and Mr. Norman Shaw, R.A., after careful consideration, reported to the executive committee that the designs sent in "gave evidence of the great care and pains the competitors had bestowed upon their work and the admirable response they had made to the invitation of the committee." In concluding their report the advisory architects said:—"What we had to find was not the best or the most beautiful drawings, but the best idea and the finest conception. Many of the drawings are attractive, but we had to look much further than that—we had to look to the real effect of the building rising to its final completion, at the dimensions and proportions of the different parts, such as piers and arches of the great nave; we had to look at the practical and feasible aspect of the designs; we had to look for a sufficiently original conception; we had to look for a fine and noble proportion, combined with an evident knowledge of detail, and, lastly, we had to look for that power, combined with beauty, that makes a great and noble building." In Mr. Gilbert Scott's set of drawings these qualities were pre-eminently shown. The executive committee had approved of the selection made by their advisers, and they had appointed Mr. Bodley, R.A., and Mr. G. Gilbert Scott the joint architects for the new cathedral, thus securing the experience of the greatest modern exponent of Gothic architecture and the brilliant talent of Mr. Scott, so conspicuously displayed in his drawings. The building committee had instructed their architects to prepare the plans for the new cathedral with such modifications as they might think desirable. Also to provide a morning chapel to seat 300, a chapter-house and more commodious vestries. They had also been requested to submit plans for the foundations for the chancel by October 1 next, which the committee trusted might enable them to arrange to have the foundation-stone laid during the spring of next year. The principal dimensions of the cathedral taken from Mr. Scott's drawings were as follow:—Total length over all, 450 feet; total length of nave, 224 feet; total width of nave between the piers, 50 feet; total length across transepts, 198 feet; total height of nave vaulting, 116 feet; total width of north façade, 196 feet; total height of towers, 260 feet.

Lord Derby, in moving the adoption of the report, said it was now becoming a pleasure to look back to the times of difficulty and doubt which necessarily surrounded their earlier movements. Even last year many great questions were unsolved, and though by that time they had become pretty well established, the future was not so bright as at present, and he thought they met that day under circumstances which should encourage them all. One or two details had been given him from a source competent to speak with authority, and which showed that the designs were admirable in every way. The leading characteristics would be a building of much breadth, effect and dignity. It was proposed to build with local red

sandstone, which gave a pleasant warmth and colour. He trusted the work would be worthy of the efforts of those who had taken part in it, and that many in that room would see the building well on the path of progress. He thought they ought not to omit to express their thanks to the assessors who had taken such great pains in the matter. Their examination and analysis of the different designs must have entailed a great amount of labour of the most difficult and conscientious character. As far as they could see those gentlemen had given clear and straightforward advice, and he thought they ought to express their thanks for their kind assistance.

Bishop Chavasse, in seconding, said the resolution was one of the utmost gravity. It formed the second great step in the work to which they had put their hand—the building of a cathedral for that great city. The first step—selecting a site—was one of great difficulty and momentousness, but he ventured to think the selection of the design was no less difficult and equally momentous. It meant selecting a design for a building which in years to come would probably be the chief architectural feature of Liverpool. It meant providing for the Church of England a holy and beautiful house, in which her children for many generations would gather and worship God. It meant a building on one of the highest and most picturesque sites in the city, an edifice which would be seen by every ship that left the Mersey and by every ship that entered it, and which would be a landmark for many miles on the Cheshire side of the river. The committee, he thought he might say, were guided in their selection by three great principles. First, it was their object to select a design worthy of the city of Liverpool; secondly, to build a house of prayer which would help to devotion; and, thirdly, that the cathedral should be suitable for modern needs—a cathedral in which a large number could worship God congregationally, and in which a large number should hear and see the preacher. He believed the nave and choir would be as large as that at Westminster, and there would be seating accommodation for as large a congregation to see and hear the preacher as at St. Paul's itself. In selecting a design to meet the needs of the present day and of generations to come, the committee had done the best thing they could.

The Rev. Dr. Porter asked if this was the best plan, and whether they could not hark back to Sir William Emerson's design of sixteen years ago.

Sir William Forwood replied that the plan of Sir William Emerson was for the site of St. John's Church. It was a Classical design, which the committee thought would be wholly unsuitable for the site now selected, which was considered much more adaptable than St. John's site.

Rev. A. H. Rhodes asked the utmost limit of a congregation that would be able both to see and hear.

Sir William Forwood said that the figures given showed that the number of persons who could see and hear would be 3,000, but the number who could be accommodated for a ceremonial purpose would be much in excess of that.

The resolution was adopted.

Mr. Arthur Earle moved and the Hon. A. Stanley, M.P., seconded a vote of thanks to the advisory architects, which was accorded.

UNIVERSITY OF BIRMINGHAM.

ON Saturday, July 4, the Chancellor (the Right Hon. J. Chamberlain, M.P.) will confer degrees upon candidates for graduation. The Chancellor will on this occasion be attended by a mace-bearer, a specially fine mace having just been presented to the University by Mrs. C. G. Beale, wife of the vice-chancellor. The mace, a large and impressive work of art, was designed by Mr. Philip Webb, architect, and executed by Messrs. Haseler & Co., under the guidance (at Mr. Webb's particular request) of Mr. R. Catterson Smith, late headmaster of the Jewellers' School of Art in Birmingham, and now headmaster of the Municipal School of Art, who has put some of his own handiwork into it. The execution of the mace, says the *Birmingham Post*, has taken a long time and much thought; and the donor, in a letter to the Chancellor, "hopes that it may be thought worthy to be handed down through successive generations as a specimen of good workmanship made in our city." The Chancellor expresses the opinion that "the mace so generously presented to the University by Mrs. Beale is a beautiful work of art worthy of the University, and most creditable to its designer and to the craftsmen engaged on it." The mace, measuring 4 feet 6 inches in length, is substantially wrought in silver, embellished with enamelling and pale parcel gilding. The stem is hexagonal, with a spiral band running round it in relief. At points where this band traverses the front of the stem diamond-shaped medallions are formed enclosing the following emblems in low relief and gilded—a bee, representing industry; a sun, representing motive power; the letter B, standing for Birmingham; the moon and stars, representing time; and the letter

W, standing for Warwickshire. These are repeated along the stem. At the butt end is a steel point intended to give a hold upon the floor, and towards the top are two handles something like the guards of a sword hilt, by which the mace is to be held erect during important ceremonies. Above the handles and the boss is an inverted pallium, slightly domed and enclosed in a hexagonal engrailed frame or border. Upon the pallium is an effective blazon in enamels of the coat of arms of the University. The points of the frame form trefoils filled with translucent enamel, while a fine ruby at the top adds to the richness of effect. The reverse side of this portion of the work bears the inscription in raised decorative lettering, "The University of Birmingham, founded in the year of our Lord, 1900." An elaborately wrought border has for its salient features conventional roses in high relief, and a repoussé and chased wreath of thistle. The rear side of the mace has a projection forming a support when the emblem is laid upon a table, and which also serves as a shoulder rest when the mace is being carried. It may be mentioned that Dr. William Wright, lecturer in anatomy, has been appointed mace bearer. After the mace has been used on the occasion of the next congregation, the Chancellor suggests that it should be exhibited to the people of Birmingham for a short time in the Art Gallery, and that an account of the symbolism of its design, inscribed on parchment, shall be kept as a permanent record in the archives of the University.

The gift of the mace was reported at a meeting of the University council on Wednesday in a letter from the Chancellor to the Principal, when the following resolution was passed:—"That the hearty thanks of the Council be conveyed to Mrs. Beale for her most opportune presentation to the University, through the Chancellor, of an exceptionally handsome mace. They wish to thank her for the care and thought which she has bestowed upon it, and to congratulate her on the artistic merit of the design and execution, and they request that she will allow the circumstance that it has been presented by the wife of the first vice-chancellor to be engraved on some suitable place upon its surface."

THE CITY OF SALONA.

THE buried city of Salona, where Diocletian was born, is four miles from Spalato, where in A.D. 313 he died. It was established as a Roman colony in the first century before the Christian era, and must have been a very large city, for traces of the walls are distinguishable for miles (writes a correspondent of the *Times of India*). Its greatest diameter is along the line of the Castelli bay, but it stretches up the gentle acclivities at the foot of the first range of the Dinarics that separate Dalmatia from Bosnia and Herzegovina. Before the recession of the sea it had a good port and a fine situation, for it borders the southern end of one of the most beautiful tracts in Dalmatia, the Riviera delle Sette Castella. Its opulence must have been a source of envy to the incessant procession of marauders who fell upon this coast. It was raided by Odoacer in the fifth and by Totila in the sixth century, and was finally destroyed by Goths and Croats in 639. From the date of its abandonment it has been left at the mercy of rain and winds and desolating dust. It has to be dug up out of its grave where it has been partly protected but entirely forgotten under 8 to 10 feet of mould. These excavations began in 1847, and they have continued since with the slowness and interruptions so characteristic of dear drowsy Austria. It is hard to understand why so much money and international co-operation are devoted to Babylonia when archaeological treasures of deep and pathetic interest to the Christian world can be laid bare close at hand at very little cost. For the soil over Salona can be conquered with the spade. If it had nothing but its Christian antiquities to show, its tombs of the saints whose names are treasured in the martyrology of the Diocletian persecution, no Christian traveller could possibly pass it by. To move among these tombs, to touch the dust and reverently tread the mosaics of these old basilicas just unearthed from the fields that, half desolated, have protected them, is like one's first visit to the Catacombs. That man, if he be a Christian, is not to be envied who has not felt the tide of emotion surge within him at such a moment. Salona gave to the Church one of the greatest persecutors; but Diocletian disappeared, leaving the victory to the martyrs whose blood and dust make these sanctuaries holy. The episcopal basilica, on a lower terrace than the basilica of the cemetery, is almost entirely uncovered. Many of the little cubes in the mosaic of the apse have parted from the mortar, and something should be done at once to fix and protect them from our insuppressible and contemporary Goth. The pediments of the sixteen columns of the nave are in their place, but the shafts are in fragments. The design is perfect. It is curious to note the portion of the edifice annexed to the church, but outside it, which was set apart for catechumens and for Christians undergoing the canonical penances. The

church covers the site of a former Roman villa, for under a portion of the foundations is visible a handsome mosaic floor delineating one of the muses. The name of the muse—Terpsichore, if I remember rightly—is embedded in the plan of the picture. But the basilica of the cemetery of Monastirine on the upper ground is the one to which visitors mostly flock. Underneath and buried in its walls and all round the plateau are the graves and sarcophagi of the Christian dead. These sarcophagi have the massiveness of monoliths. The tops, sloped like a double roof, have the corners finished in curved pyramidal segments. Great force must have been employed to scatter such dead weights of limestone in reckless disorder over the ground. The entire floor of the basilica is covered with sarcophagi, all desecrated, and underneath the church are family vaults into which you can look. The monogram of Christ is everywhere. The evidence goes to show that the Catholics of the time had men of wealth among them.

THE LATE JOHN JONES BATEMAN.

WE announce with regret, says the *Birmingham Daily Post*, the death of Mr. John Jones Bateman, which occurred on the 13th inst., at his residence, Hawkesford, Four Oaks, Sutton Coldfield. The deceased, who had attained the advanced age of eighty-five, was seized with a chill last Easter, and complications ensued which ultimately caused his death. He was the senior member of the old-established firm of Messrs. Bateman & Bateman, architects, of 83 Edmund Street. He was a Birmingham citizen by birth, and received his training as an architect in the office of his father, Mr. Joseph Bateman, who established the practice as far back as the eighteenth century. The deceased gentleman, who took an active part in the business until Easter last, could remember how in the early days of his professional career he was once employed in assisting to do certain work that had been occasioned by the damage wrought by the mob in Birmingham at the time of the Chartist agitation. Mr. Bateman was the first president of the Architectural Association, in the formation of which he was prominently identified, and many of the buildings in Birmingham and the district were erected to his designs. The Birmingham Workhouse, Queen's College, the Church of the Messiah, Broad Street; St. Cuthbert's Church, Winson Green; The Quadrant, Hyams, New Street; the branch libraries in Gosta Green and Deritend; the Birmingham Fish Market, the Dudley Free Library, School of Art and Art Gallery; the Hockley and Balsall Heath dispensaries, and the picturesque building erected in Broad Street for the Birmingham District and Counties Bank may be mentioned as examples. Many of the larger residences in the district were also erected to the designs of Mr. Bateman, who it may be added was frequently engaged in arbitration and compensation cases between the railway companies and property owners. The last work that engaged his attention in a consultative way was the successful competition design for the town hall, High Wycombe, Bucks.

THE RUSKIN MUSEUM, SHEFFIELD.

THE report for the year ending March 25, 1903, states that the museum committee have pleasure in placing on record a largely increased attendance of visitors at the museum. The museum was open on 313 days during the official year, and the total number of visitors was 58,325, as against 40,580 the year before, an increase of 17,745. The Sunday attendance has been considerably better also, numbering 11,095, compared with 8,996, whilst the total for week-days was 47,230, against 31,584. The averages are as follows:—General daily average, 186; increase, 55; weekly, 1,121; increase, 341; Sunday, 213; increase, 40; week-day, 143; increase, 21. The largest number on any Sunday was 451, against 395; the greatest on any week-day, Whit Monday, 1,609, against 1,310 on the same day of the previous year. The Whit Monday attendance was the largest for any single day during the past six years. The least numbers were:—On any Sunday 47; against 39; and week-day 17, against 20, respectively, compared with last year's figures. The figures for the library and print department are being well maintained. The number of visitors who made application for perusal and study of the works were as follows:—The total for the year was 652, against 668, and the number of works perused 863, against 879. The museum handbook has sold fairly well during the past year, 583 copies being sold, compared with 725. This is a decrease of 142, but many visitors now bring their copies with them. The average sale of handbooks during the previous three years was 587, so that the number sold last year is still well up to the average.

The King has honoured Mr. Charles Davis, of 147 New Bond Street, with the appointment of art expert to His Majesty.

Royal Institute of British Architects.

SIR,—On Monday next will take place the sixteenth general meeting of the Royal Institute of British Architects for this session, when the gold medal will be presented. On Tuesday occurs the annual dinner, and on Wednesday a meeting of the presidents of the eighteen allied societies by invitation of the President of the Institute. These facts have suggested to me the establishment of an annual R.I.B.A. week (in London and elsewhere as might be determined) as is the custom obtaining with other institutions. A special week of this nature could be made a distinct benefit and attraction to members of the Institute, Promoters of special exhibitions dealing with matters connected with architecture and the kindred arts would quickly find it to their interests to make their displays coincide as to time and place with such an event. No doubt further proposals may accrue, but for the nonce a rough programme suggests itself to my mind.

Monday.—Exhibition of prize drawings; visits to exhibitions and displays of handicraft, materials, &c.; general meeting; presentation of gold medal.

Tuesday.—Visits to buildings completed or in course of erection; president's at home.

Wednesday.—Meeting of presidents of allied societies with president of the Institute; special papers and discussions; annual dinner.

Thursday and Friday.—Excursions to places of interest.—Yours faithfully,

BUTLER WILSON,
President, Leeds and Yorkshire Architectural Society.

International Congress of Hygiene at Brussels.

SIR,—May I ask you to allow me a little space in your valuable paper to draw the attention of your readers to this Congress, which—as far as I can make out—does not appear to have received that notice which, in my judgment, it deserves.

The Congress has been fixed somewhat earlier than usual (September 2 to 8, 1903), so as to be more convenient as regards the time of general holidays, and it is to be hoped that when making the necessary arrangements for this purpose all interested in sanitary matters will make a point of including the Congress within their circle of holiday travels.

The general secretary of the Congress is Professor Dr. Putzeys, of 1 Rue Forguer, Liège, Belgium, and the secretary of the English committee is Dr. P. F. Moline, of 42 Walton Street, Chelsea, S.W., who will, no doubt, be pleased to supply all desired information, but for the convenience of your readers I may be allowed to give a few particulars from the programme.

The Congress is divided into seven sections, as follows:—

The first section deals with bacteriology, the second with alimentary matters, the third with building and engineering matters, the fourth with industries and professions, the fifth with traffic, the sixth with administrative matters, and the seventh with colonial matters.

In all these sections various subjects have been selected with a view to elucidating thereon the latest views, and gentlemen have been asked to speak thereon who are known to be experts. In addition to this, so far as time will permit, other subjects may be brought forward for discussion after they have received the sanction of the executive committee.

It would be quite impossible for me to give here all the names of the readers of the various papers or their subjects, but amongst the readers of papers in the first section I may mention such names as Bordet, Denys, Gruber, Pfeiffer, Wassermann, Ehrlich, Roux, Loeffler, Malvoz, Netter and many others, names which speak for themselves and are a guarantee that the subjects to be discussed will be fully and well treated, and that the latest researches and developments will not be omitted from the discussion.

The third section, which deals with the work of the architect and engineer, will discuss the following subjects, viz.:—

The first set of papers will be on the bacterial purification of sewage and trade wastes, and the names of the authors are G. F. Fowler, Launay, Pagliani, Rideal, Rolants.

The second subject to be discussed deals with the advantages and disadvantages of the combined and separate systems of sewerage, and here the following gentlemen have promised to contribute papers:—Buesing, Imbeaux, E. Putzeys and Spataro. It is hardly necessary to point out that the authors in most cases occupy different standpoints, so that the *pros* and *cons* of the various subjects may be fully discussed.

The third question to be submitted deals with the sanitary precautions to be adopted in case of underground water supplies taken from limestone formations, and on this the following gentlemen will speak:—Gravelius, J. A. Howe, of H.M.

Geological Survey; Janet, Martel, Nicolis, Schardt, Broeck, and H. B. Woodward, F.R.S., assistant director of H.M. Geological Survey.

On the fourth subject of street hygiene, which embraces the whole subject of scavenging of towns and the destruction of the refuse by fire, the chairman of the international committee of street hygiene has promised to contribute a paper, to which will be attached the reports from the various members of the committee dealing with their respective countries.

The fifth question deals with the progress made during the last twenty years with the heating and ventilation of public and private buildings, and here papers have been promised by Herscher-Genests, Pfuertner and Van Rysselberghe.

The sixth and last subject is the distribution of dwelling-houses, their permanent ventilation and the decoration of their interiors, on which Bonnier and Nussbaum have promised to speak.

I have not time to-day to deal with the other sections, nor can I do more than draw attention in passing to the exhibition of sanitary objects which will take place in connection with this Congress, but I hope I may have time before long to give a few further particulars concerning the latter.

Those who know Brussels will not require to be reminded of the charms this city possesses in many respects, and that it has only lately shown marked hospitality to the Lord Mayor of London. It is a very interesting town, and everyone ought to greatly enjoy a week spent there.—Yours faithfully,

H. ALFRED ROECHLING.

GENERAL.

Mr. Rowland Plumbe had the honour of being presented to the King and Queen by the Duke of Cambridge on the occasion of opening the additions to the London Hospital, of which he was the architect.

Mr. Bertram Blount, consequent on the death of his partner, has removed his chemical and testing laboratory to 76-78 York Street, Westminster, where he will continue in practice under his own name.

The **General Board** of Cambridge University have been authorised to appoint a University lecturer in electrical engineering, and another in mechanical engineering, as assistants to the Professor of Mechanism and Applied Mechanics, at stipends of 100*l.* a year from the University, supplemented by a share of the fees of the Engineering Department.

The **Civil Service Commissioners** have announced that an open competitive examination for four appointments as assistant civil engineer in the department of the Director of Works of the Admiralty will be held in July next. It is understood that the salary commences at 200*l.* a year, and that assistant civil engineers are eligible for promotion to higher grades.

The **Church** of St. Ignatius, Stamford Hill, was opened on the 11th inst. It is only half finished, but it gives seating accommodation for 650 people. At present the building is 120 feet in length, 40 feet of which is devoted to the sanctuary; but when the designs of the architect, Mr. Benedict Williamson, which we have published, are fully carried out, the church will be 40 feet longer and two towers are to be added in front. The cost of the building is 12,000*l.*

Arrangements have been made for the celebration of the jubilee of the Wiltshire Archaeological and Natural History Society at Devizes next month. The Marquis of Lansdowne, the Marquis of Bath and others are expected to take part in the proceedings. Excursions have been arranged to Avebury and Stonehenge, and Lord Avebury has consented to give a paper at Avebury, which is anticipated with much interest.

The **Director-General of Archaeology**, Punjab, is to start work on the restoration of the Chhoti Khwabagh in Lahore fort.

Mr. W. H. Knowles has been appointed architect, and Mr. J. P. Allen quantity surveyor, in connection with the completion of the Durham College of Science at Newcastle.

An **Open-Air Theatre** at Port Sunlight was used for the first time on Saturday. The building was designed by Messrs. Grayson & Ould, of Liverpool, and is constructed of Ruabon red bricks with proscenium cornices, columns, arches, niches and other dressings of salmon-coloured terra-cotta, richly moulded and modelled, the work of Mr. J. C. Edwards, of Ruabon. The principal pediment is filled with an adaptation of Guido's *Aurora*, which was modelled by Mr. E. O. Griffith. There is accommodation for 3,000 spectators.

A **Laffan's Telegram** from New York says that ruins of a large city containing pyramids and extensive fortifications have been discovered in the midst of a dense forest in the State of Puebla, Mexico. President Diaz is about to send a commission to arrange for early excavation.

The **Drawings** submitted for the A. A. prizes will be on view on Monday next at 56 Great Marlborough Street, W.

A **Design** has been prepared for the cross which is to be erected on Roker Cliff, near Monkwearmouth, in honour of the Venerable Bede. Mr. Hodges, the designer, has undertaken to select the stone, supervise the elaborate carving, and see the cross, which will be 25 feet high, erected for the sum of 400*l.*

Discoveries of much interest have been made at Tintern Abbey in the course of certain works undertaken by the Crown when the latter acquired the ruins from the Beaufort estate. Part of the original and elaborate system of drainage has been disclosed, and, by the removal of old cottages built into the Abbey, gateways and windows formerly hidden have been brought to light. Most interesting of all is the discovery of the lay brothers' staircase. On the demolition of an old cottage and subsequent excavation the workmen found a doorway leading from the lay brothers' quarters to the staircase, and thence by the door named after them into the abbey.

The **Corporation of Maidenhead** received designs from eighty architects in a competition for the erection of a free library.

Messrs. A. B. M'Donald & P. Fyfe, Glasgow, in the competition invited by Hamilton Town Council for plans for the housing of the working classes, have made the following awards:—1st, R. W. Horne, 201 Kent Road, Glasgow; 2nd, W. Inglis, 102 Portland Place, Hamilton; 3rd, F. Southorn, 144 St. Vincent Street, Glasgow.

"**Ancient and Modern Furniture**," measured and drawn on stone, by John W. Small, F.S.A.Scot., will be a reprint of a privately published volume by the author, issued in 1883. It has for many years been out of print and scarce, copies fetching high prices on the rare occasions when offered to the public. The new edition will be an exact facsimile of the first edition, and will be printed from the stone by Messrs. MacLure, Macdonald & Co., Glasgow.

Mr. Edward R. Taylor will retire from the head-mastership of the Birmingham Municipal School of Art on June 30, under the terms of the Corporation superannuation scheme. The Museum and School of Art committee have passed to Mr. Taylor a cordial vote of thanks for his valuable services during his twenty-six years of office as head-master. It is proposed to present to Mr. Taylor a copy of this resolution specially written on vellum and bound.

The **King** has ordered that a copy of "A Description of the Papyrus of Nas-Khem" is to be presented to the West Ham and other libraries in the Metropolis. The papyrus was found in a tomb upon a mummy, near Gournah, Thebes, while an excavation was being made by the King, then Prince of Wales.

The **Abbot of Downside**, on Monday last, blessed the new great bell of the abbey which has been erected as a memorial to Roger Bede Vaughan, Archbishop of Sydney, N.S.W. The bell, which is called "Great Bede," weighs 5½ tons, and is supposed to be the ninth of the big bells of England. Its total cost is 721*l.*, including fittings.

M. Sauffroy, the architect of the Russian church, Rue Daru, Paris, has been nominated as Commander of the Imperial Russian Order of St. Stanislas.

M. Chédanne, architect to the French Ministry of Foreign Affairs, has come to London for the purpose of superintending the arrangements at the French Embassy for the fêtes during the visit of President Loubet.

The **Steining Guardians** have instructed Messrs. Clayton & Black, Brighton, to prepare a full scheme for the erection of new infirmaries, nurses' home, &c., at the new workhouse, such scheme to include the following buildings:—Infirmaries buildings for 300 beds, nurses' home for thirty beds, married couples' quarters, lying-in-ward, two punishment cells and padded room. The architects will also prepare a plan providing for increased accommodation for tramps adjoining the present tramp ward.

The **Ayr Corporation** have voted 600*l.* for the repair of the famous Auld Brig of Ayr, which was the subject of a poem by Robert Burns. The brig is supposed to date prior to 1236.

An **International Competition** has been announced by the Austrian Minister of Commerce for designs for a ship lock with a lift of 35.9 metres for the Danube-Oder canal. The boats to be handled are assumed to have maximum dimensions of 67 metres length, 8.2 metres beam and 1.8 metres draft. The designs must provide for thirty lockages in each direction in twenty-four hours. Prizes of 100,000, 75,000 and 50,000 crowns are offered. The competition closes on March 31, 1904.

Mr. Victor Cavendish, as representing the First Commissioner of Works, has officially stated that the plan which it is hoped will be carried out at Spring Gardens is substantially the same as that shown in a plan attached to the report of the Select Committee upon the Public Office (Appropriation of Sites) of 1896 (House of Commons Paper, No. 310).

Architect and Contract Reporter.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

POPLAR—June 23.—Competitive designs are invited for a public library to be erected in Cubitt Town, Poplar, E. A premium of 75% is offered for the design accepted by the Council, which will be deducted from the architect's commission should he be employed as architect in the execution of the work. Mr. Leonard Potts, town clerk, High Street, Poplar.

TAUNTON—July 20.—Competitive designs are invited for a library building to be erected in Corporation Street, at a cost not exceeding 5,000*l.* inclusive. Premiums of 30*l.*, 20*l.* and 10*l.* will be awarded for designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. George H. Kite, town clerk, Municipal Buildings, Taunton.

WORKINGTON.—June 24.—For the erection of one lock-up shop, four shops and houses, one dwelling-house and four cottages in South William Street and Lowsa Lane. Messrs. W. G. Scott & Co, architects, Victoria Buildings, Workington.

CONTRACTS have been accepted for the erection of a mansion-house for the Earl and Countess of Aberdeen on their Cromar estate, to take the place of Tarland Lodge. The design partakes of the Scottish Baronial style. The main building will be 102 feet long by 50 feet broad, and, in addition to the basement, the house will have two storeys with attics. The main door is to be surrounded with elaborate carvings, and surmounted by the coat-of-arms of the family. The drawing-room and dining-room enter off the central hall, and other apartments on this floor are a boudoir and smoking-room, and in a wing a billiard-room. The upper floors are to be used as bedrooms, bath-rooms, &c., and the basement will contain accommodation for the servants, while a hoist will give ready access to each floor. A feature of the south elevation is two finely carved panels. In the immediate vicinity of the house an extensive park is being laid out, and the site commands a wide view of fine mountain scenery.

TRADE NOTES.

THE Wilson Engineering Company, Limited, of 227, &c., High Holborn, W.C., the well-known makers of gas cooking apparatus, are leaving their premises for temporary offices and show-rooms at 77 Great Queen Street, High Holborn, in consequence of the County Council acquiring their old offices for the new street.

MESSRS. ANDREW HANDYSIDE & CO., LTD., of Derby and London, makers of steel bridges, roofs, buildings and structures, have received the contract for the supply of two swing-bridges for the Cardiff Railway Company. One bridge carries two lines of rails and two roadways over the communication-passage of the South Dock, Cardiff, and the smaller bridge carries a single line and one roadway over the entrance-lock.

IN our description of the new out-patients' department of the London Hospital, which was opened by their Majesties on the 11th inst, we omitted to mention that the whole of the staircases in the building were supplied and fixed by Messrs. Alfred Walker & Son, of 7 Upper James Street, Golden Square, W., and Leeds. The same firm also supplied and fixed the main and other staircases at the University College Hospital, London, as well as at the Surveyors' Institute and Prudential Buildings, London. They make a specialty of that class of construction

VARITIES.

MR. A. E. PILLING, town clerk of Devonport, was last week elected clerk to the London Water Board at a salary of 1,500l. a year.

THE new Corporation destructor, which has been erected in Doughty Road, Grimsby, at a cost of 3,500l., was inaugurated on June 13.

THE St Paul's Church Council, Southport, have decided to build a new church at Ecclesfield, where there is now a mission church; also to erect a new school and parochial hall, to cost altogether 5,000l.

THE Hornsey Urban District Council have opened an account for subscriptions towards the 5,500l. required to acquire a strip of well-timbered land between Highgate Woods and Muswell Hill Road. A portion of it has already been purchased as a building site.

A SANATORIUM for consumptives is in course of erection at Winsley, near Bradford-on-Avon, for the counties of Wilts, Somerset and Gloucester. The contract price is 6,877l. It is proposed to erect six blocks of ten beds each, which will be used entirely for the consumptive poor.

THE Lord Provost's committee of Edinburgh Town Council have resolved to recommend that the magistrates and Council petition His Majesty's First Commissioner of Works to give instructions for the maintenance of Holyrood Palace as a Royal residence.

THE report of the Chief Inspector of Factories shows that 90,355 accidents were reported last year as having occurred in factories and workshops. In the cotton mills, however, there was a small decrease, which is attributed to the action of the inspectors in insisting upon safeguards.

A PAPER read by Mr. T. W. A. Hayward at a meeting of municipal and county engineers revealed that since the earthquake of 1884 the water supply of Sudbury had been reduced by about one-half. At Colchester, which is also in Essex, the supply was increased.

THE Edmonton public baths were formally opened last Saturday. There are two large baths, each 90 feet by 30 feet, one of which is covered and the other uncovered. A number of slipper baths have also been provided. The cost, including the erection of a council chamber and additional offices, amounts to about 30,000l.

tant public works.

THOMAS LAWRENCE & SONS, BRACKNELL, BERKS.

MR. G. HOLT has offered to the Knutsford District Council a plot of land on a lease of 999 years, at the nominal rent of 1s. per annum, for the purpose of a free library. Mr. Carnegie, who has offered a considerable sum towards the object, has expressed his approval.

THE Manchester Ship Canal is to be deepened from the original depth of 26 feet to 28 feet. The sills of the locks were placed 2 feet below the 26 feet depth, so that the work is of a comparatively simple character. The object is to permit of the entry of the larger steamers to Manchester.

THE Stepney Borough Council commenced over two years ago the erection of workmen's dwellings on the Queen Catherine Court area, and these were opened for occupation last Thursday. The buildings have cost over 6,000l. and will accommodate over 200 people.

MAJOR C. E. NORTON, R.E., the Local Government Board inspector, conducted an inquiry on Friday at the Public Hall, Horwich, into the application of the Horwich District Council for powers to borrow 35,000l. for the purposes of constructing a reservoir of about thirty and a half million gallons capacity on land about 10 acres in extent known as Marklands and Wallsuches.

THE contract for the erection of the Little Ilford Congregational church and school has been awarded to Messrs. F. Gough & Co., Hendon, at 4,435l. The block comprises church to accommodate about 724 adults, and the usual vestries, &c., also large two-storey school, the main hall being on the upper storey, and the classrooms and small hall on the ground floor. The architects are Messrs. Baines.

A STAINED-GLASS window in memory of the Rev. W. L. Ker, M.A., was unveiled on Saturday afternoon in Kilwinning parish church. The window, which has for its subject "St. Paul Preaching on Mars Hill," is the work of Messrs. Stephen Adam & Son, 121 Bath Street, Glasgow. Its treatment is broad and effective, and the colour is rich and pure in clear and translucent harmonies of choice glass.

MR. ALFRED MOSELY has just made arrangements for a reprint of the complete reports of the Mosely Industrial Commission in cheap form. Copies may be had at 6d. each net, or post free 9d. It is being produced not only without profit, but at a loss, and solely in order that the public may be enabled to possess themselves of the knowledge gained from the inquiries made in the United States. The Board of Trade has ordered 3,000 copies for free distribution.

WHILE workmen were engaged in stripping an old wall-paper in the room of a house until recently occupied by a solicitor of Woodstock, they discovered in a hole in the wall a cardboard box. On being opened, it was found to contain ten 50l. Bank of England notes. Judging by the dates on the notes, they must have been hidden for years. The notes at present are in the possession of the new owners of the house.

LADY PEARSON, the wife of Sir Weetman Pearson, the contractor, has formed a Voluntary Association of Contractors for Public Works, for the purpose of providing pensions of 5s. a week for navvies on their arriving at the age of sixty-five, or 7s. 6d. a week if they are married. The pensions are not to be paid to all indiscriminately. A certain standard of good character is to be required.

IN three parishes in Buckinghamshire important schemes of restoration are under consideration. At Radnage it is proposed to restore St. Mary's parish church, which was erected in the early part of the twelfth century, while at Bledlow the ancient tower of the parish church is to be restored at an outlay of about 800l. The tower of the parish church at Princes Risborough is also to be extensively restored.

THE Cleveland Bridge Company, Darlington, obtained the contract for the Rhodesia railway bridge over the Zambesi, which crosses half a mile below the Victoria Falls. There was considerable competition by British, Continental and American firms. The bridge, 650 feet long, crosses a deep gorge 360 feet above the water-level. The main span is a 500 feet steel arch. There will be a double line of rails for the Cape-to-Cairo railway.

MR. W. P. HARTLEY has informed the Primitive Methodist Conference that he is prepared to bear the expense of building and furnishing a new ministers' college large enough to provide forty new places, in addition to the existing sixty in the old college at Manchester. The building will be erected next to the present college, and the probable cost is about 10,000l. A chapel will also be erected.

A REREDOS has been erected in the Church of the Resurrection, Brussels, to the memory of the late Queen Victoria. The ceremony of dedication was attended by the British Minister and a representative gathering of English residents in Brussels. The reredos is a specimen of Flemish wood-carving, and the cost has been entirely defrayed by subscriptions, to the amount of nearly 700l., from local English residents.

THE Dean and Chapter of Winchester have placed at the disposal of the war memorial committee a window and space beneath, near the south door of the cathedral, and it has been determined to erect a stained-glass window, with a marble tablet, recording the names of all the men who lost their lives in South Africa during the war, and who were members of any of the Hampshire regular or auxiliary forces.

MRS. HIGGINS, late of Frizington, has undertaken the cost of the restoration of Arlecdon parish church, in Cumberland, estimated at 4,000*l*. There are certain conditions, which include the provision of a peal of bells, already subscribed for, at a cost of 600*l*., by the parishioners, and certain other "necessary alterations," which cost 400*l*. Mrs. Higgins bears the expense of the erection of a handsome tower in memory of her parents.

A MEETING of the members of the Liverpool Cotton Association has been summoned for the 22nd inst. to authorise the directors to proceed with the preliminaries for the building of the new Exchange in Oldhall Street, between Ormond Street and Edmund Street. The directors have already purchased the land at something between 85,000*l* and 88,000*l*., and they advise the purchase of City Buildings at 26,500*l*. Mr. F. G. Briggs has been engaged as advisory architect, and it is proposed to have a competition for the design of the new building.

THE Queen Victoria Memorial at Newbury, which has been presented to his native town by Mr. George Sanger, will be unveiled on the 24th inst. It consists of a full-length figure of Her late Majesty with four recumbent lions. The memorial was fixed under the direction of Mr. Lawrence, of the staff of Messrs. Doulton & Co., of the Lambeth Potteries, and the supplementary works have been carried out under the supervision of the borough surveyor (Mr. S. J. Lee Vincent).

THE Midland Railway Company made an application to the Manchester City Council for a dramatic license for the new Midland Grand Hotel. The city architect in his report to the watch committee called attention to the fact that though the main staircase was more than 6 feet wide it was not provided with a centre handrail in accordance with the by-laws. When the application was considered on the 11th inst the railway company submitted that the ornamental design would be sadly interfered with if the committee exercised their undoubted right of adhering to the strict letter of the by-law. It was hoped that the company's wishes would be met in this case. The application was granted.

THE Stirling Town Council have received a report from the master of works giving the relative costs of different methods of refuse disposal. The probable cost of a refuse destructor of two cells, with boiler and settings, flues, damper, &c., and centrifugal dust-catcher, he estimates at 2,126*l*., with an additional 1,277*l*. for chimney, buildings, &c. The average yearly cost of destroying the refuse he estimates at 686*l*. 12*s*. 8*d*., including 238*l*. 4*s*. 2*d*. as interest and sinking fund at 7 per cent. The return for the clinker he estimates at 23*l*. 13*s*. while the value of the steam generated would be 150*l*., bringing down the yearly cost to 512*l*. 19*s*. 8*d*.

THE Wetheral parochial committee considered on the 10th inst. a sewerage scheme for Wetheral and Corby, and estimated by the engineer, Mr. J. Graham, to cost about 8,000*l*. The following resolution was unanimously carried:—"That the scheme for the sewerage of Wetheral and Corby prepared by the engineer involves an outlay of such a large amount that it would exhaust the borrowing powers of the parish and prevent schemes already proposed for other villages being proceeded with, and this committee request the District Council to sanction the appointment by this committee of an expert to advise on the whole question."

THE Walton-on-Thames Urban Council recently announced the vacancy of the post of surveyor. They received 197 applications for the post, which brings in a salary of 250*l*. a year and the right to take not more than one pupil. The choice was brought down to eight candidates whose names were:—J. G. Carey, assistant surveyor, Heston and Isleworth, aged 30; J. R. Cartledge, assistant surveyor, Barnes, 30; T. Graves, assistant surveyor, Kingston-on-Thames, 31; H. D. Mather, assistant surveyor, Surbiton, 30; H. G. White, deputy surveyor, Cheltenham, 36; R. Wilds, surveyor, East Grinstead, 32; W. Woolam, assistant surveyor, Barnes, 33. The Council on the 11th inst. appointed Mr. Wilds to the post.

THE Birmingham District Tramways Bill, which has been promoted in Parliament by the local district authorities in conjunction with the City of Birmingham Tramways Company, the Birmingham and Midland Tramways Company and the British Electric Traction Company, came before a committee of the House of Lords this week. The promoters are asking the authority of Parliament to construct additional tramways, and also for compulsory running powers over the existing lines in the city. In view of the decision of the City Council to municipalise the tramways the Corporation are strenuously opposing the application of the promoters for power to run

their cars from the outside districts into the city, and it is upon this point that the Bill will be mainly fought in Parliament.

THE select committee of the House of Commons on the 11th inst. found that the preamble of the Bristol, London and Southern Counties Railway Bill had not been proved. It was proposed to construct a new railway, some seventy-three miles long, from Avonmouth Dock, Bristol, *via* Bath and Trowbridge, to Overton, near Basingstoke, and there to effect a junction with the London and South-Western Railway, thus obtaining communication with London, and providing an alternative route to that of the Great Western Railway, which at present is the only direct line between London and Bristol. The total capital powers sought were 6,000,000*l*.

At a meeting of Ayr Town Council an interesting report was submitted by Mr John Eaglesham as to the state of the Auld Brig of Ayr. The Auld Brig, it is said, was undoubtedly a very old structure. There was a grant by charter, dated 1236, for the upkeep of the bridge, and in 1491 it appeared the bridge had been under repair when James IV. passed through Ayr on his way to Whithorn. About 1867 the bridge had been in a very dilapidated state, and considerable sums had from time to time been expended by the Town Council on its repair. The bridge was again showing signs of decay, partly the consequence of the very repairs that had been carried out on the structure, and on the recommendation of Mr. Eaglesham it was agreed to carry out necessary repairs on the structure at an estimated cost of about 660*l*.

THE foundation-stones of a Wesleyan church to be erected at West Kirby were laid on the 10th inst. The new church, which adjoins the present school chapel, will be 58 feet in length by 41 feet, with the addition of a chancel with accommodation for the choir and organ. There is to be seating accommodation in the body for 345 adults, and in a gallery at the front for 85 adults. Architecturally, the design of the new church is Gothic, and the exterior facing is of local rock-faced stone with ashlar dressings of the windows, doorways, &c. The front will contain a projecting central porch and entrance at each flank. The gable is to be flanked by buttresses finished in octagonal pinnacles. The roof will be partially open, with curved and stained timbers and light pitch-pine ceiling. The pulpit, seating, &c., are to be of pitch pine throughout. Ample provision is to be made for heating, ventilating and lighting, and a vestry with the usual conveniences will be added. The cost of the building, exclusive

of land and architects' fees, will be 3,500*l*. The architects are Messrs. John Wills & Sons, Derby, and the builder is Mr. Samuel Fowler, Bootle.

BUILDING AND BUILDERS.

THE Master Builders' Association have determined to visit Oxford for their annual outing on Wednesday, July 8.

THE Bridlington Corporation contemplate an expenditure of 11,000*l*. on sea defence and groynes works.

IT is reported from Durban that there is a considerable demand there for good men in the bricklaying, plastering and carpentering trades.

A NEW department of a Board school was opened at Tinsley Park Road, Sheffield, on Monday. The plans were prepared by Messrs Holmes & Watson, and the contractors were Messrs Ash, Son & Biggin. The cost was about 10,000*l*.

THE plans and works committee of Edinburgh Town Council have agreed to recommend the magistrates and Council to erect a public washhouse on a site in St. Leonard's to be afterwards fixed.

A GOTHIC chapel for the Wesleyan Methodists at Kenilworth was opened on the 11th inst. Accommodation is provided for 200 persons, and in the adjoining schoolroom for 200 pupils. The cost of erection has been 2,500*l*.

THE Vicar of Hampton-on-Thames is offering free marriage to every couple who will settle down in one of the new working men's dwellings which are being erected there by the Urban District Council.

MR A. G. MALET opened on Tuesday a Local Government Board inquiry into the proposal of the Bolton Corporation to borrow 74,176*l*. for the purpose of repaving certain main roads, 22,795*l*. for other works of paving, 2,398*l*. for the Bradford Street Bridge, and 6,500*l*. for the rebuilding of Toothill Bridge.

THE town clerk of Liverpool has issued public notice in which bakers are advised to apply early for certificates by the Council that their premises are suitable for the purpose. This is in connection with the recent legislation relating to underground bakehouses which comes into operation on January 1, 1904.

THE Crieff Dean of Guild Court have passed plans of a large addition to be made to the buildings of the Strathearn

Hydropathic The addition principally consists of winter gardens and loggia, to be built to the south of the existing drawing-room. The estimated cost of the addition is about 5,000*l*.

THE Board of the London Missionary Society have accepted the tender of Mr. J. Carmichael (27,730*l*.) for the erection of the new Mission house in New Bridge Street, E.C. It was the lowest of sixteen tenders. The ground floor and first floor will be let as offices, the Society occupying the remainder of the building.

MR. A. SPICER, who laid last week the foundation-stone of a new church at Barry, South Wales, had made the proviso on accepting the office that the funds of the church should be saved from the outlay of providing either trowel or mallet, and that he should use the ordinary workman's tools. Accordingly an everyday trowel and an ordinary mallet were employed.

THE foundation-stone of a new church for Rock Ferry, near Liverpool, was laid on the 11th inst. The church is to be Gothic in style and built of grey brick, with terra-cotta dressings and stone interior dressings, and the roof and seats are to be of pitch pine. The cost will be from 4,000*l*. to 5,000*l*. The architects are Messrs. Grayson & Ould, Liverpool, and the contractor is Mr. Richard Allen, Birkenhead.

THE Government of India have ruled that no new works or alterations or additions to existing works of defence in charge of local Governments, railway administrations, &c., shall be executed until the project has been examined and passed by the Director-General of Military Works, and that Royal Engineer officers only shall be entrusted with the supervision and execution of such works.

A MEETING was held recently of the metropolitan committee on materials and means of paving the streets of London. The committee is the outcome of the conference recently convened by the Westminster City Council on the subject of street paving, the object being to obtain periodically from the various borough councils of the Metropolis information with regard to the life and wear of the different kinds of paving.

THE foundation-stones of a new Baptist church at Acock's Green were laid on the 8th inst. At present only a portion of the contemplated church is being erected, viz. the lecture-hall and rooms for Sunday-schools. The new church will stand at the junction of Yardley and Alexandra Roads, on a freehold

site the gift of Mr. Joseph Walker. The cost of the buildings at present in course of erection, together with furnishing, is about 3,212*l*.

THE Wesleyan general chapel committee, which has submitted to it all cases of proposed extension, have just sanctioned a further outlay of 116,500*l*. on new erections in all parts of Great Britain. These cases comprise thirty-five new chapels, the estimated outlay on which is 92,500*l*. Sanction is also given to the erection of six Sunday-schools at a cost of 4,370*l*; seven ministers' houses, costing 6,520*l*; fourteen new organs, costing 4,140*l*; also twenty-seven alteration and enlargement cases, involving a total expenditure of 8,963*l*.

THE Wandsworth Borough Council resolved at their last meeting "That the attention of the London County Council be called to the destruction of property, the injury to health and the annoyance caused at Tooting by the insufficiency of main drainage, and that the London County Council be requested to consider the advisability of postponing the proposed addition of 9,000 to the population by the erection of dwellings on Totterdown until the Council has provided adequate means for the disposal of sewage and storm water."

THE new hall erected in connection with the Oxtou Road Congregational Church, Birkenhead, was opened on Tuesday. The building is an addition to, and is incorporated with the original church building in such a manner as to distinctly increase its importance as a whole, and it has been erected at a cost of 3,700*l*. The peculiar shape of the land to which the building had to conform has been handled with such skill by the architect, Mr. James H. Cook, Liverpool, as to secure quite a unique effect. Externally the building on its Woodchurch Road and Balls Road frontages is faced with Storeton stone, while internally the rooms have a high cement dado, with smooth plaster above. The woodwork throughout is pitch-pine. The ventilation of the hall and the seven classrooms has received special attention, and the building is heated throughout with hot water by means of radiators. The work of building has been carried out by Mr. Peter Rothwell, Birkenhead.

LAST week the foundation-stone of a new church in North Heigham, Norwich, was laid. The building is to cost 5,000*l*. The present intention is to build the nave, which it is calculated will cost 3,000*l*. The new church will consist of nave, aisles, chancel, western porches, baptistery, two vestries and heating chambers, and the whole building will be erected in a Perpen-

FIRE COMPANY LIMITED. LIFE

Head Office: 92 Cheapside, London, E.C.

The Company commenced Business in the REIGN OF GEORGE III., and the following figures show its record:

AT THE ACCESSION OF		INCOME.		FUNDS.	
		£		£	
KING GEORGE IV.	- -	77,413	- -	160,121	
KING WILLIAM IV.	- -	131,423	- -	607,676	
QUEEN VICTORIA	- -	157,973	- -	915,082	
KING EDWARD VII.	- -	700,134	- -	2,237,081	
PRESENT TIME	- -	755,010	- -	2,296,583	

In addition the Company has a Subscribed Capital of One Million Two Hundred Thousand Pounds,

Affording a TOTAL SECURITY for its Policyholders of **£3,496,583.**

Claims Paid exceed £15,000,000.

The New Edition of the Company's Prospectus contains several fresh features of importance, among which are:—

- 1.—NEW TABLES OF RATES FOR ASSURANCES WITHOUT PROFITS, providing a sum assured which is absolutely guaranteed, at the lowest possible premium compatible with safety.
- 2.—CONVERTIBLE TERM ASSURANCES giving large cover for a very low premium.
- 3.—DEFERRED ASSURANCES FOR CHILDREN giving the benefit of the low premiums applicable to youth and avoiding the risk of the life becoming uninsurable.

REALLY ACTIVE AGENTS PAID LIBERALLY, ESPECIALLY FOR LIFE BUSINESS.

SAMUEL J. PIPKIN, General Manager.

dicular style of architecture. The walls will be built of brick, faced externally with local rubble flints with Monk's Park stone dressings; internally they will be stuccoed. The roofs will be open and constructed of pitch-pine timber, boarded and felted; the nave and chancel covered with Broseley tiles and the aisles, vestries, &c., with Westmoreland green slates. The flooring beneath the seats will rest upon a solid foundation of coke breeze concrete, whilst the paths to the nave and aisles will be laid with small red Staffordshire pressed tiles with simple border; the chancel will be floored with encaustic tiles. At the east end of the chancel will figure a large five-light window, and at the west end of the nave there will be another large window, but of six lights. All the windows, including those to the aisles and clerestory, will be glazed with cathedral glass. A bell-cot is provided upon the west gable for one bell, as it is not proposed to build a tower. The architect is Mr Arthur J. Lacey, of Norwich, and the tender of Mr. G. S. Tinkler, of Norwich, has been accepted for putting in the foundations.

A BOOKLET, entitled "Holidays in Belgium and the Ardennes," by Mr. Percy Lindley, has appeared at a most opportune time. At this period of the year many minds are busy with the framing of plans as to the best way to spend the brief annual respite from work. The problem becomes more difficult after the most apparent modes have been once worked out. It becomes necessary to wander further afield in the search of diversion. However, it often happens that the holiday-maker is oblivious to the advantages of places which lie, so to speak, at his door. Many people will find themselves in this position when they read through Mr. Lindley's charming pages. As he remarks, one drives after dinner to Liverpool Street Station and catches the Continental express for Harwich. The train draws up at Parkeston Quay, almost alongside the steamer. On board one of the Great Eastern Railway Company's splendid boats the traveller may take his night's repose and arrive in the morning at Antwerp. Within easy journey of this town a multitude of interesting places and objects may be seen. The lover of picturesque scenery will find his taste more than satisfied with the Ardennes, where a week at least should be spent. The return journey may be made down the Moselle to Coblenz, and thence by the Rhine to Cologne, where the train can be taken to Brussels and Antwerp. The Great Eastern Railway Company have prepared ample guides to assist the traveller, and it would be advisable for all to apply to them for assistance before making their arrangements.

ELECTRIC NOTES.

THE Incorporated Municipal Electrical Association will hold its next Council meeting at Bolton on the 20th inst.

THE clerk to the Horwich District Council has informed the Bolton Corporation that his Council consented to the Bolton Corporation furnishing a supply of electricity to Horwich.

GLASGOW Corporation Tramways, since their electrification, have been highly successful, the receipts for the last financial year being 40,374*l.* in excess of those of the previous year.

THE St. Helens electric supply and tramways committee have been considering the question of extending the generating station and erecting additional plant in view of the increasing demand for energy, and they have resolved to extend the present engine-house and to erect gas plant for the purpose of supplying the motive-power for the new machinery.

THE statement of accounts for the past year's working of the Coventry electric-light undertaking has been approved by the committee. It covers the twelve months ended March 31 last, and shows a total revenue of 8,076*l.*, with working expenditure of 3,691*l.*, or a gross profit of 4,385*l.* The total of capital account charges is 4,574*l.*, and the net deficit is 189*l.*—a satisfactory result compared with previous years.

MAJOR PRINGLE, one of the inspectors under the Board of Trade, made the final inspection on Tuesday of the electrical equipment of the new portion of the District Railway Company between Ealing and South Harrow, which will be opened to the public on Monday. The new line is about five miles in length, and brings Harrow, Sudbury and Alperton into direct and easy communication with the City. The trains which are to be used on the new line will be made up of four coaches, with a motor at each end and one in the middle. The seating capacity of each coach is fifty-two.

THE BUILDING EXHIBITION.

THE International Building Trades Exhibition duly opened on Saturday morning last in a deluge of rain. No formal ceremony took place, but visitors and exhibitors both commenced without interruption the business which had called them together at the Agricultural Hall, Islington. The hall, galleries and minor hall are all practically full, and, considering that the weather on Saturday was so disastrously bad, and also that it was the opening day, the exhibition was extremely well attended. Mr Montgomery occupied the chair at the luncheon, and was supported by a number of well-known architects. Some of the familiar faces we may mention were Col. Edis, Messrs. Arnold B. Mitchell, W. E. Riley, E. R. Robson, Lewis Solomon, H. O. Cresswell, Max Clarke, Maurice B. Adams, Ryan-Tennison, Arthur F. Briggs, Edwin O. Sachs, C. H. Shoppee, Ellis Marsland, Percy Marks, &c. The toast of "Success to the Building Trades Exhibition" was most happily in the hands of Col. Edis, whose speech was listened to with evident signs of pleasure. It is perhaps a good thing that Mr. H. Greville Montgomery is not, seemingly, a bashful man, as the Colonel waxed eloquent in referring to his ability in having produced such a successful gathering together of representative firms. Mr. Montgomery, in his reply, stated that he had been able to arrange that during the week some important visits would be made to the hall by well-known and prominent bodies connected with the building and allied industries. Such societies as the Architectural Association, the Society of Architects, the Institute of Builders, the London Master Builders' Association, the Institute of Sanitary Engineers, the Association of Municipal and County Engineers, and the Institute of British Clayworkers, &c. He had also arranged for a visit of the members of the Union Céramique de France, an important body of French clayworkers. He, Mr. Montgomery, was glad to be able to meet them again this year, and to inform them that this year's exhibition was the largest and best of all those which had preceded it during the twenty-five years which they had been held at the Agricultural Hall, Islington. His thanks were due to those architects who had

come there and supported him to-day, to the authorities who had lent him the valuable and interesting exhibits of Irish marbles, and to Mr. P. A. Gilbert Wood, the managing director of this Journal, for his assistance in the collection of such a splendid collection of architectural drawings, which had been so kindly and generously lent by the architects and artists whose names would be found in the catalogue.

It is absolutely impossible in the small amount of space to refer in detail to all the exhibits. We shall endeavour as far as possible to describe some of the most important in this week's issue, and complete the notice in our issue of the 26th. Before commencing these descriptions we may add that the hall has been well filled each day, and that the exhibitors all seem perfectly satisfied by the results of their efforts.

The Warrington Bond Iron Syndicate, Ltd., of Manchester, are exhibiting at Stand No 45, Row B, their patent wall-tie. This is a particularly strong and effective tie, and the fact that upwards of five millions of them have been supplied, shows that it is rapidly coming into favour. There are three varieties, one for cavity work, one for solid work, and a special flat tie which may be used either for cavity or solid work.

Messrs. B. Ward & Co have at Stand No. 85, Row D, a good exhibit of their granite-concrete paving, which has been extensively used for paving stables, cowhouses, dairies, &c. The firm have acquired the patents of the late firm of Charteris & Longley, and are exhibiting some excellent specimens of wood-block and parquet flooring.

The Rhodes Patent Sash-Hanging Co. have at Stand No 99 in Row E an extremely interesting exhibit of a valuable invention for raising the heaviest sashes instead of the ordinary and usually inefficient smooth-grooved pulleys, worked by sash-cords, chains or wires. This invention enables the largest and heaviest of sashes to be opened and closed by a child. The fittings consist of a cog-wheel or teeth-pulley and steel chains, which are fixed to the sash and frame in the usual way. The chains are chemically treated to prevent rusting, and there are no intricate parts to get out of order.

At *Messrs. Worrall & Co's* Stand, No. 20, Row A, some very good examples are shown of hammered ironwork, a pair of entrance-gates marked 101. 105, of an extremely effective design, and which seem particularly reasonable. The firm is better known in the North of England, but they evidently mean to make a bid for the London work, as we are informed that they are also exhibiting at the Royal Agricultural Show, which opens on the 23rd.

Partridge & Cooper, Ltd.
1 & 2 Chancery Lane, London, E.C.

Messrs. L. Lewis & Co., of Shirland Road, W., show at Stand 16 specimens of their improved flexible mastic damp course, made in 3 feet lengths and from 4½ to 18 inches wide, which they guarantee is damp-proof, will not decay or crack or ooze out with pressure. They are also exhibiting their patent flexible mastic roofing felt, 39½ inches wide, which is highly compressed and elastic and is a non-conductor of heat, damp and frost; and their improved flexible mastic slaters' felt, which placed under slates, tiles, zincs and wooden sheetings deadens sound, equalises temperature, preserves wood. This is made in lengths of 11 yards or 22 yards by 39½ inches wide.

In a handsome pavilion erected by *The National Opalite Glazed Brick and Tile Syndicate, Ltd.* (Wm. Griffiths), of Hamilton House, Bishopsgate Street, a variety of the bricks and tiles which are the specialty of this firm can be seen *in situ*. This form of decoration, while highly effective, has the additional merit of being durable and inexpensive. It can be applied to old and unsightly as easily as to new walls, and has very great reflecting power, which renders it of great value for lining tunnels, subways, corridors, &c. It is essentially sanitary and is impervious to bacteria, fungi or vermin. These tiles are supplied in bull noses, angle beads, &c., and are largely used for hospital and similar work, where they are found to answer very satisfactorily.

Messrs. Maughan's Patent Geyser Co., Ltd., Worship Street, E.C., have at Stands 30 and 31 some of their patent steel-clad copper baths, which are constructed with an outside shell and an inside lining of planished copper, with highly-finished tinned surface. The bath is supported by four ornamental malleable iron feet, silver or gold bronzed, and the plug and overflow are nickel-plated. The bath is adapted to any class of fittings; and their patent galvanised enamelled bath is made on similar principles to their steel-clad copper-lined, the only alteration being the dispensing with the copper lining. The steel shell before being enamelled is galvanised both inside and out; the galvanising does away with any rusting, and makes a much finer surface for enamelling upon, enamel adhering better to a galvanised surface than any other. The firm's well-known geysers are also shown in various forms.

The Safety Lift and Elevator Co., Ltd., Rolt Street, Deptford, show (Stand 37) an electric lift, a self-sustaining dinner lift, electric lift controllers, hydraulic valves, &c. The gear of the dinner lift consists of a large hauling wheel, a V-wheel to prevent rope from chafing, and a brake wheel with lever. The boxes are strongly made of well-seasoned yellow

deal or whitewood, and have movable shelves; the guides are of best seasoned pitch-pine, scarfed and jointed; the ropes are of best quality manilla or hemp; no brake or brake line is required; the cages deliver 2 feet 9 inches above the floor level. These lifts are made in a variety of sizes, and are suitable for hotels, clubs, restaurants, flats, &c.

Messrs. James Austin & Sons, Ltd., have at the adjoining Stand in a glass case some capital specimens of their well-known patent sash, balyard, log and blind lines; the latter are made in a variety of colours to suit the decorations they will be used in conjunction with.

At Stand 56 *The London Fireproof Platewall Co., Ltd.*, 60 Watling Street, show the construction of internal partitions of solid smooth plaster (gypsum) plates or slabs, 2 inches, 2½ inches, 3¼ inches and 4 inches in thickness, grouted together, forming one solid partition, fire and sound-proof. The walls shown, although not plastered, have an absolutely smooth surface ready for paper or other decoration. They save time, space and expense, and are supplied and erected by the company either smooth or rough, the latter for setting coat or tiling.

Mellowes's patent "Eclipse" system (*Mellowes & Co., Ltd.*, Corporation Street, Sheffield) is shown at Stand 58. This exhibit consists of a wooden structure entirely glazed on Mellowes's patent "Eclipse" system. The bars which support the glass consist of a steel bar entirely encased in a tin-lead cover, having webs on either side, which are rubbed down on to the glass. A spray of water continuously plays on the roof and effectually demonstrates its watertight properties. The glazing has been in use for twenty-two years and is absolutely waterproof. Messrs. Mellowes recently completed the re-glazing of the Crystal Palace roof, employing upwards of 100,000 square feet of their patent glazing.

Veronese, Ltd., New King's Road, S.W., have erected in their fibrous plaster a highly ornate pavilion (No. 59), which shows the capabilities of the material to great advantage. Within the building may be seen a large variety of mouldings and other enrichments of a like nature, conspicuous among them being a particularly effective frieze in a design of cupids well executed, and showing considerable artistic feeling. The glazing of the pavilion is provided by the *Cloisonné Glass Company*, 66 Berners Street, who supply the window and roof-light in this highly decorative glass, which, while thoroughly translucent, has the great advantage of looking equally well from the lighted side, so that while strikingly effective when

used in windows; it is not less so when applied in panels to walls, &c. In colour and design this material leaves nothing to desire. The electric lighting of this comprehensive exhibit is supplied by *The Electric Fittings Co.*, of 59 Conduit Street, who show some elegant designs in electroliers and pendants, in the panels and shades of some of which they turn to excellent account the decorative qualities of the above mentioned cloisonné glass.

The Decorative Marmorite Co., 55 Queen Street, N.W., show (66) some highly wrought panels in this decorative material, which is a composition of metal and glass, and is solid in colour throughout. Its high polish renders it of great value for the use of facias, trade tablets, wall panelling and shop fronts. It is already very largely used on the Continent with the greatest success. Letters, ornamentation, trade-marks and any other designs are engraved by patent machinery on their own premises at Camden Town, and coloured or gilded as may be required. Conspicuous among the samples shown is a large panel decorated in new art style. It is contended that the material is imperishable, a contention which may be taken as justified inasmuch as the colour itself is solid, while those applied in decoration, including gilding, are burnt in. There is no doubt a wide field for this material for the purposes mentioned above as well as for permanent advertisements, &c.

Messrs. Thos. Wragg & Sons, Swadlincote, have at Stand 69 a comprehensive exhibit of samples of stoneware pipes and connections, among which will be found Hassall's patent double-lined pipes, Hassall's patent single-lined pipes, Stanford's patent pipes, the "Spiralitic" patent joint, Wakefield's patent corrugated socket pipes, Wakefield's patent street gulley, Wakefield's patent insertion pipes and junctions, Jennings's patent joinder or impermeable capped stopper, Emden's patent stopper for making air-tight every kind of inspection arm, and which will not blow out; Gordon's patent syphon, Gordon's improved junction blocks, Hughes's inspection interceptor, tested pipes, Monk's patent chimney-pots, sinks, glazed bricks and blue goods. The "Spiralitic" joint is a recent introduction, and deserves a few words of description:—The joint consists of containing walls of composition, between which, when the pipes are in place, liquid Portland cement is poured through one of the holes made in the pipe for that purpose. The cement not only acts as an important part of the joint to secure water-tightness, but the spiral or screw-like arrangement causes it to act as a key, locking, as it were, the whole constituents of the joint into a

compact whole, thereby greatly strengthening the resistance of the joint to various deforming forces.

Venesta, Ltd., 20 Eastcheap, shows (70) applications of Venesta boards to the various purposes to which it is adapted as door, wall and ceiling panels, trunks, hat boxes, chairs, seats and backs. This material, which is susceptible of effective decoration in various colours, is made of wood of any description, usually in three plies. It is made in boards up to 60 inches by 180 inches. It is light, strong, hard and waterproof, and is specially useful for fretwork, &c.

The Permanent Decorative Glass Co., Ltd., of 36 Basinghall Street, E.C., Manchester and Lancaster, at Stall 62 are showing examples of their well-known Florite Opal tiling and metal wall decoration, including a large variety of pattern tiles, imitation marbles, granites, ornamental borders, &c. They have also a tiled partition showing several excellent examples of their work. Their process of decoration on opal appears to be quite unique, and architects visiting the exhibition should not miss the opportunity of inspecting these interesting exhibits.

The feature which principally attracts attention in *Messrs. Gibbs & Canning's, Ltd.*, exhibit is a massive doorway in buff terra-cotta, a replica of one recently erected in green terra-cotta in Goole to the specification of Mr. A. G. Atkinson, architect. Other exhibits comprise sections of stone grey terra-cotta balustrading, coping and capping, &c., terra-cotta vases, a display of buff vitreous pavings and gutters, air-bricks, buff terra-cotta facing bricks, salt-glazed sanitary and engineering bricks, highly glazed sanitary ware and fittings, cream glazed (leadless) sinks, salt-glazed garden edging, &c.

Vulcanite, Ltd., 118 Cannon Street, specimens of patent vulcanite roofing for application to flat roofs of wood or concrete construction, and for waterproofing roof tanks, reservoirs, &c.; vulcanite sheet asphalt for roofing sheds, farm buildings, brick kilns, &c.; and vulcanite sheet asphalt for damp-proofing foundations, &c., are to be seen at Stand 19, Row A.

Messrs. Stanley Bros., Ltd. (Nuneaton) exhibit occupies a large space (82) in Row D, where they show some walls erected in their glazed bricks, the colours of which—brown, grey, granite, white, &c.—as well as the glaze are excellent. Here are also to be seen chimney-pots of artistic design, red, buff and salt-glazed, plain, and ornamental roofing tiles, ridges, finials and ventilators, pressed blue bricks, copings, garden tiles, and some ventilating bricks of new and very effective pattern. Other specimens of the firm's productions comprise

panels, string-courses, window and door heads and jambs of excellent design, ventilating blocks, &c.

Messrs. J. A. King & Co. have a space nearly in the centre of the hall, where they show partitions erected in their Mack patent fireproof slabs. These partitions are 2, 2½ and 4 inches thick. It is claimed that the principle embodied in the patent insures that walls, floors, ceilings, &c., in which the material is employed are fire and sound-proof. It can also be used for the insulation of roofs, the lining of damp walls, &c. The firm are opening works throughout the country for the manufacture of these partitions, which, in consequence of their lightness, strength and durability, have been rapidly coming into favour.

Messrs. Samuel Elliott & Sons, of Caversham (at Stand 97), show a very large variety of mouldings of all sizes, varying from ½-inch to 15 inches in width, of all sections, curved and straight, in many kinds of wood, and adapted to all purposes. Here may also be seen room-doors which are splendid specimens of joiners' workmanship, one of these, in Honduras mahogany inlaid with satinwood, being especially worthy of remark, although those in less expensive woods are not less admirable as regards style and finish. Another important exhibit at this Stand are *Elliott's* patent fireproof tiles for a base, which is a substitute for wooden or metallic lathing, having a suction for hastening the setting of plaster or cement. It is claimed these tiles can be used on wood floors as a base for cement floating for encaustic or other tiled floors; on matchboarded partitions, for lime or cement plastering, causing such partitions to be fireproof and sound-proof; on flats, as a base for any thickness of cement or asphalt flooring. They can be used for bay-window roofs as a base for cement floating and finishing, and for gables to roofs, instead of the usual lathing between the timbering.

Messrs. Sissons, Bros. & Co., Ltd. occupy a special position (No. 11) where, on a screen, they show some charming examples of wall decoration in Hall's washable distemper in conjunction with their white Japan paint. In these schemes of decoration the colours are of the utmost delicacy and bear ample testimony to the value of the distemper as a decorative material, to say nothing of its hygienic qualities, which are, of course, obvious. It is perhaps scarcely necessary to say that the distemper can be had in any colour.

Mr. Joseph Fishburn, of High Wycombe, is again showing (102) his labour-saving winch, which is so named because of its adaptability as a means of lifting or lowering by hand-power articles or material of almost every kind with great despatch

and safety, and by its use a considerable amount of labour will be avoided. In building operations ladders are only necessary to allow the staff and workmen to reach the work, and hods are not necessarily required, ordinary wheelbarrows, handbarrows, or porters' baskets, buckets, or receptacles being used—one ascending while the other descends. To painters, plumbers, plasterers, tilers and slaters sending up or serving material to lofty altitudes, and where steam hoists, winches, or cranes are employed it will be found a useful auxiliary.

Messrs. Bolton & Laughlin, of Henley Road, Ipswich, show at Stand 105 a comprehensive assortment of their red Suffolk facings in light, medium and dark shades, best white Suffolk facings, best brimstone facings, rubbers red and white, red and white arch bricks, red and white moulded headers, stretchers and returns, carpenters' fixing bricks, string-courses, coping bricks, panels in white and red rubbers, &c.

Samples of worked freestone from Castle Bytham quarries are shown at Stand 107 by *Messrs. Joseph Boam, Ltd.* These samples show the stone from both the lower and the upper beds worked and in the rough. Prominent among the exhibits is a window, one of those which is about to be placed in the new library at Barnet. Specimens are also to be seen here of Castle Bytham lime, a stone lime, grey in colour and very strong. When slacked it is claimed that it will carry at least six parts of sand to one of lime, and will then make a stronger mortar than chalk or Bedfordshire lime.

The Weldon Quarries are represented at Stand 113, where Mr. John Rooke is showing specimens of the stone. The Weldon Quarries have long been famous in the Midlands for the quality of their stone. Many fine buildings of historical interest, e.g. Kirby Hall, Lyveden, Rothwell Market House, &c., bear testimony to its excellence. This is admitted by all judges of stone who have seen the sharp carvings and undercuts, mouldings and angles in those buildings, and a feature of this exhibit is a date panel of the year 1696, which was taken from Kirby Hall, and in which the cutting is as sharp as if it had only been executed yesterday.

The chief feature of a Stand (152) where are also shown Blackman's ventilating fans, Keith's patent hot-water boilers, registers, ventilators, &c., is undoubtedly the *Keith Light*, shown by *Messrs. James Keith and Blackman Co., Ltd.*, of Farringdon Avenue. This light is obtained by burning ordinary gas at high pressure obtained by means of Keith's patent automatic compressor, which is generally worked by the ordinary water service, either from the street main or from

a cistern. It uses an extremely small quantity of water, and, we understand, meets with the approval of water companies and committees. It can also be worked by electric motor. It is silent and absolutely automatic in operation; the pump portion working in a water seal is frictionless, and requires no leathers, packings nor lubrication. It gives a steady unvarying pressure of gas, irrespective of the number of burners in use at the time, and being entirely automatic, the whole action starts or stops on the mere turning the gas taps at the burners on or off. It can be placed anywhere with safety. The water for driving need scarcely be taken into account; if charged at 7d. per 1,000 gallons the cost of it is only about one penny for each thousand cubic feet of gas compressed. Great economy of gas results from securing perfect combustion of the gas by these patent compressors and burners, which raise the pressure of the gas to 8 inches of water column and mix it with about five times its volume of air. We understand that burners of 300 candle-power and 150 candle-power, with 8 inches pressure, pass 10 and 5 cubic feet of gas per hour respectively, and give a clear, steady, white light costing, with gas at 2s. 6d., only a penny an hour for 1,000 candle-power. These burners can be instantly adjusted to suit the quality of coal gas in any district, so as to get the proper mixture of gas and air to give complete combustion. In combination with these burners Messrs Keith show their patent electric lighter for gas-burners, which should prove a useful adjunct.

Mr. John Tann, 11 Newgate Street, shows (153 and 154) a selection of his "Anchor Reliance" safes, doors, locks, &c.; fire and burglar-proof bent steel safes without joints at the corners; dwelling-house safes, commercial fire and fall-proof safes, book and deed safes, thief-resisting plate safes, fire and thief-resisting jewel safes. Strong-room and bullion-room doors, party wall and warehouse doors are also to be seen here.

Ripolin, Ltd., show in Bay 3 results of applications of paint to various materials. A conspicuous object at this Stand is a panel delicately tinted in flat Ripolin, the effect of which is eminently artistic and pleasing. Ripolin, Ltd., are introducing a new filling, which they strongly recommend for use with Ripolin, whether glossy or flat, for which it prepares a beautifully smooth, hard surface to which the finishing coat can be applied to the great economy of the latter.

The Wood-carving Co., Birmingham, show at Stand 64 some beautiful designs in Saracenic and fretwork fittings in

arches, window-heads, &c., and notably an elaborate doorway in Oriental style, the work in which is particularly graceful and refined. This firm has executed a quantity of work for various railway and tramway companies, and details of some of this are shown here; a prominent object in this stand is a staircase with massive handrail and specimen balusters in various designs handsomely carved and otherwise worked up.

In our issue of November 7 last we gave a description of the new system (Messrs. Möller & Pfeifer's) which had been adopted by Messrs. Eastwood & Co., of Belvedere Road, who have erected an office in these bricks in Bay 9, where they are showing Kent stocks, which were made, dried and burnt in three days. Messrs. Eastwood have found this system to work so satisfactorily that they have largely increased their works at Teynham, in Kent, and erected others, in their various brickfields besides acquiring all rights for the whole of the United Kingdom. These tunnel dryers, which may be said to form the base of the system, are suitable for drying all kinds of bricks and tiles, as well as for porous ware, slabs and pipes of every shape and description. The extension of this system of drying has been more rapid than that of any other in the history of the brick and tile industries, the number of installations having been as follows:—In the year 1895, 1 drying apparatus was erected; in 1896, 20 were put up; in 1897, 50; in 1898, 92; in 1899, 140 were erected. At the end of 1902 over 250 had been erected, and this rapid extension results from its many and important advantages, and, above all, from the fact that the process is entirely independent of weather. The brick, tile and allied industries can be carried on uninterruptedly throughout the entire year, and with complete independence of atmospheric or climatic conditions. Among the advantages which the system offers we may mention the following which, however, do not exhaust the list:—(a) Drying can be carried on regularly and continuously throughout the year; (b) there is great saving of labour and consequently a greatly reduced cost of production; (c) the goods are faultless in shape and improved in quality; (d) a clear and uniform colouring and a freedom from all inequalities is insured; (e) a greater production of the kiln, and a saving of fuel is secured; (f) rapidity of production is greatly increased; (g) the best boiler supply water is obtained through the vapour arising from the material to be dried being liquefied in the condensation heaters. New brick and tile works following Möller & Pfeifer's system are cheaper to erect

than similar works with other drying appliances. All mechanical fittings, ovens or kilns, and in particular the whole building itself, are smaller in proportion than those working under other systems. All particulars can be obtained at the office here or at Belvedere Road. The following great increase in weight-bearing strains obtained by the new system is worthy of note, *i.e.* Conyer stock, made by machine, dried in dryer and burnt in kiln, 194·7 tons per square foot; ordinary hand-made, 125·9 tons per square foot; increase, 68·8 tons per square foot. We understand that moulded bricks are being made on this system out of ordinary Kent clay with good results, and that a visit of inspection to Messrs. Eastwood's works at Conyer will be paid on the 27th inst. by the Incorporated Association of Municipal Engineers.

The *Ellkay Patent Bath Syndicate, Ltd.*, of Orchard Street, S.W., are showing a contrivance which will be found of the utmost utility in hotels, flats and other positions where the economy of space is an important consideration. It provides a full-size plunge bath, having hot and cold water and waste connection in perfect form and complete for fixing in a bedroom or other place, conveniently folding up for enclosure within an ornamental cabinet which resembles a wardrobe in appearance. The door of the cabinet contains a mirror, and forms a very attractive piece of furniture. The woodwork can be made to match any other in the same room. The cabinet is arranged to contain bath mat, bath towels, bath gown, sponges, soaps and other bath requisites. The bath is specially counterpoised so as to be easily lifted into position, and when closed provides a safety sink to take away any water which may be left in the bath or drip from the taps. The cabinets can be also supplied with a spring mattress to fix on to the top of the bath, forming a very comfortable single bedstead for emergency use.

In the arcade on the right side on entering, *Messrs. Wm. Oliver & Sons*, of Bunhill Row, occupy some 60 feet of wall space with their fine display of timber, comprising fine specimens of all the choicer woods—mahogany, sequoia, pines of various descriptions, walnut, teak wainscot, oak, birch, &c. An item of their exhibit, too, which deserves attention is the pair of handsomely panelled doors in oak. These doors are conspicuously good, whether regarded as from the point of view of workmanship or from that of the beauty of grain of the wood from which they are made.

In the Gallery (7) *Mr. C. E. Johnson*, of Hoxton Street, shows some good specimens of timber in mahogany, wainscot

and American oak, teak, walnut, birch, whitewood and all descriptions of hard woods in logs, planks and boards, 2 feet 5-inch white wood planking, kauri, Oregon, pitch and yellow pine; yellow and white in planks and deals; oak, teak and pitch-pine flooring for secret nailing, hardwood mouldings and electric casings, lavatory seats, &c.

The Empire Stone Co., Leicester, show in Bay 7, Gallery, a doorway and two windows of excellent colour and workmanship. They are made to imitate yellow Mansfield and Portland stone respectively. A flight of steps in fancy and plain flagging is also shown, specimens of grooved and channelled stable floors, &c.

The Acme Wood-flooring Co., Ltd., Gainsborough Road, N.E., have a very fine display in Bay 9, Gallery, of Duffy's well-known system of dowelled paving and flooring, the latter plain and polished and made in the following woods:—Kauri pine, East India teak, pitch pine, jarrah, maple, oak, Swedish redwood, karri, &c. In the adjoining Bay they show West Australian jarrah and karri planks; red gum planks from the Mississippi Valley, U.S.A.; yellow deal planks from Sweden; paving blocks in jarrah, karri, red gum and deal; worn paving blocks from the streets of London. They also show and explain the system of dowelling which they employ and its many advantages.

Messrs. Wilson & Stockall, Bury, Lancs, are represented in the Gallery, Bay 13, by two of their ambulances, which, as regards utility, convenience and finish are of a high order of merit. One is a patent brougham ambulance for modern isolation hospitals. It closes up like an ordinary brougham, placing patient in position. There are doors at the side and back, opaque windows at the sides which prevent the patient from being seen from the street, but the patient can see outside; the other is a patent accident ambulance (van pattern) which will convey two injured persons in a recumbent position at one time.

The adjoining space is occupied by *Messrs. Defries & Sons, Ltd.*; Houndsditch, who show their "Equifex" disinfectant cleaner. This appliance enables water from a main water-supply to be automatically mixed with an exact proportion of disinfectant, antiseptic or deodorant solution. The disinfectant can be cut off at will or readmitted without stopping the current of water. We understand that the automatic working of the apparatus has been found in the disinfection of public streets, markets, abattoirs, stables, ships, waggons, &c., to effect a saving of 80 per cent. on the cost of labour, and the complete utilisation of the disinfectant effects a still further economy. The "Equifex"

QUOTATIONS FOR CASTINGS.

odourless tank waggon for emptying cesspools is an apparatus which acts by creating a vacuum in the cylinder through the action of the large pumps, either by the motion of the wheels or by the handles. The exhaust from the cylinder is passed through the disinfectant cylinder, where it is broken up, disinfected and deodorised, first by a disinfectant spray and then by perforated baffles, through which it is led, these baffles being kept wet with disinfectant-deodorant solution by the spray. The "Equifex" steam disinfectant is a machine which has been adopted by the home and colonial governments. For absolute disinfection it is worked with saturated steam at 10 lbs. pressure (239 degs. Fahr.). The chamber consists of a cylinder of mild steel, made without steam jacket, so as to avoid risk of superheating. The cylinder is lagged with non-conducting composition and wood, with brass bands, to reduce loss of heat by radiation, and, as usually supplied, is furnished with doors for infected and disinfected articles respectively.

Mr. W. E. Farrer, Cannon Street, Birmingham, occupies Bay 17, Gallery, with an automatic alternative distributing apparatus for small bacteria beds, such as are required for use at large public buildings, as asylums, isolation hospitals, barracks, &c. Distribution is provided for by means of an automatic tipper discharging alternately into two sets of light perforated cast-iron channels supported about 1 inch above the filtering medium. Torfit urinals, by the use of which flushing is rendered unnecessary; an improved apparatus for flushing sewers, closets, &c.; a patent lattice-gear penstock or sewerage valve, a rust-collecting chamber for the base of sewer ventilating columns, &c., and a selection of his sluice, air and other valves are also shown.

Messrs. Mather & Platt, Salford, have a stand in the Gallery, Bay 19, and exhibit a model of their automatic mechanical sewage distributor which, according to the analytical report by Inspector Leigh, on samples from Farington sewage works, Preston Rural District Council, gives admirable results. A model may be seen here of their patent gravity filter, which consists of a large circular iron tank, open at the top, and resting on a cast-iron chamber in which the filtered water collects before its discharge through the outlet-valve. The collecting-chamber is separated from the filtering-tank by a dished iron plate into which a large number of brass nozzles of special design are screwed, the object of which is to insure the effective use of all parts of the quartz bed during filtration, and a proper distribution of the water used for washing out. On this plate rests the quartz bed in graded layers, passing from the coarsest

at the bottom to the finest at the top. The filtering-tank is fitted, at a few inches above the surface of the quartz bed, with an annular channel communicating by a number of openings with the tank, and into which open the inlet-valve for unfiltered water and the wash-out discharge valve. This annular channel affords a free outlet for the wash-out water, and is a marked improvement on any former arrangement, there being nothing whatever to impede the free discharge of the wash-out water. A third model to be seen here represents the Archbutt-Deeley water-softening apparatus, all the mechanical operations in connection with which are very simple, and the labour involved is light.

The Patent Victoria Stone Co. occupy a large space in the south-east corner of the Gallery with a stretch of their well-known paving, on which is erected a particularly handsome monumental porch in yellow Mansfield tint, with moulded caps, sills, brackets, and heads and carved enrichments. This is, we believe, a replica of doorway erected at Clarence Gate. A flight of moulded bracketed steps and landing, some bold balustrading, which we understand is a portion of a large contract in hand for a mansion being erected in Surrey, vases, terminals, &c. As an object-lesson in the value of the stone as regards wear, three flags are shown which were respectively removed—one from London Bridge, where it had been in use fourteen years, subjected, as we are told, to a daily traffic of 126,000 passengers, giving a total of 640,000,000, in spite of which it only shows scarcely appreciable wear; another taken from the entrance hall of the South Kensington exhibitions, which had been traversed by 20,000,000 visitors, and this only shows wear to the extent of 1-32 of an inch; and the other from the corner of Commercial Street, Whitechapel, where it had lain for five years, gives equally satisfactory results. Among the many important works which this company have in hand we may mention the following:—Architectural stonework, staircases, &c., for the electric-power station at Southwick, near Brighton; stonework for the boulevards, recreation-grounds, refuse-destroyer and other work for the Tottenham Council; balustrading, &c., for mansion at Burgess Hill; mansion and new schools, at Ogmere Vale, South Wales; several blocks of mansions at Clarence Gate, the Carnegie Library at Hartlepool, Kynoch's new premises at Birmingham, new brigade offices and married quarters at Shorncliffe Camp, Great Western Railway stations on the new Ealing and High Wycombe lines, staircases for innumerable public buildings, police-stations, &c.

LISTS of ART PLATES and of
CATHEDRALS, published in THE ARCHITECT, sent
on application to GILBERT WOOD & CO. Ltd., Imperia
Buildings, Ludgate Circus, London.

In an attractive glass case in Gallery 8, Row D, *Messrs. W. F. Stanley & Co., Ltd.*, Great Turnstile, have arranged a large number of their well-known drawing, surveying and scientific instruments, including protractors, compasses, scales, rules, aneroids, theodolites, inclinometers, gradiometers, levels, telescopes, &c.

Close by (Stand 14, Row D), *The Clee Hill Granite Co.*, Ludlow, show graded samples of the stone from which the company derives its name. The tough nature of this stone renders it invaluable for road-making, either as setts for paving or as macadam. It wears remarkably well under heavy traffic, and consequently produces very little dust in dry or mud in wet weather, thus providing a pleasant and economic road stone, a property which has commended itself to engineers and surveyors all over the country.

Messrs. Field & Mackay, of Titterstone Quarries, Ludlow, are also showing specimens of Clee Hill stone at Stand 14, Row B.

At *Messrs. Norton & Gregory's* (Westminster Palace Gardens) Stand, Gallery 22 and 23, Row D, is to be seen a new black-line process for the reproduction of architectural and engineering drawings, &c. The results produced by this process can only be characterised as admirable, every line being perfect and the colour not less so. Drawings can be reproduced on paper or linen as may be desired, and the reproductions can be coloured as readily as the drawings. In addition to the beautiful appearance of the prints, this process possesses a great advantage in the rapidity with which the work can be turned out as compared with other "black-line" processes. We may add that *Messrs. Norton & Gregory* undertake architects' perspectives, which they execute from plans and elevations, and some of their work in this department may be seen here. Another exhibit at this Stand is in quite a different category, namely, the "New Idea" spring hinge, which is very simple, and appears to possess all the advantages claimed for it, *ie* it prevents the door from sagging; it is capable of such perfect adjustment that it closes the door quickly and gently without noise or vibration; it is neat in appearance; it admits of the door fitting closely against the jamb; it holds the door in perfect alignment; it is easily and quickly fixed; it is practically impossible for the hinge to get out of order, and obviates the necessity of cutting away floor for bedplate, or the removal of door for repairs.

Specimens of high-grade Limmer asphalte are shown at Stand 36, Gallery, by *Messrs. Bradshaw & Co., Ltd.*, 52 Queen Victoria Street. Other exhibits at this Stand consist of samples of refined bitumen for asphalte and electrical purposes, sample asphalte cauldron, contractors' trestles, sample of improved limestone tar-paving for playgrounds, &c.

At an adjacent Stand, that of *Messrs. W. Salter & Co.*, of Harrow Road, samples of Seyssel asphalte may be seen. *Messrs. Salter & Co.* are asphalters to H M Government, the Admiralty and War Office, and testimonials speak well for their workmanship, &c.

The Columbian Fireproofing Company, of 37 King William Street, have erected (Stand 55, Row C) a building which exemplifies their method of fireproof construction, which consists of special ribbed steel bars from 1 inch to 2½ inches in depth, suspended in steel stirrups over steel joists, and 3½-inch, 4-inch and 5-inch heavy ribbed bars, between main girders or resting on the walls. By the use of the heavy ribbed bars the ordinary steel joists are eliminated. These ribbed bars are in every case surrounded by and completely embedded in concrete, composed of the best Portland cement, sand and furnace slag or cinders. These ribbed bars being, by their special shape, adapted to the concrete, utilise the full strength of the concrete and thereby furnish a fireproof floor, so far in excess of the requirements for strength, that it is practically impossible to break it down. The exhibit shows a 15-foot floor with a 15-foot span, formed of 4½-inch steel-ribbed bars spaced 20 inches apart, and embedded in 5½-inch concrete; the roof is of Mansard form, with dormer windows formed of bars and concrete. The method of construction is exceedingly simple, and the result eminently satisfactory. We have so recently referred to this company's system of fireproof construction in connection with the Exhibition at Earl's Court that it will be fresh in the memory of our readers. Steel and concrete sewer conduits are also shown.

Messrs. Freeman & Hines show (Gallery, Bay 11) samples of their new patent aluminium baths, which present a very bright and attractive appearance; the Freeman patent double seal drain pipe—the advantages of this new double seal pipe joint are many, among others we may mention that it requires no skilled labour and very little cement; it is a locking joint insuring concentric fitting and absolutely close abutting of the pipe ends; the pipes are manufactured in stoneware and also in Midland ware; space will not permit of our reference further at present to its many advantages; Hassall's patent w.c. suites, which, it is claimed, give a perfect flush with a 1½ gallon discharge; some good designs in mosaic and art tiles, &c.

Belgium has a reputation for building stone, and there is no more interesting variety than the "blue limestone." The title gives no indication of its value. The large example shown by the agents, *Messrs. Chas. Vandekerkere & Co.*, in the Minor Hall, at once is suggestive of strength. Looking at it, we are not surprised to find its crushing strength is 4,250 lbs. per inch. It lends itself to all varieties of tooling, and takes an excellent polish. It has been more used than any other stone in Polaert's Palace of Justice in Brussels, which the Belgians consider to be the greatest of modern buildings. It is no less excellent in buildings on a small scale, and the Belgian artists employ stones of different colours to serve as foils and to bring out its effect. It is a most interesting addition to the building stones which are readily obtained, for the prices are moderate. We may mention that the stone is suitable for steps, landings and other use where strength is indispensable.

Messrs. Ewart & Son's extensive exhibit at Stand 20, Row A, contains a well-arranged display of their well-known "Victoria" ventilator, "Empress" smoke curer and "Prince" cowl, an assortment of agate and other baths, several specimens of their Geysers, one of which is in practical work. Among these the "Lightning" is of great power, supplying water at the rate of eight gallons per minute. A feature of the exhibit was the attractive display of nickel bath-room fittings and bath seats. *Messrs. Ewart* show also their "Euston" and "Ideal" radiators, which are self-contained, and are useful for heating halls, offices and rooms where there is no flue. These are said to be very economical in the consumption of gas—an important consideration.

Velvrl paint, specimens of which are shown by *The Velvrl Co., Ltd.*, of 29 New Bridge Street, E.C., at Stand 67 in Row C, contains no lead or linseed oil. It is supplied in various colours, such as stone, red, green, slate, brown, black, white, &c., as well as in metallic colours, as gold, bronze, aluminium, &c. This paint, which is easy to work, can be used for iron and bridge work, gasworks, inside work in steamers, wood and stone work, &c. It is claimed that it is not affected by atmospheric influence, and is perfectly waterproof and non-corrosive, while its covering powers are about equal to that of ordinary paint. It has, we understand, given perfect satisfaction when tested as a waterproof covering for the haunch of an arch, to prevent percolation of moisture from breeze cement penetrating and discolouring stone.

Messrs. Brown & Co., of Glasgow, are showing at Stand 104, Row F, their patent Simplex window fittings, which can be fitted at small expense to any existing window. In consideration of the new Act which makes it compulsory for all windows to be so fitted that they will open inwardly to prevent accidents, these fittings should meet with approval from architects, builders and property owners; they are inexpensive and easily fitted. One of the great difficulties in many of the patent windows invented has been in dealing with the sash or balance weights; this has in this patent been obviated, as the application of this patent to an ordinary window allows the sash with both weights not only to rise and fall, but to open inwardly, arresting and re-engaging the weight automatically as it is opened and closed. It is claimed that there is therefore now no need for dispensing with the ordinary window, no awry, lop-sided openings, no drooping and dragging sides, no need of tramway roller to aid lifting, no obstruction limiting the rise of sash, no dividing of sash stiles creating draughts, no tricky springs or bolts, no obstructions to blind screens, no formidable eyesore to the view—both weights remaining in action—the sash rising and falling full length, equally balanced, and at the same time opening inwardly like a casement. *Messrs. Brown & Co.* have appointed as their London agents the well-known firm of Nettlefolds, and also O'Brien, Thomas & Co.

Velure is shown by *Messrs. C. Chancellor & Co.*, Clerkenwell Road, at Stand 14, Row A. Velure is a new and perfected Japan paint, superseding varnish, with remarkable spreading, elastic and weather-resisting properties. It is sanitary and washable, and it is claimed that it will not crack, chip, peel, blister or fade. It is stocked in 120 colours and any shade can be matched. Samples of *Stripso*, another specialty of this firm, are also shown. This is a paint or varnish remover which has satisfactorily withstood the tests of time and experiment, and been proved to be an efficient labour-saver.

Silicate cotton, otherwise known as mineral or slag wool in its raw and various manufactured forms, is shown by *Messrs. Frederick Jones & Co.* at Stand 44, Row B. The valuable qualities which this material possesses for fire, sound and heat proofing are too well known to need any special reference here, but another feature of the exhibit, namely, "Hercules" partition blocks and slabs, is worthy of note, as the following advantages are attributed to it, namely, that it is cheaper than brick partitions, economises space, possesses great strength and lightness, is absolutely fireproof, is rapidly erected, is a sound-deadener and a vermin repellent, and is free from complexities. It is supplied in slabs 3 feet by 1 foot 6 inches, by 2½ inches to 4 inches thick.

The Enderby and Stoney Stanton Granite Co., Ltd., of Narborough, whose Stand in the Gallery is No. 20, show samples of granite of excellent texture and colour, which is now meeting with considerable success as a building stone, for which it seems very eminently suitable, and the price, we understand, is right. Dressed granite in the form of spur stones, kerbs, channels and specimens of various kinds of dressing, setts, broken granite and granite chippings are also to be seen at this stand.

In view of the rapidly extending use of lifts, the principal exhibit at Stand 9RB in the Gallery is the model of an electric lift, which is shown by *Messrs. Joseph Richmond & Co., Ltd.*, of Kirby Street, E.C. This lift, which is electrically controlled and operated, is on the press-button principle. The main switch controls the movements of the lift, and is fitted with a pendulum which tends to break the main circuit by returning to its central position. Current flowing through solenoids causes the lift to move upwards or downwards respectively. These are connected directly with the positive main; but the negative is connected up through two contacts, the flexible wire cords, the gripping contacts and the small switches. An insulating piece and an insulating spring, keeping the wire cord in tension, separate this cord into two parts. The former is fixed to the car and travels with it. Each floor is provided with a button, which if pressed closes the small switch of that particular floor, the circuit through the main switch is thereby closed, and the lift begins to move. At the same time the main current energises the solenoids, which lock the press buttons in whatever position they may be at the time. The lift ascends or descends, as the case may be, until the insulating piece breaks the current. By this time the lift is opposite a door, which it automatically unlocks. Each door is provided with a circuit-breaker operating in the main circuit. The lift can, therefore, only operate when all the doors are shut. The action of the pushes inside the car, of which there are as many as there are floors, is similar. After closing the door the passenger presses the button of the floor he wants to proceed to. The lift then ascends or descends until the insulating piece breaks the circuit. In the unlikely event of two persons on different floors pushing buttons simultaneously, the car will travel to the floor farthest from that at which the cage was at rest. Other interesting items are a model of self-sustaining dinner lift, of which the mechanical motion is unique, the heavier the weight put on the gear the greater the self-sustaining power, and one of a street orderly bin, of great interest to surveyors to

public bodies. The bin automatically empties into cart by means of a handle, and thus assures thorough cleanliness. From a health point of view, as well as for its simple character and effective working, the bin should certainly be adopted universally and at once.

The Hard York "Non-slip" Stone Co. have paved Bay 5 in the Gallery, South Side, with their non-slip hard York stone flags, which, in addition to presenting a neat and pleasing appearance, fully justify their title as regards firmness of foothold. This stone is eminently workable, as is exemplified by worked specimens which are shown here, "Non-slip" stone channelling, platform coping with a distinctly defined edge, stone steps, moulded and spandrel and stone landings, &c., go to make up an interesting and in its way instructive exhibit.

Messrs. Geo. Wragg, Ltd., Salford, show some capital stained and leaded windows at Stand 75, Row D, casements and sashes in steel and bronze, window gearing, mosaics, enamels, jewellery, metalwork. In iron, brass, copper, aluminium, pewter, silver, &c., for interior and exterior decoration, such as gates, rails, vanes, altar rails, lecterns, communion plate, vases, &c.; gas and electric-light fittings, repoussé work, bronze founding, &c.

The Desolle Electroplating Co., Ltd., Cornhill, exemplify at the adjoining stand their system of electroplating in copper, bronze, brass and nickel, and exhibit ornamental ironwork, &c., treated by the process.

At 24 A *Messrs. Potter & Co., Ltd.*, 66 Victoria Street, have a concrete fireproof floor, 12 feet between supports and $4\frac{1}{2}$ inches thick. In the construction of this floor no steel joists are embedded. It is strengthened with $\frac{1}{4}$ -inch corrugated tension rods, and it is claimed that it possesses five times the strength of an ordinary concrete floor. Other exhibits comprise a specimen of steel lath bracketed for plaster cornice, and a specimen of wood attached by secret nailing to concrete floor.

Messrs. Mark Fawcett & Co., 50 Queen Anne's Gate, are to be found under the North Gallery, where they are showing their familiar fireproof floor, of which they have a full-sized example. They also show samples of the various materials which are used in its construction.

Messrs. Candy & Co., Ltd., Newton Abbot, show, special position No. 4, a large selection of glazed bricks of various descriptions, but of uniformly excellent quality and colour, granite vitrified paving bricks and channels, buff architectural terra-cotta, stoneware sewerage pipes, gullies, interceptors, &c.

Manufactory: White Lion Street, Long Acre, W.C.

Mr H Blackwell, of Fleet, Hants, shows Stand at 22 A a variety of crowding and bearing-off barrows, hack caps, pallet boards for hack and steam dryers, loo boards, seed and postal boxes, and all kinds of nursery trays and sample boxes, and such like useful brickmaking appliances.

Patent chequer bricks form the staple exhibit in Stand 95, Row E, by Messrs. Joseph Place & Sons, Ltd., Darwen, who attribute to them the following excellent points:—Increased strength, decreased solid on floor-level, rubbish cannot lodge on supporting walls nor between the chequers, 4-inch pipe can stand anywhere and still have free draught, supporting walls tied together and lateral movement prevented, broken or damaged chequers may be lifted out at any time and replaced without disturbing the rest, and they claim that they possess the following advantages—free draught, cannot choke, bottom strengthened, walls supported, repairs easily made. Specimens of salt-glazed and enamelled bricks are also shown here.

Messrs Towers & Williamson, Little Bytham, are showing (Stand 111, F) samples of their Adamantine clinker for paving stables, fire brigade stations, abattoirs, coachhouses, yards, kennels, cattle markets, and for floors of every description. These clinkers have been supplied, we understand, to the Royal Mews, Windsor, Sandringham, and also to their Royal Highnesses the Dukes of Connaught, Cambridge, and the late Prince Leopold and others. Fire-bricks and other fire goods are also to be seen at this stand.

The specialty exhibited by Messrs. Colthurst, Symons & Co., Ltd., of Bridgwater, at their Stand 90, Row E, is their patent interlocking Roman tile, whose gripping propensity seems to have caught architects and builders, and to have established the tiles in favour. The patent renders nailing unnecessary, as they so clip each other as to prevent stripping even when used in most exposed situations or in the most boisterous weather. Each tile has two grooves on its upper surface to prevent drift. Other tiles of Broseley type are shown as well as numerous ridges, finials, pier-caps and other samples, all of which have the excellent colour associated with this firm's goods.

A pavilion of pleasing design, erected entirely in the fire-resisting material which is their specialty, serves for exhibit and office for The British Uralite Co., Ltd., of 50 Cannon Street. This valuable invention, the progress of which we have watched with interest since its inception, and in commendation of which we have written on many occasions, is now so well known as to require no further description. It is, however,

interesting to note that it is now recognised as a reliable fire-resisting building material, and has been accepted by The Fire Offices Committee of London as a first-class roofing substance. Within the pavilion are exhibits demonstrating the various purposes to which it can be applied; for instance, there are samples of uralite for roofing, ceilings, partitions, &c; samples painted with Ripolin and other paints; samples coloured with Hall's distempers; others veneered in oak, maple, mahogany, walnut, teak, sycamore, &c; a fire-resisting uralite deed safe; a fire-resisting uralite despatch box; models of uralite roofs, as used in Great Britain and the Colonies, &c. We noticed that the effective lettering employed here was by the Brilliant Sing Co., Ltd., of Gray's Inn Road.

Messrs Shanks & Co., of 81 New Bond Street, are represented at two Stands, Row D, 84, and Bay 1, and show many of their well-known make of baths in the several varieties, as plunge, spray, canopied and tubular, in fireclay and porcelain enamelled iron; water-closets and supply cisterns, improved kitchen and scullery sinks, lavatories in vitro-porcelain and fireclay, &c.

At Stand 85 The Asbestos and Asbestic Co., Ltd., 27 Billiter Street, have on view numerous samples of asbestos, crude, fibrised and manufactured; in the latter category may be mentioned sectional pipe and boiler covering, asbestos and other deadening materials, asbestos packings, asbestic fireproof plaster, Manville registered fire extinguisher, &c.

Messrs. G. Tucker & Son, Loughborough, have arranged, at 87, D Row, a good businesslike display of architectural terra-cotta in door jambs, lintels, cornices, capitals, panels, copings, &c, as well as some excellent specimens of their red pressed facing bricks, red sand stocks, special bricks for sewers, red paving tiles, red roofing tiles, &c.

Messrs. Hall & Co., Ltd., of Croydon, who seem to have offices and wharves nearly all over the South of England, the names of no less than fifteen towns being given in this connection, are showing a varied assortment of slates and tiles at Stand 79, Row D. Among the green slates shown are samples of Precelly randoms for mansions and schools, as used at the Royal School of Art Needlework, Kensington; Precelly rustics, a popular slate, suited to country houses and mansions. These slates can be mixed in seven colours and will vegetate a beautiful green of varied shades if in suburban and country districts; Precelly peggies, a small slate, suited for turrets and Mansard roofs; Tilberthwaite green slates, very fine Westmoreland slates, such as we understand are used on most Govern-

ment buildings; Buttermere slates, a beautiful green, even in colour and texture; Elterwater slates, which are particularly suited for domes, as they will go round any roof and are even in colour; Bettws-y-Coed, Bangor, Carnarvon and Portmadoc slates, &c. The sample roof is covered with the well-known Keymer tiles, which can be had in either mouse or red colours.

An effective exhibition of mezotil, a new and attractive mural decoration, is shown at Stand 78, Row D, by *The London Tablet Co.*, of Sydenham, whose proud boast it is that product is the result of a combination exclusively English, namely, that it is made in England by English capital and English labour. This wall covering consists of sheets of zinc of the normal size of 5 feet by 2 feet, enamelled and decorated in various styles, the designs hitherto employed being chiefly in imitation of tiles. There are signs of deviation from this tradition, and there is no apparent reason for adhesion to it, perhaps, but we think that the excellent tile designs are the best of those shown here. As a clean, bright and inexpensive wall decoration this material deserves more than cursory attention. It is of course non-absorbent and vermin-proof.

The stand of *The Patent Indurated Stone Co., Ltd.*, must needs arrest attention alike by reason of its conspicuous position and its attractive exhibits. Prominent among these is an elaborately carved tablet in a warm buff colour, which admirably illustrates the susceptibility of this material to ornamentation and the ease with which it works. A beautiful pair of vases and pedestals of elegant design carved by Mr. C. H. Mabey also command attention; while not less excellent in their degree are a moulded corbel (terra-cotta colour) as used at the Fox public-house, Wilson Street, Finsbury, and warehouse adjoining in Scrutton Street, a ball terminal (yellow Mansfield) and moulded corbel (red Mansfield) as used for villas at Reigate, sections of moulded cornice and a moulded step as supplied to the Portland estate, a portion of moulded staircase (partly grooved treads) as executed for building in High Holborn, W.C., window heads and sills as supplied for the Western Electric Company's Works, North Woolwich, and moulded caps, ball and spike terminals, strings, neckings, entrance steps, staircase, all as executed for the Urban District Council of Hampton.

Sam Deards, Ltd.—At Stand 29 in Gallery, Mr. Sam Deards has on show two recent improvements in his patent

system of glazing, viz, a self-locking steel bar for glass roofs, when affixed to iron structures, which saves the making and drilling of all holes along the ridge, purlins and canopies, as well as the cost and use of nuts, bolts and screws. The new section bar is formed with a deeper web, so as to carry glass up to 11 feet long, when needed, the same being covered entirely with thin-tin lead of uniform thickness; but the cap for holding down the glass is quite independent and separate, so that should repairs be needed at any time, it can be not only removed but replaced without any injury whatever to the existing lead-covered bar. In this one particular it is unique. The indent for holding down the capping is on a level with the glass, so there is no fear of its ever becoming loose. The other new patent is *Sam Deards's* patent simplex glazing bar, which is so formed as to make a gutter on either side of bar to receive the glass, and also to turn down over and on to the glass, while the centre core of the wood bar is carried above the glass and admits of planks being placed upon outside of glazing to carry the workmen when repairs are needed, and to obviate the risk of breaking or injuring the glass. The principles of this glazing have been subjected to the test of two streams of water playing upon it on the outside during the run of the exhibition, and have attracted the attention of visitors. *Sam Deards's* patent coil boiler for heating 1,000 feet of 4-inch pipes is also on show. This well-known coil boiler has carried off, we understand, all the premier medals of the contests in which it has been engaged.

At Stand No. 132, wall space, *Messrs Bratt, Colbran & Co.*, patentees and sole manufacturers of the "Heaped" and "Valley" fires, 10 Mortimer Street, W., have a splendid exhibit of their well-known designs in wood and iron mantels, copper and brass interiors, wrought-iron dog stoves, antique door furniture, hand-painted "Mortimer" tiles, &c. Their new patent "Heaped" and "Valley" fires are shown in action, and these have been much admired by all who have seen them for their extreme simplicity, cleanliness and heat-giving capacity. The "Heaped" and "Valley" fires are being fixed throughout three London hospitals, and are in great demand for public buildings, offices and dwelling-houses.

Mr. F. A. Fawkes, Chelmsford, at Stands 48 and 49, shows a very handsomely designed fumed oak mantel with pewter inlay, and a pine mantel enriched, of broad artistic effect. Also a section of a room, showing the application of his well-known and appreciated enriched joinery, picture and

OUTRAM & CO. WOODVILLE, near Burton-on-Trent.

Excelsior and Rawdon Potteries,

dado rails, skirtings, cornices, doors and over-doors, all of excellent workmanship.

Mr. E. J. Smith, of Grosvenor House, Camberwell, is showing in the North Gallery (3, Row A) some very fine samples of Venetian, Florentine, canopy, duchesse, flounced lace and roller blinds, adapted for houses of all kinds from the cottage to the mansion, as well as for shops, hotels, &c. The diplomas for gold medals and other documents exhibited also at this stand attest to the value and excellence of the work done and materials supplied in various parts of the country.

Messrs. C. B. N. Smevin & Co., Back, Hatton Garden, fill two Bays (23 and 24) in the North Gallery with a very fine collection of seasoned woods for builders, cabinetmakers, carvers, &c. The varieties of wood shown comprise mahogany, wainscot, teak, oak, kauri, sequoia, whitewood, birch, ash, pitch-pine, yellow pine, Oregon, Carolina and deal, maple floorings, &c. Many of these woods are exceptionally fine specimens as regards the width of the planks and their fine grain. A notable feature of the exhibit is the curly pitch-pine arranged round the pillars of the bays.

In the Arcade *The Coalbrookdale Co., Ltd.*, of Queen Victoria Street, are exhibiting some attractive specimens. The Bostel patent combined sunk and lifting fireplace, which is made so that the fire burns either sunk in the hearth, or it can be tilted up to burn with the bars raised. The advantages of this combination are great. No air duct has to be provided through the hearth, yet there is no difficulty in getting the fire to light or to burn up when required. The grate when tilted up induces a quick draught, and the fire soon becomes a glowing mass of smokeless fuel; the bars are then lowered to the sunk position, bringing the fire well forward so that practically the whole of the heat generated is given out into the room, and the gases as they pass into the chimney are quite cool. Combustion is slow; the fire will burn for hours without any attention or additional fuel, and the coals burn away to a powder, which falls into the pan below the bars and is easily removed.

The Emdeca Metal Decoration Co., Ltd., have at Stand No. 57, Row C, an elegant exhibit in the shape of a Corinthian temple, the pillars of which are made of metal, while the interior walls are of thin-gauge zinc sheets, stamped out and stuck on to the surface whatever it may be, plaster or wood. They are made in all the best tile designs, having the effect of majolica tiles, and it is claimed that they last just as long for the decoration of bath-rooms, lavatories, and in all places

requiring to be kept clean where water splashes about, the cost being, we understand, one-half or a quarter the price of real tiles. The ceiling is covered with stamped steel made of solid Bessemer steel sheets, and yet the cost is said to be as cheap as paper, with the further advantage that a perfect ceiling is made without the use of any plaster. The general effect of metalwork for interior decoration is certainly very fine.

The *Globe Granite Co.* are showing at Bay 8 some capital specimens of red bricks, glazed bricks, broken granite and granite setts, as well as concrete work in the shape of flags, coping, heads and cills, kerbing and channelling, door pediments, steps, pillar heads, &c., the whole of which are well deserving of inspection.

Messrs. *Newell Brothers* show at Stand 24, Row A, samples of opal tiling, which is claimed to be of a very cheap and durable character, and made in England, with the view of affording the poor man the luxury of glass tiles for lavatories, &c., equally with the rich.

No visitor to the Exhibition will fail to devote a portion of his time to the attractive Stand (71, Row D) wherein Messrs. *Geo. Jennings, Ltd.*, of Lambeth, have arranged a number of their well-known sanitary appliances, among which will be found some admirable specimens of fitted baths. These are shown in many forms and styles of decoration, and vary in price from 7*l.* or 8*l.* to ten or twelve times those prices. A large variety of closets is shown, including the "Century Syphonic," an ornamental as well as useful adjunct to which is the semi-circular porcelain flushing cistern, which advantageously replaces the old and somewhat unsightly iron tank with which we have had hitherto to be satisfied. Lavatories in extensive variety, adapted, as we are told, for palaces, mansions, villas, hotels, restaurants, factories, &c., may be examined and admired here. A new bath-valve, Jennings's patent duplex, attracts a good deal of attention, as by its means the water can be supplied to the bath hot, cold or blended, while all fear of scalding the bather or spoiling the enamel through the inadvertent turning on of the hot water first is obviated. Other exhibits to be seen here comprise urinals, housemaid's sinks, vegetable, salad, poultry, fish and kitchen sinks, wash-up, bed-pan and slop sinks for hospitals, and other cognate items.

Messrs. *Clark, Hunt & Co.*, of Shoreditch, are well represented at two stands. At the first they are showing in action (Wall space 142) Bailey's patent Geyser hot-water supply, a description of which we gave on its introduction. This very

useful arrangement, which will be found of the greatest utility, consists of a small portable range for fixing in workmen's dwellings or small flats, where economy of space and small initial cost are of paramount importance, and provides a supply of hot water over a sink without the need of a feed cistern and hot-water tank. The cold-water supply pipe is in direct connection with the boiler, and is controlled by a stop-cock over the sink. The outflow pipe from the boiler terminates with a brass nozzle below the stop-cock. When the stop-cock is opened cold water flows into the boiler and causes a rapid discharge of hot water through the nozzle below the stop-cock. When the stop-cock is closed the discharge ceases, leaving the boiler full. The sink may be any reasonable distance from the range; the impetus of the discharge partly empties the outflow pipe, leaving but little "dead" water. This system, which is automatic and dispenses with the need for supply cistern and hot-water tank, has attracted a considerable amount of attention and should be greatly used. At this Stand is also shown a range with independent steam-cooking apparatus, suitable for hotel and restaurant use, where it should prove of great utility. In Bay 11 Messrs. Clark, Hunt & Co. are showing a very handsome kitchener, the Middlesex, finished in bright nickel with buff tiles, &c. This kitchener has a patent lifting fire of great simplicity, and other modern improvements. The Francombe's slow-combustion warm-air stove is an attractive stove, which has an independent setting into which it fits, the space behind acting as a warm-air chamber. Other exhibits at this stand comprise builders' brasswork, consisting of brass door-handles, knockers, postal handles, lock furniture and finger plates in various finishes, antique copper lock plates, also in white metal, German-silver, gun-metal, Florentine, silver and copper bronzes, electric bells, telephones, &c., the "Roy" patent fanlight opener, "Telo" casement stay, "Dean's" invisible casement stay, "Reading" fanlight opener, general mill furnishings, "All wrought steel" pulleys, "B.B." wood pulleys, "Smith's" pulleys, best oak tanned belting, "Condensed" hide belting, &c., &c., "Ward's" patent lift and force pumps and combined air-valve, best London-made brick moulds, hand-power mortice machines.

The Simplex Steel Conduit Company exhibit galvanised, enamelled and brass-cased conduit and fittings for electric wiring of buildings, outhouses, car sheds, stables, mines, &c.,

where the electric wires are placed in positions where moisture is nearly always present, and where there is likely to be any damage done to the wires in exposed positions either by mechanical or physical means. The system, which has been thoroughly brought up to date and standardised, is a method by which the wires of an electric installation are completely protected by the steel conduit and fittings. It supersedes the old method of wood casing, and can be erected with less labour, and the first cost compares favourably with the wood system. The conduits are shown enamelled, galvanised and brass cased, and arranged for screwed or socket junctions. There are some eight grades of conduit and 1,000 fittings, comprising couplings, normal and sharp bends, tees, inspection bends and tees, branching, intersection and tee-jointing boxes, switch and ceiling rose boxes, distribution switch and fuse boards, &c. The stand is built up of the simplex conduits, and the black enamel of the tubes against the dark polished oak panels on which samples are mounted presents a very fine appearance. In the front of the stand is a five-way distribution fuse board of the company's make, which controls the lights on the stand. The tubes connected with the outlets of this case rise vertically in front of the stand and then join a run of tube from the back in each case, thus forming five rows of tube to which the company's ceiling rose, pendant and lampholder fittings are connected. A large number of the accessories shown are arranged with lamps in place, and the stand is thus well lit at night. The back part of the stand has a roof of woodwork mounted on a tube framework, which also carries a show case containing the most improved and up-to-date fittings for use with the system. On the under side of the roof are fitted a number of ceiling roses, &c., and on the large panel at the back are various samples of the material very neatly and carefully arranged.

Mr. G. W. Riley makes a display in the Gallery of some well-made and capitally-designed rustic work, including five summer-houses, one of which is on the revolving principle for the open-air treatment of consumptives, and a number of garden seats, chairs, vases, &c., of an ornamental as well as a useful character.

In the Minor Hall one of the first exhibits to claim notice is that of Mr. Mark Gentry, who has brought a capital selection of his "M. G." red facings, red rubbers, red-moulded bricks, terminals, ridges, finials, &c., all of which exhibit the beautiful colour which one has come to associate with goods which emanate from Mr. Gentry's works

The Architect.

THE WEEK.

WE referred last week to a magisterial decision from which it would appear that railway premises come within the scope of the Metropolitan Management Act and the other Acts relating to buildings in London. Another case has since been heard which shows that dock companies have no more claim from exemption than ordinary traders. The Bermondsey Borough Council summoned the Surrey Commercial Docks Company for neglecting to give notice respecting a new workshop which was to be erected. Section 76 of the Metropolitan Management Act says that "Before beginning to lay or dig out the foundation of any new house or building within any such parish or district, or to rebuild any house or building therein, also before making any drain for the purpose of draining directly or indirectly into any sewer under the jurisdiction of the vestry or board of or for any such parish or district seven days' notice shall be given." The company maintained that they were exempt from this section by reason of their special Act, 1894, which gave them power to enlarge the docks and erect new buildings, and that it had been decided that a specific Act repealed a general Act. The magistrate, Mr. PAUL TAYLOR, held that there was nothing inconsistent in the Borough Council, whose duty it was to look after the interests of the public, having building notice. He therefore decided in their favour, and imposed a penalty of 5s. and 5s. costs. The two decisions are of extreme importance, and will tend to more uniformity in the application of building and sanitary regulations.

As a rule, not many actions arise between insurance companies and employers over cases under the Workmen's Compensation Act. But one has been just heard in Glasgow which suggests there is no advantage in disputing claims on account of trivial defects. In Scotland the system of separate contracts prevails, and Mr. ROBERTSON, slater, had undertaken to do work at a school in Glasgow. The operations were in charge of a competent workman named MACNEILL. He selected the plant. One day he took with him to the job two sets of $3\frac{3}{4}$ slings, which were adapted to carry the double scaffold proposed to be used. He also brought an old $2\frac{1}{2}$ rope, which had originally been constructed to carry a single seat, intending to use it for a guy rope. MACNEILL and his men suspended their double scaffold by two of the $3\frac{3}{4}$ slings fixed in the usual way to the rafters, and led through a hole in the roof. When it became necessary to shift the scaffold one of the slings was unfastened and led through a new hole made in the adjacent roof, and this supported one end of the scaffold in its new position. But the other $3\frac{3}{4}$ sling was left where it was. For some unexplained reason it was not shifted, nor was it lengthened, nor was the other shortened to suit it, nor did MACNEILL make use of the other $3\frac{3}{4}$ slings, although they were on the roof. What he did was to take the old $2\frac{1}{2}$ rope, which he had brought for the express purpose of using as a guy rope, to make a fresh hole in the roof, and then to fasten this $2\frac{1}{2}$ rope to the rafters and use it to support the other end of his scaffold. He did this in the face of a remonstrance from one of his men, who thought the $2\frac{1}{2}$ rope should not be so used. Upon the scaffold so supported MACNEILL and another man had been working for some time when the $2\frac{1}{2}$ rope snapped. MACNEILL was thrown to the ground and killed. His widow sought compensation, and was awarded 274*l*. When the employer applied to the Scottish Employers' Liability and General Insurance Company, Ltd., they repudiated liability on the ground that the insured, in terms of the arbitration clause of the policy, had forfeited his claim under it, as he had failed to fulfil the conditions of the agreement as regards the providing of efficient plant and the taking of all reasonable precautions for the avoidance of accidents. One of the conditions in the policy was, "The employer shall provide efficient ways, works, machinery and plant, and shall cause to be taken all reasonable precautions to employ compe-

tent workmen and to prevent accidents." The case was left to the arbitration of Sheriff FYFE. His Lordship said that the company could succeed only if it could be held that an employer was in breach of his policy merely because, in addition to a supply of sound and suitable ropes, he happened to have also in his store an old rope, which a workman, who should have known better, used for a purpose for which it was never intended. In his Lordship's opinion such a contention was untenable. An employer was entitled to assume that a workman would not deliberately risk his life, and he thought that an employer complies with the third condition of this form of policy when he engaged competent workmen and provided for their use efficient plant, both of which the claimant here did. He did not think that an employer could be held responsible for the use—or rather the misuse—of the plant by the workman, or for his failure to use it at all. Judgment was therefore given in favour of Mr. ROBERTSON for 290*l*. and costs.

It will be remembered that in last July there were serious accidents caused by the balustrade of All Souls Church, Langham Place, yielding to the strain of a rope bearing flags suspended between the Langham Hotel and the church. One of the ladies injured sought on Tuesday to recover damages for her injuries. It was contended for the plaintiff that no steps were taken to ascertain the strength of the balustrade, in which cracks were visible. The man who fixed the rope said he had looked for flaws in the stone, but had found none. It was usual on occasions of rejoicing to hang a rope with flags between the two buildings, and no sign of weakness was betrayed. But on the day in question there was what meteorologists call a strong breeze, but which defendant's counsel termed a miniature cyclone. On one side it was stated that the strain on the balustrade equalled three tons, which was six times what it could sustain. The jury assessed the damages at 600*l*., and as there are similar cases awaiting settlement the danger of such a mode of display should be enough to make people careful. In all such circumstances it is usual to allow servants or labourers to take charge of the operations. When only a thin rope with a few light flags are strung between two windows the worst that can happen could hardly be injurious to a spectator, but with a heavy rope and large flags the contingency was different. The church, too, was known to be an old one, and should have inspired caution.

In the old explorations architecture was necessarily the foremost in importance, then came sculpture and pottery. Inscriptions were copied, but the value attached to them depended on the information they conveyed. The vast interest aroused by the writing on the wall in Knossos is evidence that in late years importance is attached to the forms of lettering. Writing in general, which includes the lettering of the stonecutter, has now become a very prominent branch of inquiry. By tracing the forms of a variety of alphabets it is anticipated that knowledge will be gained about the relations between the languages of antiquity, and it may be with those of a later time. This will explain the interest which in Germany has been attached to the discovery of an inscription in Aramaic found in a well near the temple of Eschmun, where excavations are in progress by Dr. WINKLER and Dr. LANDAU. Aramaic might be called the Italian hand of antiquity. In Assyria cuneiform letters were used on the clay tablets, but for any abstracts or endorsements Aramaic was used. It is also met with in many of the later papyri of Egypt. There is no doubt it was in favour with the Jews. It was believed, however, that its use had not extended so far as Saida in Sidon. It is presumed that what has been discovered is only a part of a long inscription, but as there are eighteen lines with letters of large size the find is of importance. Although a concession was granted to carry on excavations, it is not supposed to comprise the removal of such a relic, and it will therefore be necessary to obtain new authority from Constantinople in order that the inscription may become available for the use of scholars in Europe.

MASTERS OF ART: POETS AND COMPOSERS.*

THE motto under which ALFRED STEVENS sent in his design for the Wellington Memorial was "I know of only one art." He may have wished to suggest his competence in architecture as well as in sculpture, or perhaps desired to explain why he designed grates and fire-irons instead of noble groups like *Courage and Cowardice, Truth and Falsehood*. The idea he expressed was, however, an old one, which can be traced back to CICERO, and it was also adopted by some later æstheticians as a principle. If the arts serve a common purpose, there must be unity amongst them. While in theory it may seem to be desirable to place all the arts on the same footing as if they were only one, in practice they have been regarded in a different way. Each artist still tries to obtain supremacy for the one he follows. To an Egyptian architect the sculptors and painters appeared as only humble assistants. At the Parthenon PHIDIAS evidently considered it was the architect's business to make arrangements to display the work of the sculptor. At the Pœcile, MICON and PANÆNUS also regarded architecture as no more than a means to provide suitable surfaces for their great wall-paintings.

Without going back so far, we have in the history of the French academies evidence of the struggle for exclusiveness without any concern for effecting unity. When the Academy of Fine Art was founded in 1655 all the advantages were seized by painters and sculptors. It was not until 1671 that architecture gained recognition, and then it was forced to be a separate institution. The Governments experienced continual opposition in their endeavour to secure an appearance of unity. In the Academy of Fine Arts there are now representatives of architecture, painting, sculpture, engraving, medallion engraving and music. But in spite of the supposed union it is well-known that in 1900 there was a difficulty in obtaining for architecture acceptance as one of the fine arts in connection with the International Exhibition. In England art has been long identified with painting. The Royal Academy, from the time of its formation, has been mainly occupied with the interests of painters, and in some of the exhibitions it was not easy to discover examples of any other art. The indefiniteness of our notions about what is art is also suggested by the Exhibition of 1851. It was intended to display the "industries" of all nations. The few paintings that were seen won admittance simply as exemplifying the processes of some colour manufacturers. Architecture could only gain a footing in the big glass house in the form of ecclesiastical metalwork and embroidery. But sculpture was held to be one of the industries, and consequently a great many examples were assigned places.

The recognition of music as one of the Fine Arts equally with painting, sculpture and architecture on the podium of the Albert Memorial was therefore an innovation. We may attribute it not to the power of any subtle scheme of æsthetics, but rather to the circumstance that the PRINCE CONSORT had composed some chorales, and that his countrymen had acquired more general reputation in music than in any of the other arts. But by admitting music it became necessary to accept the art which in most cases inspires sweet sounds. Indeed, all the arts may be said to be no more than pictorial or melodious language forming substitutes for words. Picture-writing was an early discovery, and few musicians would have the courage to describe their pieces, like MENDELSSOHN, as "Songs without Words."

The combination of the *belles-lettres* and music was serviceable to Mr. ARMSTEAD, the sculptor. It enabled him to arrange his composition as if it were a pendant to his representation of the painters. By comparing the two prints it will be observed that the poets occupy the central part in one and the Italian School in the other. HOMER appears enthroned, like RAPHAEL among the painters, and we have also with apparent symmetry a slight difference in the number of poets on either side of the bard. German and English composers are made to balance those belonging to the Italian and French schools.

The supremacy of HOMER could be justified by the declarations of most of the men surrounding him. VIRGIL

paid him the high compliment of imitating the "Iliad" and the "Odyssey" not merely in outline, but in details. The Roman poet was by his contemporaries charged with plagiarism; and indeed he had so humble an opinion of his own work when compared with his predecessors, he gave instructions for burning the "Æneid" after his death. At a subsequent time the renown of HOMER became merely a vague tradition. VIRGIL was not only estimated by the Italians, and all who came under their influence, as the greatest of poets, but as a wonder-worker, a magician. It was therefore in accordance with the spirit of the age when DANTE followed his guidance in his great journey. He spoke of him both as his master and as the model from whom he derived that beautiful style through which so much honour came to him. But it was not considered disloyal to VIRGIL to describe HOMER as the sovereign poet, and to represent him with a sword in his hand as if he were a warrior minstrel. MILTON has also lauded the ancient poet whose blindness was a bond of sympathy. CORNEILLE, like VIRGIL, is supposed to have sought after the Homeric spirit. GOETHE not only made a study of the old poet when in his prime, but he endeavoured to extend the Homeric spirit by introducing some of the characters of the great epic in the second part of "Faust." It is remarkable that no tribute can be ascribed as coming from SHAKESPEARE. In *Troilus and Cressida* the fall of Troy is retold; the English view, however, is taken, and it was always in favour of HECTOR rather than ACHILLES. Hence Mr. ARMSTEAD suggests that SHAKESPEARE was listening to other music than that of the Homeric lyre. The introduction of PYTHAGORAS in the group is not easily explained. The first of the philosophers—the introducer of the "unity in variety" theory of beauty—is more mythical than HOMER himself. His ideas were exalted and mystical. For that reason he censured HOMER for his disrespectful familiarity towards the gods. But he is credited with having discovered the chords of music in a village smithy, and on that account at least is entitled to a position among the figures. He also enjoyed the harmony of the spheres in addition to poetry. CEKVANTES may also seem out of place, for he was not a poet; but no native poet could so worthily represent Spanish literature. CHAUCER has related some of the old legends in his own way, for his genius seemed to be competent to deal with the remote as well as the near. PIERRE CORNEILLE also utilised Classic themes, and French Governments have acted wisely in insisting on the performance every year of some of his dramas in the subsidised theatres. Although they may seem tame productions to a modern English playgoer, there must be power in the works of a man of whom NAPOLEON said, "S'il vivait, je le ferais prince." MOLIÈRE as a writer of comedies may not be considered as exemplifying Homeric influence, but it is well to remember he received an excellent education in the Classics. Although the manuscript has been lost, he translated almost the entire work of LUCRETIUS, and it is not unreasonable to imagine that he also was indebted to the "Grecian MERLIN."

After hearing a course of lectures, especially if there are instrumental illustrations, on Greek music, it is difficult to resist the conclusion that music was not always the most human of the arts. There is no apparent connection between the old combination of sounds and the oratorios, operas, symphonies and songs of our times. The figure of St. AMBROSE we see in the relief corrects that belief by recalling the debt of modern to ancient music. The erection of Christian temples, which brought crowds within a building, exercised an effect on music. The congregation joined in the singing of psalms, and according to the account which was given by St. JOHN CHRYSOSTOM there was delightful harmony, especially when there were ascetics present, although there was no instrument to accompany them. These ancient musical services were not without their effect on the evolution of ritual. But the airs which were derived from the Greeks indirectly were exceedingly simple when compared with the arrangement of them which, if not made by St. AMBROSE, the Bishop of Milan, was carried out under his direction. St. AUGUSTINE testified that when he heard this new psalmody he wept, but as his was a severe nature, he also says that he wished to stuff his ears and those of the entire Church against what appeared to him luxurious innovation. At this distance

* See Illustration.

of time it is difficult to determine the respective shares of St. AMBROSE and Pope GREGORY I. in the improvement of ecclesiastical music. But harmony having a footing in the Church was sure to prevail afterwards in the world.

At least six centuries had to pass before GUIDO of Arezzo came as the successor of St. AMBROSE. There was some sort of notation known to the Greeks, and which probably was adopted in Christian churches, but it required many years practice before a student of music was able to use it. GUIDO invented a new system which was easily acquired, and it received the sanction of the Pope. It was soon adopted in monasteries and churches. Then there was another interval of 500 years, and PALESTRINA appeared. Unlike GUIDO, he was a layman; he found employment in the Papal chapel, for which he composed several works. In the course of the eleven centuries which had passed from the time of St. AMBROSE, many airs which were overflorid had found their way into Church services. If words are disregarded it is not always easy to discriminate between sacred and profane music, for the principal factor is one of association. The Council of Trent, however, judged it was necessary to have a reform. Three model combinations of airs for six voices which could be used for the celebration of Mass were ordered from PALESTRINA. One of them alone obtained approval, and, as the "Mass of Pope Marcellus," is still occasionally heard. Henceforth, says RANKE, the historian, "music, which speaks a language more direct, more impressive, more adapted to ideal expression than any other art, became the interpreter of the emotions, and thus subjugated all minds to her empire." With PALESTRINA the primitive system of Church music may be said to have reached its perfection.

Soon afterwards St. PHILIP NERI endeavoured to attract people to musical performances which were independent of Church services. They began in a small way in his own oratory, and to them may be traced not only the great oratorios, but even operas. It was not necessary to have the severity required in Masses. They were at first allied to the ancient mystery plays, the difference being that the words were sung instead of being spoken. The practice has had an astonishing effect on music. CLAUDE MONTEVERDE of Cremona, in the beginning of the seventeenth century, was inspired to produce something resembling the semi-religious works of the oratory. It was an opera on the subject of ORPHEUS and EURYDICE. In it, as in others of the time, there was a very strong line of demarcation between the songs and recitatives, which in course of time was less defined. MONTEVERDE is therefore well entitled to his place in the history of music or in any collection of portraits of composers. CARISSIMI, who stands near him, was another seventeenth-century musician, but he gained his renown as much by his Masses as by secular music. Then there is a gap, and we come to ROSSINI, who died as lately as 1868. He probably realised that he was the last of a great race and that new combinations were to follow, for after he had finished "William Tell" he ceased to write for the stage. His "Stabat Mater," like all his works, abounds in melody, but it does not interpret the subject properly, and indeed the best parts of it are sometimes performed with applause in London music-halls. Like all musicians, ROSSINI was often indisposed to exertion, and he cared little about altering his notes, but his gift of melody seemed unlimited, and in his operas, at least, he rarely failed to be expressive as well as delightful.

JOSQUIN-DESPRES stands alone as the representative of Belgian music, and brings us back to the fifteenth century. Belgium at that period produced several eminent composers who made their way to the courts of Germany and Italy. JOSQUIN-DESPRES is sometimes claimed as an Italian, because at an early age he went to Italy and obtained an appointment in the papal chapel. Afterwards he was director of music for the French King LOUIS XII. He left France and died in Belgium. His remains lie in the church of St. Gudule, Brussels. Dr. BURNEY asserts that JOSQUIN is entitled to be considered as the father of modern harmony and "the inventor of almost every ingenious contexture of its integral parts."

A spectator who is acquainted with the history of LULLI would imagine on first seeing the figure that he was comparing one of his new buildings with its plan, or was

examining a building site and trying to imagine its altered appearance when his schemes would be carried out. At the time when the part of the district between the Boulevard and the Rue Saint-Honoré was being transformed he was able to acquire both houses and land. MOLIERE lent him 11,000 livres to begin building. He was a hard man in his dealings with contractors, and if we believe LA FONTAINE his architect would have been very glad if LULLI were earlier called to a better world. By birth he was an Italian, and he was engaged as a guitar player in the French court when a boy of thirteen. He gradually rose to be director of music for LOUIS XIV. LULLI is credited with the creation of French opera. As a composer there is much difference of opinion about his merits. The pieces by him which are sometimes introduced in modern concerts are not impressive; but his contemporaries were charmed with his works, and he was able to amass a fortune of about 2½ millions of francs. GRÉTRY, who is seen standing behind him, was a philosopher as well as a composer. He may be considered as the precursor of the modern comic opera. RAMEAU wrote a treatise on harmony in 1722. He had previously been known as an organist and composer of Church music. He was fifty-three when he finished his first opera, and during thirty years he was accepted as the foremost of French musicians. Unlike LULLI, he encouraged others and used his influence to bring about the creation of a school of composition. MEHUL may be called the revolutionary composer. His *Chant du départ*, *Chant de victoire* and *Chant du retour* were sung by the revolutionary troops and were heard all over the Continent. But songs of that kind were not acceptable to all amateurs, and he published some of his works under an Italian name. His style was peculiarly French, but his "Joseph," which was brought out in 1807, is the only opera of his which can now command any attention. AUBER, who stands in the corner, is perhaps the most characteristic exponent of French music. His ambition was not high, and he was satisfied as long as he was sufficiently sparkling to please Parisian auditors. If he believed another composer's style was successful he endeavoured to assimilate it in his next work. He was as successful in opera as SCRIBE in comedies, and on that account he was severely criticised. But his "Masaniello," "Fra Diavolo" and "Crown Diamonds" have contrived to keep some slight hold on the stage, and that is much in so changeable an age.

On the other side of the poets we find the German and English composers. Music is the true universal language, and the works of the former are more familiar to Englishmen than those by their own countrymen. JEAN-SÉBASTIEN BACH has, except for a few people, blotted out the reputation of his father and uncle, who were also able musicians. He was a most productive composer, and if it were not for the efforts of musical societies it is doubtful whether, owing to their number, all his works would have been available for use. He could be terribly in earnest. But in his most serious passages he sometimes introduced a succession of auxiliary notes which might be compared with gold threads running through a piece of sombre embroidery. GLUCK, like WAGNER at a later time, was the cause of an operatic row in Paris. The Italians were supposed to be the sole possessors of the art of opera composition in the eighteenth century. GLUCK dared to enter into competition with them. He had taught MARIE ANTOINETTE in Vienna, and through her influence he was asked to compose an opera for Paris. But his "Iphigenie" excited the anger of the opponents of the Austrian alliance, and there was a battle between the pro-German and the pro-Italian parties which seemed to be an omen of the Revolution. One song in his "Orfeo" moved even the composer to tears when it was first heard from the lips of a male contralto and it has lost none of its effect after 140 years. As to HANDEL little need be said, for his oratorios form a national institution in England. There was a good deal of the Englishman in his character, and he was worthy of a grave in Westminster Abbey. GOETHE in his old age was able to relate how he had seen and heard MOZART at a concert when the musician was only seven years old. He was very prim, with powdered hair, a court suit and a sword. MOZART, in fact, was an infant phenomenon, and one can hardly think of him as ever arriving at maturity. There seemed to be no limit to

his capacity for music, and no man who was in the world for only thirty-six years has produced so vast an amount of melody that is likely to become immortal. It is to be hoped composition was a reward to him, for he never was justly remunerated for his pieces. HAYDN could claim that he came to England, was heard, and conquered. On his second visit he was created a doctor of music by Oxford University, and was one of the guests of the Prince Regent. He was no less successful in Paris. NAPOLEON showed his respect for him by giving orders that during the bombardment of Vienna his house was to be respected. Indeed, he seems throughout his life to have been one of the happiest of all musicians. He alone could say he had a band at his command in order to try the effect of any fragment of a composition. Behind him we see the refined MENDELSSOHN and WEBER, who was the pioneer of Wagnerism. HAYDN remarked of the young BEETHOVEN that he liked his first manner, but that the second was too tormented to please him. The elder musician had few causes for trouble, but nature made BEETHOVEN a self-tormentor. It is because of their subjectiveness, as being expressions of the mental condition of the composer, that his works are now appreciated. It is owing to their personal character that so many of his compositions failed to be understood by his countrymen.

If measured by quantity or science, the few English composers cannot be regarded as rivals to their companions. TALLIS was connected with the Chapel Royal in the time of EDWARD VI. and ELIZABETH, and his productions consist of Church music. ORLANDO GIBBONS was another royal official. But in addition to chapel music he composed some madrigals. HARRY LAWES was a gentleman of the chapel in the reign of CHARLES I., and remained in the king's service until the king's execution. Then he found employment as a teacher and as a composer of song music. He wrote the music for MILTON'S "Comus," and the poet in one of his sonnets addressed him as follows:—

Harry, whose tuneful and well-measured song
First taught our English music how to span
Words with just note and accent, not to scan
With Midas's ears, committing short and long;
Thy worth and skill exempts thee from the throng,
With praise enough for Envy to look wan;
To after age thou shalt be writ the man
That with smooth air couldst humour best our tongue.

The words reveal the state of music in the seventeenth century. Finally, HENRY PURCELL was also a chorister, but he felt the attraction of the theatre, and composed the songs introduced in several plays. He died in 1695 at the age of thirty-seven, and his grave in Westminster Abbey is indicated by an inscription saying that he "is gone to that blessed place where only his harmony can be exceeded," a compliment which was inspired by the humble notions of music which then prevailed.

ARCHÆOLOGY AND TREASURE TROVE.

ANYONE who read the report of the proceedings before Mr. Justice FARWELL, which we published last week, would find no difficulty in anticipating the decision. A judge equally with the simplest auditor likes to have a novel case well fought out, and it was evident that the arguments which he heard were one-sided. The theory set up on behalf of the Trustees of the British Museum was not a plausible one, but, having relied on it, common sense required that it should be properly upheld. To suppose that the sea once overspread the field where the articles were found was not extravagant, for the greater part of Ireland, as well as of Europe, at one period or another was the bed of the ocean. The only difficulty that arises would be the time when land was sea, and *vice versa*. Geological depositions are commonly so gradual it is impossible to arrive at a decision respecting their chronology unless there are objects which will serve as a standard. The late BEETE JUKES, who was Director of the Geological Survey of Ireland, in speaking of soils, says:—"Certain districts, now high dry land, were formerly deep sea, in which certain beds were deposited, including the remains

of creatures that lived in the sea. The time when these things took place was a very remote one, and the interval occupied by them a long one—hundreds, thousands or millions of years, as the case may be. We have not yet arrived at any satisfactory union of the history of the pre-human and human periods, and possibly no very satisfactory union may ever be arrived at." A process which is so slow and unequal can hardly come within the purview of a Court of Law, where even an error of a day may affect the result of an action.

The British Museum authorities were not satisfied with supposing that the gold ornaments were at one time lying in the sea. They introduced a more untenable proposition by saying the objects were the offerings of some Celtic chief to a sea-god. If a fact of that kind could be demonstrated it is possible the decision would be in favour of the Trustees. According to the view of the Crown lawyers, which is an ancient one, treasure must have been hidden in the earth or in some private place in order to be considered as treasure trove. If it were voluntarily cast away its character would be changed. The theory was no doubt ingenious, but risky. All depended on the kind of testimony by which it was supported. Again and again Mr. Justice FARWELL asked to have some proof of the existence of a marine deity to whom votive gifts might be made. It should have been anticipated that evidence of the kind would be demanded, and something ought to have been done towards supplying it. There would be, we acknowledge, some difficulty. In this country we give great attention to the mythology of Greece and Rome, and of late years there is a close investigation of what savages in all parts of the world believe concerning the unseen powers. It is impossible to appreciate WAGNER'S operas without some acquaintance with Scandinavian and early German mythology. It is now allowable to speak of ODIN, THOR and FRICKA without being considered a pedant. But the Celtic Pantheon is regarded with indifference, if not with contempt. It is probable that in Germany some followers of the Brothers GRIMM are to be found who have systematised the subject. But we should have thought that among the staff of the British Museum there would be a scholar or two who could explain that the Celts had also their representative of NEPTUNE or POSEIDON—it might be more exact to say their NIÖRDHR—and that he was a very terrible being whom it was wise to conciliate. The old belief in this matter was expressed in one of the poems of THOMAS D'ARCY M'GEE, the Irish statesman who first proposed the federation of the Canadian States:—

Long, long ago, beyond the misty space
Of twice a thousand years,
In Erin old there dwelt a mighty race
Taller than Roman spears;
Like oaks and towers they had a giant grace,
Were fleet as deers:
With winds and waves they made their bidding-place,
The Western shepherd seers.

Their ocean-god was *Manannan MacLir*,
Whose angry lips
In their white foam full often would inter
Whole fleets of ships:
Crom was their day-god, and their thunderer
Made morning and eclipse:
Bride was their queen of song, and unto her
They prayed with fire-touch'd lips.

If a few passages relating to MANANNAN MACLIR which are to be found in ancient writings were quoted at the trial, Mr. Justice FARWELL might have taken another view of the case. As to his lordship's doubts about the want of records of the custom to present votive offerings to the sea-god, that also can be explained. All our readers are doubtless aware of the controversy which at one time took place concerning the "Poems of Ossian," which were introduced in an English form by JAMES MACPHERSON. Without entering into the question, we may say that OSSIAN, whose poems, it may be mentioned, were much admired by NAPOLEON and are recommended to modern transcendental students by EMERSON, was not a Scotsman but an Irishman, his right name being OISIN. BURKE told HUME, the historian, that the Irish people were acquainted with the poems although in a somewhat different version. There is

no doubt the poems are based on some antique legends, if not faithfully translated from them. Dr. HUGH BLAIR, who was then Professor of Rhetoric in Edinburgh, investigated them on a plan which was sketched out for him by DAVID HUME. Now, one of the peculiarities which struck Dr. BLAIR was the absence of everything suggestive of religious ceremonies. As he points out:—

The invocation of a Supreme Being, or at least of some superior Powers who are conceived as presiding over human affairs, the solemnities of religious worship, prayers preferred and assistance implored on critical occasions, appear with great dignity in the works of almost all poets as chief ornaments of their compositions. The absence of all such religious ideas from Ossian's poetry is a sensible blank in it; the more to be regretted, as we can easily imagine what an illustrious figure they would have made under the management of such a genius as his, and how finely they would have been adapted to many situations which occur in his works.

It is possible that the poems held a mirror up to nature in that respect. There was a period of transition when the old Pagan beliefs seemed to become less worthy of acceptance, while the new Christian creed, which imposed the supposition of the perdition of ancestors and an abstinence from all that helped to make life worth living, was looked upon with aversion. The doubts are expressed in the very ancient Irish poem in which the unconverted OISIN in a conversation with PATRICK, the missionary, asks:—

Where now are the royal gifts of gold,
The flowing robe with its satin fold,
And the heart-delighting bowl?
Where now the feast and the revel high,
And the jocund dance and sweet minstrelsy,
And the steed loud-neighing in the morn,
With the music sweet of hound and horn,
And well-armed guards of coast and bay?
All, all like a dream have passed away;
And now we have clerks with their holy quails,
And books and bells and eternal psalms,
And fasting—that waster gaunt and grim,
That strips of all beauty both body and limb.

In the interval, as it were, between Paganism and Christianity there probably would be a silence about rites and ceremonies which were still continued to be practised. There yet prevails along the coast line in Ireland more terror of the sea than is usual with islanders, and this may be one of the consequences of hereditary influences. In our enlightened days votive offerings on the part of those who have to go down to the sea in ships are not unknown. We are doubtful whether the gold ornaments which were brought into Mr. Justice FARWELL's court were ever used for that purpose, but they were not ill-adapted to serve on an occasion when destruction by wave-power seemed inevitable. At any time between 300 B.C. and 500 A.D. at least, the casting of them into the waters would not be considered ridiculous.

The question of the origin of the ornaments may here be raised. Mr. Justice FARWELL attached much importance to the record of an incursion of Norsemen about A.D. 850, when the objects, he believed, were likely to be concealed. We hear a great deal concerning similar invasions of Ireland, but it is overlooked that often they were only acts of retaliation. The Irish kings or princes must have found it monotonous to rob their neighbours and to be robbed by them. Occasionally they varied the sport by more distant raids. When victorious they brought back spoils of which the value was long remembered. There are numerous references to them by the old historians. In the Annals of the Four Masters it is recorded as an event of 90 A.D. that—

Criomthan Nia-nair, sixteen years monarch of Ireland, died after his illustrious foreign expedition. It was from that expedition he brought home the noble spoils: the golden chariot, the golden chess-board studded with three hundred sparkling gems, and the *ceth-criomtham*, which was a parti-coloured shirt, interwoven with gold. He also brought with him a battle-giving sword, having various figures of serpents engraved upon it and inlaid with gold; a shield embossed with bright silver; a spear which gave an incurable wound; a sling from which no erring cast could be thrown; two hounds linked together by a chain of silver, together with many other valuable rarities.

The descriptions often recall the "Arabian Nights," but historians at all times claim the privilege of exaggeration. What is certain is that works in the precious metals found their way from other lands to Ireland. The Irish marauders did not always restrict their attacks to Denmark and Norway. NIALL of the Nine Hostages died at Liège, and his nephew and successor, DATHIE, was killed by lightning at the foot of the Alps. It is therefore easy to explain how objects have been brought to light in Ireland which cannot be considered as of purely Celtic workmanship. One of those which it was sought to remove from the British Museum is a boat. It is doubtful whether a boat was an accepted model by Irish goldsmiths, but from a very early date boats seem to have been commonly represented in various materials in Denmark. In some instances we see them alone, while in others they are associated with sea-serpents or similar enemies. It is therefore possible the boat in question was by a Danish artist, and the chains, collars and brooches may also have been of foreign workmanship. If that is the case there is no reason why Ireland should be allowed to monopolise them.

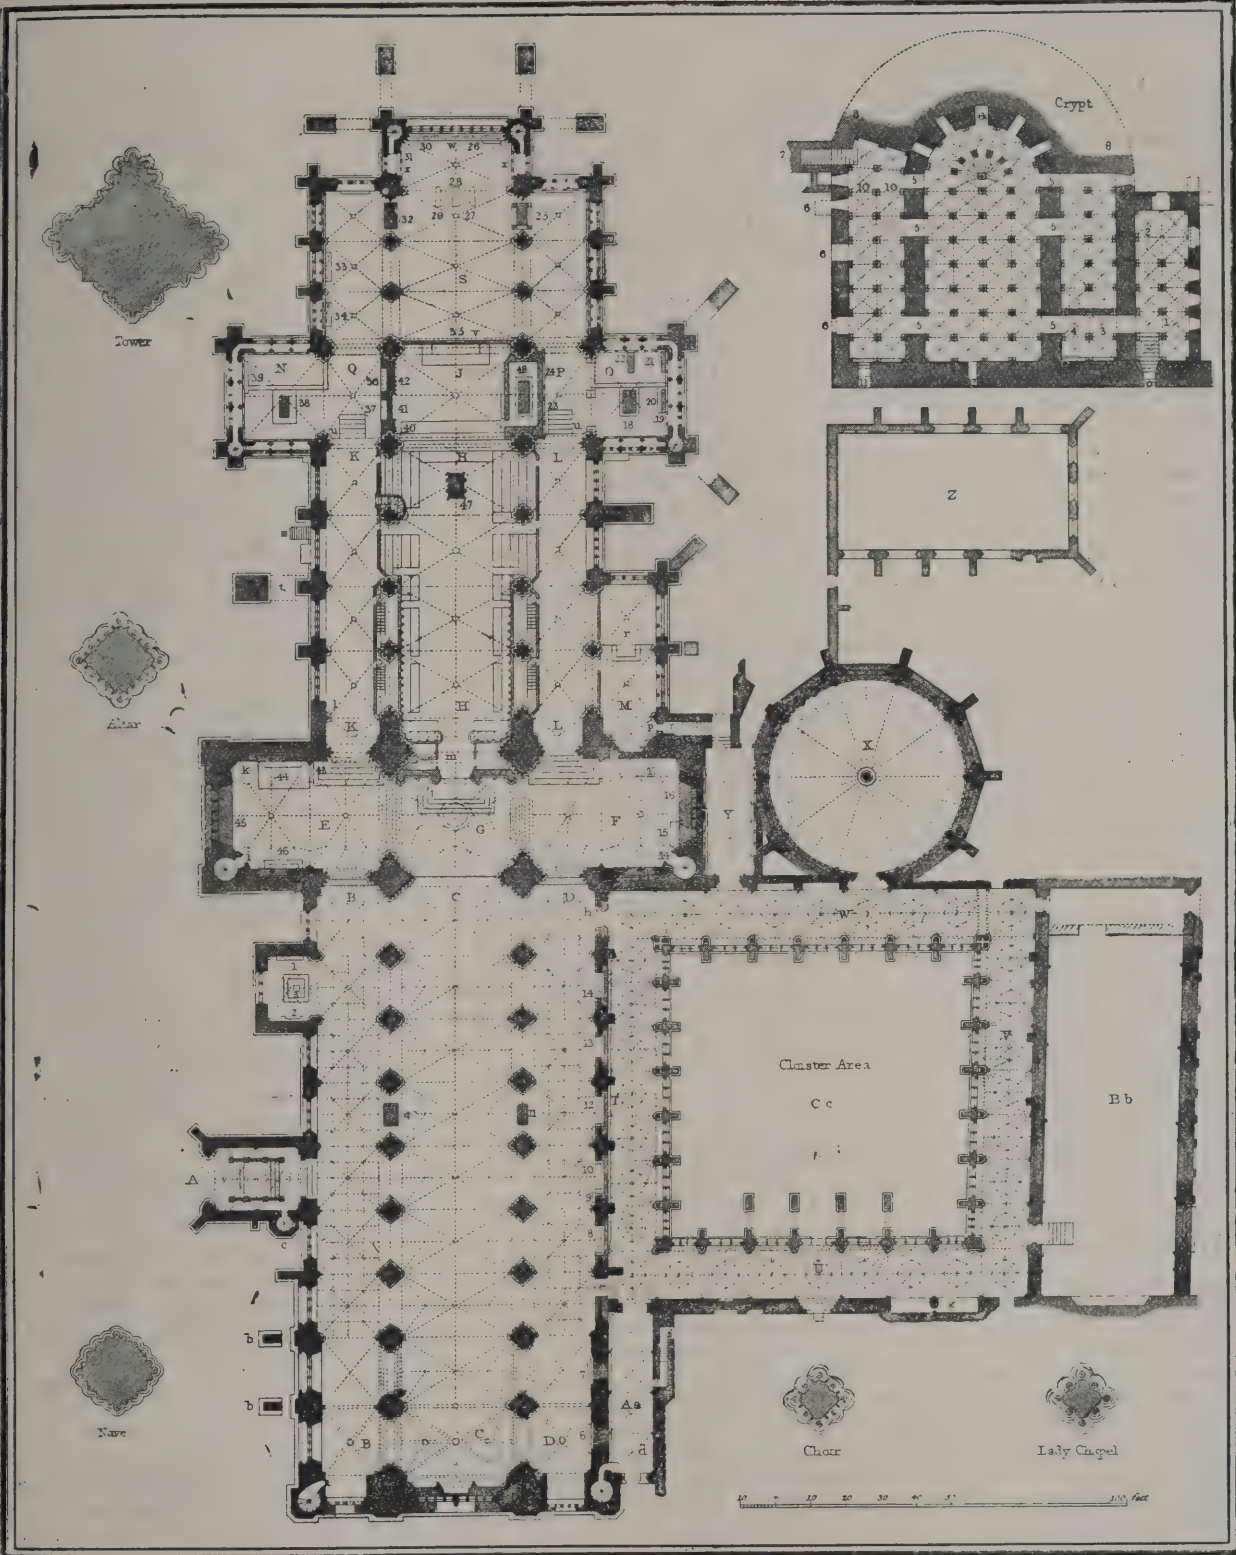

In the various articles which have appeared in this Journal concerning the ornaments since they came to England we have taken that view. England, Ireland and Scotland should be considered as one country, of which the principal museum is in Bloomsbury. There may be advantages in having examples of ancient workmanship in Dublin or Edinburgh when they are likely to be local products. But in the majority of cases the British Museum is the most fitting receptacle. It is not so much a local museum as a cosmopolitan one. Students from every country go there, and the collections should be equal to all requirements. From what was said in Court by Mr. Justice FARWELL, by counsel and witnesses, it must be plain that the gold ornaments are puzzles to acute minds, and present problems which have yet to be solved. They are likely to receive far more attention in London than in Dublin. The recent discussions and investigations in connection with the tiara of SAÏTAPHERNES are enough to show that in the case of antique work it is often well to obtain information from remote places; and properly used the ornaments found in the field near Limavady may be the means of opening out a new chapter in archæology, and of giving a fresh impulse to the study of Celtic and northern art. In Dublin, where there is an excess of goldsmiths' work, they are likely to strengthen the delusion about the wealth of Ireland in the ages before the English arrival.

A NATIONAL WELSH MUSEUM.

A COMMITTEE of members of Parliament representing Wales have been considering the subject of a Welsh national museum. They have arrived at the following conclusions:—It may be decided: (1) To promote the creation of a museum similar in type to the British Museum; or (2) to promote a museum the funds and property of which may be equitably distributed between the national college centres of the principality. If the former course be taken it will involve—(1) The obtaining of a charter of incorporation, which would provide for the creation of a governing body and executive committee; (2) the selection of a site for the proposed building; (3) the purchase of the site and the erection of a building of adequate dimensions; (4) the appointment of a permanent staff of officers and servants. The selection of a site is, in the present state of Welsh feeling, a matter of difficulty, but experience shows that it is not insurmountable. The choice might be left—(a) to a committee of the Privy Council—the course taken in regard to the national colleges; (b) the University Court; or (c) a body of representative men elected in proportion to the population of each county by the Welsh county councils. If it be decided that it is expedient to take the second course suggested, it could be effected by a charter constituting a Welsh museum with a governing body with power to distribute either the available funds or the objects and books purchased or given to the museum among the national college centres, according to a defined and equitable scheme for museum purposes. It is not considered necessary at present to go into the details of any such project. The next step recommended to be taken is to convene a meeting between the Welsh members of Parliament and representatives of the University Court, the national colleges, the central board and the Welsh county councils.

NOTES AND COMMENTS.

AFTER long waiting there is at last a memorial of CHARLES GARNIER in Paris. Placed beside his opera-house it may seem to be supererogatory. But it can be considered as an inscribed plaque on a large scale which is adorned by sculpture. Hereafter the New Zealander or the visitor from Central Africa when he journeys to Paris will be able to identify the name and appearance of the designer of the gorgeous theatre. The red granite of Scotland and the blue granite of Corsica have been united in the masonry. The figures of Labour and Posterity were modelled by M. THOMAS, a comrade of CHARLES GARNIER in Rome. The bust of the architect has been reproduced from a model by CARPEAUX, whose group of dancers imparted unnecessary notoriety to the building. All the work was carried out under the direction of M. PASCAL, who has had a share in the construction of the building. There were five addresses. M. CHARLES NORMAND read his father's discourse; M. MOYAUX spoke as representative of the Société Centrale des Architectes, M. PASCAL as an associate of GARNIER; M. LARROUMET gave a set oration, and M. CHAUMIÉ, as Minister of Fine Arts, testified to the admiration of France, and he might have added of other countries, for the architect. M^{me}. GARNIER expressed her appreciation in a few words and the interesting ceremony was over.

M. LÉON BONNAT on Saturday entered on the three-score-and-ten period of human life, and all lovers of painting will wish that his days may still be long in the land. Among French portraitists he holds the foremost place. In any exhibition his heads are easily recognised from their strong relief. It might be said he models rather than paints, for none of his countrymen have displayed work so massive as to recall VELASQUEZ. The art is well concealed and many people suppose his portraits are produced without much trouble, which it is needless to explain is a mistake. His reputation as a portrait painter is comparatively recent. Thirty or forty years ago he was not much known. One of the reasons was that BONNAT was trying his hand, and to some extent succeeding, in other forms of art. A native of Bayonne, he spent his youth in Madrid, where he could hardly escape the influence of VELASQUEZ. He obtained an allowance of 60% a year from Bayonne, went to Paris and studied with LÉON COGNIET, whose portrait many hold to be M. BONNAT's masterpiece. Although he failed to gain the great prize, he went to Rome. Then he had a turn in the East, and after meeting with varying success in high art and genre, about five-and-twenty years ago he startled the public with his portraits. He has not been spoiled by success and he continues to study as if he still had a career to make.

FOR a long time difficulties have been arising in the metropolitan police courts in endeavouring to discriminate between drains and sewers. Sooner or later all drains are supposed to be connected with sewers, but the question arises whereabouts in the length of the drain does the responsibility of the owner of the house or houses drained come to an end and that of the local authority commence. Recently the owner of two houses in Fulham was threatened with proceedings in the Courts by the Council for some irregularity. He carried out the works ordered and then sought to recover the money in the Courts. His two houses formed one block, and had a gutter running along under the eaves, which carried a portion of the rain-water from the roofs of both houses into a down pipe, into which also flowed the slops and bath-water of one of the houses. The down pipe discharged into a gully, and from thence into the pipe in question, which communicated with a main sewer. Mr. Justice WRIGHT held that the pipe was a sewer, and gave judgment for the plaintiff. The Fulham Council brought the case before the Court of Appeal. But their Lordships, without calling on counsel for the plaintiff, dismissed the appeal. The effect of that dismissal is calculated to increase the taxes on the ratepayers in the Metropolis by a halfpenny in the pound. It is no wonder therefore that representatives of twenty-one metropolitan borough councils waited on the President of the Local Government Board, asking that the Government should deal with the subject. Mr. LONG admitted that the

question did not affect merely the local authority and the private owner, but it might seriously interfere with public improvements. Certainly in regard to a sewer which a local authority had to maintain they ought to be masters, both as to the situation of the sewer, its construction, and everything connected with it before they should be called upon to be responsible for it, and much less to be responsible for its maintenance. That was a very serious difficulty, and it could be only remedied by the intervention of the Government. In conclusion, the President said he fully accepted the situation, and asked the deputation to be content with his assurance that he would give to the solution of the matter his most careful and earnest consideration. What is desired is a clearer definition of the difference between a drain and a sewer, for by the late decision eaves-gutters might be considered as sewers.

WHAT can be done by a firm local authority has been exemplified in Birmingham. The city is not so wealthy as others in the provinces, and economy in all public undertakings is therefore a necessity. Birmingham has still slums and unhealthy houses, and it was indicated that some of them would have to be dealt with as a condemned area. A week or two back we mentioned how it was stated in Portsmouth that improvements could only be accomplished by paying six times the value of the property demolished. A commercial transaction of that kind would be impossible in Birmingham. The value of the property would be accurately determined, and an exorbitant price would not be obtainable. The owners of the threatened property must have a misgiving that they might be losers instead of gainers through the improvement, and they have endeavoured to evade the day of reckoning by patching up their property. The housing committee, under the guidance of Mr. NETTLEFOLD, lately visited about one hundred houses in the objectionable area. We are told that the extent of the repairs was in most cases very evident, amounting often to practical rebuilding; roofs are stripped, ceilings taken out and replaced, privies removed and w.c.'s substituted, damp courses put in, the floors laid with 3 inches of concrete, and so on. In one yard alone the owner is spending as much as 850%, in another 320%, while the expenditure on individual houses ranges from 8% to 25%, where the changes do not extend to actual reconstruction. A very great improvement was manifest in some cases where houses have been demolished to make an opening to the street. The housing committee members and the Lord Mayor frequently gave expression to their satisfaction with the work done. Another gratifying feature is the wholesome effect upon the householders themselves, the cleanliness of the surroundings and furniture suggesting that the housewives were endeavouring to co-operate with the landlords in the general improvement. There is another side to the undertaking—the rents have been increased. But it is better that the tenant should pay from 3d. to 1s. extra for better accommodation than that Birmingham should be saddled with the cost of an improvement of a partial kind.

IN addition to the medals which are awarded in the Salon, prizes are offered for the benefit of young artists. The Minister of Fine Arts presided at the last selection of candidates. The Prix National has this year been awarded to M. ALBERT GUILLOUX for a group in plaster, *The Ghoul*, and a marble group of *Eve Finding the Body of Abel*. Both works have been purchased by the State. The two travelling "bourses" for architects have been awarded to M. GASTON MUNIER, who has exhibited a view of the Temple of Philæ, and to M. GASTON RAPIN for a study of the church and cloister of the old Abbey of Cadouin (Dordogne). The successful painters have been MM. AVY, GRAVE and MICHEL BENNER. The studentships in sculpture have been won by MM. ANTOINE BOURLANGE and ALIX MARQUET; and in engraving to M. C. F. BOURGEAT.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Mr. Aston Webb, R A., president, in the chair.

Mr. ALEXANDER GRAHAM, hon. secretary, announced the decease of Mr. Edward Woods, the oldest railway engineer in the country. He was born in 1814 and elected President of the Institute of Civil Engineers in 1886. He had been connected with the Institute of Architects since 1877, when he was elected an honorary associate. The decease of Mr. Robert Walker, who was elected a fellow in 1893, was also announced, and a vote of condolence and sympathy with the relatives of the two late members was passed.

Presentation of the Royal Gold Medal.

The PRESIDENT said:—As you all know, we are met together to-night to present the Royal Gold Medal for the promotion of architecture, annually given by His Majesty the King to "some distinguished architect or man of science or letters who has designed or executed a building of high merit, or produced a work tending to promote or facilitate the knowledge of architecture or the various branches of science connected therewith." The mode of selection is that a name is brought forward by the Council and submitted to the general body of members of this Institute, after which it is submitted to the King for his gracious approval. Amongst those to whom the medal has been awarded, and who are now no longer amongst us, are Professor Cockerell, the first recipient in 1848, Sir Charles Barry, Owen Jones, Sir Gilbert Scott, Viollet-le-Duc, Sir James Pennethorne, George Edmund Street, John Pearson, Baron von Ferstel, F. C. Penrose, H. Schliemann, Charles Garnier, Baron von Hansen, R. M. Hunt, Lord Leighton. In selecting a recipient for this honour it has almost become an unwritten rule to select in rotation an English architect, a foreign architect and a literary man with architectural instincts. This year we have somewhat departed from this rule, and, as you know, our Institute has selected, with the full approval of His Majesty the King, Mr. Charles Follen McKim, of New York, and Mr. McKim has returned us the compliment by crossing the Atlantic especially to receive the medal in person to-night; and here he is, I am glad to say, safe and sound with us this evening, and very heartily we all welcome him. I have said that in selecting Mr. McKim we have somewhat departed from our rule, for we cannot claim him as an English architect, we have not selected him for his literary attainments, and least of all can we consider him as a foreign architect. No, we have selected him as a highly distinguished American architect, a very near relation of ours and a representative man, in order that we may show to him personally and to the whole world of American artists our high appreciation and admiration of the great work that marvellous country is doing on the other side of the world, an appreciation not only of what they are doing, but also of what we expect them to do untrammelled by traditions, full of youth, energy, imagination and initiative, and supported by almost boundless resources; and [we] are confident that as time goes on they will not only develop fresh types and plans of buildings, but that they will, though still mindful of the past, clothe those buildings in a language that will be distinctly their own. As I have already said, this selection has met with the full approval of His Majesty the King; and I venture to hope the presence here to-night of the Ambassador himself from the American people to our Court may be taken as setting the American seal on this selection of ours also. And now I must introduce you to Mr. McKim a little more in detail, in order that not only those present, but also those who read these proceedings may fully understand our choice. I may say my facts may be depended upon, for I have received them from the best authority—Mr. McKim himself. He was born in Chester Co., Pennsylvania, fifty-six years ago, and at eighteen entered Harvard University with a view to becoming a mining engineer. A year later, finding the work uncongenial, he entered the office of Mr. Russell Sturgis, architect, of New York, and in the autumn of the same year the atelier Daumet in Paris, where he was prepared for, and admitted to, the Ecole des Beaux-Arts, remaining till the outbreak of the war some three years later. During this time Mr. McKim also travelled in Europe, and visited England in 1869, where, he tells me, through the kindness of Mr. Phenè Spiers, Mr. Florence and others, he was able to make profitable use of his time, as far as cricket matches would permit. He also was made an honorary member of the Architectural Association. Returning to New York in 1870, Mr. McKim entered the office of the well-known architect, H. H. Richardson, and in 1872, at the age of twenty-five, commenced practice on his own account, being joined in 1877 by Mr. Wm. Rutherford Mead, and in 1879 by Mr. Stanford White, and since that time they have continued their practice as McKim, Mead & White. In 1887 they were appointed architects to the new public library of the city of Boston, now a famous building. In 1889 two fellowships in the

School of Architecture, Columbia University, known as the McKim fellowships, were established; in 1891 made a member of commission of ten architects from throughout the United States to design the World's Columbian Exhibition at Chicago; in 1894 appointed architect to the new Capitol building of the State of Rhode Island; in 1897 the American Academy of Architecture in Rome was incorporated under the laws of the State of New York and Mr. McKim was made president; in 1899 he was elected a member of the Academy of San Luca, and in the same year was appointed to serve as a member of the first Municipal Art Commission of the city of New York; in 1901 Mr. McKim was appointed a member of the park commission for the improvement of the park system of the district of Columbia, and assisted in drawing up the magnificent scheme, photos of which are exhibited here to-night. Here is to be an avenue 1,600 feet wide and 1½ mile long architecturally treated at various points, with great public buildings incorporated in the scheme. The cost is put at some three to four millions, some half of which has already been voted. A Bill has also passed Congress for locating the memorial. Mr. McKim was elected president of the American Institute of Architects in 1901 and re-elected in 1902, and in the same year appointed by President Roosevelt to restore the White House and also as architect for the new Army War College. Of the buildings erected some idea may be gained from the splendid series of photographs and drawings Mr. McKim has kindly shown us here to-night. He seems equally at home with a palace or a bungalow, with a university or a railway station, with laying-out a great park scheme or arranging a charming little formal garden. In all I think you will find true artistic feeling, nobility of plan, breadth of treatment, absence of unnecessary or meretricious ornament and a suitability of purpose. The style, based largely on Italian examples, shows the influence of French training, and while founded on traditional lines appears to me to show just that amount of individuality required, and without which the best work must be dull and uninteresting. Then, again, Mr. McKim has set all us architects an example by the opportunities he has given to painters and sculptors to further adorn his works. The decorations of the Boston Library by Mr. E. A. Abbey, who I am glad to say is here to-night, and by Mr. Sargent, who would have liked to have been here but is still abroad, is a case in point, and are well illustrated by photographs here to-night. And now, Mr. McKim, it only remains for me to present you with this medal as an English token of our admiration and esteem of yourself and your colleagues. May you long live to still further adorn your country with your works.

Mr. McKIM, in response, said:—I am no speaker, and if I were it would be quite beyond me to adequately express to you my appreciation and deep sense of obligation to His Gracious Majesty King Edward and to the members of this Royal Institute of British Architects. The broad philanthropy which created this medal, not alone for British subjects, but that it might help and encourage the successful development of the art of architecture in other countries, was characteristic of the most gracious Queen whose memory we, next to you, hold in veneration. That it should have a second time within a single decade come to our shores is indeed cause for felicitation, since it attests, in lasting form, the progress and achievement your eminent body has been pleased to recognise in the work of your younger colleagues in America. The medal which you do me the high honour to bestow on me may be given in virtue of my accidental Presidency of the American Institute, but is, I feel, to be regarded in a far larger sense than as a personal recognition of the ties which unite the builder's art on both sides of the Atlantic. As a spur and incentive, and as a token of the friendship and respect that for many years have been growing up between our two bodies, I accept with grateful pride this medal, tendered as to my countrymen by the Royal Institute. I accept it for the whole profession in the United States, and I accept it for my associates of twenty-five years, to whom I owe everything. As the bearer of many messages from across the seas, I cannot let such an occasion as this pass by without at least briefly advert to the ties which have united us in the past, and which must render the development of our future of something more than passing interest to you. I will add also a word concerning recent events on our side of the water. The early buildings of the New England coast, dating back to the eighteenth century, and more rarely to the seventeenth, from the once vice-regal town of Portsmouth to Charleston, S.C., have happily descended to us, despite political revolutions. Notwithstanding their simpler forms, both of construction and design, made necessary by slender means and the circumstances of transplantation, they still reflect the mother country in their excellence of construction as well as sound and correct taste. Precisely the most interesting, and in their sphere the most admirable, architectural monuments of my native land, private dwellings and public buildings alike, are those that most strongly recall their English prototypes. Our obligations, for instance, to Sir Christopher Wren are very imperfectly understood even at home, yet the

cities of the Atlantic seaboard, especially in New England, abound in examples showing the influence of his school. The struggle of these landmarks for existence in the advancing tide of commercial prosperity before which they are gradually being swept away, is a melancholy daily spectacle. Not alone deplorable in the loss of historic monuments, but for the lessons they invariably teach of sound proportion, simplicity and good manners. Happily some of the best examples remain to us. At the seat of Government, for instance, our Capitol, and the home of the President, the White House, are both singularly animated by a pure taste and devoted love of beauty, not to mention the City Hall and the old Department buildings of the city of Washington. Of these, for our information at home, as well as yours, let us gratefully acknowledge that the Capitol, though enlarged and changed since, was originally designed by one William Thornton, the White House by a certain James Hoban, while the City Hall and old Department buildings were the creation of a man of the name of Hadfield—all Englishmen. I can well remember the thrill of surprise and pleasure which I experienced on my first visit to England, more than thirty years ago, in the discovery of a strange familiarity in the appearance of things, and in the sense of not being after all so far from home. Though I did not understand it then, the reason, as has been shown, was not far to seek. I will venture to refer to one more building, of the era which we call early and you ingloriously late, albeit of the period of Adam—the Octagon. Our Institute, which has urged upon Governments—national, state and municipal—the duty of preserving historic monuments, has itself recently secured possession of one of the historic houses of America, known from its shape as the Octagon, and designed by the same William Thornton, architect of the Capitol. Here in the early days was dispensed a liberal hospitality by President Madison, whose home it was. Under its roof, too, the Treaty of Ghent was signed. The house was finished in a manner befitting its importance, and to-day is in an excellent state of preservation. Thus the expressed desire and often recurring efforts of the Institute to secure for itself a permanent home has been accomplished after nearly half a century of existence. May it typify to those who assemble in it, as well as to the people of the city of Washington, the spirit of public service. The Institute has ample reason for felicitation in both the increase and betterment of our own schools of architecture, in Harvard, Columbia, Penna, Cornell and Chicago universities, as well as in the admirable and still older foundation of the Institute of Technology in Boston. The movement to endow an American Academy of Fine Arts in Rome on the general lines of the French Academy in the Villa Médicis is not new. Till now dependent for support upon the insufficient means at the command of the incorporators (members of the Institute), the number of scholars has of necessity been small, and the conveniences for work not such as would be afforded by an older, well-equipped and well-endowed institution. Nevertheless, in spite of its vicissitudes, such has been the quality of the work and men turned out, so strong the conviction of those most deeply interested in the need for an institution offering a post-graduate course intended only for those who shall be already technically well equipped, that a Bill for the incorporation of the American Academy in Rome by Act of Congress, and asking the protection of the United States Government, was introduced in 1901 by the late Senator McMillan. The persons named as incorporators, besides the leading architects, painters and sculptors, include the great universities and technical schools, represented by their presidents, the Secretaries of State and War, the Librarian of Congress, the Government architect, and a considerable number of names of men chosen from the community at large known for their interest in art and art education. This Bill passed the Senate, and was favourably reported to the House, but owing to the legislative conditions prevailing in the latter body during the closing weeks of the session, it failed to become law. I am happy to say that it will be reintroduced in the coming fifty-eighth Congress, and is considered to have every prospect of success. Indeed, we seem to be living in a new age, not only in our private enterprises, but in our relations with the Government. It was no small thing that a committee of the United States Senate, under the leadership of the deeply mourned Senator McMillan, called into consultation, officially, the Institute and accepted the advice of its committee in the formation of a commission to prepare plans for the improvement of the park system of the district of Columbia, including the location of public buildings. Following this lead have come frequent requests from Government officials on the various and often perplexing problems of their departments, so that, informally and unofficially, there has come to pass a seeking for expert advice as gratifying as it has been unusual. The forces which have brought about plans for the improvement of the National Capital are acting throughout the land. Not only in the Atlantic seaboard city of New York and the cities of the lake region like Buffalo, Cleveland and St. Paul, but even from far-away Seattle, on the Pacific coast, comes

the news of attempts to treat the city as a unit and to develop a municipality as a consistent work of art. It is worthy of note also that as the star of progress takes its western way, the effort at improvement is made with increasing vigour in both enthusiasm and money. As evidence of the times, and amongst the measures voted by the last (fifty-seventh) Congress for new buildings to be erected within the district of Columbia alone, I will quote the substance of a single paragraph from the Report of the Senate Commission of the District of Columbia, dated March 14, 1903:—"The fifty-seventh Congress, besides the restoration of the White House, authorised the construction of the Army War College and the Engineer School of Application; a building for the National Museum; the Union Railroad station; (an office) building for the use of the members of the House of Representatives; a municipal building for the district of Columbia, and a Hall of Records. The cost of these buildings completed will approximate not less than fifteen millions of dollars, or over three millions sterling." I cannot close even these brief remarks without an expression of appreciation for one whom your eminent body so recently did honour. After nearly half a century of successful endeavour, during which Mr. Hunt held aloft the banner and fought the battles of the Institute, and in the fullness of his powers, at a time when his influence was greatest, he was suddenly taken away. Ladies and gentlemen, I have to thank you for the great patience and forbearance with which you have listened to these fragmentary remarks that but poorly express my appreciation of the great honour which you have seen fit to confer upon me.

Mr. CHOATE (American Ambassador) in congratulating Mr. McKim, said he spoke in a threefold capacity. Firstly, as a personal friend; secondly, as a Harvard man representing the university who was so proud of Mr. McKim; and thirdly, as the official representative of his country who shared with the architect the lasting honour conferred upon him. In speaking before a body of professional men his Excellency said he understood the difficulties of a layman, but he believed he could make a few remarks without coming into conflict with technical criticism. It was his good fortune to have known Mr. McKim from boyhood, and it was no exaggeration of the esteem of the architect's friends and fellow countrymen in view of his whole souled devotion to the art which he pursued, and of his enthusiasm from the beginning for the profession he had so highly honoured, to say that they all expected thirty years ago that he would be the recipient of some of the highest honours, not only of his own countrymen, but also from his professional brethren throughout the world. As a Harvard man he rejoiced in being present at the English recognition of his countryman's merit. This pride of the university could be understood, because Harvard bore the same relation to American life as a training at Oxford did to that of Great Britain. Harvard was proud of her son whom they had honoured that night. She had already conferred upon him one of her honorary degrees, and it was believed that one day she would confer upon him the highest degree known to her records. As a representative of his countrymen he had no hesitation in saying that if the bestowal of the gold medal had been left to the vote, and the whole American people had been asked who among her distinguished sons was most worthy of the honour, by a practically unanimous vote they would have selected Mr. McKim, and if they had called for the vote of Congress as representing the power and judgment of the whole community, they too would have selected him, because with their approval he had been associated with nine others to form a commission, and had taken an important part in the presidential commission—corresponding to a Royal commission here—regarding the restoration, the laying out and the development of the city of Washington upon the lines and according to the plans, that received the approval of the father of his country, George Washington, more than a hundred years ago. It was thought fit a few years ago to select a body of architects to see if the plan of George Washington could not be brought into effect, and it was owing to the genius of Mr. McKim and his associates on that commission that the movement was successful, which had resulted in a complete restoration, both of the palace itself and of the city, of which they were proud. Moreover, if the choice had been left to President Roosevelt in place of the King, he felt sure that on account of his lifelong friendship and his hearty sympathy with Mr. McKim's success, the President would have joined in the approval of the selection. Their republican palace, the White House, so beautifully simple and wholly unambitious, did not venture to compete with the magnificent palaces of the old world, but notwithstanding this it was venerated by every ingenious true-born American, and every American boy was taught to regard it as his ultimate home. It was also his good fortune to know Richard M. Hunt, whom the Institute honoured ten years ago in the same way, and he thought he might say that in the immense development of their art which had taken place in the United States during the last thirty years both those gentlemen were entitled to a very great

share of the credit of that development. In all quarters of the realm, from Boston to Seattle, on the shores of the Pacific, the advancement was apparent, and buildings were remarkable both for their beauty as for their utility. After the Civil War was over, and it was at last established that the United States was to be a nation, one and inseparable, for ever, there grew up throughout the length and breadth of the land an ambition to improve and adorn the buildings, both public and private, to make them worthy of the wealth and powers, as well as of the municipalities, of the country. This was the universal sentiment, and the result was that America had been, and was now, and was likely to be in the future, a perfect paradise for architects. The attractions of such a paradise were great, and there had not only grown up a school of architecture, but a great many schools of architects connected with the leading universities of the United States, and they were sending forth every year large numbers of young men highly qualified for the pursuit of this profession. These young men were following in the footsteps of Hunt and McKim, on whom the Royal Institute had conferred this highly honourable and distinguished medal, and if he was not mistaken the result would be that in future years they would have added to their fraternity of architects—for he considered the profession were one great fraternity throughout the world—a noble contribution from the United States, of whom he believed, as of the recipient of the gold medal, they would have great reason to be proud.

Sir L. ALMA-TADEMA, R.A., expressed his admiration for American art, and said that at the Academy they welcomed American works, and they felt there was a feeling of kinship. He had been reproached for not visiting America. His only excuse was that he could not do everything, but he always regretted he was not better acquainted with his many friends on the other side. He believed that no one could write a true history of the art of the century without going to America.

Mr. E. A. ABBEY, R.A., spoke and bore testimony to the great part Mr. McKim had taken in the development of modern architecture, making special reference to the great scheme of the American School in Rome. It was the beginning of a sort of new renaissance—a wedding, so to speak, of the three arts of architecture, painting and sculpture, which had been separated too long. To this school, which added so much to the fame of Mr. McKim in Rome, he hoped to see English students going as to a Mecca or university of the combined arts.

In response to the President's request and invitation, Mr. McKim said he would be glad to be associated with the Institute, and would be happy to become an honorary corresponding member.

PALESTINE EXPLORATION.

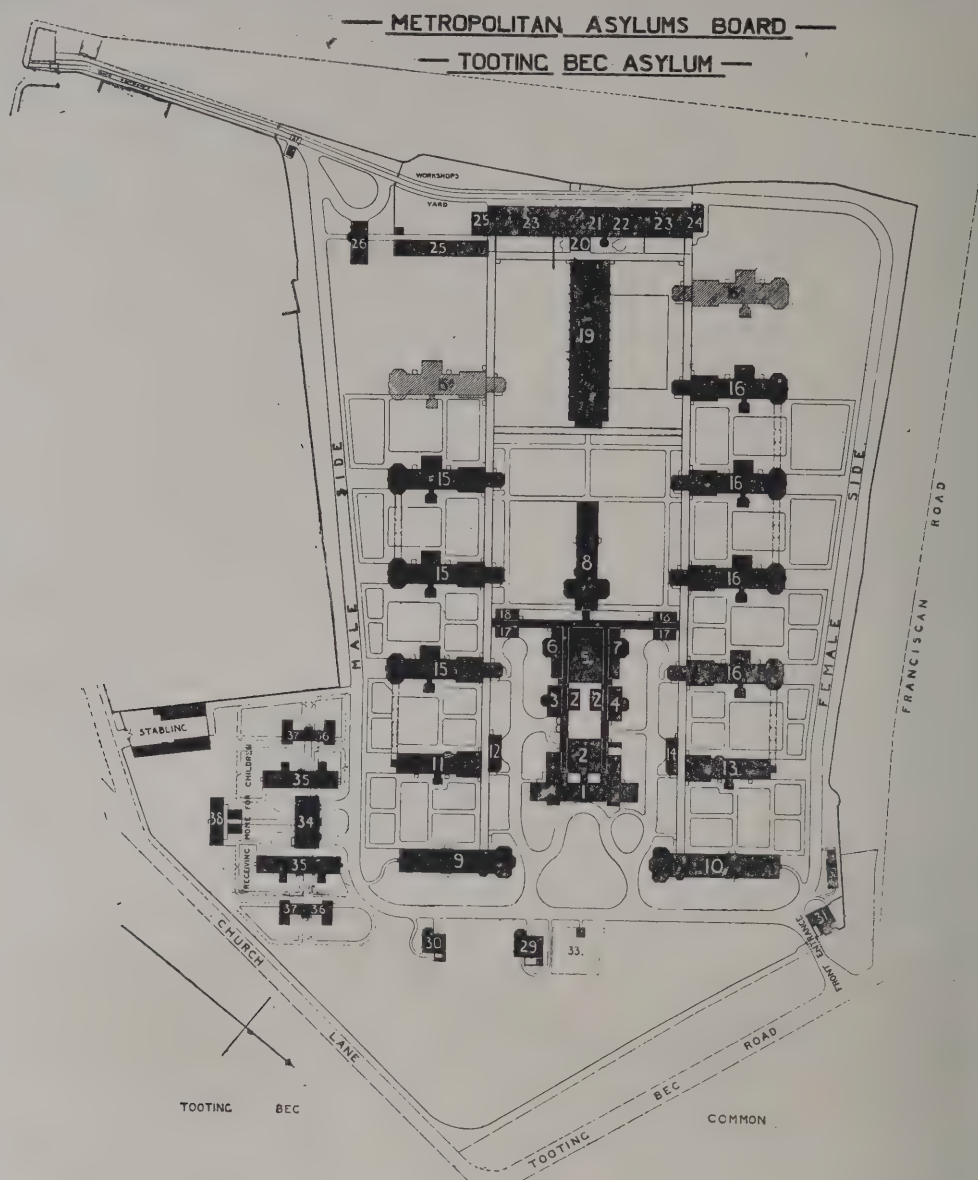

THE annual report of the Palestine Exploration Fund states that the principal work of the Fund during 1902 was the partial excavation of Gezer. Mr. Macalister was not able to begin operations until June 14, and in November he was obliged to retire to Jerusalem, in consequence of the outbreak of cholera in the surrounding villages and among his own working parties. He was thus actively employed at Gezer for five months only. The result of the excavations, thus far, had been to show that there are at Gezer seven strata of remains, which carry back the history of the site to the remotest antiquity. In some instances the objects found indicate a continuous history, whilst in others they as clearly show that the continuity has been interrupted either by the advent of a new race, or by some event of which the nature is not clearly known. The two lowest strata belong to a period (the Neolithic Age) when men used no metal and lived in caves or in houses built of mud brick. The people were of slight build, and were not Semites. They cremated their dead in a cave specially prepared for the purpose, and their bones, reduced to ash, or only blackened, were found exactly as they had been left after cremation. From these strata were obtained stone implements, objects in bone, fragments of primitive hand-made pottery, and a few rudely-formed idols in stone. The two next strata supply evidence of the occupation of the site by Semites, who were stronger and larger boned than their predecessors, and were more advanced in the scale of civilisation. They lived in houses with rude walls of mud and stone, and protected them with strong well-built walls of stone. They buried their dead within the walls, either singly or in groups, and for this purpose they utilised the above-mentioned crematorium and a cistern of the cave-dwellers. In the crematorium the remains and the food-vessels deposited with them were found untouched, and in the cistern exceptionally fine bronze weapons had been buried with the bodies. Professor Macalister was fortunately staying with his son when the crematorium and cistern were excavated, and to him the committee were indebted for reports on the bones which were uncovered, and on the physical characteristics of the two races to which they belonged. A large number of objects of the most varied kind was found in the two strata; part of an

inscribed statue, scarabs and impressions of scarab seals of the Egyptian Middle Empire (about B.C. 2500-1500), flint and bronze implements and weapons, fragments of pottery and broken idols in stone and clay. The most characteristic of the pottery types are common to Gezer and Lachish, and almost unknown in the sites lately excavated by the Fund in the Shephelah. In the higher portion of the strata the pottery has been influenced by Ægean styles. The most interesting discovery in connection with these strata is that of a "High Place," which, as far as it has been excavated, consists of a row of eight monoliths standing upright on a stone platform within a walled enclosure open to the air. In the earth beneath the floor of the enclosure a number of large earthenware jars, each containing the remains of a newly born infant, were discovered, and Mr. Macalister makes the suggestion that "we have here to deal with infant sacrifices." The fifth stratum from the bottom supplies evidence of a break in the continuity of the occupation, which apparently coincides with the immigration of the Israelites. Iron appears for the first time, the open area of the "High Place" is encroached upon by dwelling-houses, and the debris is characterised by those lamp and bowl deposits under the foundations of buildings which Mr. Macalister suggests may be connected with some ceremonial custom peculiar to the Hebrews. The next stratum in ascending order may with certainty be assigned to the period of the Jewish monarchy, for it contains the well-known jar handles with "Royal stamps," bearing the legend "To the King" in old Hebrew characters. The lamp and bowl deposits continue, and the size of the city is reduced. There is evidence that the "High Place" retained much of its sanctity during the greater portion of the periods represented by the fifth and sixth strata, and the large accumulation of nude female figures and objects emblematic of nature worship seems to indicate that the place was then sacred to Astarte. The seventh stratum marks a complete interruption in the history. Flint implements and the lamp and bowl deposits disappear; iron is in common use; the bronze objects are only ornamental, and there is no trace of worship at the "High Place." The masonry of the houses and the pottery types are similar to those found at Tell Sandahannah, in the Seleucid or Ptolemaic town of Marisa, and an Egyptian inscription of the fourth century B.C. was found in the debris. The number of broken or whole objects in flint, stone, bone, bronze, iron and clay which have been unearthed by Mr. Macalister is already greater than has been obtained from any previous excavation, and there is every reason to expect that the remaining portions of the mound will be equally productive.

ROYAL INSTITUTE OF ARCHITECTS OF IRELAND.

A SPECIAL general meeting was held at the Institute Rooms, 20 Lincoln Place, Dublin, on the 18th inst., Mr. G. C. Ashlin, president, in the chair. There were also present. Messrs. W. J. Gilliland, C. T. McCarthy, C. A. Owen, J. Kelly Freeman, R. M. Butler, J. F. Gilchrist, J. W. Donnelly, Frederick Hayes, Harry Allberry, A. G. Miller, F. G. Hicks, G. P. Sheridan, C. H. Ashworth, Sir Thomas Drew and Mr. W. Kaye Parry, hon. sec. The adoption of the report of the professional practice committee, addressed to the Council, recommending the passing of qualifying examinations precedent to admission to membership of the Royal Institute of the Architects of Ireland, was moved by Mr. F. G. Hicks, seconded by Mr. G. P. Sheridan, and carried. Mr. W. J. Gilliland moved the following resolution pursuant to his notice of motion:—"That the absence of restriction of the use of the title 'architect' to those properly qualified to use same is a great injustice to architects who are so qualified, and seriously retards the progress of architecture in Great Britain and Ireland; that it is the duty of the Council of the Royal Institute of British Architects, as representing the profession, to make an immediate and serious effort to obtain statutory powers for the purpose of establishing such restriction." The motion was seconded by the hon. secretary, Mr. W. Kaye Parry, and carried unanimously.

The Committee of the Hertford British Hospital at Levallois Perret, Paris, have put into hand the work of rearranging and reinstalling the existing operating theatre, which, constructed some years ago, no longer comprised the necessities required by modern surgery. The room is being entirely remodelled on the lines of other recently constructed operating rooms, and an annexe added for containing the complete installation for sterilising purposes, and for the supply of sterilised water for the hand-washing basins and sinks. The architect is Mr. Arthur Vye-Parminter, an English architect of Paris, official architect to the British Embassy in that city.

TOOTING BEC ASYLUM.

THE Managers have had the matter of this new asylum for aged, helpless and infirm imbeciles and epileptics under consideration since 1892, and in 1894 purchased upwards of 22 acres of land known as the Tooting Lodge Estate, adjoining Tooting Bec Common, at a cost of 27,000*l*. The house, a dilapidated mansion, has been pulled down, but care has been taken to preserve as many of the trees as possible.

The soil is gravel and loam overlying London clay, and there is a rise in the surface from north to south of about 16 feet.

The accompanying small block plan shows the general arrangement of the several buildings. The asylum forms the principal feature with its central group of administrative buildings, male wards to the left and female wards to the right. The entrance is from Tooting Bec Common, but there is a second entrance from Church Lane for bringing in coal and heavy stores and removing refuse, for which purpose a granite tram-road has been laid through the workshop yard to the several coal stores, and a weighbridge fixed. The detached houses in front are for the steward, foreman of works and gate porter. The group of buildings to the left forms the receiving home for children, and further to the left is the stabling with a separate entrance from Church Lane.

The asylum has been designed to afford accommodation for 996 patients, but for the present two blocks have been omitted, reducing the number to 804. Staff accommodation has been provided for 70 men and 105 women.

The infirmary blocks are three-storey buildings, and on each floor there is a dormitory for twenty-four beds, a smaller dormitory for six beds and two single rooms. The dormitories provide for each patient a lineal wall space of 6 feet, a floor area of 72 feet and a cubic space of 936 feet. At the further end of and separated from the main dormitory by a dwarf partition is a large day-room. Each floor is self-contained and separately approached from the staircase. It forms in fact a flat for thirty-two patients. At the entrance end are two single rooms, linen and day clothing-rooms, broom recess, bath-room and ward kitchen, with inspection window overlooking the large ward. The sanitary annexe is near the centre of the east side of the ward and connected by covered bridges with cross ventilation.

The staircases are formed of concrete, with steps 5 feet wide, in short straight flights encircling a brick centre shaft which contains a hand-power lift for raising coals, &c. At the rear ends the blocks are coupled on the first and second floors by means of bridges formed of concrete and steel, which afford a ready means of escape in case of fire and in suitable weather.

serve as ambulatories for the use of patients. On each floor of the staircase is an enclosed recess for the dirty linen basket, opening direct to the external air.

The floors throughout are of concrete and steel construction without voids of any kind, and the spaces below the ground floors have been solidly filled in. The ward floors are finished with polished oak, with terrazzo margins and curved skirtings. Other floors are finished with terrazzo. The walls are plastered with Barrow selenitic cement and have curved internal angles.

The large dormitories are warmed by Hendry & Pattison's central air-chambered stoves with descending flues, and the day-rooms and small dormitories by similar side stoves. In addition there are hot-water radiating coils and radiators in the smaller rooms and offices. The windows have double-hung sashes and fan sashes with glazed hopper cheeks, and below each ward window is a grating with a valve for the admission of fresh air at a point at which it will impinge upon the hot-water coils. In the smaller rooms the air is admitted to the base of the radiators.

The probation blocks are somewhat similar to the infirmary blocks, but provide on each floor day and night accommodation for twenty patients only. A receiving-room adjoins each of these blocks. Two of the single rooms in each block have been padded by Pocock Bros.

The central group are administrative buildings, and the front portion contains the offices and quarters of the chief officers and the committee-room. From the entrance two side corridors branch right and left to the main corridor and between these are situated the stores and the kitchen departments. The central feature of this group is a glass-covered court, which gives access to the whole of the stores and also to the kitchen court.

rooms and sanitary-rooms are provided on each floor, and lavatory, linen-rooms, box-rooms and cleaning-rooms are provided.

Each block has a staircase at each end, the floors are of concrete and steel construction, and are finished either with terrazzo or oak or fir laid direct on the concrete. The bedrooms have open fireplaces, and the corridors, cubicles, bath-rooms, lavatory, sanitary-rooms, &c., are warmed by steam radiators. The bedroom windows are fitted with specially designed ventilating heads with balanced flaps for admission of fresh air above the blinds, and they have also outlet ventilators into the flues.

The arrangement of the laundry is a new departure initiated by the Managers. It has been customary hitherto to divide the asylum laundries into four separate departments, each practically a complete laundry for male and female patients and male and female staff respectively. This of course involved expense in building and rendered supervision difficult. Acting upon the Managers' instructions the architects have much simplified this building, and it now has but one wash-house and one ironing-room for the whole of the work. There are separate receiving-rooms and packing-rooms for staff and patients, a steeping-room for foul linen and four drying closets. The laundry has been fitted up with the most modern and approved machinery and fittings under the supervision of Mr. W. T. Hatch, M.I.M.E., engineer to the Board. It is electric driven, and the drying-rooms are fitted with horses, the drying being effected by hot air on the Plenum system. The contractors for this work were Messrs. Entwisle & Gass, of Bolton.

The mortuary is near the back entrance and consists of a dead house, fitted with a cabinet, a friends' room, post-mortem

GENERAL VIEW FROM EAST.

The stores consist of a basement and ground floor with a scullery subdivided and fitted in a suitable manner for the several classes of goods. The uncooked meat, fish, milk and vegetable rooms are kept separate and adjoin the kitchen court.

The kitchen, which is 43 feet by 32 feet, immediately adjoins the main corridor and opens into a scullery 43 feet by 22 feet, with vegetable washing-room, cooks' store, larder, &c. Both kitchen and scullery are lit by windows on three sides and by lantern lights, the floors are paved with silex stone and the walls lined with opalite. They are fitted with steam-jacketed boiling pans in central groups, beef-tea and milk pans, steam ovens, gas ovens, hot plates and grillers and a bakers' oven for pastry. The contract for these fittings was undertaken by Messrs. Moorwood, Sons & Co., Ltd., and Messrs. H. Smith & Son built the oven.

On the side corridors adjoining the kitchen are the mess-rooms for nurses and attendants, kitchen staff and stokers, with sculleries and lavatories. On the same corridors are the dispensary with consulting-room and drug store, with fittings by Messrs. Howlett & Son, and the needle-room with matron's office and store. The two front blocks are for nurses and attendants, and provide a separate bedroom for each member of that class, together with bath-rooms, lavatories, cleaning-rooms, linen-rooms, box-rooms, &c. There is also on the ground floor of each block a spacious sitting-room. The assistant matron and head night nurse have rooms in the nurses' block, and the head attendant and head night attendant in the attendants' block.

The domestic staff block occupies a central position on the main cross corridor. On the upper floors are dormitories divided into cubicles, and on the ground floor mess and sitting-rooms, together with rooms for the chief domestics. Bath-

room and pathological room. A disinfectant room is being built at the west end of the boiler-house block, and will be fitted with a steam disinfectant with vacuum apparatus.

At the rear of the laundry is the boiler-house with steam-coal store, gas-house, dynamo-house and cell-room, and in continuation of the same block two large stores for house coal in immediate connection with the side covered ways. All these buildings open into an enclosed workshop yard, where also will be found workshops for smith, engineer, plumber, carpenter, painter, upholsterer and mattress maker, together with a store and office for the foreman of works, and lavatory and w.c.'s for the workmen.

The buildings generally are built of stock bricks faced with Lawrence's red bricks with blue Staffordshire plinths, and they are covered with Bangor slates. The boundary walls are built with pressed Leicester red bricks and blue Staffordshire plinths and capping. Next Tooting Bec Common the land is enclosed by a wrought-iron fence 8 feet 6 inches high, supported by cast standards. The corridors have concrete flat roofs covered with asphalt; the covered ways have glass roofs, on Rendle's system, carried upon iron columns, and the floors which cover the pipe ducts are of concrete asphalted.

The water supply is from the mains of the Lambeth Water Works Company. For fire purposes a 6-inch main is run to and through the main ducts, forming a ring with 6-inch and 4-inch branches. There are twenty-five external hydrants and fifty-five internal fire valves, all fitted with outlets to suit the London Brigade fittings. For the domestic supply, two cast-iron tanks, each upwards of 25,000 gallons capacity, have been erected over the staircases of the two central blocks at a height of 80 feet. These tanks are connected with the fire main so that in case of a temporary stoppage of the Company's supply the water in the tanks will be available, and the pipes are so

arranged that one tank may serve the whole building while the other is being cleaned. The rain-water is collected in an underground reservoir of 120,000 gallons capacity, situated in front of the main building, this being the lowest part of the site. The reservoir has a wash-out pipe and an overflow to the drainage system, and the water is pumped by an electric pump to the laundry-tank for use in the laundry and as feed-water for the boilers, the pump being controlled by a switch in the boiler-house.

There are three steam boilers of the Galloway type, each 20 feet long by 6 feet 6 inches diameter, with Green's economiser and mechanical stoker by the Underfeed Stoker Company, the forced draught for which is furnished by a Sturtevant blower driven by an electric motor. These boilers form the heat centre for the whole building, supplying steam for warming purposes, for heating water, for laundry and kitchen, and steam supply-mains are carried through the several ducts and the water of condensation is brought back to the hot well next boiler-house and reused as feed-water.

The hot-water pipes and radiators in the several blocks are worked by Royle's calorifiers with automatic control attachments which regulate the supply of steam to the quantity necessary to maintain a suitable temperature. The hot water for baths, lavatories, sinks, &c., is heated by means of a similar calorifier in the basement of each building with circulating pipes to the several fittings.

The lighting installation consists of about 2,300 glow-lamps of 8 or 16 candle-power, and 12 arcs for lighting the laundry, and has been carried out on a novel principle devised by the consulting engineers. This system, which may be called the draw-through concentric system, consists in running on the

CONNECTING BRIDGE.

surface of the walls, buried in the plaster, small brass pipes varying from 5-16-inch to 7-16-inch internal diameter, and drawing into them a single (or in the case of a three-wire circuit, two) insulated conductors, the pipe serving at the same time as a channel for, and a protection to, the cable, and as the return conductor for the current; one pole being thus connected to, and at the same pressure as the earth, it is impossible to accidentally obtain a shock, and only half the usual amount of wire is required. The lamps are supplied at 120 volts on the three-wire system, and there being a complete ring main, there are four circuits available for the current, rendering it practically impossible for any breakdown of the main cable to put out more than half the lights at once. Each separate block has its own service-box and main switch by which it can be disconnected at any time from the ring mains, and all the fuses are grouped in distribution fuse-boards in the passages, there being not more than ten lights on a circuit. The electric-generating plant marks a new departure in asylum practice, inasmuch as the motive power employed is power-gas instead of the more usual steam. The engine-room contains three gas-engines, each giving a maximum of 70 b.h.p. at about 210 revolutions per minute, and driving by belt a shunt-wound dynamo giving 140 amperes, 250 volts at 550 revolutions. As a general rule two engines only are in use, one being a stand-by.

The producer gas plant was supplied by Messrs. Paisley Welch, and consists of two of their gas producers with the necessary scrubbers. During the trials made by the engineers on completion of the plant the consumption of anthracite coal per electric unit, measured at the terminals of the dynamo, amounted to only 1.4 lbs., whereas with steam plant this would

have been at least 4 to 5 lbs. In addition to the three dynamos there is a battery of accumulators, consisting of 132 L.B. 9-Tudor cells, capable of discharging at 56 amperes for 10 hours at 240 volts, or in other words, of supplying 1,000 16 candle-power lamps for 10 hours.

The boilers and the electric-generating plant and wiring were carried out by the undermentioned contractors from designs prepared by Messrs. Handcock & Dykes, and under their supervision:—Boilers, Messrs. H. & T. Danks; generating plant, Messrs. Crompton & Co.; wiring and main cables, Messrs. R. Dawson & Co.

Gas is supplied by the Mitcham and Wimbledon District Gas Light Company for cooking purposes and for the plate-warmers and hot-plates in the ward kitchens.

The soil and surface-water drainage discharge into the sewers of the Wandsworth Borough Council. The branch drains are disconnected from the main drains, and these in their turn disconnected from the sewer.

An electric fire-alarm system has been installed with thirty-six call-boxes, ten alarm-bells and two indicator-boards. There is also telephonic communication between the various departments through an "exchange" at the porter's office.

Messrs. W. Johnson & Co., Ltd., carried out the main contract, which included steam mains, hot-water engineering, tanks, &c., together with road making and groundwork. Their contract amount was 204,523/., but owing to saving effected on the laundry building and in other matters, the work was finished for about 2,000/., less.

Mr. J. T. Rees acted as clerk of works. The architects are Messrs. A. & C. Harston, who have, in addition to this work, carried out several other asylums.

THE CELTIC GOLD ORNAMENTS.

ON Saturday last Mr. Justice Farwell gave judgment in the case *Attorney-General v. Trustees of the British Museum*. A report of the arguments and evidence appeared in *The Architect* last week. His Lordship said:—

In the year 1896 two ploughmen were driving a furrow in a field near Lough Foyle, the leader with a 6-inch plough, the second, Nichol, following down the same furrow with a 14-inch American plough. Nichol's plough struck something hard at the bottom of the furrow, and he stopped and went back and found certain gold articles all lying together in a space about 9 inches square. The articles found consisted of the following:—(1) A hollow collar with repoussé ornaments; (2) a model boat with thwarts, and a number of oars, spars, &c.; (3) a bowl with four small rings at the edges; (4) a solid gold torque; (5) one-half of a similar torque; (6) a necklace consisting of three plated chains with fastenings; (7) a single chain. The two last were found inside the hollow collar. The oars were much bent, and were inside the bowl, which was flattened. The boat was crumpled up. Nichol took the articles to his master, and they were sent to the factory of Messrs. Johnson in Grafton Street, Dublin, who restored them to the shape in which they had been shown to the Court. They are articles of great interest and beauty, of Celtic origin. The dates suggested for their manufacture range from 300 B.C. to 600 or 700 A.D. I think that they may fairly be attributed to the second or third century after Christ. Ultimately they were purchased by the Trustees of the British Museum, and they are now claimed by the Crown as treasure trove.

The Trustees set up two defences—first, they deny that the articles are treasure trove; and secondly, if they are, they allege that by a charter of Charles II. the right to treasure trove is vested not in the Crown or themselves, but in the Irish Society. Several definitions of treasure trove have been cited to me, not substantially differing one from another. I will take that cited in Chitty on Prerogative, page 152:—"Treasure trove is where any gold or silver in coin, plate or bullion, is found concealed in a house, or in the earth, or other private place, the owner thereof being unknown, in which case the treasure belongs to the King or his grantee having the franchise of treasure trove; but if he that laid it be known or afterwards discovered, the owner and not the King is entitled to it; this prerogative right only applying in the absence of an owner to claim the property. If the owner, instead of hiding the treasure, casually lost it or purposely parted with it, in such a manner that it is evident he intended to abandon the property altogether and did not purpose to resume it on another occasion, as if he threw it on the ground or other public place or in the sea, the first finder is entitled to the property, as against every one but the owner, and the King's prerogative does not in this respect obtain." So that it is the hiding, and not the abandonment of the property that entitles the King to it. It is clear from the very terms of the definition that no direct evidence can be given of the intention to hide, or the intention to abandon, by a person who is *ex hypothesi* unknown. The direct evidence must necessarily be confined to the discovery of articles in fact concealed, and the Court must presume the in-

tention to hide or to abandon from the relevant surrounding circumstances, and the motives that usually influence persons acting under such circumstances, according to the ordinary dictates of human nature. In the present case the articles were obviously of considerable value, but of a miscellaneous nature, such as might well represent the store of a native chief or the spoils gathered in the raid of some Norse pirate. The articles were all put close together, the chains being actually concealed within the hollow of the collar in the mode which a person hiding them for safety with a view of returning to reclaim them would be likely to adopt. Their value renders it improbable that they would be abandoned except under stress of imminent danger, and the care with which the chains were put inside the collar and all the articles were collected together point to the absence of any such imminent danger as would necessitate abandonment. The inference, therefore, is that they were intentionally concealed for the purpose of security. There is no evidence at all as to the date of concealment, but the state of Ulster from the beginning of its history down to comparatively modern times has been such as to render it highly probable that treasure would have been concealed on many occasions, and in this very district there is record of a great invasion of Norsemen who overran the land comprising this spot about the year 850 A.D. The inference therefore appears irresistible that this was *vetus depositio* unless the defendants can displace it.

Mr. Warrington argued that it would be enough for him to show any other plausible theory. I do not agree with him. The Crown must first prove a *prima-facie* case, but when they have done so the defendants must defeat that title by producing a better title. But, in my opinion, the defendants' theory is not even plausible. I desire to speak with all respect of the gentlemen who have been called as witnesses for the defence, but I must express my opinion that the Court has been occupied for a considerable time in listening to fanciful suggestions more suited to the poem of a Celtic bard than the prose of an English law reporter. The defendants' suggestion is that the articles were thrown into the sea, which, they suggest, then covered the spot in question, as a votive offering by some Irish sea-king or chief to some Irish sea-god at some period between 300 B.C. and 700 A.D., and for this purpose they ask the Court to infer the existence of the sea on the spot in question, the existence of an Irish sea-god, the existence of a custom to make votive offerings in Ireland during the period suggested, and the existence of kings or chiefs who would be likely to make such votive offerings.

The whole of their evidence on these points (if I may so describe it) is of the vaguest description, and I find as follows:—(1) There is no evidence to show that the sea ever flowed over the spot in question within any period during which the articles could have been in existence; it is not disputed that the raised beach on which the spot is situate is of later origin by upheaval than the surrounding land, but there is nothing to show that it was raised at any time since the Iron Age began; and so far as I can see it may have been at any time between 2000 or so B.C. and some time before the beginning of the Christian era. (2) There is nothing to show that votive offerings of the sort suggested were ever made in Ireland. There is no such consensus of expert opinion as would enable me to find that such offerings have ever been made in Europe since the Bronze Age. There is no case known of a votive offering anywhere of a ship coupled with other miscellaneous articles, and there is no case on record of any votive offering having ever been made in Ireland at any time. (3) Notwithstanding the passage in Brash, it is by no means certain that there was any Irish sea-god at all. (4) Or that there were any Irish sea-kings or chiefs who made offerings to a sea-god, if any such god there were. Further, the negative inferences against the defendants' theory are of considerable weight. Votive offerings to a pagan deity would be offered in such a way as to make the most display; no one seeking to propitiate an anthropomorphic deity, who like Baal might be engaged in hunting or sleeping, would be likely to conceal two of his gifts in the hollow of a third; nor (as pointed out by Mr. Coffey in his evidence) would the donor mutilate some only of the objects, as the defendants here allege to be the case. Mutilation would either be essential or an insult, and one would expect therefore to find all or none mutilated. Again, by virtue of what process have all these articles of such different sizes, weights and shapes been kept together during all these years under the whelming tide? What magic bag had the Irish sea-king which would withstand the action of the waves until the ornaments confided to its care found a safe resting-place in the soil formed on the surface of the beach when the sea receded? It was perhaps natural that the defendants should grasp at theories which, in justice to them, I may say were not invented for the purpose of this defence, but it is really little short of extravagant to ask the Court to assume the existence of a votive offering of a sort hitherto unknown in a land where such offerings are hitherto unknown,

in a sea not known to have existed for 2,000 and possibly 4,000 years, to a sea-god by a chieftain both equally unknown, and to prefer this to the commonplace but natural inference that these articles were a hoard hidden for safety in a land disturbed by frequent raids and forgotten by reason of the death or slavery of the depositor. It is perhaps hardly necessary to mention that my observations as to votive offerings are confined to votive offerings of the character suggested by the defendants, and have nothing to do with votive offerings in Christian churches, or with offerings to wells and fountains, of which many instances are collected in Brand's "Popular Antiquities," volume ii., page 259 and onwards.

The view that I have expressed on the facts renders it unnecessary for me to express any opinion on the Attorney-General's further point that votive offerings may be treasure trove.

Mr. Justice Farwell next considered the point raised by the Trustees about the right to treasure trove having passed by the charter of Charles to the Irish Society, and held that treasure trove would have been specified if it was intended to grant it. Finally his lordship said:—I have arrived at the conclusion that treasure trove does not pass by the charters by applying the ordinary rules of construction so far as is compatible with the subject-matter of the grant, and it is therefore unnecessary for me to express any opinion on the contention of the Attorney-General as to the rules by which the Crown is entitled to have its grants construed. It is also unnecessary for me to express any opinion on the last point urged by the Attorney-General, which is of considerable general importance, viz. that in all claims to property the Crown is entitled to treat the defendant as if he were plaintiff, and to insist that he must succeed on the strength of his own title and cannot defeat the Crown merely by showing that the Crown's title is bad. The result is that I will make a declaration that the articles in question are treasure trove belonging to His Majesty by virtue of the prerogative Royal, and order the delivery up of the same accordingly.

SUSSEX ARCHÆOLOGICAL SOCIETY.

ON Tuesday the Sussex Archæological Society met at Ford. The occasion was a district meeting at Ford, Clymping and Arundel. The archæologists, says the *Sussex Daily News*, assembled at Ford shortly after mid-day, coming in by trains from Brighton, Worthing, Portsmouth, Chichester and Horsham. Quite a large party left the station in carriages and brakes.

The first drive was short, being broken near Ford Church. This little church almost on the banks of the Arun received inspection, and Mr. P. M. Johnson, as cicerone to the party, undertook to describe items of interest in the church. Mr. Johnson opened his description with an epitomised history of the church. It was a puzzle whether Ford Church was or was not mentioned in Domesday. Clymping was, and another church was set down as belonging to it, but with no name attached. So far as the nave was concerned, the church was, however, of pre-Conquest date. Two miniature Saxon windows and a plinth also denote an early date. Great interest was displayed in the painting of "The Doom" over the chancel arch, in the mural paintings, the Saxon consecration cross, and other work of the same date in the north wall of the nave. Having examined the outward structure of the church, the party rejoined the conveyances and drove through winding lanes to Clymping Church.

They were met by the vicar. Before entering the church Mr. Johnson drew attention to the beauty of the Transitional Norman tower and its unique buttresses with their zigzag borders and pointed arches. The interior of the church surprised many of the party. Clymping Church is a beautiful and well-lighted building, and stands almost alone of its kind in Sussex. Although of decidedly modern appearance, it is not new. It dates back to the thirteenth century and is supposed to have been preceded by a wooden erection of Saxon origin. The pulpit, font and the pewing, of which about a dozen benches remain, are relics of the Early Perpendicular period. In the restoration the beautiful Early English work in the nave was admirably preserved. An item of exceptional interest, and viewed by all, is the thirteenth-century chest. There is none in England of an earlier date, and only half a dozen contemporary. After a close inspection and a climb to the roof of the tower by the more adventurous, the conveyances were again joined.

The party next drove to what is known as Bailie's Court, Atherington. A wrong turning took them somewhat out of the way, and some distance had to be recovered before the Court was reached. The moated house of the Bailiff of the Abbey of Sees, with its little thirteenth-century chapel, formed not the least enjoyable subject for inspection during the afternoon. The naturalistic foliage on the walls was noted by many. Atherington belonged to an alien priory in early days, but is now in the occupation of Eton College. Before leaving the

Court expressions of thanks were conveyed to the present tenants for their kindness in opening the little chapel for inspection.

Again mounting, the party retraced their ground to Ford, and thence passed to picturesque Tortington Church, almost hidden from sight and passed by unnoticed by the uninitiated. Tortington Church is one of the smallest churches in Sussex, and even the original structure has been added to. A special feature of this diminutive church is the remarkable arch leading to the chancel. This arch is surrounded by beak heads of grotesque shapes. The aisle was tacked on about 1230, and was built almost entirely of chalk—still in a good state of preservation, and a test as to its lasting qualities. One or two of the early windows appear to have been tampered with. The roof is of great antiquity, and is of practically the same date as the walls. Tortington Priory, fragmentary ruins of which alone remain, was next visited. It was during this inspection that Mr. Johnston made a particularly gratifying statement. The Duke of Norfolk, he said, had consented for the whole of the remains of the priory to be, as far as possible, thoroughly excavated and examined. The proposal that this work should be undertaken shortly is to be submitted to the Society's Council for them to consider as to the supply and obtaining of funds necessary for the excavating. The stay at the priory was comparatively brief.

The party next drove to Arundel Castle, and, through the kindness of his Grace, inspected the Fitzalan chapel. Here Mr. Kemp, J.P., was the conductor. He narrated the early history of this chapel, and gave special attention to the splendid series of tombs of the Earls of Arundel. Some time was spent in the chapel examining the tombs and the brasses. From the castle the party proceeded to the parish church, which was scrutinised outside and inside. Of more than average interest were the curious remains of paintings on the walls still distinctly visible.

The excursionists then adjourned to the Norfolk hotel for tea. This concluded, Canon Cooper, on behalf of others, expressed gratitude for the services rendered by Mr. Johnston, and to the excellence of the arrangements made by the hon. secretary, Mr. H. Michell Whitley. He also thanked the local hon. secretary, the Duke of Norfolk, and the Rev. Prebendary Burdon for their assistance towards the enjoyment of the outing. Canon Cooper further expressed pleasure at the forthcoming excavations to be made at Tortington. Mr. Johnston having responded, the party renewed their inspections, visiting the ruins of the Maison Dieu near Arundel Bridge and the remains of the priory of De Calceto or Pynham, near to Arundel station on the Lyminster side. These ruins are exceptionally fragmentary, the only remaining practical evidences being two buttresses, supposed to have been a portion of the tower of the once existent priory. The archaeologists disbanded at the station, after one and all had expressed every satisfaction at the success of the meeting.

MANCHESTER SOCIETY OF ARCHITECTS.

ON the evening of June 16 thirty members visited the new St. Mary's Hospital, Manchester, Messrs. A. Waterhouse & Sons, architects, and were shown with the greatest thoroughness the admirable fittings and arrangements of this excellent modern hospital.

On Saturday, June 20, thirteen members visited Liverpool. Messrs. Norman Shaw & Doyle's White Star Line Offices, and Parr's Bank by Mr. Norman Shaw and Messrs. Willink & Thicknesse, were very much admired, and the excellent design and detail, inside and out, carefully examined. Another treat was in store at Mr. Mountford's new technical school buildings, where Mr. Willink, chairman of the committee, with some of the staff, explained the buildings very fully, giving special attention to the "Plenum" ventilating system, and also most hospitably entertained the party. A visit to the new central fire-station concluded a most enjoyable and instructive afternoon.

GENERAL.

The First of the historical pictures for the decoration of the luncheon-room of the new portion of the Edinburgh City Chambers has now been placed in position. The picture in question is that by Mr. W. Hole, R.S.A., of the Coronation of James II., which was shown in the exhibition of the Royal Scottish Academy. It has now been fixed in the large panel on the south end of the luncheon-room. The subject shows the boy king, the first of the Stewart dynasty who was crowned at Holyrood (1437 A.D.), receiving the homage of the assembled prelates of the Church and nobles.

The Old Church of SS. Peter and Paul, of Swanscombe, Kent, which was almost completely destroyed by lightning last August, has been restored by Messrs. Multon & Wallis, Gravesend, and was opened by the Bishop of Rochester on Tuesday.

Senator William Clark, it is said, proposes to invite competitive designs from architects in London and Paris for the town mansion he is about to erect in Washington.

Mr. G. Macmillan, hon. treasurer of the Cretan Exploration Fund, has announced the receipt of 1,000*l.* from an anonymous donor towards the completion of Mr. Arthur Evans's work at Knossos. A further sum of 2,000*l.* is asked for.

The Bridge House Estates Committee have under consideration a scheme for the lowering of the crown of Southwark Bridge by several feet in order that the gradients on the City side may be reduced to such an extent that vehicles will have no difficulty in making use of it.

M. Besnard has received a commission to paint a ceiling-piece for the Comédie Française. The subject shows Apollo in his chariot passing before a temple having statues of Corneille, Racine, Molière and Victor Hugo. The god is accompanied by the Hours and Muses.

A Conference of members of Parliament and others interested in the iron, steel, engineering and electrical manufacturing trades was held in one of the committee-rooms of the House of Commons on Thursday for the purpose of instituting a fund for the vigorous promotion of Mr. Chamberlain's preferential tariff proposals.

The Bishop of Oxford opened on Saturday the chapel at Bradfield College, which has been enlarged. The new chapel in its finished state consists of a nave with aisles and a chancel, with a transept on the south side and an organ-chamber on the north. The style of the chapel is Early Flowing Decorated, and the tracery has been treated with considerable richness. The work was carried out after the design of Mr. J. Oldrid Scott, the diocesan architect.

The National Gilchrist Scholarship for Art of 50*l.* per annum, tenable for two years, has been awarded by Sir Edward Poynter, P.R.A., to Miss Anne Seaton, a student of the Royal Female School of Art.

M. Quentin-Bauchart has nearly completed his report on the reorganisation of the Fine Arts in the municipality of Paris. The work will include a complete historical account of the department of *beaux-arts* and of the museums of the city. The main suggestion will be the creation of a "Direction des Beaux-Arts."

An Exhibition of works in ivory has been opened in the Musée Galliera, Paris. A great part of the collection comes from Dieppe, where the art is followed on a commercial basis. Some statuettes by Parisian artists are of a higher quality.

The London County Council are unable to sanction the borrowing by the Marylebone Borough Council of 1,274,000*l.* for the purchase of that portion of the undertaking of the Metropolitan Electric Supply Company, Limited, which was within the borough and which the borough was authorised to purchase by the Electric Lighting Order Confirmation Act of 1901, and for costs in connection with the purchase.

Dr. Paul F. Moline, hon. secretary British Committee, 42 Walton Street, Chelsea, S.W., will furnish particulars of the eleventh International Congress of Hygiene and Demography, to be held in Brussels from September 2 to 8, 1903, with the travelling and hotel arrangements.

Mr. J. J. Burnet, architect, Glasgow, has received 500*l.* from a correspondent to be expended on the purchase of a picture for the Corporation of the City of Glasgow, to be selected from the exhibition of the Royal Glasgow Institute of the Fine Arts, to be held in their new premises in 1904, by a committee of gentlemen elected by the Corporation, the Glasgow Institute of the Fine Arts and the Glasgow Art Club.

The Free Exhibition of works by Dutch painters in the Guildhall Art Gallery has been already visited by over 100,000 visitors.

Lord Iveagh has offered to give 34,000*l.* to Trinity College, Dublin, in order to erect laboratories and lecture-rooms for physical science, electrical and mechanical engineering, botany and zoology. Other subscribers are expected to contribute a sum sufficient to pay the estimated expenses, or 2,730*l.* a year.

A Mosaic Floor or pavement from the excavations of the Roman city at Caerwent (Mon.) has just been placed in the Corporation Museum at Newport, and another is being prepared for removal. The latter is stated to be one of the best examples of Roman mosaic work yet found in England. It is decorative in character, bearing figures of animals and what are believed to be Cupids. Both floors were found in the same Roman house (which has been denominated "No. 7"), one above the other, and they represent different periods of Roman domestic art.

The Ancient Cloth Hall in the corn wharf at Newbury, which was purchased of a local body of charity trustees and restored at a cost of about 2,000*l.*, was on Tuesday accepted by the Corporation as a free gift from the committee. The work was carried out as a town memorial to Queen Victoria. The building is likely to be used as a museum and fine art gallery.

THE

Architect and Contract Reporter.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

SCOTLAND.—Sept. 12.—Competitive plans are invited for alterations on and additions to the Stonehaven town hall. Mr. George Murdoch, borough surveyor.

TAUNTON.—July 20.—Competitive designs are invited for a library building to be erected in Corporation Street, at a cost not exceeding 5,000*l.* inclusive. Premiums of 30*l.*, 20*l.*, and 10*l.* will be awarded for designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. George H. Kite, town clerk, Municipal Buildings, Taunton.

ELECTRIC NOTES.

THE York City Council have obtained sanction to the loan for 50,000*l.* for extensions at the works, to be repaid during a period of twenty years. A discussion ensued on the relative merits of street lighting by electricity and by gas, a circular having been issued to the members by the Gas Company alleging that nearly 700*l.* annually was lost to the town by the substitution of electric light for gas. Mr. Scott (chairman of the committee) controverted the statement, maintained that the cost per candle-power was less for the electric, but if even the latter was more costly it was a better light.

MR. KING, engineer to the Glasgow Corporation electrical department, carried out last Friday an interesting experiment. At the crossing of the tram rails there is a renewable piece of cast steel bedded with white metal spelter into a larger piece of metal. This renewable piece up to the present has been chipped out, taking eight or nine hours. The time between the stoppage of the cars at night and starting in the morning being limited, Mr. King aimed at melting out this metal by means of a large blow-lamp. This has been accomplished by the adoption of a lamp made by the Scottish Oil Gas Lamp and Furnace Company, of Govan, one hour being sufficient to melt the white metal. The Waterworks Department were also represented at this experiment.

THE engineer to the Stirling Town Council has presented his annual report on the electrical undertaking. The estimated deficit balance on the year's working, as compared with the estimate, was about 48*l.*, the revenue having fallen short by 195*l.*, and the expenditure being 147*l.* less than the sum calculated. The average price received from private supply had been 4*68d.* per unit, as compared with 5*27d.* last year, being a reduction of rather more than $\frac{1}{2}$ *d.* per unit, owing partly to the more extended use of the maximum demand system, and partly to the introduction of the Nernst lamp. The cost of production per unit has this year been reduced from 1*98d.* to 1*51d.*, or nearly $\frac{1}{2}$ *d.* per unit. The total costs have decreased from 2*77d.* last year to 2*05d.* this year, showing a reduction of nearly $\frac{3}{4}$ *d.* per unit sold.

"ELECTRICITY" for June 19 commences the publication of a short serial upon "Some Practical Aspects of Electric Traction." The serial is written by Mr. A. P. Haslam, A.M.I.E.E., who is an expert in the subject, and deals with the conditions which must be fulfilled if an electric tramway is to succeed

where a horse-equipped line has failed. The cost of electrical equipment, the relative costs of working, the influence of electric traction upon traffic receipts and the possible effect of heavy sinking fund and depreciation charges, are all dealt with. The present forms one of a series of articles upon various phases of electrical engineering work, in which the commercial problems involved will be considered from a technical standpoint.

At a meeting of the Redditch Urban District Council a discussion took place upon the proposed extension of the engine-house at the electric-light works to accommodate the new engine. The committee strongly urged that the extension should be made, and the Chairman pointed out that if they had not the house ready the contractors would not be able to meet their engagement as to the date. Mr. Harbon urged that the resolution passed at the town's meeting, "that no further capital expenditure be incurred upon the undertaking until the opinion of an expert had been obtained" stood in the way. He moved as an amendment that before proceeding with the extensions it was desirable to obtain the opinion of the expert upon the plans. On being put to the meeting the recommendation of the committee was adopted.

THE Bo'ness Town Council have decided to sign the agreement with the National Wiring Company, London, to take over and work the provisional order when obtained for electric lighting and power in the burgh. By the agreement the Town Council find the capital, estimated at 26,000*l.*, and the company lay down the plant and work the same on a twenty years' lease, with breaks at ten, fourteen and seventeen years. The town pay the company a premium of 7 per cent. on the cost, and the company pay as interest and sinking fund on the Council's loan 6 per cent. If at the end of ten years the Council take over the scheme the company pay over any excess of profit over 3 per cent. per annum they have made during these years. The rates charged to be not more than $5\frac{1}{2}$ *d.* per unit for lighting, 3*d.* and 2*d.* for power and heating, and $2\frac{1}{2}$ *d.* for streets and public buildings.

At a meeting of Dumfries Town Council the electric-light committee reported that they had before them proposals by the National Electric Wiring Company and by Messrs. Frank Suter & Co. to carry out the electric installation in the town, and recommended that the Council enter into negotiations with Messrs. Suter & Co. with a view to arriving at an agreement. Under the firm's offer the Town Council are to provide the

the gas department which, it is affirmed, show conclusively that the mains in other parts of the city are being subjected to similar damage.

## BUILDING AND BUILDERS.

THE memorial-stone of South Rutherglen United Free Church has been laid. The church will cost a sum of 3,500*l*.

THE foundation-stone of the new Roman Catholic church at Eccleshall was laid on the 17th inst.

THE tender of Messrs. Stirling & Kay, Glasgow, for the erection of the sewage purification works at Dumfries at 21,007*l*. has been accepted.

PLANS have been prepared by Mr. Talbot Brown for the erection at Higham Ferrers of schools, classrooms, &c., at a cost of 2,000*l*.

THE Wesleyan Methodists of Brockholes, near Huddersfield, have begun operations for the building of a chapel, with a school to follow, to seat about 200 persons and to cost, including land, about 2,000*l*.

THE memorial-stone of St. Andrew's, Alexandra Parade, Glasgow, has been laid. It is estimated that the new church and hall will cost 7,000*l*., and there will be 850 sittings in the church, while the hall will accommodate about 150.

THE Wesleyans have just secured a site in Chester Road, Gorse Hill, Stretford, for the building of a large chapel. The foundation-stones were recently laid. It is intended eventually to build a large chapel, which will cost between 5,000*l*. and 6,000*l*. The school chapel, which will at once be proceeded with, will cost 1,250*l*.

THE foundation-stones of a new schoolroom connected with the Southbank Road Wesleyan church, Southport, were laid on the 20th inst. in the presence of a large company. The building is to replace one which had become too small, and is to cost 5,000*l*.; it will afford accommodation for between 300 and 400 scholars, and in addition to a large schoolroom and a lecture hall it will have a ladies' room, classrooms, a library and a social club-room.

THE Wellington Markets Company have decided to erect a new public hall, with spacious banqueting-room and theatre for Wellington. The new building will be in Market Street, in proximity to the Market Hall. The Urban Council having

capital, and Messrs Suter & Co. undertake to pay the interest and sinking fund, and to divide profits equally with the Council, loss occurring in any year to be debited against the profit of subsequent years. The Council are to have the option of taking over the undertaking without payment of any premium at any time on giving twelve months notice. They roughly estimate the capital expenditure of 15,000*l*. to 20,000*l*., but undertake to make a survey and then send in a given tender. Dean M'Lachlan moved the adoption of the committee's recommendation, and Mr. Lennox seconded. Mr. O'Brien moved that it be remitted to the whole Council in committee to enter into negotiations with all the firms who had submitted offers. This was seconded by Mr. Thomson. Dean M'Lachlan's motion was carried by 11 votes to 9.

A DISCOVERY has been made by the Leeds Corporation of the utmost importance to all places where electric tramways are in use. It is that the gas and water mains and the electric-light cables are being eaten through by the electric current which escapes through the rails into the earth after serving the cars. The discovery was made by the gas department. An escape of gas occurred in Kirkgate, and digging operations ensued. A leak was found in a pipe of an inch diameter, which could only be accounted for on the assumption that the electricity from the tramway overhead had eaten its way through the metal. This alarming theory led to further examinations, with the result that in the space of 6 inches on a 12-inch main no fewer than seven holes were discovered, which were evidently to be ascribed to the same cause. None of the perforations were quite complete. They varied from one-sixteenth to five-eighths of an inch in depth, and as the thickness of a new 12-inch main is only a little more than five-eighths the damage is in some cases almost complete. The gas main in question, it is stated, was a comparatively new one. The evidence as to the cause of the holes was supported by the electric-lighting department, by whom similar discoveries were made as to the injurious effects of the escaping fluid upon the electric-lighting cables. Moreover, tests have been made in

APPLICATIONS FOR AGENCIES INVITED.

adopted the Free Libraries Act, a free library and reading-room has been erected in Walker Street. It is rapidly approaching completion, and will probably be opened in July.

THE tender submitted by Messrs. Battley, Sons & Holness, 21 Old Kent Road, London, S.E., has been accepted for the new Baptist church and schools, Gloucester Place, Brighton, the contract amount being 5,381*l.* 10*s.* 1*d.* The accommodation provided in church is 725 adults. A bold square tower terminating with a quaint spirelet forms a prominent feature at one side. The architects are Messrs. G. & R. P. Baines, 5 Clement's Inn, Strand, W.C.

THE Leith Dock Commission have been informed by the assistant engineer that at the present rate of progress the excavation of the rock by the General Works Construction Company, Ltd., at the entrance to the new Imperial Dock would not be completed earlier than six months hence. With reference to the erection of "dolphins" for the working and protection of vessels entering the basin, the engineers reported that in consequence of the discovery of rock in the substratum the scheme of timber piling must be abandoned. The engineers advised that the alternatives would be four caissons or a continuous concrete wall, the comparative costs, broadly estimated, being for the four caissons and connecting gangways, 22,000*l.*, and for the continuous wall 18,000*l.* to 20,000*l.* The special committee were empowered to proceed in either way after receiving detailed reports.

THE third annual tour of the Edinburgh and Leith Master Builders' Association and the Building Trades Exchange of the city and district of Edinburgh took place on Tuesday to St. Mary's Loch. A company of over eighty gentlemen travelled to Selkirk, where they breakfasted. The weather, unfortunately, was of a disagreeable kind, heavy rain falling when the company drove off to Tushielaw. Fortunately, after lunch the sun broke through the dull sky, and the drive to St. Mary's Loch was made under much pleasanter circumstances. The company having been photographed at the Loch, they drove back by the Dowie Dens of Yarrow to Selkirk, where dinner was served. Mr. Neil M'Leod, president of the Association, occupied the chair, and was supported on his right by Mr. Graham Yooll, president of the Exchange, Mr. Patrick Knox and Mr. James Morris, and on his left by Mr. James Forrest, Mr. Alexander Drysdale and Mr. Cameron, the secretary. After spending a most enjoyable day, the return journey was made to Edinburgh.

## VARIETIES.

THE massive stone parapet on the Glasgow and South-Western Railway near Thornhill, over 100 feet high, has collapsed at one end. The engineers will remove the structure and replace it with an iron one.

THE parish church of Houndwood, Berwickshire, is now open for public worship, after having been closed for seven months, during which it has undergone extensive structural alterations. A new chancel, in neo-Corinthian style, with a three-light east window and a new porch with moulded doorway, have been added, and the interior of the church has been entirely rearranged and reseated, the work costing 700*l.*

A BOY aged eight was killed and two women badly hurt by the fall of a verandah at 32 Barnsbury Road, Islington, on Monday evening. The deceased, James Roberts, and Emma and Rose Roberts, aged thirty-two and thirty-three respectively, were standing on the verandah watching some sheep being driven to the cattle market when, without any warning, the structure collapsed.

FOUNDER'S day at Dulwich College proved an even more interesting anniversary than usual last Saturday, as on that day the new library which has been erected in memory of the Old Alleyneans who served in the South African war was formally opened. It is English Renaissance in style, of red brick and Portland stone, and covered with tiles. The floors are of polished teak, the bookcases and panelling being of fumigated oak. The whole effect is quite admirable. There is accommodation for 7,000 volumes, with facilities for increasing to almost any extent. All the material is of the best, and the library situated, detached, at the north or Dulwich Common end of the college, is a very worthy memorial. The gate is flanked on each side by a statue, one of Minerva and another of Mars. The prefect's room, at the south end, has externally four buttresses, each to be terminated by a statue. Mr. Edwin T. Hall, F.R.I.B.A., is the architect, and the cost was about 3,600*l.*

AN open-air theatre, which has been erected by Lever Brothers, Ltd., in their model village of Port Sunlight, was, on the 20th inst., formally opened by the Mayor of Bolton. The building is the first of its kind which has been established in this country, and is situated in a delightfully wooded vale, part of the village grounds. It is intended for theatrical performances, concerts and athletic displays during the summer months. The permanent building contains the stage, 50 feet

wide by 35 feet deep, which is framed towards the front by a beautiful proscenium arch of terra-cotta, fitted with a revolving steel curtain. The auditorium is 158 feet in length by 95 feet wide, and is formed of concrete, with a large central area, rising gradually to the back, and with stepped galleries all round, which will seat nearly 3,000 people. The audience are sheltered from the weather and sun by a steel-framed roof carried upon iron columns, over which is stretched strong waterproof canvas, the sides being closed in with the same material.

### NEW CATALOGUE.

THE Fram Fireproof Flooring Company have issued an illustrated description of their "fireproof boards," of which we spoke in connection with the Earl's Court Exhibition. The long list of works already carried out or in progress is a striking testimony in favour of the invention.

### TRADE NOTES.

MESSRS. E. H. SHORLAND & BROTHER, of Manchester, have just supplied some of their patent warm-air ventilating Manchester grates to the infectious hospital, Warrington.

THE mayor of Accrington (Alderman Thos. Broughton, J.P.) set the new clock in motion at Great Harwood, Lancs, erected to the memory of John Mercer, who was born at Great Harwood 100 years ago, and the inventor of the Mercerised cloth and other valuable inventions. The tower was designed by Mr. Dunkin, borough surveyor, and erected by Messrs. Lewis Bros, builders. The clock and bell were supplied by Messrs. Wm. Potts & Sons, clock manufacturers, Leeds.

### A NEW RAILWAY LEVEL.

MESSRS. W. F. STANLEY & CO., LTD., of Great Turnstile, W.C., have just perfected a new railway level which should prove of the greatest utility to railway and other engineers. In this level the centre is cast in one piece with, and directly upon, the telescope body and object end. The cast telescope body is cored out to a suitable thickness, so that although of vastly greater strength and rigidity, it does not weigh as much

as the old form of tubular body, collars and stage, while it does away with many separate pieces which are usually soldered and screwed together, and thus forms the strongest and most compact level yet made. The rack is fixed under the draw tube, and the pinion is fitted from side to side of the outer cast body and spindled at each end, so that the pinion has a double bearing in the cast body, which adds greatly to its strength. The level is fitted with clamp and tangent adjustment, tribrach levelling and patent locking plate, so that it can be used on a wall or masonry as well as on the tripod. The diaphragm is fitted, at the option of the purchaser, with (a) webs, (b) platinum-iridium points, or (c) lines on glass. The two latter are set for stadia reading, 1:100, so that the distance of the staff is read in the telescope without other measurement. The points do not cover up the divisions of the staff, are permanent in all climates, may be dusted with a brush, and are strongly recommended. This principle of construction gives greater strength and rigidity combined at the same time with less weight. Messrs. Stanley & Co. believe that the level is unexcelled for strength and compactness, and is particularly adapted for hard wear as by contractors, &c.

### CORRESPONDENCE.

SIR,—It having been brought to our notice that a report is being circulated to the effect that this company's business has been transferred to some other centre, or has been amalgamated with that of some other firm (the report appears to have assumed both these forms), we beg to inform our customers and friends that, in whatever form circulated, the statement is without the slightest shadow of foundation. The company's business is carried on now, as hitherto, at Albert Works, Newbury, and at that address only, and is not connected in any way whatever, directly or indirectly, with any other business.

We have an exceptionally fine stock of thoroughly seasoned timber, and the same staff of competent workmen who have been trained for so many years in the class of work for which we have obtained, and we venture to think deservedly obtained, so high a reputation. We shall therefore be glad to hear from our friends as hitherto, and to give to all orders entrusted to us the same care and attention, both as regards material and workmanship, that have made our goods so valuable in the trade.

## THE BUILDING EXHIBITION.

(Concluded from last week.)

In the Minor Hall the central position was occupied by the very interesting and instructive exhibit of Irish stones lent by the Department of Agriculture of Ireland. These are numerous and varied, among them being marbles of beautiful grain and colours in columns and slabs, while a handsome revolving statuary pedestal in Connemara Green marble formed a conspicuous object in the collection. A variety of Irish granites, slates of large size and excellent quality, "Shamrock stone" (a very hard sandstone which, we believe, is being used in considerable quantities in the construction of the new War Office), and samples of a hard white limestone. Among the examples of terra-cotta were two large panels in red ware of very bold design and artistic treatment, Kingscourt bricks, roof and ridge tiles, finials, &c.

Messrs. F. Merrick & Son, Glastonbury, showed some excellent examples of high-class joinery, of which a handsomely panelled dado in oak is a fine piece of work. Their registered fixing brick for securing joinery will, we should think, be found of great utility, obviating as it does the need for plugging, the brick being of a tough nature, and affording a perfect hold for nails. It is besides very light. Messrs. Merrick also showed samples of their continuous nib plain roof tiles.

In the next position Mr. R. Trower, Redhill, had arranged samples of red-facing bricks, ornamental bricks, washed building sand, his next neighbours being Messrs. Leverstock & Acorn Red Brick Co., Ltd., Hemel Hempstead, showing key bricks, swags, Gothic string-courses, date panel, beaded jamb brick, mouldings and angles, wall copings, &c.

Messrs. Broad & Co., Ltd., Paddington, were worthily represented by a numerous assortment of their well-known sanitary specialties, consisting of white enamelled channel bends in various sections, with manhole cover and chamber complete urinal and trough channels, gully traps, interceptors, patent and other sinks, manhole covers, stable gully, cream Bristolware channels and gully traps, channel shoe and reversible gully trap, brownware traps, stoneware drain pipes and connections, improved channel interceptors and gullies, Armstrong's improved inspection openings for drains; also a new patent interceptor for testing inspection chambers, white and coloured glazed bricks, building bricks, cast-iron drain pipes and connections, a cast-iron inspection chamber, samples of

stable paving and channels in adamantine clinkers, and laid specimens of various designs for floor and hearth, wall and mosaic tiling, dados, friezes, skirtings and mouldings.

The principal exhibit at Stands B and C, 21, Gallery, Messrs. B. J. Hall & Co., 39 Victoria St., was Hall's patent electric copier for reproducing tracings. An antiquarian size machine was shown at work. This machine makes two blue prints in two minutes, two black line prints in six minutes. It has a special arc lamp made to the inventor's specification, which will burn with 85 to 90 volts at lamp terminals on a 100-volt circuit, and 160 volts on a 200-volt circuit. These lamps are largely used for process engravers' work. Upwards of 500 sets of the complete apparatus are now in use, and the demand is, we are informed, increasing. A new vertical or horizontal balanced drawing-desk by Messrs. B. & S. Massey, of Manchester, for which Messrs. B. J. Hall & Co. have the sole London agency, is of unique design, perfect in every detail, and is coming largely into use in the high-class drawing offices. Folding writing-desks were also shown, and students' drawing-tables, inexpensive and substantially constructed articles, which can be used for a variety of purposes, and when not in use occupy a very limited space. The boards, if fitted with magnetic tee squares, can be worked in a vertical position. The tables are most useful as an auxiliary to a roll-top desk, and can easily be brought out to accommodate a temporary surplus of papers. Messrs. Hall & Co. showed a 10 feet by 3 feet photo print in one sheet without joint, and a large number of samples of British photographic papers prepared at their own works, also drawing instruments, colours and the like.

At Stand No. 9, Gallery, was an exhibit of metalwork by Messrs. Waltham & Co., of 46 York Street, Buckingham Gate, S.W., from the designs of their artist, Mr. Robert Evans. In these days of swirls and curls it is interesting to find a firm who so steadfastly cling to the traditions of their craft, their work having that restraint and sincerity of purpose which is rare in any but old work. A fine example of light smithing is their altar crucifix in bright iron, with its delicate lacework ends, and a clock in hammered and repoussé brass is also worthy of mention. Architectural metalwork was well represented by the photographs of the covered verandah and balcony, 105 feet long, and the two covered porches made for the Bath and Cheltenham Hotel (Messrs. Treadwell & Martin, architects). Messrs. Waltham & Co. had also some interesting portfolios illustrating the lighting of town and country mansions, all of which go to prove to what an extent

Telegrams, "DIS" END, LONDON."

York Mansion, York Street, Westminster, S.W.

the traditional treatment of metalwork may be preserved, even with the most modern methods of lighting by electricity.

*Incorporations, Ltd.*, of 33 St. Swithin's Lane, E.C., showed (Stand 11, North Gallery) John's patent windows. These are so made that the whole of the glass, both inside and outside, can be readily cleaned from the inside of the room. There is nothing of a complicated nature in their construction, and their appearance is not impaired by cumbersome fittings of any kind.

*The Newellite Glass Co., Ltd.*, 139 Cannon Street, were worthily represented by a prominently-placed pavilion, the walls of which were effectively decorated with their glass tiles. These tiles, as most of our readers are aware, have been specified in connection with many public works, and, *inter alia*, have been supplied to H.M. War Office, for lavatories, Sobraon Barracks, Colchester; sergeants' mess, baths, Wellington Barracks, S.W.; New War Office, Horse Guards Avenue, S.W.; H.M. Admiralty, for tiling vaults, Greenwich Hospital, S.E.; H.M. Home Office, for Cannon Row Police Station, S.W.; Highgate Police Station, N.W.; H.M. India Office, for Civil Secretariat, Simla; Walker Hospital, Simla; General Hospital, Madras; Law Courts, Rangoon; and the Borough Councils of Bermondsey, Camberwell, Chelsea, Croydon, Fulham, Poplar, Westminster, &c., in London, and to numerous public bodies in the United Kingdom, India, Australia and the Continent. They make an excellent decoration with a clear impervious surface, unaffected by frost or weather, and owing to the special nature of the backing, which is elastic, do not crack or craze.

*Mr. H. Hart*, 29 Settles Street, Commercial Road, E., showed drain-cleansing machines, with various forms of improved brass couplings. Also apparatus for use with them, stout ash sewer rods, with shovels and scoops to connect with them.

The "Offa" ventilator, exhibited by *The Offa Ventilating Co.*, 64 Basinghall Street, is an inlet ventilator so arranged that it admits clean, diffused air without draught; it is noiseless, can be easily cleaned, contains an air filter, and can be decorated in accordance with its surroundings.

Cooper's patent "Champion" drain clearer was shown by *Mr. A. T. Cooper*, of 92 Moray Road, N.

*Messrs. O'Brien, Thomas & Co.*, Upper Thames Street, were represented by the Coburn patent sliding-door hangers, roller and ball-bearing carriers for warehouse, and parallel folding partitions and fire doors, lateral and vertical adjustment.

*Messrs. H. G. Goodwin & Son*, 16 Charles Street, Hatton Garden, had a good display of useful joinery, staircase, doors,

sashes and frames, turnery, closet seats, hand-rails, carved mouldings and overdoors, front gates, wood fireplace fronts, newels and balusters and compo-board.

*Mr. Walter Edwards*, of Mitford, Surrey, brought his patent ventilator, which works automatically to carry off impure air. This apparatus is invented to fix in ceilings to carry off impure or vitiated air without any down-draught, thereby causing a supply of pure air to take its place. It is fitted with mica valves which hanging perpendicular in its normal position are always open, and the slightest down-draught striking the curved plate in the interior of the ventilator cause it to deflect and impinge on the valves, thereby closing them. It is also fitted with an apparatus to close the valves completely, if desired, by turning a knob or handle, and has an index plate to show the position of the valves.

An ingenious and very useful scaffold fixer was shown, and its working explained, by *Mr. James Hunt*, 86 Herbert Street, N.

The exhibits contributed by *Messrs. J. Bonsor & Co.*, Barrington Road, Brixton, comprised a variety of expansion sockets for lead soil-pipes and waste pipes, copper-strengthened lead sockets and closet-connecting cones.

Non-slipping metallic woven stair treads, Banner's sanitary fittings, for which twelve medals have been awarded at exhibitions, drain-testing appliances for scent, smoke, air and water tests were shown by *Lyte's Metallic Woven Stair-Tread Co., Ltd.*, and *Banner Sanitation Co.*, 24 Craven Street, Charing Cross, London, W.C.

*Mr. James Oates*, Huddersfield, explained the working of his "Empire" wall-paper trimmer, trimming all classes of wall-papers at a speed equal to the labour of ten men.

Some extremely effective decoration was to be seen at the Stand of *The Crystalline Co., Ltd.*, Stourbridge, consisting of crystalline patent glass tiles, with "key" back for wall facings, "Verre-sur-Verre" window decorations, "Verre-sur-Verre" vases and tiles, devitrified glass mosaic flooring, and crystalline elastic cement.

Granite silicon plaster, which, we understand, is largely used by H.M. Government, both by the War and Postal Departments, also in many public buildings, hospitals, asylums, &c., was shown by *The Granite Silicon Plaster Co., Ltd.*, 36 King's Road, N.W.

*The Hockley Hall and Whateley Collieries and Brickworks, Ltd.*, Tamworth, were represented by a comprehensive collection of their Staffordshire vitrified blue and red bricks,

copings, plinths, quarries, ridges, roofing and garden-border tiles, ornamental string-courses, mouldings, mural tiles, &c., in various colours, kerbs for footpaths, various kinds of terra-metallic pavings, &c.

*The Mosaic Manufacturing Co.*, King's Road, N.W., had on view some excellent samples of Roman and Venetian marble mosaic, Venetian glass and gold mosaic, opus sextile mosaic, ceramic mosaic, parqueting and wood-block flooring.

A Stand which attracted a large amount of attention was that of *The Marmart Co., Ltd.*, where were seen specimens of a new material composed of glass and metal of a highly decorative character, and eminently suited for decorative panels, advertising tablets, shop fascias, pilasters, &c., the effect of highly ornamental marble being obtained at a very appreciable saving in cost.

*Messrs. Moule's Patent Earth Closet Co., Ltd.*, were as usual represented by a range of their patent closets, which are too well known to need description.

Some pleasing designs in gas-fittings were displayed by *Messrs. S. P. Catterson's, Ltd.*, Newington Causeway, conspicuous among these being pendants and branches for the inverted incandescent gas-burners.

Stoniflex roofing felt, tarred felts, inodorous felts, &c., for roofing and lining; circular wooden lattice girder felted roofs; silicate cotton or slag wool in various forms, showing its application for sound and fireproofing buildings, and insulating cold-air stores; silicate pipe cloth, for covering steam and other pipes; Anderson's patent hair fabric, for covering hot and cold-water pipes, and to prevent freezing, &c., also for covering brine and ammonia pipes; dry hair felt and sheets in long lengths; clean-washed cow hair; plasterers' hair, &c., were shown by *Messrs. D. Anderson & Son, Ltd.*

*The British Compo-board Co., Ltd.*, 18 Roscoe Street, E. exhibited specimens of their compo-board, as suitably applied to buildings, structures, partitions, walls and ceilings, in panels, and showing in a general way its application to building purposes. This material was shown also in sections, demonstrating its use for showcards and signs, veneered wood, furniture, drawing-boards, dark-rooms, blackboards, screens and similar articles, where a large smooth surface is of advantage.

Among the many interesting specimens of their work shown by *The Crittall Manufacturing Co., Ltd.*, Braintree, was a piece of iron window frame forming portion of one of a range of windows which the firm are making for the Yerkes electricity-

generating station at Neasden; these windows are each 60 feet in height, and are probably unique. Other exhibits comprised, among many others, reversible casements to facilitate the cleaning of windows from the inside. Doors fire and thiefproof, sliding roofs, lantern, sky and dome lights, puttyless glazing, opening gearing for lanterns, fanlights, &c, constructional ironwork, lattice and compound girders, stanchions, coal bunkers, footbridges and gangways, overhead trolley-ways, fire-escape staircases, &c.

One each 36-inch, 30-inch and 24-inch sanitary pipes, in 3 feet lengths, one 18-inch street gully, 4 feet deep, and sample 6-inch interceptors and yard gullies were here to represent *Darwen Sanitary Pipes, Ltd.*, Darwen.

*Mr. W. Höfler*, Soho Square, had a very pretty little show of quaint and artistic furniture, wall-papers and other mural decoration, metalwork, a portion of a handsome and massive carved oak staircase, electric-light fittings, paving and mural tiles, &c.

*Messrs. C. Faust & Co.*, 2 The Crescent, Tower Hill, E.C., and *Clemons, Marshall & Carbert*, Leeds, showed work treated with their magnite cold-water paint, of which they distributed samples, specimens of their Flintkote roofing, and samples of metal covered with their Lustrogen aluminium.

*Messrs. Dawson & Co., Ltd.*, Battersea, did justice to their wares with their extensive display of sanitary ware, including, amongst other specialties, their new designs of stable gully trap, with reversible top and intercepting bucket; the "Mendip Gully;" the "Glasarm" interceptor, a new design to facilitate the releasing of sewage in a manhole; "Ephos" ware, a new brown glazed ware, adapted for the manufacture of gully traps, interceptors, channel bends, &c.; white enamelled channels, interceptors, gully traps; white enamelled and cream glazed sinks; white and coloured glazed bricks; brown stone-ware pipes, traps, &c.

*Messrs. John Knowles & Co.*, King's Road, N.W., were represented by samples of glazed stoneware, "Vitrifine" pipes and sanitary fittings; patent "B.P." stoppers, fitted to junction-arms and to interceptors; "Brighton" interceptor, with "B.P." stopper; reversible gullies and gully-extendors; improved "Bellman's" gullies, used largely in asylums and all public buildings; channel bends, with examples of "Lustrine" glaze; improved access pipe; their latest specialty being Turner's patent "locking-grid" gully.

*Messrs. Watson Nelson, Ltd.*, Napton, near Rugby, showed some excellent samples of the dark red roofing tiles of which

they are justly proud. These tiles, which have a hard, durable surface and a good metallic ring, have undergone, we understand, the severe test of being subjected to 20 degrees of frost in a freezing-room for six consecutive nights, being thawed each day in a temperature of 75 degrees, and coming out perfectly sound. Another specialty of this firm is their patent fluted-face tile, of which they also showed specimens.

Their usual attractive display was made by *Messrs. S. & E. Collier, Ltd.*, of Reading, who showed some capital machine-made terra-cotta of effective design especially adapted for use in the erection of small villa property. This comprises door and window heads, sills and lintels, string-courses, pier caps, ridge tiles, finials, &c. As specimens of their productions to architects' specifications were photographs of Reading Town Hall and Municipal Buildings, an imposing block of business premises in Queen Victoria Street, Reading. Some excellent samples were to be seen here of their well-known roofing and wall tiles—red smooth-faced, plain, dun-coloured, strawberry-coloured, sand-faced (hand-made), with and without nibs, patent sand-faced (machine-made), with and without nibs, patent rough-faced for weathering quickly; ornamental tiles in various patterns for vertical work, eaves and header tiles, gable or one-and-a-half tiles, hip, valley, angle and sprocket tiles, small tiles for bays, porches, &c. Bricks, chimneypots, drain-pipes and ornamental red pottery (vases, &c.) were also *en evidence*.

*Messrs. Perrett Bros.*, Sutton, showed red ridge tiles in 18-inch lengths, finials, chimney-pots, ordinary and moulded red bricks, terra-cotta, garden edgings, &c.

A new combined gas-cooker and hot-water circulating boiler (L. Rasch's patent), by which hot water is supplied throughout the house in fifteen minutes at an average expense of 1d. per hour, was shown by *Messrs. Beaven & Sons*, 27 Victoria Street, S.W.

*Messrs. J. Halden & Co.*, Manchester, exhibited engineers' photo-copying processes, electric copying frame, arc photo process, giving intense black line; surveyors' levels, theodolites; planning instruments, mining dials; drawing instruments, drawing-office materials.

A goodly show of radiators of various descriptions for gas and oil, gas and oil conservatory boilers, geysers, &c., were shown by *Messrs. Fenlon & Co.*, Whitefriars.

*Messrs. Moore's Patents Co., Ltd.*, Edmonton, showed and explained their various kinds of window fittings, door springs and hinges, fanlight and skylight openers, check springs, &c.

*Messrs. Carter & Co.*, Poole, showed some charming examples of lustre glaze applied to tiles and decorative art objects, as vases, beakers, &c. This glaze, which, we understand, is a specialty, gives some extremely pleasing effects, and was greatly admired. The firm's other exhibits comprised tiles for floors, walls and hearths, ceramic mosaic, constructional faience and terra-cotta.

A very peculiar building brick was exhibited by *Mr. Cecil Nathan*, 39 Victoria Street. It is an interlocking brick. These can be laid with perfect accuracy by unskilled labour. By this system no pointing is required, and the bricks can be set up temporarily to form walls without mortar.

*Messrs. Powers & Deane, Ransomes, Ltd.*, had a section of the patent "M.P." fire and soundproof floor and ceiling, with rolled steel joists, patent tiles, coke breeze concrete, and finished with granolithic paving complete. Patent fireproof doors made of two steel stampings only. Samples of steel compound girderwork, stanchions and roof trusses, showing various methods of construction, connection, &c., and a compound girder section, showing simplicity of construction combined with extraordinary carrying power.

A small roof covered with the Somerset tiles showed that these tiles can be laid without nails; they are lighter than pantiles and are rain and snowdrift proof. The exhibitors, *The Somerset Trading Co., Ltd.*, also invited attention to their improved plain roofing tiles, patent "Rainbar" plain tiles, interlocking triple angular tiles, ridge tiles, "Lockjaw" tiles, triple and double Roman tiles, &c.

*Messrs. Cobbetts*, Virginia Road, Bethnal Green, had their Stand quite at the entrance to the main hall, where they showed a large variety of "Marbut" machine-carved mouldings, which attracted a great deal of attention. These mouldings are actually machine-carved by gauges and chisels by an English patented machine; there is no planing, stamping or turning about these goods, and the designs are remarkably clean and sharp. The assortment is also a very useful one, comprising mouldings for dados, cornices, panels, picture hanging, picture frames, &c. *Messrs. Cobbetts* also showed a very fine selection of newels and balusters in square and round turning, the workmanship being of a very high order.

*Messrs. Thos. Pascal & Sons*, Norwood, were represented by samples of their Wrotham P.W. 2½ inches by 2 inches hand-made sand-faced red facing bricks and sand-faced red moulded bricks, their Wrotham hand-made sand-faced red, plain and ornamental roofing tiles, hips, valleys, angles, &c.,

# B. & S. Patent FOLDING = = GATES and = KINNEAR = = Patent = = = STEEL = = = ROLLING = = DOORS = = =

Are in use on the Best Buildings  
in all parts of the world.

The B. & S. Folding Gate Co.

19, 20 & 21, TOWER STREET,  
Upper Saint Martin's Lane, LONDON, W.C.

expanding ridge tiles in ordinary widths, also extra wide to weather 14-inch wall, ornamental and plain-crested fixed pitch ridge, red chimney-pots, &c.

The *Cloisonné Mosaic Co.*, 76 Newman Street, showed a very elegant and, so far as we know, distinctive decorative effect in their cloisonné mosaic, the design of which is formed in apparently specially made cubes of various coloured glass contained within metallic divisions or cloisons. Notable among these were the surround for grate and hearth *en suite*, the design a garland in blue on a white ground, the effect being very chaste and elegant. Among the several very pleasing panels one representing a pair of flying storks was particularly successful. At this Stand were also shown some excellent panels in *Marmorite artistique*, a very attractive material which we described fully a few weeks since as having been exhibited at the Trocadéro restaurant. Among the notable samples of this material was the fascia of the Stand in pale green with gold letters, which fully demonstrated the extreme applicability of the material to this and cognate uses.

Faija's patent cement-testing plant, including testing machines, moulds for briquettes, gaugers, steamers, sieves, Vicat needles, scales, &c., were shown by *Messrs. R. H. Mudd & Co.*, Chiswick.

The *North Devon Clay Company*, Torrington, had some good impervious buff facing bricks, vitreous paving bricks, and some engineering and sewer bricks on view.

The *clou* of *Messrs. Yates, Hayward & Co.*'s exhibit, which occupied its accustomed position under the east Gallery, was a monumental kitchener for hotel use, which, being a combination for the use of coal and gas, possesses the advantage that when the fires have been shut down, the day's work being presumably over, the smaller or gas portion can be lighted in an emergency, and a meal for an unexpected party expeditiously prepared. The other numerous exhibits at this Stand comprise varieties of their well-known high-grade grates and mantels, many of them being of beautiful design and all of good workmanship.

*Messrs. Richard Hornsby & Sons, Ltd.*, Grantham, showed an oil-engine (fixed), the "Hornsby-Ackroyd," R.A.S.E., first prize; made for working with either ordinary oil or "liquid fuel."

*Messrs. Ashton & Green*, who were also in their usual position, showed a variety of kitchen ranges, including their specialty, the "Sine qua Non," a large and choice selection of chimney-pieces in wood, iron, marble and slate; stoves and

interiors of the latest improved designs, including the new well-fire; tile surrounds, panels and hearths; baths in porcelain and other enamels, lavatory stands, &c.

The patent "Emperor" brickmaking machine, in operation, attracted a good deal of attention. This was shown by *Messrs. Sutton, Speakman & Co., Ltd.*, Leigh, Lancs, who also sent specimens of their patent stiff plastic brickmaking and pressing machine; flags made on their patent process from slag, granite, sand, destructor clinker, limestone chippings, &c.; lime-sand bricks, made from all classes of sand, slag bricks made from several varieties of slag, destructor clinker bricks, made from a mixture of clinker and lime, gas lime and clinker bricks, made by their special process, and special sandstone facing bricks.

Another crowd was attracted at the neighbouring Stand of *Messrs. Sagar & Co.*, Halifax, who showed a variety of wood-working machines, all of the utmost ingenuity and utility; among others we noticed a new pattern builders' mortising and boring machine, with crank shaft in base of machine for running at a very high speed; and an automatic reversing chisel, which takes timber 11-inch by 4½-inch stroke, with self-coring chisels.

The *Glendon Engine Works Co.*, Kettering, showed a new design "Century" mortar-mill combined with engine and boiler, a 12-feet by 5-feet patent brick-breaker, an improved friction winding hoist, and a first process clay pan, 7 feet in diameter.

The Kielberg machine shown by *Mr. Paul Fernau*, 63 Quintin Avenue, W., is used for making drain-pipes of every dimension from Portland cement and sand or other materials. Hitherto such pipes, which are largely used on the Continent, have generally been made by hand.

Saw-benches and other wood-working machines, also in motion, with engines of various descriptions, formed the attraction at the Stand of *Messrs. Easton & Bessemer, Ltd.*, Taunton.

*Mr. Joseph Hamblet's*, West Bromwich, exhibit consisted of Barnes's patent direct-acting steam pump, brick machine, rolls and presses, and *Messrs. Herbert Alexander & Co., Ltd.*, Leeds, showed sand and clinker concrete brick and stiff plastic machinery. That of *Messrs. J. B. Stone & Co.*, Finsbury Pavement, showed a large variety of wood-working machines and tools.

*Messrs. Jas. B. Petter & Sons, Ltd.*, showed some handsome patterns in their patent "Nautilus" grates. The "Nautilus"

54, Blackfriars Rd. S.E. 124, Kings Road, S.W. LONDON.

grate is so constructed that there is no inlet to the chimney above the grate. The grate is in the form of a shell, and the heated gases pass around the hood or volute before escaping into the chimney. They also showed the patent "sou-wester roof" plate for carrying smoke pipes through roofs of buildings, providing a safe watertight joint; the patent "Mermaid" boiler for kitchen ranges; the "Petter" engine, an oil-engine burning common paraffin oil, and the "Handy" stable loft crane for hoisting all kinds of materials for building and other purposes.

Mr. T. Potterton had his familiar Stand, at which were to be seen his patent zigzag range boilers, independent boilers, radiators, towel dryers and an acetylene gas generator.

The "Stott" electric ventilating fan for removing smoke and foul air from smoke-rooms, bars, restaurants, &c., ventilating hotels, theatres, churches, &c. The "Stott" patent instantaneous and silent water-heater and circulator, for swimming-baths, and other useful appliances were shown by Messrs. James Stott & Co., Queen Victoria Street.

Some very useful fittings and appliances, consisting of adjustable steel bookstacks for libraries, cabinets and cards for card-indexing system for architects and builders, their vertical filing system, which is a new method of filing correspondence, catalogues, &c., office furniture, &c., were shown in the Arcade by The Library Supply Co., Queen Victoria Street, E.C.

In the Arcade were also to be found Messrs. Pryke & Palmer's exhibit of steam radiators, lead closet connections, jumpers, slate clips, &c. (The Exeter Gasteam radiator, it was explained to us, is a complete steam-heating apparatus in itself; no separate boiler or steam-pipe is required, the only connection needed to work it is to a 3-inch gas pipe, which supplies the fuel for producing the steam). That of Messrs. Crewe & Co., consisted of trucks, bogies, barrows, handcars, hay-racks, &c.

Mr. John Coppard, of 189 Copenhagen Street, Islington, N., displayed in operation at Stand No. 27, in the North Gallery, a couple of his patent self-sustaining swing scaffolds, with the aid of which one man can raise and lower himself and fellow-workmen with safety to all concerned by simply turning the handle. A great advantage of the scaffold is that it can be packed for storage or transport, so as to occupy a space of only a few inches in thickness.

The flagging shown in Gallery by The Basaltine Stone Co., 45 Parliament Street, is made of materials different to any other in the market, and it is claimed that it is extremely

durable, is also non-slippery, and possesses a tread superior to the natural York paving. Armoured kerbing and channelling. Sewer and water conduits in circular form in sizes varying from 4 inches to 40 inches, and in egg-shape in sizes varying from 12 inches by 8 inches internal section to 60 inches by 40 inches internal section. This company also exhibit copings, checkered paving, slabs, steps, window-sills, &c.

Mr. Geo. Riches, Cromer, in adjoining space showed red facing common building bricks and red moulded bricks.

The Oliver standard visible typewriter, a variety of desks, typewriter furniture, supplies for the various makes of machines, duplicators, &c., were shown by The Oliver Typewriter Co., Ltd., 75 Queen Victoria Street, E.C.

The Shannon, Ltd., had an extensive display of writing tables and roll-top desks, letter-filing and card index and other cabinets, chairs, and a number of their labour-saving office appliances.

Messrs. Colledge & Bridgen, Wolverhampton, showed and explained the action of Fisher's patent window attachment for the prevention of accidents to window cleaners.

Flat or garden roofs, and samples of their plastic roofing and damp-course felts occupied the Stand of The "Coolmore" Durable and Asphalte Co., of Belfast.

Mr. Vernon Parker, 20 Victoria Street, S.W., had a very comprehensive exhibit of the various goods for which he is agent; among these were specimens of Hamblet's building; and stable bricks, kerbs, channels, plinths, bull-nose copings, blue "ironware" pipes and invert blocks for ovoid sewers, &c.; Hassall's improved safety-pipe joint, specially designed to enable engineers to make thoroughly water-tight sewers in water-logged districts; Preston Concrete Granite Co.'s artificial paving flags, steps, &c., made of Penmaenmawr granite chip-pings and Medway cement; Prismatic Wood Paving Co.'s wood-blocks consisting of squares or prisms of oak, with iron tongues inserted; Shone's system of drain and sewer ventilation, and E. P. Hooley's patent tar macadam.

The British Felt Co., 92 Tooley Street, had a collection of their specialties in inodorous asphalte roofing and other felts, glue, concentrated size, scaffold cords, &c.

The Patent Automatic Sewage Distributors, Ltd., Westminster Palace Gardens, showed their latest devices in patent automatic, mercury-sealed revolving sprinklers for the bacterial treatment of sewage; patent floated or buoyant sprinklers and travelling sprinklers for bacteria beds; rotating sewage-feed apparatus; automatic feed valves; automatic sewage screen, &c.

MARMORITE supplied, AS USED IN THE PRINCIPAL HOSPITALS. Full particulars on application.

*The British Paving and Granite Co*, Great George Street, S.W., showed a sample of paving and other granites, as Norwegian non-slipping (interior rock) granite setts, open grey Norwegian granite setts, close texture Norwegian granite setts, pink Swedish (interior rock) granite setts, open pink Swedish granite setts, best blue Welsh setts, best grey Irish setts; samples of dock coping, curbing, edging, &c.; 2-inch Myddleton granite macadam, Myddleton chippings, 2-inch best Welsh Ceiriog granite macadam, Rostrevor and Norwegian granite macadam, &c.

*The Sanitary Block and Tile Paving Co., Ltd.*, 17 Victoria Street, showed a section of pavement blocks laid *in situ*, together with samples of the paving blocks of various sizes. These blocks are composed of steam-refined Trinidad Lake asphalt, with finely broken trap-rock, hard limestone, or other suitable material mixed in carefully ascertained proportions. A wood fibre block, granulated wood or wood fibre being substituted for the stone. Sample block made from dust destructor refuse, mixed with Trinidad Lake asphalt, &c.

A model of Meldrum's simplex regenerative refuse-destructor, front hand-fed type, four-grate unit size, with Lancashire boiler, regenerator, &c.; a model of Meldrum's simplex regenerative refuse-destructor, improved top-fed type, three-grate unit size, with Babcock & Wilcox boiler, regenerator, &c.; an interesting collection of curios from high-grade destructors, &c., formed the staple of *Messrs. Meldrum Bros., Ltd.* (Victoria Street), exhibit.

The Heenan patent refuse-destructor, centrifugal fans, forced-draught plant, smokeless chimneys and coal-saving appliances, &c., were shown by *Messrs. Heenan & Froude, Ltd.*, Manchester.

*Messrs. John Wainwright & Co., Ltd.*, of Shepton Mallet, sent a number of samples of asphalt for various purposes. These comprised specimens of Seyssel, mastic and British asphalt, asphaltic paving, basalt stone, limestone for dressing, for mixing with cement and for tar paving, Kentish rag-stone for macadam tar-paving, &c.

*Messrs. Mackay & Daviss*, Pontypridd, showed varieties of blue Pennant stone, self-faced flagging, self-faced Keil, self-faced channel setts, &c.

*Messrs. Sutton & Co.*, Overseal, near Ashby-de-la-Zouch, were represented by an extensive array of their impermeable stoneware sewerage pipes, 2 inches to 18 inches diameter, with junctions, bends, inspection and access pipes, syphons, traps, interceptors, yard and street gullies, pipe and block traps,

Henman's channel gully and trap, Stanford jointed pipes, their patent flush joint, single and double seal pipes, Smith's patent iron-jointed pipes, Green's patent Wyvurst channels, &c.

*The Hopton Stone Co., Ltd.*, Wirksworth, made an attractive Stand by arranging *in situ* their specimens of paving and dressed work, balustrade steps, kerbs, gutters, footways and material for town carriage-ways and road metalling.

*Messrs. Chalmers & Co.*, Redhill, had a capital ambulance carriage or two, and we noticed an ingenious automatic tilting sanitary refuse-cart, disinfecting vans, carts, hand trucks, &c.

*The Phoenix Engineering Co., Ltd.*, Chard, showed a variety of boilers and pumps, a road-scraper, hose, &c.

Samples of granite paving setts, channels, kerbs, crossings, macadam and chippings, from the Minfordd and Gimlet Rock, Pwllheli, Quarries were shown by *The Pwllheli Granite Co., Ltd.*, Runcorn. The special features claimed for the paving materials produced at these quarries are freedom from slipperiness and comparative noiselessness.

*Messrs. J. A. Reynolds & Co.'s*, Birmingham, exhibit consisted of an extensive display of tachometers, theodolites, dumpy levels, builders' levels, levelling staves, ranging poles, mining dials, circumferentors, cross staves, box sextants, prismatic compasses, optical squares, Abney's levels, reflecting levels, protractors, parallel rules, anemometers, air meters, aneroid barometers, drawing instruments, planimeters, eidographs, surveyors' rods, land chains, scales, engineers' photographic apparatus, drawing boards, squares, drawing and tracing papers, tracing linens, mounted paper and all other drawing materials used by architects and surveyors.

*The Rowley Regis Granite Quarries, Ltd.*, Rowley Regis, had installed a short length of tramway line and a length of 10 by 5 Rowley kerb, with 4 by 4 sett channel, besides showing sample setts of various sizes, various sizes of macadam, coarse and fine chippings, &c.

A drawing and model of non-septic sewage disposal—Goodridge's patent—was exhibited by *Mr. Alfred S. Goodridge*, Bath, showing plan and sections of an installation by which the solid is preserved for its material value, being removed weekly by a barrow with dry earth, on an inclined plane, and cleared by rake out of the straining channel into it.

Drain rods, fitted with the "Ferrett" patent lockfast brass joints and specially-selected Malacca canes, were shown by *Messrs. Cakebread, Robey & Co.*, Stoke Newington, with fittings and appliances for use with above, and tube-clearing rods for telephone and electric cablework.

# THE PASTEUR FILTER

A new process for seasoning timber was explained and samples of treated wood shown by *The Powell Wood Process Co.*, Liverpool. By this system the timber is first saturated at boiling-point with a thin solution of raw or common refined sugar, and afterwards the water is evaporated at a high temperature, leaving the interstices in the wood filled in with solid matter and the timber vulcanised, preserved and seasoned.

*The Nevile Engineering Co., Ltd.*, Worcester, showed specimens of Caink's patent jets and sprinklers for street watering-carts, complete with valves and strainers ready for attaching to watering-waggons or carts. Caink's sewer ventilators for ventilating sewers without permitting the sewer-gas to escape freely into the air, by which the dampness is abstracted and the gas is filtered and allowed to escape gently. A direction post for country roads was also shown.

*Mr. James Runnalls*, Penzance, showed specimens of Penlee stone. This stone is a basalt, and, we believe, has been on the market for thirty years, being supplied to numerous corporations, vestries and public bodies throughout the United Kingdom.

*The North London Ballast and Sand Co., Ltd.*, Hamilton House, Bishopsgate Without, showed samples of washed gravel and sand, limes, cements, concrete, screens, &c.

*The Glenfield Premier Brick and Terra-cotta Co., Ltd.*, Glenfield, near Leicester, showed red hand-pressed facing bricks, tapped wire-cut for seconds facing, moulded and ornamental brick; *The Staunton Colliery and Sanitary Pipe Co., Ltd.*, Worthington, stoneware drain-pipes and fittings; *Messrs. S. Barnett & Sons, Ltd.*, Dudley Port, Staffordshire, red, brown, brindled and blue wire-cut bricks, Staffs blue vitrified pressed building bricks and paviors, terra-metallic imperishable copings for walls and platforms; *The Down Mill (Bracknell) Brick Co., Ltd.*, Berks, machine-made bricks, hand-made bricks, moulded bricks, roofing tiles, ridge tiles, finials, &c.; *Messrs. Gunton Bros.*, specimens of ornamental and moulded bricks; *Plaster Brick & Stone Co., Ltd.*, Hanley, plaster-of-Paris (coarse, builder's, fine, superfine, &c.), Keene's and Parian cements, alabaster in blocks, gypsum stone for rockeries, red facing bricks, ridge-tiles, wall-coping, cill-bricks, garden-edge, terra-cotta, &c., limestone for highways, carriage-drives, footpaths, &c.; *Mr. H. C. Slingsby*, Old Street, E.C., patent trucks and trucks of all kinds; *Mr. G. Featherby*, Holborn Viaduct, E.C., red facing and moulded bricks and ornamental work, and *Messrs. Peter Wood, Ltd.*, West Bromwich, culvert, facing, paving and kerbs, channels, stable bricks, &c.

### A NEW COTTON EXCHANGE FOR LIVERPOOL.

THE directors of the Liverpool Cotton Association, in accordance with the resolution passed at the general meeting of April 1 last, have purchased the land as a site for the proposed new Exchange for a sum of about 87,000*l.*, and have settled the questions of lights and leases in a manner which they consider satisfactory. As a great many technical points arose during the negotiations the directors found it necessary to engage Mr. Frank G. Briggs as an advisory architect, and they have been guided by his and other expert opinions in regard to the agreements for lights. The maximum sum which the Association under existing agreements may be called upon to pay amounts to 8,090*l.* for rights of light (building up to 90 feet), 8,000*l.* for buying out an existing lease, total 16,090*l.* The above sum of 8,090*l.* includes a strip of land bought at the further side of Edmund Street, which is to be used for setting back the buildings on that side, thereby widening the street and thus improving the property. The total amount will, in all probability, be considerably reduced, but the directors do not consider it advisable to divulge all the details of the agreements at the present moment, and therefore ask the Association to be content with this statement:—The directors have bought Lombard Chambers for 12,000*l.* and hold an option to buy City Buildings for 26,500*l.*, total 38,500*l.*, which latter they recommend the Association to exercise. If on resale these two investments should show a loss, that loss will have to be added to the sum put down for compensation.

At an extraordinary general meeting of the above-named Association held at the City Hall, Eberle Street, the following resolutions of the board of directors were carried:—(1) That the report as printed above be adopted. (2) That the directors be and are hereby instructed to exercise the option of purchase of City Buildings and to resell this property and Lombard Chambers at their discretion. (3) That the directors be and are hereby instructed to proceed with all the preliminaries for the building of a new cotton exchange in general agreement with the terms of scheme D. (4) That for this purpose the directors, with the assistance of the advisory architect, be and are hereby instructed to prepare the details of the conditions which are to serve as a basis for the competing architects. (5) That the directors be and are hereby authorised to raise money by the issue of debentures for the purpose of paying for the property and of defraying the expenses connected with the purchase thereof, in general agreement with the original scheme, and in such manner as may become necessary.

# THE LONDON VENTILATING STOVE

**Specially Adapted for Hospitals, Infirmarys, &c.  
ECONOMISES FUEL. MADE IN TERRA-COTTA.**

A continuous current of fresh air is admitted through a shaft beneath, warmed by contact with the chambers at back, and discharged into the Ward or Dormitory at an agreeable temperature.

**THE "HEAPED" AND "VALLEY" FIRES.**

We referred last week in our account of the exhibits at The Building Trades Exhibition to the "Heaped" and "Valley" fire-grates shown by Messrs. Bratt, Colbran & Co., of 10 Mortimer Street, W., but the demand upon our space forbade our giving the detailed description of these grates which their merits warrant, and we therefore propose to take this, the earliest opportunity, to supply the omission. The "Heaped" fire is a very attractive innovation whereby the fuel is very effectually consumed by slow combustion at a very small elevation—some

two inches or so—above the hearth. Bars either vertical or horizontal are dispensed with, and the utmost cleanliness and neatness obtained. It is, moreover, the very material advantage of cheapness; we understand it can be supplied with solid brass or copper hood and all complete at from between 3*l.* or 4*l.* upwards.

As can be seen from illustration, the back and sides of the grate are formed of fireclay, the upper portion coming well forward over the fire and the cheeks well splayed in order to utilise to the utmost the heat generated by the fuel, the metallic

portion consisting only of bars similar to those which constitute the bottom of an ordinary grate, and the ash-pan, both of which can be entirely removed for cleaning or other purposes. Simplicity, effectiveness and economy may be said to be the strong points of these excellent grates, which can be fixed in any fireplace and with unskilled labour, if necessary, and they are a valuable specific against smoky chimneys. The "Valley" fire depicted in second illustration is a modification of that just described, which, although it also has no bars, has a little more iron in front, in order to satisfy those who might entertain an entirely

groundless fear that the others are unsafe; so far, however, from this being the case, we are assured that they are even safer than grates constructed on the old-fashioned plan. The "Valley" fire is, we believe, even slower in combustion than the "Heaped." We may add that a number of these stoves have been fixed at Charing Cross Hospital, the Brompton Hospital for Consumption, the hospital at Carshalton, Buchanan's handsome new building in Holborn, and have been used in private houses by architects who have signified their approval.
